In the mean time, the minister of the Indies endeavoured to excite the industry of the inhabitants, who, notwithstanding their supineness, from which the appearance of gain is alone calculated to awaken them, have the greatest aptitude to manufactures, agriculture, navigation, and the building of ships. Already had cotton manufactories been established at Manilla, and succeeded. Already had it been frequently in contemplation within the century to enliven the colony by means of a company.

In 1733, the minister Patinbo proposed the establishment of a company, which was to have a duration of twenty years, and to which privileges were to be granted which appeared incompatible with the laws of the Spanish Indies. It was not, however, from the inflexible council of the Indies that the opposition proceeded. The court of Madrid was obliged to yield to the representations of the maritime powers, who maintained that this establishment was contrary to existing treaties, which stipulated that Spain should not trade to India by the Cape of Good Hope.

In 1767, Musquiz, minister of finance, in other respects by no means of an enterprising spirit, conceived a bolder project still, which was that of forming a company, composed half of French and half of Spanish, to trade to the Philippines; a trade of which the French would have reaped the principal advantages, by amalgamating it with that of her East India Company. The duke de Choiseul, who was fond of the grand, who as well imagined that his ascendancy over the marquis di Gramaldi would make every thing practicable, received the proposition with enthusiasm; nothing, however, resulted from

It was renewed in 1783, but in a different shape, and at the instance of three different persons. The one was M. d'Estaing, who was desirous of repaying, by proofs of zeal towards Spain, the grandeeship with which she had invested him. Shortly after, the prince of Nassau Siegen, who, in his voyage round the world, had acquired some grand ideas, proposed to enliven the Philippines by attracting colonists from Europe, by opening one of the ports of these islands to the Chinese, who require nothing better than an asylum in this quarter, and by establishing a sufficient force to check a Mahomedan nation of pirates, called Moors, which infest the shores of the Philippines, and which Spain was unable to destroy, notwithstanding she consecrated annually 200,000 piastres towards carrying on a war against them. He offered to preside himself over the establishment; but his offer was coolly received, and it fell to the lot of M. Cabarras to succeed, where so many before him had failed.

Galvez, whose uneasy jealousy had insensibly become accustomed to the sight of a young Frenchman applying himself to the regeneration of his country, felt inclined to concert with him that of the Philippines. They took advantage of the tendency of the

Spaniards towards useful enterprizes, to cause the project of a direct trade between

Spain and the islands to be adopted.

Circumstances were propitious. After divers fluctuations, credit and confidence seemed to be consolidated, and the Spaniards began to accustom themselves to risk adventures. Monied men became less fearful, gave at length an employment to their capitals, which mistrust and custom had prevented them from putting to use. The company of the Caraccas was on the point of being dissolved, and its share-holders receiving back their investments, were anxious for an opportunity of replacing them to advantage. This was therefore the fittest time for the establishment of a new company, which, undertaken under the most happy auspices, might inspire confidence and a desire of gain. The plan was discussed and approved of, in July 1784, in a junto composed of different members of administration, and at which the minister of the Indies presided. It was preposed to form a capital of eight millions of hard dollars, divided into 32,000 shares, each of 250 dollars, and to employ this capital in trading from Spain to the Philippines. The advantages which Spain would have over the other European states, in carrying immediately from Mexico to these islands the piastres which other nations could not convey thither but by a prodigious circuit, were enumerated. It was attempted to be proved that Spain, thus importing from their source the merchandises of India, so much sought after in Europe, would receive them upon better terms, might furnish them to her colonies and European subjects, and at the same time find a market for them in other nations.

The plan approved of by the junto received the sanction of the king, who as well as his family took an interest in it, and means were immediately sought for to carry it into execution. In it was placed, as we have formerly observed, 21,000,000 of rials, arising from the excess of the value of the shares in the bank; and that the ardour which seemed to be awakened might not be abated by delay, directors and other persons were immediately named for the new establishment, and the patent of its institution was pre-

pared and published.

It stated, that the vessels destined to this commerce should sail from Cadiz, double Cape Horn, put into the ports on the coast of Peru, and thence take piastres sufficient to make their purchases, cross the South Secto the Philippines, and bring their returns

immediately to Cadiz, taking their course by the Cape of Good Hope.

This precipitate zeal, which seemed to be a contrast to the supposed slowness of the Spaniards, and which rather exhibits a mixture of French spirit, was seconded by a circumstance which happened very opportunely. The company of the Gremios, of which we have several times spoken, this company, which speculates in every quarter, which obtains any favour, any privilege, and any commission it requires from administration, but which of late is open to the charge of being more attentive to making the fortune of its agents, than to the security of the funds with which it is entrusted; the Gremios, I say, had already sent some ships to the Philippines; and notwithstanding they had not succeeded, were preparing to make another experiment, when the plan of the new company was under consideration.

The Gremios were offered a part in the project, and had declined accepting the offer. They hastened the departure of the vessel which was preparing for Manilla; but the elements, more favourable to the views of the minister than their intentions, soon obliged it to return to Cadiz, after having received considerable damage. To have repaired and refitted it would have been expensive, and must have required time. Government offered to purchase the vessel and cargo, and the proposal was accepted. Thus was the first expedition undertaken by the Philippine company, at the very instant of its establishment.

Like all new establishments, this company had some enthusiastic admirers, and some bitter censors. These could not conceive how Spain, which had colonies much nearer to her, and which were destitute of population and industry, could think of improving first her most distant possessions. It was a matter of surprise to them, that the management of trade which was to extend its branches to the most distant parts of Asia, should be entrusted to three directors, not one of which had ever doubled the Cape of Good Hope, and who had no other knowledge of the East Indies than what might be looked upon as doubtful and incomplete. They thought it certain that Spain could never advantageously enter into competition with nations who were experienced in the traffic, and possessed all the benefit of priority. They looked upon this enterprise as no other than an additional outlet for those metals, of which Spain is but a depository for an instant. In India every station was already occupied; every port, every comptinghouse, every market was possessed by one or another power. Was then the Philippine company to carry its speculations to China? In that case, at the very outset she would have to contend with rivals tremendously formidable. And what, at any rate, could they draw from that country? Tea? It is hardly known in Spain; and other countries possess the means of importing it themselves, as well as of preventing any supply through her bottoms. Porcelain? This is a cumbersome article, and would find but little demand? Silks? Would she distress the manufactories established at home? Of these different conjectures the latter appeared to be the most reasonable; and, consequently, the patent had scarcely made its appearance before the silk weavers of Catalonia made the most earnest representations to government, and pressingly petitioned against the measure.

Nothing can be deduced from the bad success of the first expedition. It was the consequence of a circumstance which will not again occur. Galvez, constant in his plan of directing arbitrarily whatever belonged in any shape to the duties of his administration, in the interval of the arrival of the commissaries of the company at the Philippine Islands, gave the management to the governor. A stranger to commerce, the only articles which struck him as proper to take from China were tea, muslin, and other merchandise rejected by other nations; so that as a consequent result of this ignorance, the

first cargo remained at Cadiz not entirely sold even in 1792.

The succeeding expeditions were more fortunate. Of three vessels which sailed together, one, it is true, met with damage, which it repaired at the Isle of France; the two others however happily returned to Cadiz at the end of 1787, where their cargoes were bought up with avidity, and some articles of them sold at 50 per cent. above the value at which they were rated upon their first arrival. Malevolence would not take this momentary success for a prognostic of its future welfare; it attributed it to the novelty of the matter, and the small quantity of merchandise brought by the company; and maintained, not without some probability on its side, that if a taste for these articles became established in Spain, they would be furnished at a cheaper rate by smugglers.

It surprises and excites one's indignation when jealousy and envy, finding shelter in the breasts of little minded men who accidentally fill eminent and commanding stations, sacrifice the public good to the gratification of their invidious appetite. Larena, maliciously disposed towards the founder of the Philippine Company, entertained a similar aversion for the establishment itself; and contraband trade, in consequence, met with an abettor in the person who should have been its most inimical opponent. He allowed all merchants to import muslins on the same terms as the Company. He imposed a duty of 23 per cent. on worked or printed India goods which were brought from Canton. This was giving these goods, which are vastly inferior to the manufactures brought

from the Coromandel coast by the other nations of Europe, a rivalship which could not fail to be highly detrimental. It is true, the importation of goods of a similar description from any European port was strictly prohibited in Spain, but at the same time it is well known, that there is no merchandise whatsoever but may be introduced into the country for a premium of 12 per cent. Such Spaniards therefore as might prefer Indian muslins would have an advantage of 11 per cent. in purchasing those which might be smuggled.

What chance of success with such opposition to its measures could there remain with the company? Notwithstanding this, it still maintained its ground. In 1792 its capital was yet entire, and its shares, after having fallen to a discount of 50 per cent. had again risen to par. The directors had produced their statement of balance, and satisfied the proprietors that, allowing the stock to be sold at a loss, and computing for several casual-

ties, there yet would be a profit left.

In 1795 the company had made a profit of 22,000,000 of rials, £250,000 sterling; and the three dividends which it has hitherto made in 1793, in 1795, and 1796, have been at 5 per cent. each. Government, in order to compensate for non-arrivals, latterly granted it permission to introduce into Spain from European markets the value of 9,000,000 of plain India muslins. It has hitherto employed in the trade sixteen vessels of from five hundred and thirty to eight hundred and eighty tons; fourteen of which have returned to Cadiz, and three are at sea. Besides these the merchants, on account of the company, have made seventeen expeditions, as well to the Caraccas, and Murucaybo, as to Lima, all of which have arrived safe; and in 1796 they had a very profitable year from the re-sale of the returns of American merchandise and cocoa.

This apparent good fortune does not however prevent many impartial judges from auguring ill of the establishment; and without participating in the animosity of the enemies of its founder, may it not even now, as it was in 1784, be regarded as more hurtful than beneficial, more brilliant than solid? It will doubtless be obliged to abandon the importation of tea, difficult to be disposed of in the North, and more than ever so in England; it has no market in the middle of Europe, and can only find one in Spain by becoming a substitute for chocolate, and thus injuring several colonies whose prosperity is of more consequence to Spain than that of the new company. Would not the sales of its silk be injurious to the national manufactures of that article, which are at present in a flourishing state, but which require assistance rather than discouragement? And as to its muslins, would it not be more advantageous to Spain to manufacture the raw cotton which she extracts from her colonies, and thus employ her idle hands at home; than to tax herself by contributing to the nourishment of distant industry, in order to satisfy the expensive caprice of her European subjects?

Spaniards, allies, open at length your eyes to your true interests. The structure of your prosperity is at least begun. The ground is cleared from the rubbish with which it had been covered by two ages of ignorance and bad calculation: the plan is sketched out; be careful of the foundation; there will afterwards be time enough to attend to the

embellishment of the front.

What government has effected for some time back for the benefit of Mexico, is at least traced after a better plan, and undisputed success has crowned its efforts. Galvez entertained a particular predilection in favour of this vast and rich colony, the theatre of his activity, his talents, and some of his extravagances. To him, in great measure, is owing its flourishing state, which not only has tended to benefit the metropolis in return, but has extended its influence to foreign nations also; since the Mexicans, increasing in wealth and population, have become proportionably anxious for the enjoy-

ments of the comforts and luxuries of the whole world, and thus furnish a daily augmenting market for the productions of European industry.

Galvez patronized the culture of wheat in this province; and for twenty years past its growth has been equal to its consumption; and may in time become adequate to the demand of the whole of Spanish America.

Tobacco, which he introduced into two districts adjoining the capital, has become in a few years the principal source of the revenue which the metropolis draws from its colonies.

The miners of Mexico especially are highly indebted to Galvez; and, as a pledge of gratitude, have settled on him a considerable annuity, reversible to his descendants. For some time the mercury of the mines of Guancavelica, at first so abundant, were no longer sufficiently productive for working the mines of Mexico. That of Almadin, the last village of La Mancha, on the confines of the kingdom of Cordova, had almost singly supplied them. Galvez, by improving its works, procured a much larger quantity from them. Before his ministry it yielded no more than seven or eight thousand hundred weight annually; he doubled its produce, and made an arrangement with the miners by which the hundred weight, which formerly used to pay 80 piastres, was afforded them at forty-one. The consequence was a notable augmentation in the produce of their mines. In 1782 they already yielded 27,000,000 of piastres, and would have afforded 30,000,000, if there had been sufficient mercury, but at this period a defect in the construction of the galleries of the mines of Almadin had occasioned an almost total inundation, and suspending the working of it, the Spanish government in 1784 concluded a treaty with the emperor of Germany for six years, by which Spain was to be furnished with 6000 cwt. annually, from the mines of Idria in Austrian Istria, at 52 piastres per cwt.

The miners have thus obtained the means of continuing their work, which has of late years been more productive than ever, happening very opportunely for assisting Spain to bear the expences of her war with France.

It is not easy to determine with exactitude the quantity of gold and silver which is annually collected from the whole of the mines of Spanish America.* These metals are coined at Lima, Santa Fi, Carthagena, and particularly at Mexico; but some is exported in bars either legally or by contraband. It would seem however that the quantity might be calculated from a knowledge of the amount of the duties which are paid upon the whole of the American mines. But these duties have materially varied since the conquest of the country, and are not alike in every part of Spanish America.

At first, a fifth part was exacted from all the mines, except a few which were taxed as low as a tenth, and some even a twentieth part.

In 1552, Charles V, caused an additional duty to be added of 1½ per cent. as a payment for the casting and essaying, a duty known in Peru by the name of Cobos.

At a later period the fifth part levied formerly, and which the greater part of Europe still imagines to be in force, was reduced to a tenth for Mexico and Peru; and for the vice-royalty of Santa Fi to a twentieth of the gold, the only metal which it has produced for a long time back, the duty of cobos still continued in each of these vice-royalties.

In 1777 an alteration in the cities took place as far as regarded gold, which throughout all America was taxed at no more than 3 per cent.

And, lastly, silver mines being found in 1790 at Santa Fi, they were assimilated with those of Peru and Mexico.

^{*} Compare this with the last note of Chapter VII.

The sum of duty paid therefore on silver is $11\frac{1}{2}$ per cent. and on gold 3 per cent. only. From these duties, by knowing the amount of the king's duties, one might be enabled to ascertain what is the amount of the productions of the mines to a nicety, but with the returns which are brought to Europe on account of the king, other duties paid in America are confounded: such as the customs, the profit on the re-sale of certain objects, such as mercury, paper, &c. Hence it is clear, that the real annual produce can only be identified by those initiated into the areana of finance.

In order, however, to form a near conjecture, the following data may be added to

those which we have previously given.

It is ascertained that, on an average of late years, Mexico alone has yielded from 20 to 25 millions of piastres; that, at Vera Cruz, one fourth part more of metals is embarked than at all the other ports together, including Lima, at which port one half of the metals are shipped, produced elsewhere than in Mexico. Taking therefore the product of the mines of this latter viceroyalty to be no more than 20 millions, the rest of America will furnish fifteen, of which seven and a half will be the portion afforded by Peru.

From this calculation it follows, that of late years the mines of Spanish America will have yielded annually 35,000,000 of dollars; an amount, the enormity of which would almost make me doubt of the exactitude of the data, notwithstanding the source from which my information is derived. If however, as appears to be the case, the produce of the mines continue annually increasing, should we not have room to be alarmed at the mass of circulation which it must occasion in Europe, if there were not a trade to Asia and China to absorb the superfluity?

This progressive increase is without doubt profitable to the individuals to whom the mines belong, whose revenue increases with the produce. But is it equally beneficial

to Spain considered as a nation?

This weighty doubt full well deserves a question.

Supported by the evidence of the last century, many well informed strangers would not hesitate in answering this question. They would say (and meet with more than one good citizen beyond the Pyrenees of their opinion) that this excessive multiplication of currency opposes the actual disposition of the Spaniards to manufactures; that the price of every thing as well in Spain itself as in other countries must keep pace with the increase of coin; that if Spanish industry be so far exerted as to retain at home this augmentation of currency, at present employed in paying the balance of trade to foreigners, the consequence will shortly be that the enhancement of the price of labour will again put a stop to industry in the midst of its career, and cause it to retrograde in an everlasting circle, whose rounds it will never be able to exceed.

Upon this principle one would advise the Spaniards thus: "Far from attempting to extract from your mines the whole of what they are capable of producing, rather let a part of them be closed: restrict the exportation of your metals to the old continent to the quantity necessary for replacing that diminution which insensibly takes place, the consumption which luxury makes thereof for furniture, and what the covetous hoard up, either in Europe or in Asia. Follow the example of Portugal, which limits the digging of its diamond mines, in order not to lessen their value; and that of Holland, which burns the surplus of her spices as soon as her absolute demands are answered. In the silver of Mexico behold your diamonds, your spices. If you treble the amount of their productions, your miners, whose strength might be better employed, will undergo more labour, but make you none the richer. You will have as a consequence to pay a triple price for foreign manufactures which you cannot do without.

rather let ntinent to , the conhoard up, e digging id, which . In the nt of their rego more y a triple To these arguments, certainly specious, this is the answer in Spain: "For our part we see nothing alarming in this increase of currency: in the first place, the revenue is benefited by it; and, while all the other states of Europe are employed in augmenting their revenue, which in this enhancement they find the means of bearing up against the expence of grand enterprises in peace as well as in war, by what fatality is it, that Spain alone should meet her ruin in what causes the prosperity of other states?

"We may say the same of our manufactories. Should they increase in proportion with the augmentation of the revenue of our mines, our currency will at that rate become the more abundant by the addition of those sums which we have heretofore been accustomed to pay for foreign manufactures, as well as the surplus of Mexico and Peru. Yet even in this case we see nothing to intimidate; we wish rather to know which are the most flourishing nations. Are they not England and France? and do they not possess beyond comparison the most abundant currency? Of what consequence is it from what source it flows? Joint produce of our mines and our industry, our wealth will not be less useful to Spain in the hands of great capitalists, who will embellish our towns, and our fields, and furnish funds for public establishments, of which, in critical cases, the state may borrow money, or meet assistance from at a less burthensome expense than heretofore. We are willing to allow that a period may arrive when our prosperity, having attained its acme, may bring on our decline; a period when our artisans and manufacturers may become so active and perfect as to render all recourse to foreigners for supply no longer necessary; if, while in such a state of prosperity, the produce of our mines still continue to augment our currency without any channel for its passage from us; assuredly in such a situation, the idea of which may be looked upon as chimerical, would carry with it an unavoidable inconvenience. The excessive price of manual labour in Spain would invite foreign manufacturers in spite of every prohibition; the national manufactories would be at a stand for want of sale; their useless hands by degrees would disappear for want of employment, and Spain be given up anew to depopulation, idleness, and poverty. At present, however, we are far from the circumstances which would justify such an assumption, and, until more eminent danger condemn either our manufactures, or our miners to inactivity, we deem it not amiss to draw from this double source the means of our future prosperity."

Whether this reasoning be just or no, it has formed the base of the plan followed by Spain for several years. She is persuaded that her greatest splendour is to be derived from the full activity of her manufactories, and the abundant productions of her mines.

Experience hitherto appears to establish the excellence of her plan, but is it well adapted to the position, manners, and political interests of Spain? Are there no other means of enlivening at once the metropolis and the colonies? Repeatedly have schemes been proposed which had this grand object in view. I shall say nothing of one for which neither Spain nor any other European power is yet ripe. I shall not observe that, following the dictates of wholesome philosophy, the court of Madrid ought to proclaim the independence of its colonies, and take advantage of the enthusiasm which this act of generosity would not fail of exciting to establish between the two countries treaties of friendship and commerce, much more solid in themselves than the ties stipulated in treaties formed upon interest and intrigue. No, there were no such painful efforts at any time proposed to Spain.

About ten years ago a project was proposed to the court of Madrid which would have entirely changed the face of the commercial world to the advantage of Spain. The project was not to cut through the isthmus of Panama, as more than once had been in contemplation, but to open a communication between the gulf of Mexico and the South

.. v. 3

Sea; and thus at once resolve the problem of the most easy method of shortening the commercial correspondence between Europe and the industrious and fertile parts of Asia.

Besides the old scheme of joining the two seas by means of the river Chagu, which is navigable as far as Cruzes within five leagues of Panama, there was a second which should effect this junction by a communication cut between the rivers Chamaluzin and San Miguel in the gulf of Honduras. Both the one and the other in the reign of Philip II, had been found impracticable. That which was proposed in the reign of Charles III, seemed to have obviated every objection, and united every advantage. It consisted in profiting by the Rio Sant Juan, which has its source in the lake of Nicaragua, and empties itself into the gulf of Mexico. This lake is separated from the South Sea by an isthmus no more than twelve thousand fathoms wide. Its neighbourhood abounds in commodities of every description, and wood fit for ship-building. From the course of flowing rivers, the waters of the lake must necessarily be either above or in the level with both seas; there consequently could be no foundation for the apprehension of any flood or violent cruption.

The adoption of this plan would not only have rendered the lake of Nicaragua the centre of the most brilliant commerce in the universe, but at the same time, of t' Spanish army and navy for the East Indies, and the market for all the valuable 1

ductions of both Americas.

This fine prospect did not dazzle the Spanish government. The authors of the project were French, and it began to be tired of seeing foreigners, and particularly Frenchmen, continually proposing grand enterprises. In this instance the inconveniences struck them now more forcibly than the advantages. It would for several years have attracted the attention of importunate observers to the most valuable, the central part of her American dominions. What facility would it not have afforded these unwelcome guests to implant all along this coast, and from the bottom of the vermillion sea to the straits of Magellan the seeds of insurrection, which had been but too much encouraged already by her espousing the cause of the free Americans? What plenteous means of stocking all her colonies with contraband articles, and particularly those who, more civilized and wealthy than the rest, had a greater taste for, and superior means to purchase the luxuries of Europe? on the other hand, if the execution of this project were really to promote the splendour and force of Spain in the New World; had she the right to flatter herself, that the other powers of Europe would tactily suffer it to advance to its completion? And in this last position would she not have rather been working for dangerous rivals than for herself? Could she expect to reserve exclusively for herself the enjoyment of communication? She had no longer the bulls of Alexander VI, to oppose to the navigating powers, or the cupidity of merchants. The passages must consequently be kept open to all powers. This would be therefore granting to all a transit at all times through the centre of her possessions, and furnish them with an opportunity of stopping and residing there under various pretences. What advantages could compensate for the inconveniences of a similar superveyance? The nations whom nature has condemned to such a position, such as the Turks with respect to the Dardanelles, and the Bosphorous of Thrace, must neccessarily submit to their fate; but surely it would be the very height of folly in a nation to create for itself such a pregnant source of quarrels and danger.

Such, without doubt, were the considerations which prevented the court of Spain from countenancing the project of which I have given the outline. Doubtless it will, at some future period, be carried into execution, but it will be by a neighbouring nation,

parts of which is h should San Mi-Philip II, arles III. isisted in gua, and h Sea by ounds in course of

of Spain t will, at g nation, by a new people who in the first effervescence of liberty and commercial genius, will break through the mounds which prevent its course, as they have already forced their way by the mouth of a great river to the ocean. Possibly it will fall to your lot, speculative inhabitants of Kentucky, to serve first the tea at your tables, and clothe first your wives and daughters with the rich dresses that you yourselves will have brought from India without making the tour of South America or doubling the Cape of Good Hope. But Spaniards, who have exhausted themselves in grand enterprises, who are timidly circumspect and cautious as age; Spaniards could with difficulty embrace so bold an undertaking, particularly with a council for her Indian affairs, which religiously and obstinately maintains its ancient maxims, and a minister at its head essentially jealous and ever ready to take umbrage.

Spain has effected a great deal, in throwing off the yoke of many prejudices with which she was shackled, and which kept her and her colonies in a state of mortal languor; in establishing manufactories, in making roads and beginning different canals, in having granted a sort of free trade to her Indies; in one word, in having produced a notable increase of industry, augmented the riches, and given a spur to the activity of her population. This is sufficient to refute by facts a part of the heavy blame with which the rest of Europe has been accustomed to load the Spaniards, the appreciation of whose character shall be the objects of the next chapters.

CHAPTER X.

CHARACTER OF THE PEOPLE IN GENERAL. SOME TRAITS IN THAT OF THE SPANIARDS. HIGH SPIRIT. GRAVITY. SLOWNESS. IDLENESS. SUPERSTITION.

IT is not an easy matter to delineate the character of a nation. Almost all representations of this nature may be likened to those portraits which, from a master's hand, and traced by a brilliant pencil, possess every other merit but that of an exact resemblance. It is not from similar descriptions that any idea of a modern people can be formed. Since Europe has become civilized from one extremity to the other, its inhabitants ought rather to be classed, according to their professions, than their country. Thus, although not all Englishmen, all Frenchmen, or all Spaniards, resemble each other, yet among these three nations such as have received the same education, lead nearly the same kind of life. Thus all their lawyers assimilate in their attachment to forms and litigation, all their learned in pedantry, all their merchants in cupidity, all their sailors in rudeness, and all their courtisans in servility.

In order to produce a nation, the moral and physical physiognomy of the individuals composing which should be alike, it would be necessary that they should all be under the influence of the same climate, be similarly addicted to the same occupations, and follow the same worship. It would be requisite, if they were a polished people, that they should live under a firm government, and that the part which they might share in it, should give to their ideas, their passions, and even to the external expression of their frame, a certain uniform and constant stamp. The union of all these qualities alone could justify the picturing a nation by an individual indiscriminately selected. A single variation in either of the points noticed will be sufficient to vary the physical and moral features ad infinitum. Hence it were an easy matter to pourtray the character of the ancient Scythians, of pastoral nations, of the savages of Canada, and of all barbarous races, whose religion is simple, who have but few laws, and maintain but little communication with any other people.

Hence it is that the Greeks and Romans, in the happy periods of their republics, almost entirely devoted to the love of their country, liberty and fame; inhabiting a confined space, where the influence of climate was every where nearly alike; and each taking a part more or less active in the government; might be generally described by the same lineaments.

Hence that among modern nations, the English, Swiss and Dutch, would be nearer this uniformity; the first from that universal inquietude which fixes their attention upon government, whose operations are submitted to their inspection, from their insular situation which fits them generally for navigation and the speculations of maritime commerce; and from that national pride which is in some measure justified by their dominion of the sea, but feebly contested any where. The Swiss from their geographical position, which until lately rendered them passive spectators of the troubles of Europe. The Dutch, who, in spite of the slight differences which before these late commotions existed between the modes of government in use throughout their seven provinces, had all of them a point of union in their attachment to liberty, in the nature of their territory, in their situation on the banks of seas and canals, whence must necessarily result an uniformity of occupations, taste, and even of passions.

But who can flatter himself with the idea of giving a good portrait of the whole German, Italian, and French nations? What a difference between the climates, productions, employments, laws and language of one province and those of another! Who would apply to an inhabitant of Westphalia the description of a Saxon or an Austrian; that of a Neapolitan to a Venetian; or that of a Fleming to an inhabitant of

Languedoc? The Spaniards are in the same situation as these three nations. There are in the inhabitants of their chief provinces such striking differences of climate, manner, language, habits, character, and even exterior form, that the portrait of a Galician would more resemble a native of Auvergne than a Catalonian, and that of an Andalusian a Gascon more than a Castilian. If the Spaniards ever had characteristic marks, applicable to all the inhabitants of their peninsula, it was when the Arabians, by establishing themselves in the nation, had stamped it with a particular impression, and notwithstanding the different causes which kept them separate from it, communicated a part of their manners, their noble, grand, and even sometimes colossal ideas; their taste for the arts and sciences, and every thing of which traces are still found in the provinces where they mostly resided. Then it was that the high idea the Spaniards entertained of their nation, and which was justified by circumstances, appeared in their persons; and gave them all a resemblance to the description of the present day, when represented grave, austere, generous, and breathing nothing but war and adventures. It was, in fine, when in their general assemblies, which they called Cortes, all took a part, more or less active, in the government; directing or watching its operations, and feeling more strongly than at present, that patriotism which acts so powerfully upon the opinions, affections, and manners, of those whom it animates.

But these three causes of uniformity in national character have almost entirely disappeared, and left the Spaniards more subject to the influence of climate, and the laws and productions of their different provinces; so that to describe them in their present state, they should be divided into Castilians, Catalonians, Arragonese, Navarrians, Andalusians, and Asturians, and to each of these people should be assigned a particular portrait; a difficult and disagreeable task, which could never be completed without almost continually placing the exception by the side of the rule; in which it would be scarcely

possible to be exact without descending to minuteness, to be just without being severe. or an eulogist without appearing to flatter.

However, this revolution has not been so complete as not to leave many features, by which the whole Spanish nation may still be known. A part of its manners have survived the event by which they were changed. The influence of its climate has been modified, but not destroyed. In many respects the provinces have the same form of government. The court of an absolute monarch is still the centre of all their good wishes and affections. All the modern Spaniards profess the same religion. In literature they preserve still the same taste, and copy the same models. In some instances they have retained a resemblance to their ancestors, and this is what I shall endeavour to point out.

At that period when Spain discovered and conquered the New World, when not contented with reigning over a great part of Europe, she agitated and convulsed the other by her intrigues or military enterprises; the Spaniards were intoxicated with that national pride which appeared in the exterior of their persons, in their gestures, language and writings. As there was then some reason for this, it gave them an air of grandeur which was pardoned by those whom it failed to inspire with respect. But by a concurrence of unfortunate circumstances this splendour is no more, and the assuming manners which it palliated have survived its eclipse. The Spaniard of the sixteenth century has disappeared, but his mask remains. Hence that exterior of high spirit and gravity by which he is at present distinguished, and which have frequently recalled to my recollection two lines of one of our poets on the subject of original sin, notwithstanding the consequences of which the sublime station man was intended to fill is still easy to be known.

C'est de haut de son trone un roi precipite, Qui garde sur son front un trait de majeste.*

The modern Spaniard still preserved in his air and gesture the marks of his ancient greatness. Whether he speaks or writes, his expressions have an exaggerated turn which comes near to bombast. He has an exalted idea of his nation and of himself, and expresses it vithout the least disguise of art. His vanity does not shew itself off with those pleasant exaggerations which provoke laughter rather than anger, and which characterise the inhabitants of one of the provinces of France. When he boasts it is gravely, with all the pomp of language. In a word, the Spaniard is a Gascon who has put on the buskin.

I am nevertheless much disposed to believe that the genius of the language may also be one reason for this pompous style. The Spaniards have not only adopted many words and expressions from the Arabic, but their language is impregnated, as it were, with the oriental spirit which the Arabians naturalized in Spain. This is found in all the productions of Spanish imagination, in works of piety, in comedies and novels. . It is, perhaps, one of the causes of the slow progress of sound philosophy, since by every thing being carried beyond the truth, by the accumulation of images round the most simple ideas, and by favouring whatever borders upon the wonderful, the sanctuary of truth is surrounded with illusion and rendered as it were inaccessible.

But the loftiness of the Spaniard, which would be noble were it more moderate, and that gravity which always awes, and sometimes repels, are compensated by very estimable qualities, or are rather the source of those qualities. Individual as well as national pride, elevates the mind and guards it against meanness; and such is the effect of Spa-

^{*} He is a king precipitated from his throne, who still preserves on his brow some feature: of majesty.

nish haughtiness. In Spain there are vices and crimes as well as in other countries; but in general they bear this national characteristic. It is observable in the most obscure classes, in dungeons, and even under rags and misery. It balances, in a certain degree, the genius of the language, which is naturally diffuse, and in which the ear seems to be gratified by an accumulation of sonorous words, frequently mistaking multiplied expressions for a superabundance of ideas. Loftiness is commonly laconic; it disdains detail and loves enigmatical expressions, because they are concise; leaving room for thought, and sometimes for conjecture. Hence is it that the same Spaniards who, when their imagination is in the least warmed, display all the luxury of their language, are pithy when their mind is calm. Of this I might give a hundred examples, but I shall mention only two. I had occasion to speak to a Spaniard of the lowest class, and found him with a serious countenance caressing a little child. I asked him if he were the father? A Frenchman of the same rank would have modestly answered, Yes, Sir; or, at least, I believe so; adding much more on the subject than I might wish to hear. The Castilian, without disturbing himself, or even receiving my question with a smile, answered me coldly: "he was born in my house," and immediately turned the discourse to some other subject. Another example of their Spartan shortness was afforded me by a French traveller. He met on his entrance into Castile with a shepherd, who was driving a flock of sheep. Desirous of learning what gave its exquisite quality to the Spanish wool, Frenchman-like, he loaded him with questions, and asked in a breath, If his flock belonged to that district? what they lived upon? if he was travelling? where he came from? whither he was going? what period of the year he began his journey? and when he returned? The shepherd, listening patiently to his volume of questions, answered him coolly: aqui nacen; aqui pacen; aqui mueren; * and continued on his way.

This gravity, which is proverbial, is yet very wide of what it is generally supposed to be; in fact it excludes in the Spaniards what we call affability. They do not anticipate, but wait for you. But this austere covering frequently conceals a good and benevolent mind, which the least examination may distinguish. Strangers to the unmeaning hypocrisy of French politeness, the Spaniards are sparing of professions. Their smile of benevolence is not merely a courtesy, for their heart in common opens with their features. How often have I been repulsed by the exterior of a Spaniard, remaining a long time without being able to conquer my repugnance, which was all that was necessary, to find in him, not an affected, but a real complaisance; not that obliging manner which promises, but that which grants! The Spaniards are, perhaps, in want of that urbanity, which is the result of what we call a refined education, but which too frequently serves as a covering to falsehood and disdain. They supply this by that unaffected frankness and good nature, which announces and inspires confidence

The great among them have no dignity, if by that word be meant a circumspection that fears to provoke familiarity, and which looks less for affection than respect; they make no mortifying distinction of classes, nor disdain to form connections among those beneath them in rank. They have no longer among them a duke of Alba, a don Louis de Haro, and a Peneranda, whose characters, displayed in the face of Europe, have undoubtedly contributed to propagate the idea still entertained of the imperious haughtiness of the Spanish nobility of the first rank, at least it is no longer of the description it was then. If some have still preserved the traces of it, in them it is less haughtiness than coolness, timidity, and embarrassment.

*" Here they were born, here they feed, and here they dic." After the Spanish fashion it is a metrical reply of some beauty.

200 x 22 x22, - 4, 5 , 2

Not but there are grandees among them, and others, who, without possessing that rank, deem themselves descended from an equally illustrious origin; who entertain a lofty opinion of their race, and manifest it upon certain occasions, particularly when in presence of those who pretend to place themselves on a footing with them. The pride of tutoiement, of which we have spoken before, is an evident proof of this, which constantly exists; but this loftiness disappears among them when addressed by their inferiors who solicit favours; and is entirely lost at court. Here their dignity frequently stoops, even to meanness. Despotism, notwithstanding the clothing of benignity in which for this century past it has been uniformly clad, seems to overpower it by its weight and make it almost contemptible. Stationed in its presence, the nobles meet with nothing but tiresomeness, and abasement, and have not spirit enough to seek by a removal for amusement and independence. Much more truly may it be said of them as was formerly of the nobles of France. "They might, if they would, be little sovereigns on their own estates, they prefer being lacqueys at court." Exceptions to this rule are very rare and are consequently noticed. There are however some who prove that they feel, if not the dignity of their being, at least that of their race. I have noticed some who of their own accord banish themselves for some time from court, and prefer the appearance of being in disgrace to the shame of a mean condescension; and others bold enough to make use of somewhat sharp repartees. One of these who was most intimate with the reigning sovereign, when he was but prince of Asturias, is remarkably short of statue. The prince was continually joking with him about it. One day, tired of having himself continually called little he replied with great coolness, and was heard without anger; segnor, en mi casa me llaman grande. Sire, at home they call me great.

The wives of the grandees seem to have preserved more of the stiffness that is attributed to the nobility of Spain than any others. It is impossible for mortals to be more cold, more grave, or more insipid, than the greater part of these noble ladies; there are, however, five or six who do not participate in these attributes; I shall not mention their names, as I should be unwilling to sow dissention among those beauties, whose

charms are the most pleasing ornament of the court.

In other respects, this gravity serves but as a veil in persons of every class to cheerfulness, which needs but to be excited. To prove this, I shall not have recourse to the Spanish theatres, where buffooneries are so well received; this would rather be an argument against my assertion, because it has been remarked, that theatrical representations, in nations famous for their gaiety, are more serious than those of a different complexion; as if the mind were most delighted with those emotions most opposite to its habitual state.

But in order to judge, whether or not the Spaniards have the vivacity I attribute to them, take them in their colonies, where they are at their ease; their repasts, even before the vapours of the food and wine have acted on the brain; their conversations then abound in sprightliness, pleasantry, and equivaque; all either the legitimate or illegitimate offspring of vivacity; and afterwards determine whether they be not more open, and humour better supported than in French societies. Undoubtedly he will say, that this vivacity is too noisy, and not courteous. But foul befal that delicacy which encourages tiresome insipidity, Let this cheerfulness, however, be or not be condemned by the caprice of fashion, it does not the less exist because our prejudices are different.

Similar observations may be made on other defects with which the Spaniards are reproached. If I have not quite absolved them from the charge of idleness, I assert again that it is the consequence of transient circumstances which will disappear with them. In

fact, when we witness the activity which appears upon the coast of Catalonia, throughout the whole kingdom of Valentia, in the mountains of Biscay, and every where in short, where industry is encouraged, and commodities have an easy and certain sale; when, on the other hand, we observe the laborious life of the muleteers and calessieros, who courageously lead their mules and drive their carriages through the most dangerous roads; the husbandmen, who, in the plains of La Mancha and Andalusia, become hardy by their labours in the field, and which labour, the nature of the soil, the distance of their dwelling, and the heat of the most burning climate in Europe, render far more painful than in other countries; when we consider the number of Galicians and Asturians who, like our Auvergnaes and Limousins, seek far off from home their slow and painful means of subsistence; in short, when we perceive that the idleness with which the Spaniards are reproached, is principally limited to the boundaries of the two Castiles, that is, to those parts of Spain which are the most unprovided with roads, canals, and navigable rivers, and most distant from the sea; it is but just to conclude, that this vice is not an indelible stain, nor a general characteristic of the Spanish nation.

They have another defect which borders closely upon idleness; this is slowness; and from this it would be more difficult to exculpate the Spaniards. It must, candidly speaking, be allowed, that knowledge penetrates but very gradually in Spain. In political measures, war, and all the operations of the government, nay, even in the common occurrences of life, when other nations act, they still deliberate. Mistrustful and eircumspect, they fail in as many affairs from slowness, as others from precipitation. This is the more extraordinary, as their lively imagination seems of a nature to be irritated by delay. But in nations, as in individuals, there is no single quality which is not frequently modified by a contrary one, and in the struggle, the triumph is ever on the side to which the mind is most forcibly disposed by the circumstance of the moment. Thus the Spaniard, naturally cool and deliberate when nothing extraordinary actuates him, is inflamed to enthusiasm, if his pride, resentment, or any of the passions which compose his character, be awakened, whether by insult or opposition. And his nation, apparently the most grave, phlegmatic and slow in Europe, sometimes becomes one of the most violent when incidents destroy its habitual calm and leave it to the empire of the imagination. The most dangerous animals are not those which are most prone to agitation. The aspect of the lion is grave as his pace; his motions are not without an object, his rearings not in vain. Let his quiet be unmolested, he cherishes silence and peace; but let him be provoked, you see his mane creet; his eye balls glow with fire; you hear his hollow roar; and acknowledge the lord of the forest.

I do not mean by this parody to insinuate that Spain is the lion of Europe, which, however, was the case in former times. I simply mean to maintain, that in her is evidenced more plainly than in any other nation, that qualities apparently irreconcileable may be united in the same character: such as violence and tardiness, cool gravity and extreme irascibility. This mixture is visible in two of his principal affections, his courage and devotion. With an appearance of equal calmness in each, the one in the character of the Spaniard swells into fury, the other into fanaticism. Not in me will those excesses so frequently ridiculous, and at times atrocious, into which he is lead by his wrong conceived attachment to religion, not in me will they meet an advocate; nor at the same time will I in any way attempt to lessen the pretensions to esteem which are the natural right of his undisputed courage.

On the contrary I will allow that, with the exception of a few Spaniards of the present day, the nation is religiously credulous and attached to the munmery of the church, in one word that it is justly accused of superstition. It may even be said, and the ob-

the prechurch, the observation be taken in its full sense, that this disfigured bastard sister of religion has continued almost uninterruptedly either in possession of the throne, or hovering round the court. She reigned constantly in conjunction with the weak and sickly Charles II. She was a copartner with Philip V, a good and virtuous monarch but destitute of energy, pious and sincere but ever in the extreme. And notwithstanding the taste for splendour and pleasure, which characterised Ferdinand VI, she still was his colleague. Less rigid towards these three sovereigns and their successor than to the greater part of their subjects, she yet sheltered them from all pravity of manners, and so much so that the rare phenomenon was presented to the world of a succession of several kings who never sought for enjoyment in the arms of a mistress.

As to Charles III, simple in his manners, exemplarily regular in his private life, scrupulously just even in matters of policy, to the day of his death, as well in words as

in deeds, he always paid his tribute to superstition.

It particularly belonged to the founder of the order of St. Januarius, whose motto is in sanguine fœdus, to place implicit credence in the liquefaction of the blood of that Neapolitan saint. An occasion once offered of his manifesting the blind belief which he had of this prodigy. I have heard him relate that while he reigned at Naples the miracle was all at once at a stand. The holy phial was shook in vain. Long was the cause of it sought for, at last it was found. It must be observed that the phial is kept within the shrine of the saint, but on one side, and separated by a partition from his tomb. A tradition existed at Naples that in order to cause the blood to preserve its liquid state, not the smallest communication must exist between the body of St. Januarius and his miraculous blood. Now upon examining the tomb minutely, a chink was found in the partition which separated the tomb from the phial. The damaged division was hereupon quickly repaired, and immediately the blood became as liquid as before. Let who will explain this wonder. One cannot however refuse it credit, for, as Lafontaine observes "kings never tell a lie," and of Charles III, perhaps more than any other might this be truly said.

This prince took-delight in relating, perhaps a still more strange event. The reader may possibly recollect the danger which he ran in 1744, when an Austrian army, commanded by Lobkowitz, proceeded to Naples, with a view of dethroning Don Carlos, (himself) and the good fortune he had of escaping at the battle of Velletri. The success of the day, according to the prince, was owing to a battery of cannon, fortunately placed at the end of a street, through which the Austrians were to proceed to seize him. The battery played upon them so efficaciously, that they were obliged to retire, and take another road, losing not only their prey, but the victory as well. At the close of the battle, his majesty made inquiry, what faithful and well informed subject he had to thank for the disposition of these protecting cannon. He was sought for with avidity throughout the army, and a great reward was promised him. Nobody appeared. Hence Don Carlos, and those who were with him, doubted not an instant, that the Almighty himself had placed the battery there; and this belief Charles III, car-

ried with him to the tomb.

His faith, in the immaculate conception, was consecrated by an order which he instituted, to which he gave that title. He left his virtues to his successor for an inheritance, without forgetting among the number, that first of theological virtues, which seems to be one of the necessary attributes of those monarchs, called for distinction's sake most catholic.

It will readily be conceived, that kings so pious as these must necessarily be surrounded by servants, and have at the same time a number of subjects, animated with vol. v.

the same zeal for religion, and whatever relates thereto; and so far justice must be done the Spanish nobility, the ministers, and generals, to say that, in this respect, for by much the greater part, they strive to conform with their august model. There are few among the great but what possess relies among their jewels; or who ever fail to attend

at mattins to chaunt their anthem to the virgin.

Of Galvez (whom no one can charge with possessing a weak mind) I have heard it related, that he was a witness to the following fact. Being once at Seville, he had the fecility to behold the body of St. Ferdinand. The air of screnity which was spread over his features so forcibly inspired devotion, that none could withstand its influence. An Englishman, who was among the spectators, and who previously had been accustomed to speak in the lightest manner of the ceremonials of the Roman catholic faith, was so much affected by the venerable aspect of the saint, that he burst into tears in the midst of the church, immediately became converted, and was afterwards among the most devout. The same minister once also related before me, that when he was at Mexico, he saw the corpse of the first bishop of Guadalaxara, who died in sanctitutis odore. His body was preserved from corruption: drest in his episcopal robes, he seemed to be wrapt in peaceful slumber. At that time his beatification was in course of discussion; and certainly "there was," said he, "ample reason for it." His whole life had been a tissue of miracles. Do but judge. Before he was called to the bishopric, he was councillor of audience at Guadalaxara. A criminal process was instituted before this tribunal. The accused was judged worthy of death, and by every voice, even by that of the future bishop, the culprit was sentenced to die. But when the condemnation was presented to the judges, the holy man pertinaciously refused to sign it. It was insisted that he should. At length, urged so strongly, he observed, "bishops may not sign a sentence of death." "But you are not a bishop," they replied, "I feel that I am," said he. At first it was thought his brain was deranged. They were undeceived when some months afterwards they learned, that on the very day of his refusing his signature, the pope had made him bishop of Guadalaxara.

Are more general evidences necessary of the propensity of the Spaniards to superstitious credulity? It may be recollected that in 1780 the Spanish navy experienced a violent check in the roads of Cadiz. One of their squadrons was surprised by Rodney, and defeated in spite of the bravery of Langera. Four of his ships were taken by the English, called the Phænix, the Diligent, the Princess, and the San Domingo. All those which escaped bore the names of different saints. The people did not fail to take notice of this, and as by a singular accident the San Domingo blew up at the instant of its being moored, they said that its patron chose rather to see her perish than pass into the hands

of infidele

I however wish it to be understood that I by no means imagine these remarks were made by the officers of this squadron. They do not all of them resemble admiral Barcelo, who from a simple lighterman attained the highest stations in the navy, and who was used to say that for his part bravery was no virtue in him because he was invulnerable; and shewing his scapulary would observe seriously, that he had seen many a bullet while coming direct towards him turn on one side as it approached this talisman. There are it cannot be denied among all the different classes of the Spanish nation, people who are credulous in this way to the most ridiculous excess. But what nation ancient or modern is there with whom the same reproach will not lay? The Greeks? The Romans? Their historians, Plutarch, Livy, Tacitus, that eminent philosopher Socrates, have they not all of them paid this tribute to human weakness? And was the mind of Pascal, among the most masculine that can be cited, entirely free from it?

As for Racine, has he not given credit to, and related some of the miracles which happened at Port Royal? It is true, the Spaniards at the present epoch are more superstitious than the rest of Europe; although among them there are many, who, in consequence of their different education by travelling, and by making use of their reason, are far from sharing in the obloquy; nay, even among the clergy I have met with numbers, who possess very clear and just ideas of true religion.

But in those classes in which education is neglected (and such are numerous) the members of which have little external communication, and few means of acquiring real knowledge, superstition and fanaticism are carried to a far greater height than even in Flanders or Bavaria; for religion every where taking its dye from the character of individuals, must necessarily have ardent followers, in a nation remarkable for a lively ima-

gination, and violent passions.

This mixture of strength and weakness produces even at present effects distressingly whimsical. At Madrid there is a church, in which, during passion week, the most fervent among the orthodox assemble in an obscure cell. On their entrance, long cords are distributed to each. They strip themselves naked to the haunches; and at a concerted signal they flog each other with sufficient violence to draw forth streams of blood. The silence observed during this barbarous ceremony is only interrupted by sighs of repentance, mingled with expressions of pain. The greater part thus make a truce with their licentious living. Unhappy wretches! they have none for witness to their voluntary martyrdom, but God and their conscience, and the next day they lye both to one and the other. They have resolution sufficient to punish themselves, they have not enough to reform their life; so that all this cruel superstition is labour spent in vain.

The capital, in course, dees not enjoy this privilege exclusively. In some provinces the sun shines on these scenes. A man of great credibility assures me, that he was once present in a town of Estremadura, at the following event. He had acquaintance in this place with a young lady of the mildest manners, of an amiable and lively disposition, a person adorned with all the charms of her age and her sex. He had gone to see her on a good Friday, and found her with a smiling countenance, dressed entirely in white. He asked her the cause of this extraordinary apparel, on a day set apart for mourning and penitence. You shall see, was her reply. It was at the very instant that the disciplinarians were to pass by the quarter where he stood. She seemed to wait for them with impatience; at length they drew nigh. She advances to the window which was on the ground floor, and open. The penitents halt and begin their exercise. In an instant, her snowy robe is covered with the blood that spouts from their mangled shoulders. She seemed to be delighted at the sight of her robe, besprinkled with this rosy shower, and the motive of her white dress explained itself at once. I will suppose, for an instant, that gallantry had its part in this mimickry of penitence; that the lover of the young lady was among the number of the flagellists. Yet, does the scene therefore appear less whimsically barbarous?

These are some samples of Spanish devotion; but it is not in every part of the kingdom, that it is carried to such an extreme of folly. The enlightened, among the Spanniards, whose number daily increases, are hurt at seeing it so deeply rooted. Within these last years, under the reign of the pious Charles III, some salutary reforms have

been attempted with success.

Even in Madrid, a great number of those processions have been suppressed, called rosarios, which almost at all hours of the day were passing through the streets to some church or other, the members of them chaunting unintelligible canticles; ceremonies certainly useless in the eyes of true religion, and which were without other consequence

than that of wearying passengers, drawing journeymen from their occupation, and mothers from their domestic affairs.

The government resists all attempts at encroachment on the part of the Holy Sec.

The property of the elergy is no longer looked upon as inviolable.

The misconduct of the monks and inferior clergy meets with condemnation, and severe measures are adopted for repressing it.

It begins to be felt that a diminution of the prodigious number of converts is necessary to the regeneration of Spain.

Such are the steps taken by reason in Spain for purifying religion.

On the opposite side (for I stand pledged to declare all) the most inviolable respect is shewn to the meanest ministers of the gospel. They are met with in every house, and looked upon as an Ægis, under whose shelter men are protected from the anger of both man and God. When I passed through Valentia in 1793, at which time a Frenchman was held in detestation, some ladies of that nation owed their safety to the interposition of the priests, who hastened to their relief.

People stand by to let them pass, and give them the wall; and oftentimes on meet-

ing them, persons of the highest rank respectfully kiss their hands.

If a priest be met with on foot, who should be carrying the viaticum, you are obliged to get out of your carriage in order to let him take your place, accompanying him on foot to the house of the sick person; there he is to be waited for; and when his office is finished, he is to be escorted back to the church whence he came. It is only after this that you obtain repossession of your carriage.

If the holy sacrament be carried any where, a bell is rung to announce it. All business then, all conversation is suspended; and every one falls on his knees till it pass by. Hence arises many a burlesque scene. How often have I seen the play interrupted all at once by the sound of the holy bell! Spectators, actors, however drest, Moors, Jews, angels, even devils, all without exception, turn towards the entrance from the street, fall on one knee, and remain in that posture as long as the sound continues to be heard

At the doors of the churches, this singular notice is every day seen affixed. Hoy se

soca animas. This day souls are taken out of purgatory.

Not a coachman who mounts his box, but makes first the sign of the cross, and mutters some prayers, which are instantly succeeded by some of those energetic phrases with which he animates his coursers. Frequently, while thus employed without, his master within the coach is singing an anthem to the virgin, although very likely on his way to some profane amusement; some wits have even informed me, that if on mounting the staircase they should chance to meet a rival friar by the way, they entreat of him absolution before hand for the sins they are about to commit.

Respect for the cloth is carried so far as to cause the people to attribute to it a preservative virtue, even after death: in consequence, nothing is more common than to see the dead buried in the dress of a monk, and be thus carried to their last home, with their face uncovered, as is the practice in most parts of Spain. The Franciscan habit is the favourite on this occasion; and the convents belonging to this order have a warehouse, and tailors, especially set apart, for supplying this posthumous wardrobe. So arrest a demand is there for these dresses, that a stranger, who had been some months at Madrid without being informed of this custom, and observing none but apparent Franciscans carried to the tomb, expressed his astonishment to me at the prodigious number of that order which the city must contain, and seriously asked, if I did not conceive

it a prethan to ne, with habit is a warebe. So onths at nt Franus numconceive from the immense number of deaths which occurred among them, that their order, however numerous it might be, must soon become extinct.

The dress of the convent accompanies the Spaniard to the tomb, it is also nearly his earliest clothing. It is by no means unusual to meet with little monks of four or five years of age, playing the monkey tricks so common to that age in the streets. Nor is it uncommon for the parents, whose strange inclination is manifested by the dress they give them, to turn up the tail of the robe, in order to administer paternal correction to these innocent creatures, who are perhaps the only ones of the cloth that are actually submitted to discipline.

Certificates of having regularly attended confession, and observed the precepts of the church during Easter, are exacted from all the faithful, whether subjects of the realm, or foreigners; an idle measure in itself, since nothing is more easy than to obtain them without fulfilling the ceremonial which they testify; for they are sold the same as any other article of merchandise, and women of the town (who here have numerous visitors) almost always have a quantity of those certificates for the bearer to sell, which they obtain at an easy expence, of what nature, and who the donors, may readily be surmised.

One of the most common gestures among the Spaniards of every description, is the sign of the cross. It particularly serves as a note of admiration accompanied by the expression of the word Jesus. At every flash of lightning they repeat the symbol of salvation, and even if they gape, they express it with their thumb upon the mouth; in short their every motion is in measure stamped with the mummery of devotion.

If a person enters a house unless he would pass for a heretic, his first exclamation must be: ave Maria purissima; to which there is always the response of sin piccado concebida.

Every year there is pasted on the church gates a catalogue of such books, national and foreign, as the Holy Office has thought fit to proscribe, under pain of excommunication.

Lastly, that tribunal justly enough appreciated by the wiser part of the nation, is yet in esteem with the greater part. It yet follows the same formidable ceremonial, it yet has its spies even among the higher ranks, and sometimes its victims, &c. &c.

Let the truth be spoken out however, at the risk of wounding that self-love so easily offended in any nation, and which so generally is satisfied with nothing short of eulogy, The man does not calumniate who speaking of Spain describes it, as in many respects the country of mummery, fanaticism and superstition.

CHAPTER XI.

CONTINUATION OF THE PORTRAIT OF THE SPANIARDS. THEIR BRAVERY. REMAINS OF BAR-BARISM. THEIR PATIENCE AND SOURIETY. PORTRAITURE OF THEIR WOMEN. THEIR DISSO-LUTE MANNERS, AND THE CAUSE THEREOF.

We have witnessed the influence of the character and education of the Spaniards of the present day, on their religious principles, let us now examine the effect they have on their courage.

The causes of its former active display have, for many years, passed away. The Moors are no longer their neighbours, whose proximity and difference of faith, exciting continually mutual jealousy and hatred, gave occasion for frequent wars, and numerous opportunities of nourishing and displaying the national prowess. If the Spaniard appears no longer liable to the same degree of fermentation, if he seem asleep,

he yet may be awakened; the least signal in fact, recals him to himself. His fits of holy rage, indeed, are much more rare. The period, at which the name of infidel alone, was enough to transport him to fury; that period, the age of Pizarro and Almagro, is happily past. Religious intolerance, if it be not entirely corrected in Spain, is at least accompanied more by ridiculous than atrocious forms; and when they fight with Musselmen, they combat the enemics of their country, rather than those of religion.

They even begin to think that religion may allow of policy to treat as useful neighbours, those whom they have been accustomed to look upon as irreconcileable enemies. In Spain, as well as in other nations, the progress of knowledge and philosophy, though it may have been slow, has sensibly softened the manners. The traces of ancient bar-

barity disappear in gradual succession.

Assassination was formerly common in Spain. Every man of respectability had his assassins at command; which were hired in the kingdom of Valentia, as it is pretended witnesses were not long ago in some of the French provinces. This dreadful custom was in some measure the consequence of the kind of weapon then in use. This was a species of triangular poinard which, concealed under the cloak, was drawn forth for vengeance in the moment of reseatment. A stroke from it was much more dangerous than one from a sword, which is used openly, and requires some dexterity. The dreadful poinard was more to be feared than the common one known by the name of rejon. The use of these perfidious weapons is not yet entirely abolished, and furnishes a just

ground for the charges which foreigners bring against the Spaniards.

It is seldom that the manners of a people are corrected by violence and precipitate means. In the reign of Charles III, the minister, Squillaci, made the sad experiment, now about seven-and-thirty years ago. Drest in a long cloak, and a slouched hat pulled over the face, a man with difficulty would recognize his best friend; a dress like this in course favoured excesses, and particularly such as endangered the safety of the citizen. In order to abolish the use of them in Madrid, he had recourse to coercive means, and even open force. Satellites posted at the corners of streets, provided with shears, publiely clipped such cloaks as exceeded the length prescribed. He fancied he should find the Castilians as submissive as the Russians in the time of Peter the Great; he, a stranger, minister of a monarch who had passed the greater part of his life out of Spain! what was the consequence? The people mutinied; the king was frightened, and the minister was sacrificed. The manner of dress so suddenly attacked, was in part continued after his disgrace; but milder and slower measures, the example of the court, and those about it, added to the activity of a vigilant police, have considerably contributed to correct the evil, The species of mask, under the name of a hat, which encourages insolence by insuring impunity, is totally laid aside; and the cloak, very convenient for those who know how to wear it, now favours nothing but idleness.

The use of the poinard still exists in some parts of Spain, especially in the southern provinces, but it is wholly confined to the lowest rank. Some bravoes make it a bugbear to the weak, and with the violent and passionate it is the instrument of immediate vengeance. The clergy have made it a part of their mission of peace and charity to disarm their parisioners. The archbishop of Granada, in particular, has with this view successfully employed the arguments of the pulpit. But these means have not had every where the same effect. The kingdom of Valentia, that country so highly favoured by heaven, where the beauty of the climate and the riches of nature should excite none but the milder passions, is sullied with murder. One of the prerogatives of the crown consists in pardoning annually one criminal condemned to death, provided his crime have a shadow of excuse. It has been remarked lately, that for seven successive years

lis fits of lel alone, nagro, is at least ith Mus-

il neighencinies. , though ent bar-

y had his retended I custom his was a forth for angerous dreadof rejon.

ecipitate eriment, at pulled e this in citizen. ans, and rs, pub. uld find a stran-Spain! I the miontinued nd those d to cores insonient for

t a bugmediate y to dishis view not had favourite none e crown s crime re years there has not been one criminal who could be recommended to mercy in the fatal list presented to the king, so atrociously premeditated had every crime appeared.

Poinards and assassinations are also still common in Andalusia, where the powerful influence of climate, when not counter-balanced by moral agency, appears manifest. During the summer, a certain easterly wind (Elrunto de Medina) causes in that province a kind of phrenzy, which renders these excesses more common at that season than in any other of the year.

But let Spain resume the appearance which nature prescribes; let roads and canals cross these districts which have hitherto been almost inaccessible; let a more easy communication render the vigilance of the agents of government more active and certain; let the progress of agriculture, industry, and commerce give employment to mischievous idleness; in a word, let the present plan of government continue to be executed, and it will soon appear, in this respect as in others, that the influence of climate will yield to such powerful causes.

The revolution in manners, within the last half century, evinces the truth of this prediction. It was not until the present century that two barbarous customs were by degrees abolished, which ought long before to have been proscribed by reason and humanity. I mean the Rondalla and the Pedreades.

The former of these is a kind of defiance which two bands of musicians give to each other. Without any other motive than that of shewing their bravery, they were wont to meet with swords and fire-arms, fire at each other, and then close with swords. Will it be believed that this custom still exists in Navarre and Arragon? And that a similar contest was issued in 1792, and a fight took place between two parishes in the suburbs of Sarragossa.

That of the Pedreades, has but lately been disused. This was also a kind of combat between two companies, armed with slings, who attacked each other with stones.

Such manners are equally shameful to those who retain them, and the government by which they are tolerated. However, as there is scarcely any vicious custom which has not its causes as well as apparent advantages, there are certain persons who are displeased with the abolition of these institutions, alledging that though they cannot be denied to be proofs of ferocity, they are equally so of courage, which they contribute to maintain among the people. The abettors of such paradoxes even regret the revolution, which the work of Cervantes operated in the manners of Spain, by throwing an indelible ridicule on those adventurers who, neglecting the duties of their station, and the care of their families, were used to create themselves dangers in order to enjoy the vain glory of braving them; who offered the protection of their restless valour to those who did not ask it, and whose importunate service was at least useless in a country where charity ever opens its hand to the wretched, and where the weak are protected by the laws.

It is thus that, by successive gradations, more the effect of time than wisdom, the manners of a people are reformed and softened. Those of the Spaniards have within the last century undergone, in other respects, sensible revolutions. Formerly, the point of honour, on which they were delicate to excess, occasioned frequent duels. Were proofs wanting, their comedies and novels furnish a sufficient number. At present their courage, of a more tranquil nature, is reserved for manifestation in time of war in defence of their country, without disturbing its repose during the mild reign of peace. So much is this the case, that during ten years residence in Spain I never once heard of a real duel.

On the other hand, the Spaniards have preserved their ancient virtues, patience and sobriety; the former renders them constant in their enterprises, and indefatigable in their labour; the latter preserves them from excess, a vice too common in other countries of Europe. Without seeking, however, to diminish their merit, I must observe it is, in a great measure, the consequence of their physical constitution, and the quality of their food. Their robust and muscular bodies, dried and hardened by the active heat of a burning climate, are less acted upon by either a spare diet or a superabundant meal. The flesh of animals, at least in the Mediterranean provinces of Spain, contains, in a given quantity, more autritive matter than elsewhere. Their roots, less spongy than in countries where water contributes more than the sun to their growth, are of a more nourishing substance. Strangers who go to live at Madrid soon perceive this, and if they yield to the appetite they may have upon their arrival, an endemial disease, called Entripado, a kind of cholic, which the physicians of the country only know how to treat, painfully informs them of their change of food and climate.

With respect to intoxicating liquors, the sobriety of the Spaniard proceeds in a great measure from nature, which, always employing means proportioned to her c.i.d, has bestowed on him a constitution analagous to the strength of the wines produced by the soil, whilst strangers cannot with impunity drink of them to excess. Of this I have seen repeated and striking proofs. Six years ago seven or eight servants, which the ambassador Montmorin brought from France with him, died miserably. They were accustomed to drink the wines of La Mancha in the same proportion as the light wines of France; the consequence was, they were perpetually in a state of intoxication, and fell away by inches; while Spaniards who lived the same as they, felt no ill effects from their mode of living. Nothing is more uncommon than to see a Spaniard inebriated with wine, although that which he drinks is more spirituous than French wines; and if a drunken soldier be seen in the streets of Madrid, one may safely lay a wager of twenty

to one that it is a foreigner; and ten to one that it is a Swiss.

We may remark on this occasion, that sobriety seems to be the inheritance of the inhabitants of the south, as intemperance is that of those of the north. We may also observe that the people who commit most excesses in drinking are not those whose soil produces the liquors by which they are inebriated, as if nature, which has given them the means of satisfying their thirst and appetite, and adapted their organs to the use of these means, intended to punish them for seeking, at a distance, the ford and liquor she has created for others. These dispositions are undoubtedly deranged by other circumstances; but it is easy for an attentive eye to trace the intentions of nature.

The Spaniards will pardon me for considering their sobriety as a virtue of climate; this is but comparing them with other nations, and even all the individuals of the human species, who owe alike their qualities to their education, rank in life, habits, the examples they have before them, and a thousand other causes which depend not on themselves. It is still a great merit not to resist beneficial impulses.

The Spaniards have, besides, that of triumphing over influences which dispose men to certain excesses, and for which they are produced as an apology. I have particularly in view a depraved propensity, reprobated by nature, injurious to the fair, and too common among the people of the south. This is absolutely unknown in Spain.

Jealousy, another outrage on the sex, the object of our homage, seems also the consequence of the influence of a climate which communicates its ardour to the senses and imagination. This odious passion, formerly so injurious in its suspicion, cruel in its precautions, and implacable and sometimes atrocious in its resentment, is much weakened

among the modern Spaniards. If the lover be exactory, ready to take umbrage, and tormented by suspicion, on the other hand, there are no people in Europe among whom is found a smaller number of jealous busbands. The women, who were formerly hidden from the public, of whom it was scarcely possible to snatch a glimpse through the openings of those lattices, which undoubtedly owe their name to the vile sentiment which was the cause of their being invented,* now enjoy full liberty. Their veils, the only remains of their uncient servitude, serve at present but to shelter their charms from a burning sun, and render them more attractive. First invented by jealousy, they are now employed to very different purposes. Coquetry has converted them into one of its most seducing ornaments; and in favouring secrecy, they insure impunity to the stolen pleasures of love. The lovers who, under the balconies of their invisible mistresses, sighed without hope, and had nothing but their guittar for witness and interpreter, are banished to comedies and romances. Sieges are come less slow and difficult of termination, husbands more docile, and more accessible the woman. Woman! who but at the word is sensibly affected? Who but is disposed to forgive their caprices, to submit to their cruelty, and indulge their weaknesses? You particularly, foreigners, who have sighed at the feet of a lovely Spaniard, when you remember your chains, do you not feel all these sensations? Shall I attempt to trace a feeble sketch of the object of your vows, and call again to memory your enjoyments? Or, if they have disappeared, from absence, from time, or inconstancy, which anticipates its effects, shall I endeavour to mingle some consolation with the bitterness of your regret?

The women of every country have particular charms by which they are distinguished In England, by the elegance of their shape, and modesty of their carriage; in Germany, by their lips of roses and enchanting smile; and in France, by that amiable gaiety which animates all their features. The charm felt on approaching a Spanish lady has something of deception which is not easily defined. Her coquetry is more frank, and less studied than that of other women. She takes less pains to be agreeable to every one. She rather weighs the suits of her lovers, than counts their number; and her choice once made, a single one suffices. Or if she does not neglect her success, she is nevertheless above all grimace. She owes but little to the aid of the toilet. The complexion of a Spanish beauty is never ornamented with borrowed brilliance: art supplies not the colouring which nature has refused by exposing her to the influence of a burning climate. But how many beauties compensate for her want of colour? Where are finer shapes to be met with than with them? Where greater ease of motion, where nicer delicacy of feature, where a more sweetly tripping gait? Grave, and rather melancholy, at first, should one of these beauties cast on you her large black eyes, so full of expression, should she accompany her glances with a smile—insensibility itself must fall enslaved before her. But if the coldness of his reception discourage not her admirer from addressing her, she is as decided and mortifying in her disdain, as she is seducing where

she allows of hope.

In the last case she does not make her lover languish long; but perseverance must survive enjoyment in Spain, and it is not to this country that the description of love, in a well known idyl is applicable;

" Nourished by hope, it dies in midst of bliss."

The fortunate men whom she deigns to conquer, and who are called Cortejos, are less disinterested, but not less assiduous than the cicisbei of Italy. A total sacrifice is re-

* Jalousic, in the French language, signifies a lattice.

3 U

VOL. V.

quired of them. They must give proofs of this at all hours of the day, accompanying their well beloved to the public walk, the theatres, and even the confessional. But many a storm disturbs their serenity. A momentary distraction is treated as an infidelity. The slightest incident excites some apprehension. One would say that in Spain jealousy has deserted hymen to take refuge in the bosom of love; and that it more particularly dwells with that of the two sexes which seem the rather calculated to inspire than feel this cruel passion. In one word, their chains are not so easy to be borne, as difficult to avoid. The Spanish beauty is rigorous in many respects; her caprices are rather hasty, and too obedient to the impulse of an ardent imagination. But that which is not easy to conciliate with her eternal varying fancies, is the constancy of Spanish women in their attachments. The intoxication they cause and experience, far different from all extreme agitations or affections of the mind, which continue but a short time, is prolonged greatly beyond the common term; and I saw during my residence in Spain, more than one such passion continue constant till the parties expired of age. May not this be accounted for by a religious scruple, certainly ill understood, as most such scruples are? May not the conscience of a Spanish lady sufficiently complaisant to permit her one gratification which offends her duty, be terrified at a succession of infidelities? In the first may she not possibly find an excuse for her conduct in human infirmity, in the irresistible wish of the heart, which inclined her towards one object, destined by nature to fix her affections? Would sin resume its ugliness at a successive infidelity?

It belongs to those who are acquainted with the female heart and conscience to judge of this conjecture. It is certain, that in Spain, more than any other country, both men and women appear to conciliate the irregularity of manners with the most scrupulous observance of religious duties. In many countries these excesses alternately succeed each other. In Spain they are simultaneous; and the women, in consequence of this strange mixture of religion and frailty, seem to aim less to prevent scandal, or conceal their conduct, than to establish a kind of equilibrium between their faults and their merits.

How many men have I known, who have led an extreme disorderly life, yet frequented public worship with an assiduity, which even true christians do not consider as an indispensible duty, who carefully observed every injunction of the church relative to abstinence, rendering its ministers at the same time almost degrading homage!

How many women abandoned to an attachment utterly inconsistent with their duty, surround themselves with relics, and bind themselves by vows to the performance of actions indifferent in their own nature, and scrupulously fulfil them.

I believe hypocrites to be very rare in Spain; but to compensate for this, the ridiculous association of certain meral improprieties with superstitious practices is more common there than elsewhere. Is this to be attributed to a want of knowledge, or the criminal complaisance of the confessors, who are thus prodigal of the indulgence of which they themselves stand in need? Or is it the climate which must serve as an excuse for some vices, as it is the cause of some virtue? And does this climate enforce the gratification of certain frailties too imperiously for consciences, scrupulous in other respects, to be terrified at compliance?

To endeavour to explain the dissoluteness of morals, is to acknowledge its existence. Yes, depravity of this description is carried to great lengths in Spain. Frequently does the sex destined by nature to wait for pleasure, invite to enjoyment with effrontery. It is not in this country unusual to receive written intimations of desires which one has unwittingly engendered; neither is this licentiousness restrained by the dreadful consequences that succeed it. That horrible present which the new world has made to the

old, in Spain, has become hereditary in families, and by the degeneracy of many of those races which are termed illustrious, and the extinction of others, a fatal evidence is afforded of its baneful influence. This scourge, to which the nation seems to have become accustomed, is of the most alarming nature, when it affects a person born under a different climate: and if the thousand charms, in the beauties, whose attractions I take delight in celebrating, draw some irresistibly into their sphere, the dreadful apprehensions with which a foreigner must be inspired, who by experience or report becomes acquainted with his danger, may reasonably justify the prudence which some have the power of exercising, and excuse an escape from their sway.

This depravity, however, is far from being so general as exaggerating libertines are pleased to uffirm; even in Madrid there are families whose conduct is exemplary, faithful husbands, and wives who are models of modesty and propriety; their daughters, although in general not reserved in their carriage, grant less than fancy is pleased to expect from their demeanor, for nothing is more rare than their anticipation of the rights of matrimony. If opportunities of purchasing pleasures, equally shameful and easy to obtain, are frequent for those who seek them, at least prostitution is neither so public nor impudent as in other countries. The police, by severely prohibiting its scandalous seminaries, obliges it to conceal itself, and sometimes pursues it to its secret retreats. And what is singular in a country where dissolute conduct is otherwise so common, in a country which contains so many rich idlers, one would in vain seek for those easy ladies, who unblushingly display in other countries the sumptuous salary of their lubricity. Among these great people, who in other respects make a trophy of the corruption which their opulence keeps in pay, a sort of shame presides in the midst of their irregularities, and mystery embellishes even their most disgraceful amours.

The severe virtue of the kings of the new dynasty can alone explain this modern singularity. At their court, there has always been an absolute necessity of concealing those weaknesses, which they did not excuse by their example: to incur suspicion only, would be acting with great imprudence: to make a show of them would be the height of temerity. Charles III, in this respect was rigid, even to tyranny. I was present once, while one of the most eminent persons of his court denounced his own son, who had been seduced by the charms of a pretty actress; and requested his majesty to have the lover confined in a castle, and his mistress in a house of correction; but it is not every young nobleman of the court of Spain who has so strict a father, nor does every actress

thus expiate the passions she engenders.

To the honour of the fair sex of Spain, I shall farther observe, that women rigorously banish from their society those familiarities, which are considered as indifferent by other nations, where the senses, less quickly inflamed, betray less suddenly their disorder; and that this distrust of themselves is at least an homage which their weakness renders to modesty. Thus a woman would not permit the most chaste kiss to be given her in public; and those which are customary in our comedies, and of which no notice is taken, are entirely banished from the Spanish stage.*

^{*} I remarked some years ago, at one of the theatres of Madrid, a minute trait, obnoxiously trivial, and which, but for its exemplifying this excessive delicacy, so whimsically allied to the grossest and most disgusting manners, I should scarcely venture to detail in a note. No traveller, who has passed through Spain, particularly Castile, can fail having observed groups of people, who, basking in the sun, amuse themselves in their laziness, by destroying the vermin with which their heads abound. Among lovers of this rank, the favoured youth, whose mistress deigns to benefit him in this manner, has a double pleasure on the occasion, not only does he get rid of troublesome companions, he, at the same time, receives a testimonial of the perfect devotion of the object of his views. It is necessary thus much should premise my anecdote. The little French opera of Le Tonnelier,

But if a proper distance be kept they allow, and even provoke at times, those wanton tricks at which decency would elsewhere be alarmed. Double meanings however gross, the coarsest jokes, even downright obscenity, whatever the tongue can express is readily overlooked. I have seen ladies admit of, nay even themselves make, observations which men with the least regard to decorum would deem admissible only at orgies, and sing catches revoltingly indecent. When in what is termed good company, I have more than once been surprised with tales of rather more than a free description. I have heard some ladies unblushingly, and without taking the smallest pains to varnish their story, relate the secret detail of their amorous meetings, and appear astonished if perchance they should see the least embarrassment in the countenance of any of their auditors.

These delineaments, which I shall not be so unjust as to lay to the charge of all the Spanish fair, would not howeve alone prove the depravity of manners in Spain. Women, who permit themselves freedom of expression, and give the example of it, are certainly not on that account more seducing to persons of delicacy, but they are not more casily seduced. On the contrary, a nation not yet entirely civilized, may have in its language a kind of ingenuousness which renders expressions far from being entirely chaste; and I should be inclined to think that these modes of expression, shocking to the decency of other nations, would disappear were a more refined civilization, more precautions in the education of young persons, almost exclusively abandoned to the government of servants, even in the most distinguished houses, and especially were a better example, adopted. But can a young lady, who from the most tender age has been familiarized to the grossest expressions, who in companies, to which she is frequently admitted, hears applause bestowed on impudence, which disdains to throw a transparent veil over the obscenities in which it indulges; can one whose ears are early accustomed to the indecent expressions which are permitted on the stage, and whose eyes repeatedly behold the wanton attitudes exhibited in the favourite Spanish dance, long preserve in her imagination and language that virgin purity which is, perhaps, the greatest charm of her sex?

Mothers of families, with what have ye not to reproach yourselves, who given up to your passions, abandon your daughters to nature and chance. Future mothers, how ill do ye conceive your interest! A taste for employment, some care bestowed on the developement of that disposition of which heaven has been prodigal to you, would make you rank among the happiest as well as the most enchanting works of creation! Alas! you are neglected, you are left to yourselves, and your corrupt attendants. You are, to our misfortune and despair, about to falsify the munificent intention of nature.

The character and manners of a nation can be known, but imperfectly, if regarded in their serious occupancy alone, or while under the dominion of the passions. It is much better seen in their entertainments, their games, and their fancies. Let us then view the Spaniards in these different relations.

(the Cooper) being translated into Spanish, the scrupulous translator dared not hazard the furtive kiss, which forms its denouement. But what does he substitute? In the last scene, while the master cooper is occupied in the interior of his workshop, the journeyman enters by stealth, and sets himself on the ground, between the legs of the lovely Fanchette, whose delicate fingers are employed in lousing his fortunate rival. They are in this situation when the jealous old man comes, and detects the two lovers in the act of giving and receiving this unequivocal pledge of mutual affection.

The Sundange >

CHAPTER XII.

MANNERS AND CUSTOMS OF SPAIN. THEIR DANCES. GAMES. PLEASURES. REPASTS.

NOTHING more contrasts with the pretended gravity of the Spaniards, than their favourite dance the Fandango; a dance, truly national, and full of expression, at which foreigners of delicacy at first take exception, but which they themselves become delighted with at last.

No sooner does the tune begin for the fandango, than every countenance becomes animated, and even those among the spectators, who by their age and profession are most obliged to gravity, have much difficulty in preventing themselves from joining in the cadence. It is related, and the apologue is certainly appropriate, that the court of Rome, scandalized that a country renowned for the purity of its faith, should not have long before proscribed this profane dance, resolved to pronounce its formal condemnation. A consistory was assembled, the prosecution of the fandango was begun, according to rule; and sentence was about to be thundered against it, when one of the judges observed, a criminal ought not to be condemned without being heard. The observation had weight with the assembly. Two Spaniards were brought before it, and to the sound of instruments displayed all the graces of the fandango. The severity of the judges was not proof against the exhibition; their austere countenances began by degrees to relax; they rose from their seats, and their arms and legs soon found their former suppleness. The consistory hall was changed into a dancing room, and the fandango was acquitted.

After such a triumph, it may be imagined that the remonstrances of decency have but little effect; its empire seems to be firmly established. It is, however, different according to the places in which it is practised. It is frequently called for at the theatre, and generally closes private dences. In these cases, the intention is no more than lightly indicated; but, on other occasions, when a few persons assembled together shake off all scruples, the meaning is then so marked, that voluptuousness assails the mind at every avenue; its incitements cause the heart of the modest youth to palpitate with desire, and re-animate the deadened sense of age. The fandango is danced by two persons only, who never touch, even the hand of each other; but when we view their mutually engaging allurements, their advances and retreats; when we observe the female in the moment of her languor, announce an approaching defeat, and suddenly acquiring new courage escape from her conqueror, who pursues her, and is afterwards pursued in his turn; the manner in which these emotions are expressed by their looks, gestures and attitudes; it is impossible not to confess with a blush, that these scenes are to the real combats of the Paphean queen, what our military evolutions in peace are to the real display of the

They have in Spain, a dance yet more voluptuous than the fandango, but it belongs rather to the provinces than the capital. It is the volero. Andalusia in particular appears to be its natural country; as it apparently was invented for the Andalusians of both sexes, a remnant of decency has banished it almost generally from private balls; it is however given on the stage.*

* A German traveller, who has lately published a little work on Spain, in which he modestly pretends to have only gleaned after me; and in which there are many beautiful pictures, very highly coloured, but with rather too much sameness. Mr. Fischer thus describes the Volero:

"The play finishes; the scene changes to an elegant saloon. The orchestra strikes up: the sound of castanets is heard, and from opposite sides of the theatre a male and female dancer dart forward, A third dance peculiar to the Spaniards is the Seguidilla. The figure is formed by eight persons; at each corner the four couple trace, although but en passant the principal movements of the fandango. A Spanish female dancing the Seguidilla, dressed in character, accompanying the instruments with castanets, and marking the measure with her heel with uncommon precision, is certainly one of the most seducing objects which love can employ to extend his empire.

The Spanish nation has a decided taste for dancing, and private balls are very frequent. They have a sort of president called bastonero whose duty it is to see that good order reigns in the midst of pleasure. It is his province particularly to take care that each of the party figures in a minuet, and to fix partners in such a manner as to make as

many happy as possible, and as few as can be avoided wretched.

As to public balls and masquerades, in the reign of Philip V, they were forbidden throughout all Spain. The count de Aranda, who, while attentive to the police of the capital, did not neglect its pleasures, revived them; but these two amusements did not outlive the retreat of the minister.

The common people have some particular games, which have a tinge of the gravity of the nation. The one, a weak and miserable image of those which kept the force and activity of the ancients in constant exercise. It consists in throwing a bar of iron to a certain distance, and hence is called El juego de la barra.

Another game, a favourite with the vulgar, but still more insipid, is common to Italy as well as Spain. A number of men are seated round in a circle, and hold up in their turn two, four, six or ten fingers, rapidly naming aloud the exact number of fingers held up.

Genteel persons have recreations of another kind. In those assemblies, where idleness collects parties together, their principal amusement consists in eard playing, hombre is on these occasions their favourite game; this game is of Spanish origin, as its name announces, hombre signifying man, but the Spaniards call it trissilio; besides at eards, they amuse themselves with a sort of game at biliards, called jueyo de truccos.

In general they seldom assemble to cat at each others houses. They are little acquainted with the innocent and healthful pleasures of the country. But few among them even are fond of the chace; of which the monarch and his family seem to possess the exclusive privilege. The amusements of the country appear to have no attractions.

both dressed in the Andalusian costume, appropriate to the dance. At their entrance, they fly towards, as if they mutually sought, each other. The male dancer, stretches out his anxious arms towards the female, who seems as though about to abandon herself to his embrace; but, all at once she turns and avoids him. He, made angry, shuns her in return. The music ceases, they both appear irresolute, but the orchestra beginning, again sets them in motion.

"The male then expresses his desire with increased vivacity. The female seems more inclined to answer it. A voluptuous languor is depicted in her eyes, her bosom heaves more violently, her arms are extended towards the object which pursues her; but a fresh return of sadness robs him of

her a second time; a second pause re-animates them both.

"The orchestra again plays up, the music increases the quickness of its measure, and assumes wings to overtake the velocity of their motions. Full of desire, the male rushes towards the female; their lips are half opened; she is again feebly restrained by a vestige of modesty. The crush of music redoubles, and with it, the liveliness of their movements, a sort of vestigo, a delirium of extacy, seems to possess them both: every muscle appears to invite and express enjoyment; their eye-sight fails. At once the music ceases, and the dancers vanish (if I may use the expression) in delicious languishment, the curtain falls, and the spectators recover their senses."

Such an animated description is more like an apology than a satire. It, however, is not wanting of exactitude. Sme years back the volero was given at Paris; but decency had shaded its tints, and

pleasure itself did not require they should be made more lively.

tions for the Spaniards. Their country-houses might easily be numbered. Among the many rich individuals who inhabit the capital, there are, perhaps, not ten who have a country retreat. With respect to the castles, seats, &c. so numerous in France, England, and Italy, and which contribute to the embellishment of the environs of their capitals, there are so few in the vicinage of Madrid and the rest of the Peninsula, that many travellers are of opinion the proverbial expression, building eastles in Spain, is thence derived. This however is evidently an erroneous opinion from the number of castles in ruins found in most of the provinces.

The rich subjects of the kingdom therefore concentrate all their pleasures within the cities. Music is one of those for which the Spaniards have the greatest taste. They cultivate this art with success; not that their national music has made any great progress, for it has a particular character; it is to be found mostly in little detached airs, called, in Spain Tonadillas and Seguidillas; sometimes agreeable melodies, but of which the modulations are little varied, and proved that the art of composition is still in its infancy. In return for this they do the greatest justice to the grand compositions of Germany and Italy, which always form a part of their frequent concerts. They have many lovers of harmony, but few composers worthy of notice.

A young poet at Madrid, Don Thomas Yriarte, who died in the prime of life, produced a few years since a poem on music, wherein didactic dryness is compensated by several espisodes and brilliancy of imagination. Connoisseurs assure us that the cha-

racter of Spanish music in particular is there given by a masterly hand.

Balls and concerts are not the only entertainments at which the Spaniards assemble. They have also their Tertulias and Refrescos. The Tertulias are assemblies very similar to those of France. Perhaps more liberty reigns in the former, but langour some-

times establishes its throne there as well as in the midst of our parties.

Women in general seldom seek occasions to meet together; each aspires to be the centre of a Tertulia; and exclusive pretensions undoubtedly contribute to banish from Spanish societies what we call French gallantry. Women are there admired, and even adored, as well as elsewhere; but when they fail of inspiring a lively sentiment, the men seldom pay them those attentions which our politeness prodigally and indiscriminately bestows upon every individual of the amiable sex. Not but the Spaniard possesses gallantry. Its subtile lineaments are strewed with profusion throughout the romances of the country, and in their comedies; but to a foreigner's eye it appears burlesqued by exaggeration; it has not those easy terms, the elegant expressions which is granted to be possessed by the French, given by those nations who are jealous of them. With them a pretty woman, who is not the object of a man's affection, is only a lovely creature, who expects, but does not exact, homage; and when paid her, the courtesan is thanked with a smile. Among the Spaniards where she can manage to make herself respected, she is a divinity who must be worshipped. A sonnet or vandeville is sufficient for one. The other must be addressed in the sublime accents and cadence of the ode.

Their Refrescos, the invention of luxury and greediness, contribute no less than the Turtulias to facilitate the intercourse of the two sexes. In general, these are only light repasts, prepared for persons from whom visits are received, and are as a prelude to the Tertulias; but on great occasions, when a wedding, christening, or the birth day of the head of a family is to be celebrated, the Refresco becomes an important and a very expensive affair. All the family acquaintance are invited; and, in proportion as they arrive, the men separate from the women. The latter take their scats in a particular chamber, and etiquette requires they should remain alone until all the company be

assembled, or at least until the men stand up without approaching them. The lady of the house waits for them under a canopy, in a place set apart in the hall, which, not yet entirely abolished, was formerly called the Estrado, over which is commonly suspended an image of the virgin. The appearance of refreshments, at length, enlivens every countenance, and infuses joy into every heart; conversation becomes animated, and the sexes approach each other. The company are first presented with great glasses of water, in which little sugar loaves, called Azucar esponjado, or rosado, square and of a very spongy substance, are dissolved; these are succeeded by chocolate, the favourite refreshment twice a day of the Spaniards, and which is believed to be so nourishing, or at least innocent, that it is not refused to persons dangerously ill. After the chocolate come confectionary of all sorts, and all colours. People are not only cloyed with them in the house of festivity, but they put quantities of them into paper, and even into their hats and handkerchiefs. And a stranger admitted for the first time, to these kinds of festivals, in which intoxicating liquors only are spared, seeks to discover the sober nation and finds it not.

A ball or card tables commonly succeed the Refresco; but it very seldom happens that the entertainment is concluded with a supper. This is always a very frugal repast with the Spaniards, and at which they rarely assemble.

Their cookery, such as they received it from their ancestors, is of a nature to please but very few people. They are fond of high seasonings; pepper, pimenta, tomates, or saffron, colour or season most of their dishes. One of them only has been introduced amongst strangers, and the French kitchen has not disdained to adopt it; this is what in Spain is called Olla-podrida, and is a sort of hotch potch of every kind of meat cooked together. There is, however, generally a mixture in the Spanish cookery, except in some obscure families, attached to ancient customs; in most houses it participates of the French cookery, and in some this has wholly supplanted that of Spain.

Thus are the French every where imitated, whilst they are ridiculed, and sometimes detested. The modes of France have reached Spain as well as many other countries French cloths, fashions and colours, are worn under the Spanish cloak. The veil is no longer worn for concealment but by the women of the lowest classes; for others it serves but to hide the disorder of their dress when they go out on foot. Except in this case, their head dress and whole attire are carefully adjusted to the French fashion. The Spanish manufacturers exert themselves to the utmost to serve the reigning taste, and to follow it through all its rapid variations, without the aid of our manufacturers; but they are yet far from being able to attain their end. Great cities, and even the court, tacitly acknowledge this by having immediate recourse to Paris or Lyons, as to the only true sources of fashions. In this respect, as in many others, the Spaniards who affect the bon ton confess the superiority of some foreign nations, and receive from them lessons of elegance. Their tables are served after the French manner; they have French cooks, house stewards, and valets de chambre. French milliners are employed to invent and make new dresses for the ladies. Their heavy inelegant equipages disappear by degrees, and are exchanged for those of England, or their French neighbours, which, however, latterly are imitated by the coach makers of Madrid and elsewhere. They neglect no means of engaging French artists and manufacturers to settle in Spain.

This homage is not confined merely to frivolous objects. The best French and English works on morality, philosophy, and history are translated into the Spanish language. French literary works of mere amusement are for the most part those only, which have but little merit in the eyes of the Spaniards; and their taste, in this respect

still appears far from inclining to change.

Their imagination, bold to extravagance, finds French ideas cold and timid. Accustomed to exaggeration and redundance, they are unable properly to value either justness or precision. The fine shades of French ridicule and manners escape their eyes, too much accustomed to caricature; and with respect to style, their ear, vitiated by the pompous prosody of their cadenced periods, by the frequent and affected repetition of their sonorous words, can find no grace in accents which speak more to the mind than the senses; and the roundness of elegant periods is to them entirely lost.

What chiefly prevents a reform in their literature, are the models which they still admire and endeavour to imitate; these are distinguished by that bad taste which formerly infected all the nations of Europe, and to which the first literary men in France have paid an ample tribute, but on the wreck of which the master-pieces of the age of

Louis XIV, have been erected.

Had French literature remained in the state it was when Ronsart, Marot, Benserade, Voiture and Balzac wrote, their very defects would still serve as models. What might have happened in France, had no improvement been there made in letters by a concurrence of circumstances, has happened to the Spaniards. Since the time of Calduon, Lopes de Vega, Quevedo, Rebolledo, and others, whose imaginations, though wild and licentious, were brilliant and fertile, no author with these splendid qualities, and at the same time endowed with that good sense which directs their use, has appeared in Spain. Letters have, for upwards of a century, been in the same state. The works of these men of genius, frequently extravagant even to absurdity in their conceptions, still continue models of style; and their example, without having produced any thing comparable with that which in them is justly admired, has served, and still continues to serve, as an excuse to every reprehensible irregularity of imagination, and all the violent bombast of false eloquence.

It is to the Spanish stage that this reproach particularly applies.

CHAPTER XIII.

OF THE SPANISH STAGE. OF THEIR PLAYS, BOTH ANCIENT AND MODERN. DEFENCE OF THE SPANISH STAGE AND CRITIQUE ON THE FRENCH. SPANISH VERSIFICATION, ACTORS. LITTLE MODERN PIECES. MAJOS, AND CITANOS.

IT would, however, be unjust to judge of the Spanish theatre according to the cri-

tique of Boileau.

It undoubtedly still suffers pieces, in which the law of the three unities is flagrantly violated. But there are many Spanish pieces, in which it is not transgressed in such a manner as to be prejudicial to the interest. The Spaniards themselves condemn most of their heroic comedies, in which princes and princesses, from all corners of Europe, assemble without motive, as well as without probability, and are by turns either actors or the sport of the most incredulous adventures, relate, converse, and joke even in the most critical situations, and conclude by usclessly shedding their blood without giving occasion to a single tear. Although several of these pieces have original beauties, and all afford proof of the talent of the Spaniard for inventing complicated plots and dexterously weaving the denouement, the Spaniards found not the much contested reputation of their theatre upon this alone.

But there are some of their productions which they justly consider as entitled to the admiration even of strangers. These are their characteristic pieces, which, though not so well conducted as the best French pieces of the same kind, and though they cannot boast the same accuracy in the choice of ideas and expressions, are generally pleasing

in the ground work, faithful in most of the characters, and shew an uncommon fer-

tility of imagination in their authors,

The pieces which the Spaniards call de Capa y Espada, are those particularly which present an exact representation of ancient manners, and these comedies are the real sources to be resorted to in the study of them. It is in these pieces that the generosity by which their manners are still characterised, those flights of patriotism and religious zeal, which formerly rendered the Spaniards capable of the greatest efforts; the sallies of national pride, which the pomp of style renders so noble; that irritability with respect to the delicate subjects of love and honour, which made duels so frequent in Spain, before the causes which softened the manners of Europe had gained sufficient influence over the modern Spaniards; the sacrifices and ardour of hopeful love, the anguish of unhappy love, and the stratagems of thwarted passion are traced in the most lively colours. Such are the outlines of these comedies, of which the Spaniards are as fond as they were at the time they first appeared.

Their authors of whom Lopes de Vega, Roxas, Solis Moreto, Arellano, and particularly the immortal Calderon de la Barca are the most celebrated, have so established this kind of comedy by their success, that more modern authors, such as Zamora and Canizaries, who wrote at the beginning of this century, dare not attempt any other.

The Spanish theatre has nevertheless experienced some happy changes latterly: and although real tragedy, unmixed with matter unworthy of its noble nature, has long been entirely unknown among them; within this little time they have represented some of the best French pieces literally translated; such as Andromache, and Zara; and some modern authors have even ventured on tragedy; Don Vincent de Huerta, who is lately dead, wrote a piece called Rachel. The serious drama has likewise made its appearance on the Spanish stage, and the Deserter, and Eugenia from the French, have been favourably received, as well they are no longer strangers to what is termed noble comedy by the French; for example they have represented the Misanthrope, from Moliere, which met with great applause. Some authors of the country have recently hazarded pieces of this description. Don'Thomas Yriarte has given the public El Senorito mimado (the spoiled child) and La Schorita mal criada (the ill instructed Miss); Moratin, a young poet, who does honour to the literature of Spain, and who by order of the court travelled through the country for some years, in order to gather subjects from life, with which to ornament and reform the stage; Moratin has also written a piece in this style called El viejo y la nina (Miss in her Teens and the Septagenerary) which was performed with great success at Madrid, and earned its author a considerable pension, a circumstance of which there have been but few examples in the world, and which excited considerable jealousy in many, but astonishment in every body. Comella, another young poet has also produced several agreeable pieces, one among others, the bent of which (for the genus irritabile vatum belongs to all countries) was to ridicule his cotemporary.

But these successful essays have been insufficient to root out that bad taste which has been long combated not only by the greater part of their literary characters but as well by those Spaniards unacquainted with any other theatre than their own. Will it however be believed that there are some among them, who not only defend with warmth the Spanish stage, but rebut with usury the blame which all Europe is agreed in laying on them.

In 1749 Don Blas Nasure, the king's librarian, reprinting the comedies of Cervantes, thus expresses himself at the head of the work: "We may very safely affirm without rendering ourselves liable to that charge which is made against our nation of prizing it-

mon fer

rly which e the real generosity religious the salility with equent in

ervantes, without izing itself highly while it thinks too meanly of others, that we have a far greater number of plays, perfect in themselves, and written according to rule, than what the English, French, and Italian, collectively, can boast."

Much more recently, that is, in 1791, Don Paschal Rodriquez de Arellano proposed a work to be published by subscription, entitled, Teatro antiguo Espanol arreglado a los mas principales preceptos del arte dramatica, in which he promises divera dramas, or comedies, written by Calderon, Lopes de Vega, Solis, Moreto, Roxas, Hoz, and Tyrso, in which the three unities are observed, the style free from hyperbole and affectation, from vain subtleties, from the heterogenous mixture of heroes and clowns, from inequality of the personages, and from indecent episodes and quolibets. He thus proposed to make an ample apology for the nation as to this branch of literature, at the same time preserving in these pieces, in spite of so many suppressions and corrections, all the force, beauty of expression, and grace of the originals. Let Spanish critics decide, if he has kept his promise.

But what will appear more surprizing to readers conversant in French literature, a Spaniard of the present time, at least who is very lately dead, a Fellow of the Academy of the Spanish language, La Huerta, expresses himself in this manner on the dramatic genius and poetry of the French, in his preliminary discourse on the Spanish theatre: A single spark from the brilliant fire visible in this divine poem, La Pharsalia, would be sufficient to give warmth and life to the weak and palsied muses of France, without excepting the Limousins, who placed nearer to Spain, received perhaps, on that account, in a slight degree, the influence of the enthusiasm and poetic talent characteristic of our

"How is it possible" he adds "that this divine fire should animate the minds of men, born and educated in marshy countries, destitute of sulphur, salts, and substance ; countries in short so little favoured by the sun, that their fruits scarcely ripen, notwithstanding the artificial means they use to expose them to its rays. Hence the mediocrity apparent in the greater part of their works. Hence the natural impossibility that the French should exceed in poetry and cloquence, those boundaries limited to spiritless minds, and fancy void of vigour. Hence, also, the astonishment occasioned in them by the grand sublimity of Spanish productions, the faults in which, where any exist, are so easy of correction.

"The great Corncille was only esteemed great among his countrymen from having badly imitated a work of one of our least excelling poets, the work itself much under

mediocrity. (But see how low M. de la Huerta rates Le Cid.)

"Athalia by Racine is looked upon as his master piece; what is there to be seen in it but a continual evidence of a want of powers! Since, without noticing the extraordinary number of actors, levites and troops introduced, a stale trick to make amends for incapacity of supporting the plot, and the momentum of the piece, without having recourse to fiction; the affected regularity, and even the hellenism which he makes shift to substitute for want of talent, prove sufficiently that the piece ought never to have passed the walls of the college in which it was composed.

"Can it then be looked upon as extraordinary that this hero of the French poetry, after employing three years in composing his Phædra, should end with laming the character of Hypolitus? The whole of this tragedy is replete with considerable faults, and the choice of an action so abominable in itself, even in the eyes of the least scrupulous or delicate, is certainly not the least. Merely from reading of it once I formed a very mean idea of Phoedra; but after seeing it acted at Paris, where Mademoiselle Dumeril, a celebrated actress, performed the part of Phoedra, I was so greatly hurt at seeing all decency and probability so violently outraged in her declamation, that I firmly resolved never to be shocked in the same manner again." What a punishment for the author

and the actress!

Don Juan Cadahalso (a Spaniard in other respects very well informed, with whom I made acquaintance on my first journey to Spain) after speaking at first in high terms of Phædra, alluding to the famous recital of Theramines, thus expressed himself; Sir, in this Phædra, the style is of that pompous and inflated description which we are so much accustomed to criticise in our poor authors of the last century. When in support of his assertion he translated literally this relation, in order to satisfy those among his auditors, who were admirers of the French drama, that when authors attempt to imitate Spanish sublimity, they must either do so by an exact translation, or failing of this, remain in a state of inferiority, both ridiculous and shameful in the eyes of all Spaniards; notwithstanding the unconsciousness of French hearers to their debased appearance. Such is the sublimity of Racine in the opinion of the Spaniards; whom, on the other hand, the French consider vastly to surpass the best of Spanish writers.

La Huerta does not treat Moliere less rigorously, than our two tragic writers. In a note which precedes el Castigo de la Miseria (the punishment of avarice) one of the pretended chef d'œuvres of the Spanish language, which he reprinted, he takes exception at those who reckon this piece to finish at the second act. He says "It is rather extraordinary that those who blame it for this defect, should tolerate and admire Tartuffe; of which the first, the second, and the fifth act are entirely superfluous. Moreover, this celebrated comedy finishes in the same manner as our Intermes, and if the indecency of it be excepted, bears much resemblance to them." We shall notice, as we proceed, what these Intermes are, and whether the comparison does much honour to the sagacity of M.

de la Huerta

It however remains for those foreigners to decide, who are acquainted with the Spanish stage, whether it be blindness, or ill will, that has actuated this unmerciful censor in his judgment. For my part, without retaliating his injurious sentence, I shall only observe that all those who possess any vestige of taste, either in Spain or in other countries, agree, that with the exception of some few modern pieces, the Spanish drama is replete with the most shocking defects. Improbable incidents are crowded on each other, it is filled with extravagance, and its language is a medley of pomposity and vulgarity. It mixes the most miserable parade with affecting and sometimes terrible parts; it has continually a fool called gracioso on the boards, sometimes humorous, but more frequently insipid, who by his wretched jokes is ever distracting the attention of the audience from the piece. Lovers are diffuse and talkative. The pleasure arising from features of delicacy, which occasionally occur, is destroyed by long dissertations on love. Scarcely one of their plays is free from the blame imputed by M. de la Huerta to the superfluous recital of the fate of Hypolitus by Theramines; not only are such repetitions common but disgusting at the same time by their digressions, their gigantic comparisons, and their extraordinary abuse of common sense. On the other hand, the plot presents such an intricate labyrinth that there is scarcely any play, to which these verses of Boileau may not be applied:

> Et qui debrouillant mal une penible intrigue D'un divertissement me fait une fatigue. Whose mazy plot, unravelled with pain, Instead of pleasing, but fatigues the brain.

This fatigue however does not appear to be felt by a Spanish audience, not even by those whose minds are least improved. Whether the people naturally possess an aptitude

to follow the thread of a plot however complicated, whether it be the result of habit, it is yet certain that they have in this respect a great advantage over other nations, and particularly the French. On this account much art becomes necessary, in fitting a Spanish comedy (and there certainly are many well worth adopting) to the French stage. This tribute has been paid it by our forefathers. The service of the Spanish drama to Moliere and Corneille is well known. Corneille extracted the chief beauties of the Cid and Heraclius from Guillen de Castro, and Calderon; and took much of his Liar from the Spanish. Moliere is indebted to the same authority for his Don Juan or Le Festin de Pierre; but at the same time all their skill was necessary to these men of genius, in modelling the strange originals which they had to work upon for the French stage, for none of these Spanish compositions could have been represented on their boards, without undergoing a change, the best of them being so much filled with relations repugnant to the taste and manners of France. An actor at one of our smaller theatres has recently however made some fortunate essays in this line; although his Ruse contro Ruse (Stratagem for Stratagem) and his Nuit aux Aventures (a Night of Adventures) may rather be looked upon as pretty close imitations, than translations of two Spanish comedies. Exact translations of Spanish pieces would be next to impossible. Duperron de Castera in 1738 published extracts from several Spanish plays with reflections and translations of the most difficult and remarkable passages. Mr. Linguet gave some of them to the public on entering his literary career. But separate from his making a bad selection he knew not enough of the Spanish language to fulfil his task completely; on which account his translations are no more than abridgements, in which nothing but the skeleton of a dramatic poem is preserved; and the passages not rendered were not those which displeased the translator, but such as he did not understand, so that I do not conceive that there exists one single Spanish piece perfectly and wholly translated into the French language. A principal obstacle to faithful translations exists in the innumerable puns with which the Spanish plays are filled, as well as all their other works of fancy; and as their minutely subtile genius is ever prompt to seize the slightest resemblances, and produce at every instant allusions to localities, customs and anecdotes of the day; these works become excessively difficult of comprehension even to the natives, and are almost impossible to be understood by foreigners; so that a translation of them, unless loaded with comments at every page, would be almost entirely unintelligible.

The Spaniards have always had a great aptitude for poetry. Their talent for extemporaneous productions is less celebrated, but is equally deserving of fame with that of the Italians. I have frequently been witness to ability of this description, which was almost miraculous. I have seen Spanish versifiers little known beyond their sphere, who have supported poetic challenges, which would have dismayed our most fertile and ingenious composers. I have been witness to their engendering strophes of ten lines formed upon the same rhyme, and which by the Spaniards are called decimas, in the twinkling of an eye. A stander-by gives for subject of such a piece, the last line which he fixes on at hazard; this is called echar pii. Instantaneously the poet produces nine others which are to precede the line given, which forms a natural close: and frequently neither the rapidity of these improvisos, nor the fetters with which the author is shackled, prevent their possessing considerable merit. They are at any rate little burlesque pieces, the emphatic utterance of which serves to unwrinkle the brow of the most serious; in which it is true good sense is sometimes outraged, but in which the laws of poetry are

rigorously observed.

The forms of poetry are singularly various among the Spaniards. Their language, very flexible and fitted for inversions, comprises all descriptions of metre common to European tongues; but they have one in a diction peculiar to themselves. Their rhymed verse is easy distinguishable both by the extended and the ear, and is called consonante. But the couplets called assonantes would scarcely be taken for verse by those who should not be informed thereof; and it is in this kind of poetry that their theatrical compositions both ancient and modern are written almost from beginning to end.

They begin generally with a succession of real rhymes, either continued, or alternate, of an equal number of feet in the one instance, or in the other of an unequal number. After the first or second scene the assonantes succeed, sometimes after but a short run of consonantes, and continue with the intervention occasionally of a few consonantes to the end of the piece. These assonantes are a continuance of phrases with a cadence, subject to a certain measure. Each of them forms a verse, but the assonante happens only in every other line, and does not require an actual rhyme. It is sufficient that the two last vowels of each second line, should be the same. An example will render this more comprehensible, for which purpose I have selected at hazard the following from a Spanish piece:

Ya, Leonor estamos solas Salyan per la boca asuera Tantos evidados del alma Como me afligen y cercan; Y antes que de mis presares Intente, amiga, dar cuenta Es bien que ponderi aora Con admirasica discreta Que siendo ias dos amigas Tanto, que enluza y estrecha, &c. &c.

At first sight there appears no rhyme in these ten lines, there is none in fact in the tirst, third, seventh, and ninth; neither is it requisite there should be. But the second, fourth, sixth eighth, and tenth, are assonantes, because each of them has for its two final vowels, an e, and an a.

A foreigner might frequent the Spanish theatre for ten years without suspecting the existence of assonantes, and when pointed out to him, he will yet find it difficult to follow the trace of them; but what he so hardly perceives, does not escape a Spaniard, even for an instant, however illiterate he may be. The second verse of a long course of assonantes is scarcely pronounced before he distinguishes the succession of final vowels, which begins its empire; he is intent on their periodical return, and an actor would not with impunity attempt to supplant them by others; singular faculty which pertains to the delicate organization of the people of the south, and the aptitude for declamation of the most vulgar and obscure individuals. These play a principal part at the theatre; their number and assiduous attendance form together one of the circumstances which render its reform so difficult.

The theatre itself had as mean an original among the Spaniards as in France, and preserves in many places its primitive form. Two parallel curtains, facing the audience, composed all the mechanic parts of the play-house, and there are places where this has not been improved upon. Behind the second curtain is the prompter, with a candle in one hand, and his piece in the other, running from one side to the other to assist with his function those actors who are in need of his help; but the theatres of Madrid of

the present day, and in other great towns, the slips, changes of scenery and decorations, and the position of the prompter are much the same as at Paris. At first indeed one is somewhat vexed at hearing the prompter recite the parts, in almost as audible a tone of voice as the actors. To this defect, however, one soon becomes reconciled, and often large system it is accessed, noticed.

after long custom it is scarcely noticed.

The play-house is divided into five parts La Luneta which answers to the Parquet of the French, and occupies part of the advanced part where the orchestra is placed with us. Los Aposentos, which are two rows of boxes, in the upper part of the theatre, La Cazuela, a kind of amphitheatre on the ground floor. In this part the women of common rank only are admitted, covered with their veils, for the most part white; but therein creep as well those charming intruders, who under the auspices of love are anxious to cheat the vigilance of some jealous hawks, or some idlers of the ton, who are either too lazy to decorate themselves, or desirous of saving the expence of having their hair drest after the French fashion. Las gradas, another amphitheatre above the boxes on both sides the house, where such of the common people as are desirous of sitting at their ease resort; and El patio, or the pit which contains none but the vulgar, with all their brutal manners, their ignorance, and their rags. This part of the audience, which has no seats, is always noisy, and as difficult to be pleased, as if it had fair pretensions.

The actors oftentimes address these five classes of spectators under the title of mosqueteros, and are lavish towards them of such stale epithets as they deem calculated to

secure their favour.

At Madrid, the actors are shared by two theatres, that of La Cruz, and that of El Principe, which for interest sake make common cause. There is, however, a rivalship as to ability kept up between them. Each has one of the players for a director, who every year dissolves and re-composes his troop. It is then that the actors, who are the greatest favourites with the public, expose themselves for sale, and close with the most expert or most generous. It will be readily imagined, that the graciosos are not forgot on these occasions. The two directors make arrangements between themselves for dividing them, for fear that too evident an inequality should exist between the two troops, and each in consequence should equally suffer. As for the others, all the talents of a different description are rather calculated for parade than the boards of Thalia. Spain has no idea of actors, in whom liveliness is united with grace, and sensibility with elegance of delivery; in one word, of such, as make the art of declamation the relative and rival of the fine arts. Their actors are but imitators, and while they servilely copy the models before their eyes, they have no conception of creating new ones in an imaginary but possible world, where every thing is noble without ceasing to be true. Driving along the same track, unskilful in delivery, as well as in their gesticulation, they exceed all bounds, exaggerate and disfigure every thing, and instead of managing their powers to enable them to effect the perfect delineation of their character, they become exhausted, and overstep all limits. Their women where impassioned are furies, their heroes are coxcombs, their conspirators rascally malefactors, and their tyrants butchers.

They are far from possessing actors resembling Clairon, Kain, Garrick, or Siddons. Indeed, in Spain, actors are no other than mercenaries, who are looked upon in society but as so many mountebanks, who, while they amuse us, are paid and tolerated, and afterwards are sent about their business; whereas in other countries, where prejudice causes them, generally speaking, to be still more meanly esteemed, the just admiration which some inspire, raises them to the level of superior artists, and men of genius.

In their ancient comedies, if deficient in some respects, they yet afforded pleasing examples of every virtue which can be taught a people; such as loyalty, magnanimity, justice, and particularly benevolence; and although in the exaggeration of their representations they may possess something offensive to taste, they cannot be seen without implanting in the mind a disposition to the exercise of these virtues. In the modern productions of Spain on the contrary, not only do they sacrifice common decency; they present the audience with pictures of the most shocking irregularities, without any attempt to excite the due horror for such offences. Conspiracies of sons against fathers, cruelty of husbands, infidelities on the part of wives, and even the unpunished villanies of malefactors; every thing is given by the actors, 15 suffered by the police, and applauded by the public. The consequences of this sufferance are, however, important, particularly in Spain, where the theatre is frequented by all classes of people. The populace even seem to be the principal object of their respects and adulation. They are sovereign at the Spanish theatre. Their whims must be attended to, their perverse taste be flattered, and the tumultuous manner in which they express their vulgar sensations, stifles the less noisy voice of the more enlightened part of the audience; a singular, possibly an unique, circumstance in a country where the people seem to be counted for nothing. May we not hence infer that there exists even amidst the most obscure classes of this people a sort of spirit, a sentiment of independence which is depressed by the continual sway of arbitrary power, but which although it may keep under, it is yet unable totally to annihilate?

One would think that a theatre so loose in its representations, would keep from it those persons with whom age or their condition of life should make decency a duty; but the foreigner sees, and sees with amazement, not only young ladies of a modest exterior, among the spectators of scenes which put delicacy to the blush, but even ecclesiastics whose grave demeanour, and austere dress, form a singular contrast with the lessons of corruption, and the sallies of libertinism exposed before them. A pagan worthy formerly left the theatre at Rome lest by his presence he should give a sanction to the offensive matter which was represented before him. Spanish priests intolerant with respect to less significant objects are not equally scrupulous with regard to the interests of virtue. Apostles of religion, are they not then doctors of morality? Or are they ignorant that without morality religion is but error, and a scourge? Let them use their influence in reforming the theatre, and no one will take exception at their appearing at it.

As to its reform, a combination of circumstances must take place in Spain before this can be expected. The sovereign in the first place should take an interest in it. Louis XIV, knew and patronised Moliere; he himself presided at the brilliant entertainments which he gave, and in which a conspicuous station was assigned to the drama. Wherefore had the Spanish theatre some celebrity in the reigns of Philip III, and Philip IV, which in so many respects are considered as epochs of the decline of Spain? The reason was because those princes encouraged dramatic writers by their approbation, and rewards; it was because they themselves took pleasure in theatrical exhibitions.

The kings of the new dynasty, who in other matters have been so worthy of praise in departing from these sad models, have not, as they did, carried their generative attention to the Spanish stage. Philip V, was of a pious disposition, and loved a retired life. Ferdinand VI, was more attached to Italian arts than those of Spain. Charles III, who seemed to hold out encouragement to other arts, who built La Caserta, withdrew Herculaneum from its tomb, adopted the pencil of Mengs, and embellished with several monuments of his taste, the capital of Spain. Charles III, if he had not an aversion to

the stage, yet looked upon it with the most complete indifference; and Charles IV, has not yet been able to effect a regeneration, which is looked for with impatience by all who are attached to the drama. Their minister, Florida Blanca, appeared to patronize the theatre of the capital, but he rather participated in the taste of the nation than felt disposed to combat it.

The part of the police, which has relation to the theatres, is divided between the Corregidor, the members of the town-hall, and the Alcaldes de Corte. But the limits of their jurisdictions are so indistinctly marked, that from an uncertainty as to proper authorities, result the irregularities, which each of these inspectors see, but which separately neither has the faculty of preventing. Each of the three or four censors, before whom every fresh offence must be carried, is desirous of removing from himself the odium of punishing, and consequently relies for greater rigour on his colleagues; so that their collective voice for the suppression of impure productions, equally offensive to decency and good taste, is difficult to be obtained. Add to which, these different examiners are frequently, themselves, infected with the general contagion. Besides they must possess more resolution than what falls to their share commonly, to snatch from the people the objects of their admiration, and not to yield to the representations of the comedians, whose receipt would suffer from such sudden reforms.

Mr. Olavidi, whose active capacity was capable of embracing at once every part of administration, together with the police, had began to effect some salutary reforms in the decorations, dress and the art of declaiming; and this formed a charge on the part of his enemies against him at the time of his disgrace.

Some samples were given in the reign of Charles III, of a resolution at reform, which cannot be too much exercised for polishing the Spanish nation. The autos sacramentales were definitively proscribed; in these pieces, angels, saints, and the virtues personified, played each their different part, to the great scandal of religion and reason; whimsical compositions, in which Calderon particularly displayed all the capricious feeundity of his genius. Other pieces have also been interdicted, such as Los zelos de San Josef, and particularly the Devil turned parson, dramas of a description at once pious and farcical, in which innocence formerly perhaps found subject for edification.

A revolution is begun, even in the mechanical part of the theatre. At Madrid, at least, decorations are better understood, the costume more appropriate; and one no longer sees (if ever such was the case as is represented by the witty impostor who has treated the world with Le voyage de Figuero) one no longer sees Orosmanes in a dressing gown, and Zara in a fart in gale. There are incongruities enough upon the Spanish boards, to render unnecessary the inventions of a witty mind, to increase the ridicule it merits. In Spain, as well as in Italy, actors of both sexes, cast their eyes over the boxes, and smile graciously on such persons as they may chance to know; and after a long speech, when they receive applause, they never fail turning towards the spectators, testifying their gratitude by a profound obeisance. These are defects which relate to the comedians. I shall give a specimen of others which pertain to the theatre itself.

Sometimes one or more of the actors entirely quits the stage, and takes his place in the boxes, whence a dialogue is kept up between him and the other performers. Nay, I know a piece, in which this extravagance is carried to a still higher pitch. It is one of those herole comedies in which the Moors and Spaniards at war with each other are prodigal of eloquent outrage. One of the Moorish generals, unable to force his way towards his foes, to whom he has to make some threatening declaration, gallops into the pit, and thence harangues the Spaniards.

What shall I say of the strange custom of interweaving in their most scrious comedies little pieces which have no relation to them whatever? I speak of those modern comedies which the Spaniards call Saynetes or Intermes, which are little pieces in one act, as simple in their plots as those of the great pieces are complicated. The manners and character of the inferior classes of society, and the petty interests which associate or divide them, are therein represented in the most striking manner. It is not an imitation but the thing itself. The spectator seems to be suddenly transported into a circle of Spaniards, where he is present at their amusements and little cavillings. The manner of dress is so faithfully copied that he is sometimes disgusted. He sees porters, flowergirls, and fish-women, who have all the gestures, manner, and language of those he has seen a hundred times in the street. The Spaniards do not seem to be aware that nature in her most simple garb may be embellished without ceasing to bear resemblance, and that it is in this that the merit of the art of imitation consists. The same observation may be made of the productions of their school of painting. Look at the shepherds, the young peasants of Velasquez, nay even of Murillo, they are with respect to elegant painting, what the Saynetes are to the dramatic art, striking but disgusting by their too exact resemblance. For these kind of characters the Spanish comedians have an admirable talent. Were they equally natural in every other they would be the first actors in Europe.

The Saynetes seem to have been invented to give relief to the attention of the audience fatigued by following the plot of the great piece through its inextricable labyrinth. Their most certain effect is that of making you lose the clew; for it seldom happens that the real Spanish comedies are represented without interruption. There are scarcely any exceptions unless in new pieces, either original or translated, in which the writers have felt the necessity of greater regularity. All the old ones are composed of three acts, called Jornados. After the first act comes the Saynete, and the warrior or king, whom you have seen adorned with a helmet or a crown, has frequently a part in the little piece; and to spare himself the trouble of entirely changing his dress, sometimes preserves a part of his noble or royal garments. His sash or buskin still appears beneath

the dirty cloak of a man of the lowest class, or the robe of an Alcalde.

When the Saynete is finished, the principal piece is continued. After the second act, there is a new interruption longer than the first; another Saynete begins, and is succeeded by a species of comic-opera, very short, and called Tonadilla. A single actress frequently performs the whole, she relates, in singling, either an uninteresting adventure, or some trivial and frequently scandalous maxims of gallantry; she then courts the applause of the audience as she retires, and the third act of the great piece is permitted to begin.

What becomes of the illusion, and interest in the piece after these interruptions? This may be readily conceived, and it is not uncommon to see great part of the audience

depart after the Tonadilla is finished.

The Saynetes and Tonadillas are frequently the most attractive parts of these strange medleys, and after a short residence in Spain, it is easy to conceive the attraction which the Saynetes and Tonadillas must have for the people of the country. The manners, dress, adventures, and music, all are national; besides, there are frequently presented in these little pieces two species of beings peculiar to Spain, and whose manners and expressions are the objects of much mirth and pleasantry, and sometimes of imitation. These are the Majos and the Majas on the one part, and the Gitanos and Gitanas on the other.

The majos are beaux of the lower class, or rather bullies, whose grave and frigid pomposity is announced by their whole exterior. Their countenance, half concealed under a brown stuff bonnet, called montera, is threatening, or full of insolence, which seems to brave those persons whose station should awe them into respect, and which is not softened even in the presence of their mistress. The officers of justice scarcely dare attack them. If provoked by any freedom, a symptom of displeasure or a menacing look, a long rapier or a poinard, concealed under their wide cloak, announce that none must make free with them with impunity.

The majas, on their parts, rival these caprices as much as their feeble means will permit; licentiousness and effrontery appear in their attitudes, actions, and expressions; but if not very scrupulous about the manner in which voluptuousness is displayed, in them may be seen the most seducing priestesses that ever sacrificed on the altars of Venus. Their charming tricks subject the senses to a delirium that the wisest can scarcely guard against, and which, if it inspire not love, at least gives promise of delight.

Persons of the most indulgent nature are however displeased that the majos and majas should thus be brought upon the stage, and preserve their attraction even in circles of good company. There are, among both sexes, persons of distinguished rank, who seek their models among these heroes of the populace, who imitate their dress, manners, and accent, and are flattered when it is said of them, He is very like a majo. One would take her for a maja.

The gitanos and gitanas are a kind of gipsies who run about the country, lead a dissolute life, tell fortunes, exercise all kinds of suspicious professions, have among themselves a language, particular signs, in short are dexterous knaves, who prey upon the unwary. This class of vagabonds, of which society ought to be purged, has hitherto been tolerated; and characters of them are given upon the stage, amusing by their originality; but the effect of this is, it renders vice familiar by concealing its deformity under a gay exterior. They are, if I may so say, the shepherds of the Spanish stage, certainly less insipid, but at the same time less innocent than those of ours. Their tricks, plots, and amorous intrigues, suited to their manners, are the subjects of several saynetes and tonadillas, and probably serve for lessons to many a spectator.

Such is the modern Spanish stage. There are playhouses at present in most of the principal towns of Spain. It may easily be conceived that their defects are even still greater than those of the capital. What then can we think of their strolling-players, called comicos de la legua, who travel from town to town with the rags which serve them for decorations, and perform in barns and stables? The heroes of Scarron are at least entertaining, these excite nothing but disgust.

After the death of Ferdinand VI, who had an Italian theatre at his court, there was for a long time no other than the national theatre. The marquis de Grimaldi re-established the Italian house at the court of Charles III, but it disappeared upon his retirement. Towards the latter part of his reign, this prince permitted the formation of one in his capital, which still subsists. The principal hospital at Madrid in the first instance was to pay the expence of maintaining it, and receive the profits, but turning out disadvantageous, the management of it was given to the proprietors, principally grandees, who however have not been able to support it without expence. Serious opera and farce is represented at this theatre; the decorations are handsome, the dresses splendidly rich, and the corps de ballet of a superior description. The Spanish actors having these models before them, appear to be pleased with them, nevertheless their representations continue nearly the same. They may therefore be deemed incurable.

3 Y 2

As for French theatres, they are at present, and for a long time back have been, entirely banished from Spain. Towards the middle of the reign of Charles III, one was established at Cadiz. The persons concerned were ruined, and the plan given up. Since that time it was in contemplation to introduce one at Madrid. The ambassador Vauguyon seemed greatly interested in the scheme. The devotees resisted it, pretending that French were full of maxims of tolerance, and breathed too much of modern philosophy. Treckoned no less than sixteen heretical assertions in the single piece of Pygmalion and addition, the hospital, whose support in a great degree depended upon the revenue which it received from the two national theatres, it was apprehended might suffer from its establishment. The king listened to the conjoint remonstrance of religion and charity against the measure, and the plan was laid aside. Notwithstanding this, the nation has become accustomed to the translations of some of our plays, although the time must needs be looked upon as distant at which we may see a French theatre at Madrid.

CHAPTER XIV.

OF THE BULL FIGHTS.

A'I the head of the amusements of the Spanish nation must be placed one which belongs almost exclusively to itself, one too to which it is singularly attached, notwithstanding its being obnoxious to the delicacy of the rest of Europe; I mean the bull-

fights.

Many Spaniards look upon them as one means of preserving, in their nation, that energetic spirit by which they are characterised; yet it is difficult to comprehend what relation there can be to strength and courage, in a spectacle where those present are exposed to no danger, and in which the actors prove by the rarity of accidents, that the hazard they themselves run is not of a nature to excite much concern. I know very well that exaggeration frequently represents accidents as very common. It is true, those cavaliers who are thrown from their horses sometimes receive very violent contusions; but in the course of nine years that I was a spectator of these fights, I never knew of more than one Torreador who died of his wounds. However, a priest is always at hand, in a latticed box, furnished with holy oil in case of necessity. Yet were accidents as frequent as they are uncommon, they might familiarize the spectators with the effusion of blood, and the sufferings of their fellow-creatures, but could not habituate them to the fronting of danger, or endurance of pain. They might render them unfeeling and cruel, but never resolute and brave. Another proof that this spectacle has no influence upon the minds of those who frequent it is, that I have seen among the spectators children, young women, old people of both sexes, men of every age, class, and character, in whom however these bloody entertainments did not tend to correct weakness or timidity, nor changed the mildness of their manners. Nay more, I have known foreigners of great benignity of nature, who at first suffered so much at the sight of these bull-fights as to change colour, yet who afterwards became much enamoured with the exhibition. These diversions are very expensive, but very profitable to the undertakers. The price of the lowest places is two, or four rials, according as they are exposed to the sun, or in the The highest price is a hard dollar. After the value of the horses and bulls, and the salary of the Torreadores, have been deducted from the money received, the remainder is commonly dedicated to pious uses: at Madrid it forms a principal fund for the support of the general hospital.

Bull-fights are mostly given in summer, on account of the spectators who remain in the open air, and the animals being then more vigorous. Peculiar breeds are set apart

for this species of sacrifice. A list is delivered to the spectators in which the number and the country of the victims are described, whose torture is intended for their amusement. There are twenty benches round the circle, and that only which is most elevated is covered. The boxes are in the upper part of the edifice. In some cities, such as Valladolid, where there is no particular place set apart for the combat, the principal square is converted into a theatre for the purpose. The sight of the people of every class assembled round the square, expecting the signal for battle, and exhibiting in their countenances every sign of joy and impatience, has in it something interesting.

The exhibition begins by a kind of procession round the square, in which the champions, as well on foot as on horseback, who are to attack the fierce animal, make their appearance, dressed in all the elegance of Spanish costume; the Picadores in a round hat, half covered with a short cloak, the sleeves of which float in the air, are on horseback, in white skin gaiters: those who are on foot are dressed in the lightest and nicest manner, and in pumps; both wear silk jackets of a bright colour, and trimmed with ribbands, with a scarf of a different colour, and their hair bound up in a large silk net, the fringes hanging from which descend as low as the reins. After the procession is finished two alguazils on horseback gravely advance, in wigs and black robes, to the president of the fight (the governor or the corregidor) for an order to begin. The signal is immediately given. The animal, until then shut up in a kind of pen, the door of which opens into the circle, makes his appearance. The agents of Themis, who have no quarrel with him, prudently hasten their retreat, and their fright, generally ill seconded by the speed of their horses, is the prelude to the cruel amusement which the spectators are about to enjoy.

In the mean time the bull is stunned with their cries and noisy expressions of welcome. He has first to combat with the horsemen (pleadores) who wait for him armed with long lances. This exercise, which requires address, strength, and courage, has nothing in it degrading. Formerly the greatest among the hobbitty did not disdain to take a part in it; at present even some hidalgos solicit the honour of combating on horseback. The picadores open the scene. The bull, without being provoked, frequently attacks

The picadores open the scene. The bull, without being provoked, frequently attacks them, upon which circumstance, when it happens the speciators conceive a great opinion of his courage. If, notwinstanding the policy steel which repels his attack, he again returns to the charge, cries are informabled, and plassure then becomes enthusiasm; but if the animal be pacific, disconcerted, and the repeated the provided in the provided

On the contrary, if he conduct himself properly, his career is more glorious, but of greater duration and more painful. The first act of the tragedy belongs to the combatants on horseback; this is the most animated but the most bloody and disgusting part of the whole.

The irritated animal braves the steel which makes deep wounds in his neck, falls furiously upon the innocent horse who carries his enemy, gores his sides, and overturns him with his rider, who in this case, upon the ground and disarmed, is in imminent danger, until the combatants ou foot, called chulos, come to his assistance, and provoke the animal by shaking before him stuffs of different colours.

But it is not without danger to themselves that they save the dismounted horseman. The bull oftentimes pursues them, and they then have need of their utmost agility. They escape by letting fall the piece of stuff which is their only weapon, and upon which the fury of the deceived animal is exhausted. But it sometimes happens that he is not thus to be imposed upon, and the champion has no other resource than leaping over the barrier six feet high, which forms the interior of the circle. In some places there are two barriers, and the intermediate space forms a kind of circular gallery, behind which the torreador is in safety. The bull frequently leaps over the first inclosure, but uneasy and ignorant what to do, he continues his course along the corridor, until an opening brings him anew into the arena; but when the barrier is single, the bull makes efforts to leap it, which he sometimes accomplishes. The alarm of the nearest spectators may easily be imagined; their precipitation in retiring, and crowding upon the upper benches, becomes more fatal to them than the fury of the animal, which stumbling at each step upon the narrow and uneven space, rather thinks of saving himself than satisfying his vengeance; and soon falls under the blows that are hastily and repentedly given him.

Except in these cases, which are rare, he returns to the charge. His dismounted adversary having had time to recover himself, immediately mounts his horse again, provided the latter be not too much wounded, and the attack is renewed; but the cavalier is frequently obliged to change his horse. I have seen seven and eight horses gored, or their bowels torn out, by the same bull, fall dead upon the field of battle. No words can then sufficiently celebrate these acts of prowess, which for several days become the favourite subjects of conversation. The horses, astonishing examples of patience, courage, and docility, at times, before they die, present a sight at which humanity shudders: they tread under feet the bloody entrails which fall from their lacerated sides, and still continue to obey the hand which guides them. Disgust then seizes such of the

spectators as possess any sensibility and embitters their pleasure.

But a new act in the piece succeeds. When the bull is deemed sufficiently tormented by the combatants on horseback, these withdraw, and leave him to the champions on foot, called banderilleros; who meet the animal, and the moment he attacks them, stick into his neck, two by two, a kind of arrow, called a banderilla, terminated like a fish-hook, and ornamented with little streamers of stained paper. The fury of the bull redoubles; he roars, and his vain efforts serve but to increase the anguish occasioned by the dart lodged in him. This last torment gives a fine opportunity for a display of the agility of his new adversaries. The spectators at first tremble for their safety when they see them so near the horns of the animal; but their skilful hands inflict so sure a blow, and they escape so nimbly from the danger, that after a few times their address appears nothing more than a trifling episode in the tragedy of which the catastrophe is as follows:

When the vigour of the bull appears almost exhausted, and his blood, flowing from twenty wounds, pours from his neck, and moistens his robust sides, the fury of the people, then satiated, calls for another victim; the president then gives the signal for his death, which is announced by the sound of drums and trumpets. The matador advances and remains alone in the circle; in one hand he holds a long knife, in the other a kind of flag, which he waves before his adversary. At first each stops and observes the other. The impetuosity of the bull is several times avoided by the agility of the matador, and the pleasure of the spectators is rendered more lively by their suspence. Sometimes the animal remains immoveable; he scrapes the ground with his feet and seems to meditate vengeance.

dor, and
metimes
s to me-

The bull in this situation, and the Matador who penetrates his design, and carefully observes his slightest motion, form a picture which an able pencil might not deem unworthy of delineation. The assembly notice this dumb scene in silence. At length the Matador gives the fatal blow; and if the animal immediately falls, the triumph of the conqueror is celebrated by a thousand exclamations; but if the blow be not decisive, if the bull survive, the murmurs are not less numerous. The Matador, whose address was about to be extolled to the skies, is looked upon only as a clumsy butcher. He instantly endeavours to recover from his disgrace. His zeal then becomes blind fury, and his partisans tremble for his life. At last he gives a better directed blow. The animal vomits streams of blood, struggles with death, staggers, falls. His conqueror then is lifted to the skies by the applauses of the people. Three mules covered with bells and banners terminate the piece, dragging the bull by those ho us which betrayed his valour from out of the circle, leaving behind the traces of his blood, and a slight remembrance of his exploits, soon effaced by the appearance of his successor.

On each of the days dedicated to these feasts (at least at Madrid) six bulls are sacrificed in the morning, and twelve in the afternoon. The three last of the animals are exclusively left to the Matador, who, deprived of any assistance from the Picadores, employs all his dexterity in varying the pleasures of the spectators. He sometimes allows an intrepid stranger, mounted upon another bull, to combat them; at others he turns a bear against them. The last bull is particularly devoted to the entertainment of the populace. The points of his horns are covered with a round case, which diminishes the effect of their strokes. In this state the bull, which is then called Embolado, loses the power of piereing and lacerating his adversary. The spectators descend in crowds to torment him, each after his own way, and often pay for their cruel pleasure by violent contusions; but the creature always falls at last under the blows of the

Matador.

The few spectators who do not partake the rage of the populace, regret that these wretched animals have not their lives, at least saved, in recompense for their many tortures, and display of courage. They would willingly aid them to escape from their persecutors. In these the humane few, disgust succeeds to compassion, and weariness to disgust: the uniform succession of similar scenes throws a langour upon the amusement which the spectacle promised at the beginning. It recals the opinion given by Pliny of the games of the circus: nihil novum, nihil varium, nihil quod non semel spectasse sufficiat.*

But to the connoisseurs who have studied the artifices of the bull, the resources of his address and fury, the different methods of tantalizing, deceiving, and tormenting him (for in some provinces this is a study from youth to manhood) to these no one scene resembles another, and they pity undistinguishing observers who cannot perceive

their variety. .

A master worthy of composing a didactic poem on this matter, in appearance so barren, and notwithstanding so famed, the famous Torreador Papehitto,† in 1796 published a treatise entitled La Tauromaquia o arte de torreur a pii y a caballo, a work useful for torreadors, whether professional or amateurs, unique in its kind, and much sought after by the public. Of this, it may be fairly said that the author was a master of his subject.

* It contains nothing novel, no variation, nothing in short which it is not sufficient for satisfaction to have seen a single time.

† He died in 1801, and it may be truly said in the bed of honour. He fell the victim of a bull he was about to kill; the second person who perished thus in the space of thirty years.

In this pursuit, as in others, the spirit of party confers reputation; and disputes or exaggerates success. When I arrived at Madrid, the connoisseurs were divided between two famous matadores, Costillares, and Romero, as people might be in other countries, with respect to the merits of two celebrated actors. Each sect was as enthusiastic in its eulogiums and positive in decision as the Gluckists and Piccinists perhaps were in France. It is difficult to believe that the art of killing a bull, which seems to be the exclusive privilege of a butcher, should be gravely discussed, and extolled with transport, not only by the people, but by the best informed men, and women of the greatest sensibility. Let us not, however, draw from this any conclusion unfavourable to the Spaniards. In spite of their singular attachment to bull-fights, in spite of the barbarous delight they take in seeing the blood of these innocent and courageous animals thus spilt for sport, they are nevertheless susceptible of good nature and humanity. On leaving these bloody pastimes, they are not the less sensible to the comfort of a pleasant home, to friendship, nor to love. Their courage does not on this account become more ferocious. When duels and assassination were more common, they were not more attached to this favourite amusement than at present. Their manners are softened from what they were anciently, without their passion for bull-lights being diminished. The day on which they are celebrated is a day of rejoicing for the whole district, for ten or twelve leagues round the place. The artist who can scarcely provide for his subsistence, has always a surplus to expend on this spectacle. And woe to the chastity of the poor girl, whose poverty should exclude her from it; the man who should pay for her admission, would certainly place it in danger.

The Spanish government under Charles III, seemed to be aware of the inconvenience of this kind of phrenzy; the origin of disorders and dissipation, and highly prejudicial to agriculture by sacrificing, in such numbers, robust animals which might be employed in cultivation. This king had himself an aversion to bull-lights, and was desirous of weaning the nation, by degrees, from its attachment to them. His first minister, Florida Blanca, entered into his views. Under his administration the number of these entertainments, in the principal provincial towns, was diminished. Even at Madrid none but weak animals were allowed for the sport, and the people began to lose their relish for them: but it was foreseen that under Charles IV, they would resume

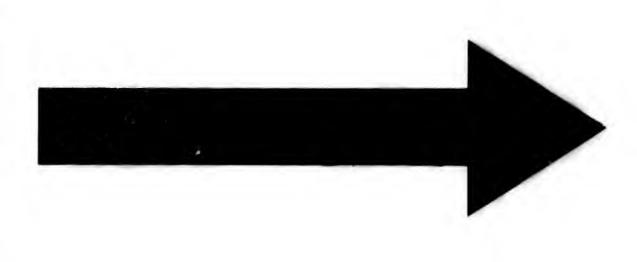

their original attraction.

There is in Spain another diversion called La Fiesta de Novillos. In this young bulls not designed to meet with death, but to grow up for the fatal lists, make trial of their budding horns, and are tantalized by a number of amateurs, who, like themselves, are learners. The prince and princess of Asturias, not during to oppose the taste of the old king Charles III, yet allowed themselves to enjoy by stealth these parodies of the grand exhibition. From this it was argued that he would give these games his countenance. The beginning of the reign confirmed this conjecture. For a long time none of those entertainments known by the name of Fiestas reales has been given by the court. The plaza mayor, on such occasions, was the theatre of these exhibitions. The king and his family honoured the spectacle with their presence. His military household presided to keep order. His halbardiers formed the inner circle of the theatre, and their long weapons were the only barrier opposed to the dangerous caprices of the buil. There were no more than one of these Fiestas reales in the former reign. They were considered as abolished. But the coronation of the new king, brought them again into fashion. Since that period the bull-lights have resumed their former charm for the people. Licence is granted with less difficulty to such towns as solicit leave to establish them for the benefit of different objects of charity. Those of the

Canadian Institute for Historical Microreproductions / Institut canadien de microreproductions historiques

capital have again become worthy of awakening that enthusiasm which began to flag. As early as 1789 the bull-fights were more animated and bloody than had been known for a long time; more than once had one of these animals kept the field after ripping up all the horses and wounding the greater part of the combatants.

There yet remains therefore two institutions in Spain, to which the nation appears to be attached by fettering bonds; two institutions which have more than one point of

contact.

Both inspire a sort of horror at those who defend them.

Both are barbarous, the one as it relates to manners, the other in its respect to

opinion.

Neither should meet with any other apologists than such as Jack Ketch, yet virtues belonging to christianity are both the motive and excuse of each. By the one Faith arms itself with rigour against incredulity; in the charitably applied produce of the other the wretched find relief.

One throws impediments in the way of increasing agriculture; the other is the chief

obstacle to the progress of philosophy.

Do they require I should name them? the one is the Inquisition, the other the

bull-fights.

With these observations, I shall conclude what I had to observe of the manners and taste of the Spanish nation. From this impartial view of the customs, pleasures, and resources of its capital it must be allowed, that where a foreigner has made himself master of the Spanish language, a matter easy enough in itself; where he is willing to introduce himself into the company of the natives of fashion, who are very accessible; where the manners of the country, which are singular but not offensive, have once become familiar, and provided he have no other favour to ask at Madrid than the smiles of some amiable fair one, he may pass his time as agreeably in this capital as in any other of Europe.

VOLUME THE THIRD.

CHAPTER I.

PROSPECT OF TOLEDO. THE ALCAZAR. MOZARABIC MISSAL. OF THE ARCHBISHOP AND HIS CLERGY. AN EXAMPLE OF TOLERATION. ECCLESIASTICAL JURISPRUDENCE WITH RESPECT TO MARRIAGE. CATHEDRAL AND PUBLIC EDIFICES OF TOLEDO. ITS ENVIRONS. CASA DEL CAMPO. VILLAVICIOSA. SAN FERNANDO. LOECHES. TOROS DE GUISANDO. BATTUECAS. AVELA. ALCOLA.

BEFORE I conduct the reader towards the south of Spain, I shall first lead him through different places worthy of attention at a short distance from the capital, whither

I was attracted by curiosity.

I shall begin with Toledo, a famous city formerly the residence of the Moorish kings, and at present the see of the primate of Spain. It is situated upon the right bank of the Tagus, twelve leagues from Madrid, and seven from Aranguez. On the road from Madrid you pass through two large towns, the lands about which are famous for their extreme fertility, and high state of culture, called Getafe, and Illescas. But as is the case almost throughout Castile, they are destitute of trees.

vol. v. 3:

In going to Toledo from Aranguez, you pass through a far more picturesque country. Beyond that residence the valley in which it is situated spreads, and the Tagus whose course is at times seen at a distance, and at others nigh, affords some pleasing views. But during this course its banks are steep, and covered with stones; and the river itself which flows tranquilly by Aranguez, on its approaching Toledo and under its ancient walls, flows with the noise and rapidity of a torrent

Before you enter Toledo, the Tagus is crossed over a bridge of frightful height. The idea which one is liable to form of this city from the pompous title of imperial, which it has enjoyed ever since it was taken from the Moors by Alphonso VI, from its disputing with Burgos for pre-eminence in the assembly of the Cortes of the kingdom of Castile, whose capital it formerly was, and whose ancient splendour is attested by its monuments, but ill agrees with its narrow, crooked, and deserted streets, its almost absolute want of comfort, and destitution of industry. Madrid, which latterly has increased its population at the expence of its neighbours, has laid Toledo greatly under contribution. The appearance of its mouldering edifices gives it an air of wretchedness, with which, however, the interior of its houses does not correspond. One meets here with neatness in extreme, a property but rarely united to poverty. The inhabitants, above all things, are highly solicitous of excluding the rays of the sun, and contrive to have coolness around them in the most violent heat of the Dog days. At this period, if you pay them a visit, you might deem yourself in the palace of sleep. By three o'clock, for them, the sun has set; the casements and blinds are hermetrically closed, the floors repeatedly sprinkled; with these, large sheets are spread over their courts, and every thing concurs to form an illusion, as to the warmth of the climate, and hour of the day.

It is true, these precautions are common to almost all the towns of Spain in the height of summer; but no where have they appeared to me so striking as at Toledo. Until lately inventions for these indulgencies were almost the only labour to which its inhabitants were addicted. Within these few years they are roused from the siesta to which they seemed perpetually condemned. Indolence and misery were successfully combated by Cardinal Lozenzana, who, for more than twenty years was their archbishop. The Aleazar, ancient palace of the Gothic kings, was almost entirely rebuilt under Charles V; but ever since the conflagration, by which it suffered in the beginning of the eighteenth century, it had continued in a ruinous condition. The archbishop put it in repair. He established here silk looms, which afford employment, to seven hundred poor people; an hospital for indigent women and old men; and formed a school for two hundred children, who are brought up at his expence, and

Such is the employment to which this prelate dedicated his superfluity; and as the simplicity of his life was truly apostolic, his wants were very circumscribed, and his superfluity immense. Notwithstanding the precision with which he attended to his spiritual functions, he yet had leisure to devote to literature. Before he occupied the see of Toledo, he had filled that of Mexico, and discovered there a new collection of the letters of Fernand Cortes. This he published with notes on his return to Europe. He has also given to the world several learned works, particularly a new edition of the Mozarabic Missal. This is a collection of the officers of the church, as celebrated according to the Mozarabic ritual, adopted by the Christians in the countries occupied by the Moors. Fallen into disuse, it was revived by cardinal Ximenes, who founded a chapel at Toledo, in which divine service is still performed conformably to this ritual, as well as in one of the churches of Salamanca.

Madrid and Aranguez forming part of the diocese of Toledo, the cardinal, archbishop of this town, frequently appeared at court, even previous to his being nominated chief inquisitor. Madrid notwithstanding is the residence of one of those grand vicars, who officiate for him in his episcopal functions. Towards the close of my first residence in Spain, I had some relation with this worthy acolyth of the prelate Lorenzana, the details and result of which, in abridgement, the reader will pardon my presenting, as they concur to prove, that fanaticism, and particularly intolerance, are evils not altogether so hopeless of cure in Spain as is commonly believed; and that in modern times even the clergy of this kingdom produce individuals accessible to reason, and capable of compassion for the weaknesses of humanity.

The agent of a foreign power, obliged by the laws of his country to profess the protestant religion, was captivated by an amiable Castilian. An obstacle of magnitude opposed their union in the invincible repugnance of the catholic family to an alliance with an heretic. The father himself comes to Madrid in order to snatch his daughter from the danger of seduction, and drags her in tears to a distance of thirty leagues from the capital. The lover follows his steps, throws himself at his feet, and moves him to compassion, but cannot shake him from his purpose. It is impossible, says the father, it is impossible I should give my daughter to a person the enemy of God, and of my religion; but be converted, you shall marry her. The young heretic, however, entreated at least the permission of pleading his cause before the tribunal of the church; hoping to find it less inexorable than that to which he had appealed in vain. The rigid Castilian approved the expedient, without, however, reckoning upon its success.

The stranger bears a gleam of hope away with him to Madrid. He seeks the grand

vicar of the archbishop of Toledo, and thus addresses him:

"You see before you an unfortunate man, whom it is in your power to restore to happiness. I doat on Donna N—, whom I wish to marry; between us I am told there is an insurmountable obstacle. I was born without the bosom of the Romish church. It were vain of you to exhort me to abjure my errors, nor could you be convinced of the truth of so sudden a conversion. And would that religion you profess, receive any glory from a similar homage? Leave to time, leave to the irresistible ascendancy of Donna N—, the office of bringing me into what you deem, what I perhaps some day may deem, the way of salvation. The honourable employment which I fill is my only means of subsistence. This employment is incompatible with a change of religion. If I fail of obtaining the hand of Donna N—, I shall die of despair; if I cannot obtain her upon any other terms than those of renouncing my faith and consequently my employment, both she and I must die of want. You only, the minister of a God of peace and goodness, you only can conciliate all; and surely as you have this power, you will not refuse my entreaty."

These arguments softened the austerity of the grand vicar. First of all, said he, I must have assurance that you are free to marry: how will you convince me? Next I must have proof that in your country, the protestant religion is so far national as to exclude the professors of a different one from holding employment, and lastly I must be satisfied by attestation, that you are not far estranged from the catholic church; and that you only require time, the influence of your future spouse, and the instructions of our min-

isters, to consummate your conversion.

Upon this, the young stranger looks upon himself as secure of success. Easily can I give you these three assurances; but it must remain with you to appoint the organs through which you will receive them. Let them be two public characters, in whom

you can confide, and who may be worthy of our confidence. He names the charge des affaires of France and that of the United States. They are accepted, and we invited to the grand vicar's. He received us, one after the other, and proposed the three questions, to which we answer in the affirmative. We sign this kind of act of public notoricty, which removes all the scruples of the grand vicar, the archbishop, and the orthodox family. The two lovers are united at the catholic altar, without either being obliged to abjure a creed. They remained faithful to their vow, as well as to the religion of their fathers; greatly intent upon promoting the happiness, and very little about the conversion of each other. If the reading of these lines should chance to occupy a leisure moment in this happy family; upon recital of his alarms, his dangers, his success, the triumph of love over intolerance, obtained by the interference of friendship; perhaps the husband, the father, and the friend, may moisten the page with a tear.

Such was the prelate of Toledo and his principal dependants twelve years ago, and such are they at present. In this instance, they exhibited the first proof of toleration of this description in Spain. Shortly after, another couple precisely in the same situa-

tion, availed themselves of this precedent to obtain a similar result.

There are other cases much less rare than those which we have just cited, in which the grand vicar is called upon to interfere in a way much less edifying to manners. I allude to the custom known in the country by the denomination of sacar por el vicario, literally, to redeem through the vicar. Any girl above twelve years of age may oblige a youth, provided he be fourteen years old, to marry her, if she can prove that he has anticipated the marriage rites, has promised his hand, or in any shape given her to understand that a union we have was his intention. Her proofs are exhibited before the vicar. If she affirm the youth has had commerce with her and he agree to the charge, he cannot escape matrimony. If he denies it, the proof remains with her; and all that is necessary is for her to produce a neighbour to testify having seen him enter her house at any improper hour. A ring, a jewel, a present, even a love-letter, notwithstanding the word marriage may not appear therein, is proof sufficient for claiming a husband.

The intention of such laws is not easily conceived. Does it proceed from a desire of putting young men on their guard, even in the most tender age, against the seductions of the fair? Or have the civil and ecclesiastical authorities united in the design of increasing the number of marriages at the hazard of making many that are bad?

However it may be, upon the plaintiff addressing herself to the vicar, the culprit is conducted to prison, where he remains pending the suit. If the sentence be, there is cause for a wedding, the prisoner is not liberated until after the celebration of the sacrament of marriage. Frequently the desire of obtaining one description of liberty causes him to sacrifice another; but it may readily be conceived that fetters thus put on will

not be cherished long.

There is another manner of employing the ministry of the ecclesiastical vicar, not less revolting to manners, but no ways so to love. Should a man become enamoured with a female under paternal restraint, who may return his passion and be unable to obtain consent of the father; he applies to the vicar, communicates their mutual inclination, and points out the house in which he wishes the object of his affection to be received, preparatory to the celebration of their nuptials. After ascertaining that their affection is mutual, the vicar sends a commissary to withdraw the female from her father's roof, and conduct her to the place indicated by the lover, and when the case is thoroughly approved, it is thence she is brought to receive the nuptial benediction.

, not less red with to obtain clination, eccived, ection is roof, and approvSuch in general throughout the Spanish monarchy is the ecclesiastical law in the instance of marriage; but in practice, the greater or less rigour with which these regulations are put in force depends much on the prudence and judgment of the minister of the church; and latterly laws have been enacted which, restoring to paternal authority a part of its influence over the disposal of children, have had for object the prevention of the scandal which is customarily attached to marriages contracted without that respectable concurrence.

But let us return to Toledo, from which digressions have led us somewhat astray. Its cathedral is one of the most valuable sacred edifices in Europe. During four hundred years it was consecrated to Mahometan worship, recovered by Alphonso VI, it preserved the form of a mosque until the reign of St. Ferdinand, who gave it that under which it now appears. It displays all the sumptuousness of Gothic edifices, and in the reigns succeeding that of St. Ferdinand was enriched with every kind of decoration. Several of the chapels are worthy of attention for the tombs they contain. In the choir there are those of four kings of Castile, who are commonly called reyes viejos, old kings, and that of the cardinal Mendoza, one of the most illustrious prelates who have held the see of Toledo.

In the chapel of the Virgin, cardinal Portocarrero is interred. 'The epitaph on his tomb is of a striking simplicity: Hic jacet pulvis, cines, et nihil; "Here lies dust, ashes, nothing."

In the chapel of St. James one pauses, irresistibly fixed before the tomb of Don Alvar de Luna, that illustrious and unfortunate favourite, abandoned to his fate on the scaffold by John II, whose blind partiality had raised him to the pinnacle of grandeur. If we give but common attention to the pompous inscriptions with which this magnificent tomb and that of his wife are covered, one cannot refrain from philosophical reflections on the instability of the favour of kings.

The same chapel contains several other tombs descring notice; I shall mention none but that of the ten kings or queens of Castile, which are in the chapel called delos reyes nuevos, the most magnificently decorated of all.

The capitulary half contains the portraits in succession of all the archbishops of Toledo; a valuable collection on account of their portraits, dating from the revival of the art of painting in Spain the different gradations through which it has passed, being clearly distinguishable on comparison; and because since the time of cardinal Ximenes they have all the merit of resemblance.

In the cathedral are several other paintings worthy of attention. The vestry contains, among others, one by Carlo Maratti, and one by Dominico Greco. The ceiling is painted in fresco, by Luca Giordano.

The cloister of the cathedral contains a painting by an author who deserves to be better known, Blas de Prado. The most indifferent connoisseur cannot but be struck by the correctness of the drawing, the excellence of the colouring, and especially the softness of expression in the figures.

The cloister of the cathedral is spacious, and its proportions just. Bayeux and Maella, the two best painters of modern Spain, have traced on its walls the principal events of the life of St. Eugenius and St. Leocadia, the patrons of the cathedral, and of some other saints, famous at Toledo by their zeal for the christian religion.

I might give a long enumeration of the ornaments, furniture and vases consecrated to divine service in this cathedral; a sufficient idea may be formed of them by considering that Toledo is one of the richest sees in Christendom, that it has frequently been held by pious prelates, who would have thought it a repreach on themselves had they made

a profane use of their opulence, and that it has had many opportunities to benefit by the munificence of the sovereigns of Spain. To the curious is shewn a piece of sculpture, in the very worst taste, and for what reason I know not, called the Trunsparent. It is a modern work, which disfigures instead of embellishing the edifice. There, who will may admire a stone which bears the impression of the feet of the Holy Virgin; she placed them upon it when she descended from heaven to bring to St. Ildefonso the first chazuble or priest's cap; a miracle which a modern sculptor has perpetuated in one of the chapels of the cathedral. The stone which bears the proof of the miracle, is exposed to public view behind an iron railing, which prevents profanation without being an obstacle to homage.

Besides the cathedral, Toledo has five-and-twenty churches and a heap of convents and pious institutions; several of which merit the attention of the traveller. The hospital of St. John the Baptist in particular, which, by the excellence of its proportions and the wisdom of the plan, does honour to the good taste of the founder cardinal Tavera, who has there a magnificent tomb; the work of Alfonso Berruguete, an able sculptor, of

the school of Michael Angelo.

Tolcdo owes also to one of its prelates (cardinal Mendoza) its very handsome foundling hospital, the church of which contains six great paintings of the school of Rubens.

Another asylum for suffering humanity is an hospital for the insane. There are two principal ones in Spain; one at Saragossa, the other at Toledo. I went several times to the latter, and was always surprised at the cleanness and regularity which I constantly found there; and, reflecting on several similar institutions kept in the same manner, I could not but admire how different this devotion, this Christian charity, which in our days is thought to be treated with mildness when only loaded with ridicule, how different, I say, it renders men from themselves, how powerfully withdraws them from their most habitual vices! On examining the charitable foundations of the Spaniards, the indolence and dirtiness with which they are charged are no longer seen. Had religion conferred but this one benefit upon mankind, it would still be worthy of admiration.

At Toledo there yet remains the wreck of the famous machine, invented by a Cremonian of the name of Juanelo, to raise the water of the Tagus into Toledo; and which for its ingenuity is worthy attention. Near the ruins of this machine there are others more ancient; part of an aqueduct erected to convey, on a level with the Alcazar, the water from a spring seven or eight leagues from Toledo. This is one of those works equally useful and magnificent by which the Romans marked their residence in several places in Spain. On the outside of the city as well, the ruins of a circus are visible, and the traces

of an old Roman road.

Thus the Romans, the Arabians, the Goths, and the Spaniards of the time of Charles V, by turns improved and embellished Toledo. I cannot say as much for the modern Spaniards. Houses out of repair, fine edifices going to ruin, few or no manufactures, a population reduced from two hundred thousand to twenty-five thousand persons, and the most barren environs; such is the picture which presents itself to the traveller, attracted by the reputation of that famous city. Under the last reign, in addition to the attempts of its prelate to naturalize industry, some successful efforts were made to recover it from the universal decay into which it had fallen. The blades of Toledo were formerly famous for their temper and solidity. Charles III, erected a very spacious edifice for making them; and the experiments already made seem to promise that the modern citizens of Toledo will not in this respect be long inferior to their predecessors.

The inhabitants of this city would scarcely pardon me, were I to pass over in silence by the their Cigarrales. These are little country houses, which I can compare to nothing they ilpture, resemble more than the Bastides which surround the city of Marseilles, except that they It is are less ornamented, and not so numerous. Thither in the afternoon, during the suffoho will eating heat of the dog-days, the inhabitants go in search of coolness and repose amid the in; she shade of orchards. It is nevertheless impossible to reach them without exciting the the first sweat of the brow, in crossing some burnt and unshaded meadow, or climbing over one of rugged hills. They are however the garden of Eden to the inhabitants of Toledo. xposed an ob-

I now pass on to other objects which, in the environs of, or at a short distance from,

the capital, are worthy the attention of the traveller.

At the Casa del campo, an ancient pleasure-house of the kings of Spain, only separated from the new palace by the Mancanares, he will meet with large trees, some good paintings, and an equestrian statue of Philip III.

Villa Viciosa, three great leagues from Madrid, is another royal palace to which Fer-

dinand VI, was attached, but which has not been frequented by his successors.

San Fernando is a village three leagues from Madrid, for some time celebrated on account of a manufacture of cloths established there. This has been removed to Guadalaxara, but the cloths still preserve their former name. The building in which was carried on the manufactory of San Fernando, formerly animated by industry, is now filled with the impure voices of such wretched prostitutes, as the police of Madrid delivers from vice to condign penitence. Formerly the Abbeville of Spain, it is now to Madrid what the Saltpetriere is to Paris.

At nearly the same distance from Madrid is a little village less known, but which appeared to me to merit attention; it is called Locches. Here are buried some master-pieces of which the Spaniards themselves are ignorant. The church of a small convent of nuns, founded by the conde duca D'Olivares, contains six capital paintings by Rubens, of the largest size and of magical effect. The principal is an allegorical painting of the triumph of religion; it is over the great altar, and unites all the beauties, and even defects, which characterise its author; richness of composition, brilliant colouring, strength of expression, and negligence of design. After this painting, I was most struck with that in which Elias is represented standing in the desert, at the moment

when an angel appears to comfort him.

Another object of curiosity, perhaps still more unknown to the Spaniards themselves, is found in the bosom of the mountains of Castile, four or five leagues from the Escurial: this is a monument which has caused much perplexity to some antiquarians, and which they know by the name of Toros de Guisando. Guisando is a convent of Hieronymites, placed upon the side of a chain of steep rocks, where, according to tradition, the sons of Pompey were defeated by the party of Cæsar, and where the conquerors, to celebrate their triumph, sacrificed to the gods an hundred bulls, and left the figures of four in stone on the place where they obtained their victory. Another tradition asserts these supposed bulls are elephants, and says, that instead of the triumph of the Romans, they were intended to preserve the memory of the passage of the Carthaginians into the country, who, indeed, have left in several parts of Spain some rude figures of these animals. But, did they most resemble bulls or elephants? This was a question, which in company with three foreigners, as curious as myself, I attempted to decide. We found, in an enclosure of vines, overlooked by the convent of Guisando, four enormous blocks of hard stone, resembling granite; they appeared to me so unshapen, that I was inclined to take them for the sportive productions of nature, rather than the regular works of art. On examining them nearer, we dis-

covered, or rather guessed, the intention of the sculptor, but the efforts of his chissel have almost disappeared beneath the ravage of time: we found no signs, either of the horns of a bull, or the trunk of an elephant. The form of the ears rather indicate the latter than the former animal; the contours of the rump and flanks are so much worn out of shape, that it is difficult to decide between the two. In short, after an hour's observation I left the difficulty as I found it. We were almost ashamed of our fruitless journey; and painfully climbed up to the monastery, whence we looked down upon this hieroglyphical monument. We found that there existed no doubt of the manner in which it ought to be interpreted. The first tradition is preserved upon a board, on which we read distinctly, the Latin inscription cut in the sides of one of the blocks, but which are now almost effaced. The principal inscription is as follows: Bellum Cæsaris et Patriæ ex magna parte confectum fuit; S. et Cn. Pompeii filiis hic in agro Bastetano profligatis. And another, Exercitus victor hostibus effusis. They sufficiently indicate that the monuments were designed to celebrate a victory over the sons of Pompey. It remains to be determined, whether the ground upon which they are placed be the Agrum Bastetanum; and to reconcile the hypothesis with history, which places the defeat of Pompey's party in Andalusia.

The worthy monks, jealous of the renown of their district, found an answer to all my objections, and that nothing might be wanting to my belief, they showed me the caverns in which the sons of Pompey found their death in seeking an asylum after their defeat. Immediately afterwards they informed me, that these asylums of the martyrs to liberty had fourteen hundred years later become those of the martyrs of penitence; and we were obliged to hear the recital of the retreat of the founders of their order, to the caverns, the detail of their austerities; the monks at the same time pointing out

the traces of their steps.

The Toros de Guisando, which many people at Madrid think imaginary, are frequently introduced into familiar conversation, to express, in a burlesque manner, the courage of a man capable of facing the greatest dangers; and in this sense, they are used by one of the heroes of Cervantes. When after my return, I said I had seen and touched these famous bulls, I was looked upon as an extraordinary person. The wonder, however,

ceased when I had described the enemy whom I had so resolutely braved.

Another district, farther from Madrid, makes a still greater figure than the Toros de Guisando, in the fabulous history of Spain; I mean the district of Battuecas, to which Montesquieu alludes in his Persian Letters, when he says, the Spaniards have in their kingdom districts unknown to themselves. According to ancient tradition, the religion, language and manners of Spain were unknown in the Battuecas. Extraordinary voices had been heard there from the neighbouring villages; the shepherds were afraid to approach it with their flocks. Was more necessary to stamp it as the retreat of dæmons or at least of savages? Each related in his own manner the origin and particularities of the place. The Battuecas also furnished a subject for the wits of Spain; they introduced them into comedies and novels; and Moreri did not disdain to give to these ridiculous stories a place in his dictionary.

Father Feijoo, an extremely well informed and intelligent monk, was one of the first who successfully combated these absurdities. The result of his researches, and the little tour I made to the Battuecas a short time before my departure from Spain is, that they are two uncultivated vallies, scarcely a league in length, and so narrow and closely shut in, that it is difficult for the sun to enter them in winter. This little district is remarkable for groups of rocks oddly formed, for variety of trees, the meandering

of the little river which waters the vallies, the excavations of the mountains by which they chissel are formed, and the great numbers of all kinds of animals to which they serve as a retreat. of the The only human habitation, which merits attention, is the convent of the bare-footed ndicate Carmelites, whose cells are buried as it were under the steep rocks, by which they are much threatened, and the trees that give them shade. A traveller might make the tour of ifter an Europe, and not find a place more fit to become the asylum of silence and peace. of our The district, which is almost inaccessible, and not upon the road to any city, is scarcely d down ever frequented. The curious few who go thither, are looked upon as persons of exof the travagant curiosity by the peaceful inhabitants, who cannot imagine the motive of their upon a visit. Their little district, which they seldom or never leave, is in the diocese of Coria, e of the eight leagues from Cividad Rodrigo, and fourteen from Salamanea. ollows: filiis hic

Avila and Alcala are two other towns in the nighbourhood of Madrid which a tra-

veller is tempted to visit, on account of their ancient fame.

Avila is situated on a hill twenty leagues from the capital. Its massy walls, its towers, its alcazar, and the dome of its old cathedral, afford rather an imposing appearance at a distance. But it is impossible to exaggerate its wretchedness and depopulation. The desertion of a number of territorial noblemen who are gone to settle eslewhere, and have left their lands to the management of their bailiffs, is the principal cause of this decay. In the beginning of the present century it had a manufactory of cloth, which did not succeed, and which the council of Castile in vain endeavoured to re-instate. However in 1789, two Englishmen, skilled in the manufacture of cotton, were enticed to Spain. They would have preferred Gallicia or Catalonia, in order to be nearer the sea; but government was desirous of having them in the neighbourhood of the court, and consequently fixed them at Avila, in an edifice occupied some years before as a military school. At first the inhabitants were greatly prepossessed against them, and threatencd to stone them. Priests had implanted in the minds of these people a belief that these heretics fed on Catholic children. Those in consequence who did not persecute vet shunned them. The peasantry of the neighbourhood went round about to some distance in order to avoid passing by their house. By degrees these prejudices vanished. The inhabitants began to be reconciled to the sight of them, and soon they caused abundance to renew its benefits in the district. In 1792 more than seven hundred persons were employed in their manufactory and its dependencies; and already not a beggar was to be met with in Avila. I saw these two persons introduced to the king at Aranjucz. The reception which they met with sufficiently made amends for the paltry persecutions of fanaticism and ignorance to which they had been subjected. How much are those governments to be pitied who, on introducing useful enterprises, have to combat enemies of this description! At a distance we are too much apt to judge from consequences, and do not pay sufficient attention to obstacles; whence proceeds a severity of decision which frequently borders on injustice.*

Alcala maintains its reputation better than Avila. The six leagues which separate it from Madrid are rather pleasant to travel over; after the first you arrive at the village of Canillejos, surrounded by orchards and gardens; a real phenomenon in the neighbourhood of Madrid. A league beyond you cross the Henaris over a fine stone bridge. leaving Leganis on the right, one of the quarters of the regiment of Walloon guards, with Vecalvaro, where is constantly a detachment of the Spanish guards, and San Fernando.

^{*} These manufactories of Avila have changed their masters, and gained nothing by the change. The direction of them has been given to the skilful mechanist Belancourt, whose active mind embraces too many objects to enable him to pay sufficient attention to the minutiæ of a manufactory. This establishment, which in its infancy promised largely, has almost dwindled to nothing.

On the other side of the Henaris, a beautiful slope begins; you perceive the town of Torrejon, beyond which is another stone bridge over the Tojote, a small river which in summer is but a streamlet. A little below it falls into the Henaris, which flows at the back of Alcala, between rugged and picturesque banks, sufficiently well shaded with trees.

The Henaris, whence Alcala derives its surname, runs at some distance from the town at the foot of a chain of hills piled one above another. Alcala is still surrounded by walls. It is disproportionately long for its breadth, tolerably well built, and clean; and notwithstanding it contains many churches and convents, and has no other employment for its inhabitants than that of cultivating most excellent fields for wheat, it does not disgust one, like many of the other towns of Castile, by a shocking display of misery. But that its university had for its founder the famous cardinal Ximenes, it scarcely deserves mention. For the purpose of employing them on an edition of the celebrated Bible, known to theologians by the title of Biblia Complutensis, he caused several really learned men to establish themselves here, who have been succeeded up to our time by none but pendants.

CHAPTER II.

ROAD FROM MADRID TO SARAGOSSA. OF ARRAGON AND ITS CORTES. ITS NEW CANAL. ROAD TO LERIDA.

ALCALA is on the road from Madrid to Saragossa, a considerable town, which I visited in 1792, in order to have a view of the canal of Arragon, of which such wonderful things had been told me. I shall conduct my readers thither, and give them an

account of this canal, and the province it is intended to vivify.

Four leagues beyond Alcala you reach the interesting town of Guadalaxara, situated on an eminence a short distance beyond the Henaris. A fine road afterwards leads to the miserable village of Torrija; thence to Granjanejos, the soil is stony and poor, and the road in the rainy season rather bad. From the top of the hill on which this town is placed, you descend abruptly into a small and very narrow valley, of highly pleasing appearance and cultivated like a garden. It affords the most picturesque prospect of all the road. But beyond Grajanejos you travel over a country mournful and bare, until you reach Bujarraval, a poor village surrounded by rocks, two leagues from Siguenza. It is still worse before you reach by a rapid and stony descent the bottom of a basin, in which Fuencaliente is situated, on the borders of a streamlet. This is a village belonging to the dutchy of Medina Celi, the principal spot of which fronts you on the brow of the circular hills which form the basin. There, some pretty houses, verdure, and plantations of flax, extended the whole length of the valley, agreeably strike the eye. The traveller is afterwards continually delighted with meadows covered with cattle, and tields in high cultivation, as far as the hamlet of Londares, after which you meet at a league beyond with a new village built by the bishop of Siguenza. Thus we see that prelates in Spain are ever the chief benefactors of their district. A little farther at the summit of a mountain is an old castle, worthy of the best feudal times. Formerly it was doubtless a military station, at present it is a peaceful appurtenance to the bishopric of Siguenza.

From Londaris to Arcos the road is vexatiously full of rises and falls, is very bad, and traverses a horrid country, to the north-east extremity of New Castile. Arcos is a vaiserable but pleasantly situated borough; it is the last in this province, and one of the thirteen belonging to the duke of Medina Celi in this canton. For three leagues the distance which separates it from Montreal, another wretched borough, the first in Arra-

is a raic of the gues the in Arragon, the country is equally hideous, and the roads equally bad. The entrance into Huerta, however, claims as an exception a village belonging to a monastery of Bernardines, who spread comfort around them, a culture which does them credit, and shades: a striking difference noticeable in Spain between the possessions of the clergy and those of the richest among the laity, but which is explained by the constant residence of the one, and the perpetual absence of the other. This monastery, besides, contains some remarkable tombs, among others those of several French replemen who came with the constable du Gueselin to the succour of Henry de Translamare. Should the traveller be desirous of spending a few hours in examining these curiosities, he will have reason to be satisfied with his reception by the monks; and will find at their table a compensation for the destitute state of the district.

Montreal belongs to the house of Ariza, whose chief grounds are about a league beyond. The ancient eastle pertaining to this house is on an eminence, at the foot of which is a pretty modern dwelling. The river Xalon, which we shall repeatedly meet with, runs close to it, and embellishes and enlivens this little canton. It forms a cascade, and has a bridge over it of a very pretty fancy. The whole of this landscape might advan-

tageously employ the pencil of the traveller.

On leaving Montreal you meet with a rapid descent, after passing which the road is constantly good to Cetina. From this village to Bubierea is two leagues of excellent road, between two ranges of hills; at the foot of that on the right the Xalon waters the valley, which is in a high state of culture. Half way this river is crossed over a bridge of stone, and you travel along its banks to Bubierea, a village most charmingly situated between the hills in the midst of rocks.

Thence to Calatayud, you change horses once at Ateca, a village surrounded by orchards amazingly fruitful. I advise the traveller who may pass through Ateca to lay in provision of a wine called Cerinana, of a partridge-eye colour, its sweet and agreeable flavour will make amends for the dark-coloured thick wine which will be presented him in this part of Arragon, as far as to Saragossa, at which the stomach revolts, and which

is certainly the most horrid beverage that ever poisoned man.

On leaving Ateca the valley becomes more narrow, but continues beautiful and fertile; it is watered by the Xalon, the course of which between the hills follows their sinuosities. Throughout all Spain I never met with a more pleasing district, none better cultivated than this vale from Cetina almost uninterruptedly to Calatavud. Trenches are cut communicating by a very simple process with the Xalon, which conduct its beneficent waters to all the grounds in its neighbourhood. It is not in this charming valley that a traveller must seek for the indolence and unskilfulness of Spaniards.

Half a league before you reach Calatayud a chain of rocks begin, piled one upon the other, and terminating in peaks, which rather disfigure the beautiful landscape. This town itself is in measure incrusted with them, the greater part being built at their foot, and commanding towards the south a valley which spreads considerably near the town.

The produce of this rich valley consists of corn, wine, pulse, and an abundance of hemp; of which a great quantity is sent into Old Castile, but much more to Bilboa and St. Sebastian. The cordage made of this hemp is used in the royal navy; and government employs commissaries of late years at Calatayud for the purpose of making purchases.

There is no oil made in this neighbourhood: however, at Calatayud there are twelve or thirteen soap manufactories; the barilla employed in which is brought from the eastern part of Arragon. There is a large demand for this soap throughout Castile.

Calatayud is still not by much so considerable a town as it used to be. It scarcely contains fifteen hundred houses; but in recompence it includes ten churches and fifteen convents, some of which are remarkable for their magnificence, and the extent of ground they are built upon. Calatayud and Tarracona have a bishop in common, who resides at the latter of these towns. The former is contiguous to the spot where Bilbilis was situated, the birth-place of Martial.

Half a league before it arrives at Calatayud the Xalon receives the Xitosa, which there loses its name, although Lopez, the first geographer in modern Spain, makes it retain it till it disembogues itself into the Ebro. I have thought myself justified in following the opinion of the inhabitants, and the statement of the abbe Pons.

The country is extremely uneven from Calatayud to the gates of Fresno, a town situated in a smiling well cultivated valley. After passing over some hills, the borough of Almudia lays before you, surrounded for a distance from its walls by olive-trees, vine-yards, fig.trees, and plantations of hemp and Indian corn. Part of the estates of M. d'Aranda lay in this delightful country. It extends to more than a great league from Almudia; afterwards, however, you meet with nothing but heath and the most barren country until you come to the miserable Venta de la Romera, and even to the neighbourhood of Saragossa.

At half a league beyond the last place but one for changing horses (La Muela) this celebrated town is distinguished in the midst of a beautiful and extensive plain on the banks of the Ebro.

I shall not enumerate the many sacred edifices contained in Saragossa. The most remarkable are its two cathedrals. The one is the church of La Seu, of most majestic simplicity; the other, so famous in Spain, and even throughout the whole Catholic world, and to the description of which cardinal de Retz did not disdain to dedicate several pages of his memoirs, is that of Nuestra Senora del Pilar. It is a spacious and sombre structure, overloaded with ornament, without taste, notwithstanding it was rebuilt at the close of the last century. But the miraculous image, around which there no longer remains a single ex voto, nor one of the rich lamps of which the cardinal speaks, is in a modern chapel, formed with superb columns of marble of the Corinthian order. Arragonese devotion owed a homage of no less magnificence to that pious tradition, which states the Holy Virgin to have appeared to St. James, in order to designate her pleasure to have her image placed in a temple on this bank of the Ebro.

The vaults of the part of this church which has been rebuilt have recently been painted in fresco by the two brothers Bayeu and Don Francisco Goya, all three natives of Saragossa.

In order to trace an additional feature in the history of human stupidity, you must descend into a cell of the church of Santa Engracia. There lay the ashes of a crowd of martyrs sacrificed by persecuting emperors. Lamps of silver are kept burning night and day in honour of them; but the smoke which proceeds from them does not soil. To prove this to the curious, the ceiling is pointed out, which, notwithstanding it be low, is perfectly free from smoke. Such as still have doubts are recommended to hold paper over the lamps. I made this experiment, and must confess that I saw or fancied the paper was not blackened. If I had had any doubts I should have been careful of expressing them before these tolerant exhibitors of this miracle. I felt much inclined, however, to accost them in these terms: What, shall the Almighty disdain to work a miracle in order to clear the sight of those ministers who oppose the French revolution, which by its recoil from the obstaoles raised against it may occasion the overthrow of all

you must crowd of ing night is not soil. ling it be d to hold or fancied careful of inclined, o work a volution, ow of all Europe; and yet, according to you, be disposed to effect an incessant miracle in this obscure cavern, a miracle too as useless in itself as your existence?

I shall more willingly direct the attention of my readers to the new Casa de la Miserecordia, the building of which, adjoining to that of the old one, was completed in 1792,
and which does no less honour to the intelligence than to the patriotism of Don Ramon
Pignatelli. Destitute young people of both sexes here meet with occupation and maintenance. They separate silk, spin and comb wool, which is for this country a valuable
production. They manufacture some coarse woollen cloths, camlets, and silk. Out of
seven hundred persons contained in this edifice, half are employed by people in the
town; for its wise founder (lost some years ago to Arragon and Spain) was persuaded,
that without this expedient such charitable institutions would do more harm than benefit to industry. There are besides several manufactories which furnish regiments with
clothing.

Saragossa possesses an academy of fine arts, an insignificant university, and a patriotic society. It encourages all branches of industry, particularly plantations of trees. It has established schools of commerce and mathematics. Don Martin Goyecochea, one of its members, even established a few years back a school for design at his own individual expense. In one word, Saragossa is visibly recovering from its long stupor, and is rendering itself worthy of being the capital of the beautiful kingdom of Arragon.

This kingdom was formerly much better peopled than at present. A vast number of its towns and villages have disappeared. Its population is reduced to 614,000 persons, of which Saragossa contains 42,600. Arragon has figured with glory in the history of free governments.* Notwithstanding the crown was hereditary, each new king was obliged to have his title confirmed by the states, and was not initiated to the sovereignty before he had sworn to maintain their rights. As a counterpoise to the authority of the sovereign, they established a magistrate called Justicia mayor, who was accountable for his conduct to none but the states. At the inauguration of the king, this magistrate remained seated with his hat on upon a high tribunal. The king appeared before him uncovered, and took oath, kneeling, to govern according to law. It was at this instant that the proclamation, so much cited formerly, was made: Nos que valemos tanto como vos, os hacemos nuestro rey senor con tal que guardeis nuestros, fueros y libertades; sino no.

The admiration which this imposing ceremony is calculated to inspire, is somewhat weakened upon learning that it was less before the people, or its representatives, than an assembly of notables (ricos hombres) whose property was purchased with the sword, that the king thus humbled himself. At first no more than twelve of the ancient families were admitted to the ceremony. By degrees the number was increased, and divided into high and inferior nobility. Among the states the clergy was represented by prelates, and considerable towns sent deputies. But labourers, artisans, merchants, these were excluded from the rank of citizens; so that the people was very incompletely represented. This unshapen assembly of the three orders made laws for the nation. The Justicia mayor was the chief restraint upon usurpation, whether on the part of the Cortes of Arragon, or that of the king. At length the prelates became devoted to the monarch; the deputies of the towns were not proof against bribery; the king thus by increasing the number of his partisans among these two orders, kept the nobility in curb, and became such as he is at the present day, an absolute monarch. Nevertheless there still exists a shadow of the Cortes of Arragon. In 1792 Philip V, in a moment of distress, caused them to be assembled, as well as those of Catalonia, which had not met together for two centuries. The young queen, in the absence of the king, presided over

* See a work by Adams on American Constitutions.

the Cortes of Arragon. She found them little inclined to satisfy her requests, and with

difficulty obtained a hundred thousand crowns.

The successes of Philip V, and the resistance he met with from these two provinces, forfeited them the transient title they possessed to his favour. They were treated as conquered provinces, and of their Cortes no more than the wreek we have noticed elsewhere remained. Nevertheless the court of Madrid is not entirely free from the alarms inspired by Arragon and Catalonia, whose inhabitants are prompt to take umbrage, and difficult to train to the yoke of despotism. Those who are supposed to be deficient of devotion to the dynasty of the Bourbons, are looked upon to lean towards the Arragonese party, that is to say, to the disaffected side; and it is to this salutary apprehension that these two people are indebted for a treatment foreign to a constitution which no longer exists but in remembrance.

Arragon contains several towns, besides Saragossa, deserving of mention.

Huesca, twelve leagues distant, is situated in a territory famous for its productions of all descriptions.

Tarracona, thirteen great leagues from Saragossa, is surrounded by a country well

planted with trees, and well watered.

Terruel, between Saragossa and Valentia. Its name brings to mind the adventures of two lovers, which have been made the subject of an extremely affecting Spanish drama, and whose dresses are preserved, with a tender and pious respect, in one of the churches of this town.

The little river Turia, before it reaches Terruel, passes by Albarracin, traverses and

fertilizes a beautiful plain which spreads beyond the town.

Daroca, on one of the roads from Madrid to Saragossa, deserves to be noticed. Situated at the foot of the mountains on the banks of the Xitoca, it is exposed to frequent inundations. In order to guard against them, a subterranean channel, 780 yards long, has been dug to earry off the water. The banks of the Xitoca are exceedingly fruitful,

and produce an abundance of hemp of an excellent quality.

The principal wealth of Arragon consists in its oil, which is sweet, full of substance, and has no unpleasant taste. In Saragossa itself are many olive mills. One of the most remarkable is that belonging to a real patriot, of whom we have before spoken, Don Martin Coyecochea. Such proprietors of olive grounds as have no mills, bring their olives to this. He has collected in his own house every thing for the use of the country people who come for his assistance. This establishment affords a proof of what even a single man can do who has the public good at heart, even in Spain. With pleasure I remarked that the workmen employed about this mill, to the number of from twenty to two and twenty, were all of them Frenchmen, who annually towards the close of December migrate for the purpose from our southern provinces. Even the country people agree that Spanish workmen would make but bad substitutes for these; neither were they less pleased with their decorous behaviour than with their superior intelligence. There are, however, other mills at which Spanish workmen are employed near to Monte Terrero, a place in the neighbourhood of the town which has recently been levelled, and planted with vines and olive trees; there is one for the olives produced upon the lands appertaining to the canal of Arragon, and those paid as contributions by the proprietors whose grounds it irrigates.

I shall now give some account of this canal, the chief object of my excursion into

Arragon.

It passes half a league distant from Saragossa, below Monte Torrero. There are its magazines, in which are deposited grain, timber, iron work, and utensils. These edi-

fices, remarkable for their solidity, contribute to the embellishment of the canal. There it was that I went on board a yacht to visit six beautiful locks a great league below Saragossa. Half a league beyond these are four others, which receive the canal upon its issuing from a large basin, on which you embark to ascend it to its source.

Recommended to Don Ramon Pignatelli, the true creator of this canal, a masterpiece of Spanish industry, I was enabled by his means to make this little water excursion with convenience and advantage. At eight o'clock in the morning I embarked
in a large boat under the management of Don Juan Payas, director of the canal. At
noon we stopped at the most remarkable spot, where the canal runs in a channel of
stone seven hundred and ten toises in length, over the course of the Xalon, which flows
beneath this stupendous piece of masonry. This part of the canal was the most expensive of any. Its cost is estimated at 13,000,000 of rials (nearly £.150,000 sterling.) We
slept at Canalista, another station worthy of remark. The old canal from the Xalon, cut
for the purpose of irrigation, proceeding from the west, takes its course here over an
aqueduct of stone built over the canals, and afterwards directs its course castward towards Lucena.

The next day we admired the works of Gallar, a village on a naked slope on the banks of the Ebro, which hereabouts approaches very nigh the canal. The inequality and ruggedness of the ground which it has here to pass over required solid and very expensive works. A little lower down, the canal runs in a channel of stone cut through very high hills. This work is not new. Under Charles V, the first author of the canal of Arragon in this part, it ran under ground, all therefore that was necessary at the present time was to open it anew.

Half a league beyond Gallar you perceive the Ebro, and, in the distance on the other side of its right bank the village of Tauste, which gives its name to a canal entirely modern. For that which we are at present passing over is, properly speaking, the imperial canal began by Charles V, but which, interrupted by the distractions of his restless ambition, he was obliged to discontinue, and which remained unregarded till the year 1770. Since then it has made but slow progress, and perhaps would not have mady any, but for the rare perseverance of Don Ramon Pignatelli. As you approach the mouth (El Bocal) that is to say, the place where the canal begins, it is divided into two by a small island. On the right, is the old canal of Charles V, on the left, that which has been lately made. Shortly afterwards we pass under the bridge of Formigalis, near which the latter canal increases its breadth, and forms a superb sheet of water. Under this bridge, of a single arch, is the first place at which the canal disembogues itself (alminara de disagua.)

There are to be five bridges over this canal between Gallar and El Bocal. Built at first of wood, they have been or will be successively constructed of brick.

Two leagues from El Bocal, after passing the old castle of Mallen, we enter the kingdom of Navarre. Thence the canal commands a vast prospect over a plain covered with pulse and maize. Below Formigalis we find the bridge of Valverdo, the confines of Arragon on that side. At length, we reach the Bocal, which is a quarter of a league beyond Formigalis.

There the Ebro, through a cut a hundred and eighteen toises long, and seventeen broad, enters the bed of the canal by eleven mouths, which are never opened all at a time, and over which the new palace is built. In front of one of the sides of this edifice is the extensive sheet of water formed from the Ebro, and on the right, the cascade.

The first story of the palace comprises a suite of apartments for the governor of the establishment, which were finished in 1787. The other buildings adjoining are warehouses for wood, planks, and ironwork. The tavern, which is spacious, is well

managed by a landlord from Thoulouse; the chapel and the old castle are a quarter of

a league distant from the bridge of Formigalis.

After having minutely examined this canal; after noticing how well every thing has been foreseen, how well every thing has been planned and executed; and joining to this grand undertaking many other monuments and establishments dispersed over modern Spain; it is impossible to retain any longer those unfavourable prepossessions against its inhabitants, which exist in the minds of a great part of the population of Europe, or

not to allow, that, if they are tardy in their measures, they yet complete many things with intelligence, solidity, and even with magnificence.

The canal of Arragon seems to re-unite all these qualities, and its utility is already attested by seventeen years experience. In the month of August 1792, it might produce 2,000,000 of rials, more than half of which was consecrated to the payment of persons employed, and the remainder was set apart for the continuation of the works. The sources of this revenue are the produce of the land for several toises in breadth on both its sides, and the contributions in kind paid by all the land it irrigates. Those previously cultivated pay a fifth of their crop; the lands newly broke up for tillage a sixth; and vineyards, olive-grounds and orchards, an eighth or ninth part. At the epoch adverted to, one hundred thousand acres were watered by the canal; and estates which a few years before sold for from 100 to 150 rials per acre, had arisen to the value of from 4 to 5000; can a better apology be possibly adduced for canals, and for that of Arragon in particular? After this, will it be credited that funds could be wanting for its completion? Yet in 1793 such was the case. It stopped at Cartuxa baxa, a great league below Saragossa, and with regret I learn, that since then it has made no progress; that the managers have been entirely destitute of funds for the continuance of the works, and that those which were finished were suffered to fall to decay. These are the results of the last war. Such is the fruit of intrigue and envy?

This canal is to have in all thirty-four locks. From Tudela to Saragossa none are necessary; but from the last town to Sastago, where the canal is to join the Ebro again, the elevation of the ground renders them indispensable. In 1793 no more than six were finished. The expence of the remaining twenty-eight ought not to create dismay. Those already made had cost no more than 200,000 rials each. The residue therefore

would not require more than 6,000,000 (about £68,000.)

For the advantage of the canal there have been contrived, 1st, Sluices (almenares de desagua) for taking off the superfluous waters.

2dly, Cuts for irrigating the neighbouring land (almenaras de riego.)

Sdly, Small bridges, or alcantarillas, to carry it over ravines. In some places the

neighbouring roads pass under the canal.

4thly, Superficial currents (corruntes superficiales) by means of which the land floods are conducted over the surface of the canal, after depositing in a sort of well the stones, mud, and gravel which they sweep along with them.

When desirous of cleaning the canal, it can be left dry in four or five hours. At the same instant all its sluices are opened, and the waters by channels more or less slop-

ing empty themselves into the Ebro.

The drain from this river below Tudela, does not perceptibly lessen its stream; for there are more precautions necessary against its superabundance, than a scarcity of its waters; but every thing is so excellently combined, that the quantity requisite for the canal is computed to the most exact nicety.

Spain has no establishment that promises greater utility. For a long time the course of the Ebro had been an insufficient means of communication for the three provinces

ining has ng to this r modern gainst its arope, or

ours. At less slop-

ream; for city of its ite for the

the course provinces through which it flows, Navarre, Arragon, and Catalonia. The canal which is to compensate for its insufficiency will run twenty-six great leagues from Tudela to Sastago. At the latter place the Ebro begins to be navigable, at least requiring little to make it so, as far as Tortosa, whence it is navigable to the sea. Along this river is another canal eleven leagues in length, which was finished even before the time of Charles V. It is that of Tausto. Intended solely for irrigation, it has become neglected, and is consequently of very little service. The directors of the new canal engaged to re-establish the old; but until the new cut be made to supply both canals, they have suffered the old one to remain, which is about half a league higher up.

The Ebro itself, however, is not entirely useless to the countries through which it flows. But navigable for no more than four or five months of the year, from Sarragossa to the sea; it is but partially beneficial to navigation, and cannot be employed to water the meadows. The new canal answers both these purposes. Its least depth is given foot, and the largest records are set of 10% to a largest to the search of 10% to a largest to the 10% to a largest to the search of 10% to a largest to the search of 10% to a largest to the 10% to a largest to a largest to the 10% to a largest to a lar

nine feet, and the largest vessels employed upon it are of 135 tons burthen.

El Bocal is very near to Navarre. The village of Fontellas is situated on an eminence night he canal. You pass through it to go to Tudela, two leagues distant, which is the first town on that side of the kingdom of Navarre.

On leaving Fontellas you meet with a specimen of the superb roads with which this part of Spain, owing to the care of its viceroy count Gages, was furnished before any other; roads which pass from one frontier to the other of Navarre. It is known that one of the roads which lead from France to Spain is that from the French or lower Navarre to the upper. This journey is begun on horseback, or on a mule, at St. Jean Pied de Port, a small town, situated at the foot of that very steep ridge of the Pyrences called Altovizar; it takes two or three hours to clear it and reach Roncevalles, situated at the bottom of the opposite side of the Pyrences. Roncevalles, a name famous in romance and fabulous history, is at present no more than a village, containing some tolerable inns and a monastery of regular canons.

Thence to Pampeluna is six leagues of excellent road through deep vallies, and rather lofty mountains, both partly covered with wood. On the way you have the valley of Bastan on the left, which up to the present day has been the theatre of continual quarrels between the borderers. After traversing the valley it may readily be considered a proper apple of discord. It is five or six leagues in diameter. The Bidassoa has its source therein; it does not produce much corn, but abounds in fruit and maize, and its meadows are covered with sheep.

Pampeluna, the capital of Spanish Navarre, and residence of its governor and viceroy, is built on an eminence on the banks of the little river Arga. It contains but three thousand houses at present; it is protected by a citadel and a fort, and in 1795 preparations were made there to resist our victorious arms. The six leagues from Pampeluna to Tafala traverses a rich and well peopled country. The distance from Tafala to Tudela is eleven leagues, the six last of which is also through a well cultivated country, if the Bardena del Rey be excepted, an uncultivated district, but which furnishes excellent pastures.

Tudela, a great league from the frontiers of Arragon, is a middling-sized town, tolerably well built. At the extremity of the wide street, which intersects it lengthways, is a stone bridge over the the Ebro; when you have crossed this bridge, the superbroad of seventeen leagues to Pampeluna begins. The territory of Tudela, known only for the production of its red wine, is adapted to all species of cultivation; but the misconceived cupidity of the rich proprietors to whom it belongs, has consecrated it to the sole

VOL. V.

culture of the vinc. Peralta, which furnishes a wine of some celebrity, is a few leagues

distant from Tudela, pretty near the road to Pampeluna.

The kingdom of Navarre, taken by Ferdinand the Catholic from John D'Albret, forms a distinct province, the same as Biscay, which preserves its customs, privileges, and separate tribunal, and is looked upon in many respects as beyond the frontiers. The greater part of foreign merchandise is admitted free of duty, not being examined until its arrival at Agreda, the first custom-house of Castile towards Navarre.

But let us re-enter Arragon, and leave its canal, which, even as it is, deserves the admiration of all persons conversant in useful and solid works, and of every friend to the public good. Were it never to be completed, enough has been done to immortalize the name of Don Ramon Pignatelli, who, in despite of the double title he possessed to be inactive, that of his rank in the church, and that of his illustrious origin; in despite of intrigue, and the coolness of the court, was one of the most diligent, most enlightened,

and most estimable men in Spain.*

Saragossa is on one of the roads from Madrid to Barcelon; but this road is one of the worst in Spain, and gives no very favourable idea either of Arragon or Catalonia. In particular, nothing can be imagined more destitute or hideous, than a great part of the country you pass over from Villafranca, at which place you lose sight of Saragossa, to two leagues beyond the wretched borough of Fraga, situated on the banks of the Cinea, and at the foot of a steep and almost impassable mountain, which you have to cross before you reach Lerida. Passing Villafranca you arrive at the Ventu de San Lucia, the most disgusting inn in Spain. Thence passing through the borough of Bujaraloz, the miserable village of Candasnos presents itself, separated from Fraga by five leagues of the most frightful country. Catalonia begins on the other side of Fraga. Lerida is at about the same distance; but in another part I shall speak of this important town, and the twenty leagues of road between it and Barcelona.

In the interim, let us proceed to the south of Spain, beginning with the elegant resi-

dence of Aranjuez.

CHAPTER III.

DESCRIPTION OF ARANJUEZ.

THE road from Madrid to Aranjuez is one of the finest, and kept in the best order of any in Europe. You see before you the broad and long bridge leading to Toledo, a massive structure, whose parapets are loaded with ill-chosen ornaments. When the Manzanares is very low the bridge may be avoided (which saves a quarter of a league) by crossing, over a small bridge, the canal intended to join this small river with the Tagus, and which, begun under the administration of M. de Grimaldi, was given up for want of funds, after it had proceeded about three leagues, and for want of such persons as Don Ramon Pignatelli, worthies very rare in Spain. The only revenue derived from it is the produce of a few mills; and this is absorbed by the repair of bridges, sluices, and the salaries of persons employed. For in almost every part, scarcely is an

^{*} After the death of Don Ramon Pignatelli, the count de Sostago, individually interested in the canal of Arragon, was nominated ad interim to the superintendance thereof. This office was afterwards delegated to the directors-general of bridges at Madrid. It is not likely that, under the management of a body distant from the spot, and whose attention is occupied by so many other concerns, the canal should attain perfection. At present it is employed either for navigation or irrigation, only from Tudela to a league beyond Saragossa.

establishment begun, before the expences of supporting it are as considerable as it it were

The Manzanares is fordable a little beyond, and on the other side begins the fine road of Aranjuez, whence are seen different groups of olive-trees. After having journeyed six leagues, on a very straight and even road, you descend to the charming valley of Aranjuez. The Xarama, which you cross over a very fine stone bridge, runs at the foot of the hills, by which the river is formed, to the north. As soon as you arrive in this valley, the dry and naked plains of Castile disappear, and you perceive a change both of soil and climate; here you travel in the shade of lofty trees, and distinguish the noise of cascades and the murmur of rivulets. The meadows are enamelled with flowers, and the pastures display the most lively and variegated colours. Vegetation appears in all its richness, and bespeaks the neighbouring river, which, with its beneficent waters, fertilizes and vivifies the landscape. The Tagus, which enters the valley at the east end, runs in meanders for two leagues, and, after having reflected the images of the most beautiful plantations, joins the Xarama.

The embellishments of Aranjuez are modern. The first Spanish monarch who resided there for any considerable length of time was Charles V. He began to build the palace which his successors inhabit, and to which Ferdinand VI, and Charles III, have each added a wing. In this new form, it has more the appearance of a very agreeable country-house than a royal mansion. The Tagus, which runs in a right line to the eastern front, glides by the parterre, and forms almost under the windows an artificial cascade.

A small arm of the river escapes at the cascade, and so closely washes the walls of the palace, that from the terrace the monarch may take the diversion of fishing. This arm afterwards rejoins the river, and thus forms a pleasant island, which is a vast garden of an irregular form, in which there is constant shade and fresh air at all times. Wandering amid the labyrinth of the winding walks, one enjoys the luxury and calm of nature, and may imagine one's self far from courts, in the midst of rural solitude. Lofty trees, high walls of verdure, and fountains simply adorned, these are the ornaments of the garden of the isle. Its magnificence increased would but diminish its charms. Charles V, and Philip II, would find some difficulty in recognizing Aranjuez, which by the attention and improvements of the two last kings has been rendered one of the most pleasing palaces in Europe. The principal alleys, that especially of the Calle de la Reyna, which is the favourite walk of the court, were planted long before their time. The height of the trees, their enormous trunks and thick foliage, attest their antiquity and the fertility of the soil in which they have flourished for many centuries. But these are not the only ornaments of the valley of Aranjuez. Under Ferdinand VI, this palace consisted of little else than the castle. A few poor houses scattered over uneven and rugged ground at some distance from the royal habitation, served to lodge ambassadors and the nobles and gentry who followed the court. These huts have been replaced by regular and elegantly simple buildings. The principal streets are shaded by two rows of trees, watered by a running stream, they are all built in a straight line and very wide, perhaps too wide for the height of the houses and the heat of the climate. The plan, after which the new village of Aranjuez is built, was given by the marquis of Grimaldi, who, before he became ambassador to France and first minister to his catholic majesty, had resided at the Hague as his representative, whence he gathered the idea of establishing a Dutch town in the centre of Castile.

The village is separated from the castle by a large but irregular square, adorned by a fountain. Charles III, constructed a portico, which almost entirely proceeds from

the end of one of the principal streets, and forming a part of the inclosure of the square,

joins the buildings belonging to the palace.

It would require too much time to conduct the reader through all the fine plantations of Aranjuez; I shall speak only of the principal. Arriving from Madrid we cross a circular space called Las doce calles, from twelve alleys which there terminate. One of the alleys leads to the entrance of Las Huertas, a large orchard, in which we cannot but admire the astonishing fertility of the soil of Aranjuez. If the traveller wishes to see more rich cultivation, and on a larger scale, he must take the road to Toledo and cross the Campo Flamenco, which undoubtedly takes its name from the resemblance it bears to the delightful fields of Flanders. The Cortijo is also worthy of his particular attention. This is a large expanse closed by a latticed barrier, within which the soil, cultivated with particular care, usuriously repays the labours of the husbandman, and the attention of the king, who has caused it to be planted with vine-suckers from differ-

ent parts of his kingdom.

Lastly, the Huerta de Valentia presents the traveller with various new and successful modes of cultivation, and gives him a pleasing idea of that kingdom. Besides fields of flax, vineyards, and artificial meadows, there are mulberry plantations, and a building consecrated to the produce of silk-worms. But the Calle de la Reyna, which forms the angle of the plantations of Aranjuez, is that which is most known and remarkable in them. Its direction, for about half a league, is from east to west, and its termination at the foot of a stone bridge thrown over the Tagus. It is renewed on the other side, continues to much the same distance, and again terminates with a bridge over the same river, the windings of which can only be seized by the imagination, as it strays through a valley shaded with groves of high trees and trellises, which at intervals conceal its course. Behind one of these thick curtains a cascade is heard at a great distance, the noise of which alone disturbs the tranquility of this solitude. The intention of it is to carry off a part of the waters of the Tagus. The branch of this river thus turned from its bed, runs in a made channel through a deep ditch, and proceeds to water part of the plantations of Aranjuez, and supply the necessities of its inhabitants. But shades and verdure of a sudden cease, nothing now is seen before you but hills piled on each other, which close the valley, and whose aspect it has been the work of art to conceal, in order to prevent the deadening effect it would otherwise have on the landscape. At the foot of these hills are stables of breeding mares, belonging to the king of Spain, and in which the breed of Spanish horses is still preserved in all its ancient beauty. The building has for inscription,* Vento gravidas ex prole putaris. The swiftness of the horses bred here justifies the inscription.

The king attaches great importance to the prosperity of the breed of Aranjuez; notwithstanding that the embarrassments consequent on war suspended the attention requisite to such an establishment. But in 1796 a council was formed exclusively charged with this task, under the title of Supreme Junta of Equitation. The breeding stud of Aranjuez consists at present of four hundred mares, and twenty stallions. In addition to this, the prince of the peace, who is particularly attached to whatever relates to the cavalry, maintains himself eighteen stallions, and one hundred and fifty mares. Aranjuez possesses likewise a breed of mules; for these beasts, of mean appearance it is true, but extremely serviceable and beautiful of their kind, are not to be scouted entirely. There are therefore eighteen stallion asses, and three hundred mares kept on the same establish-

ment, as their more clegantly formed rivals.

^{*} By their progeny you might deem them impregnate by the winds.

establish-

Leaving this establishment on the left, you re-enter the grand rows of trees which end at La Calle de la Reyna (Queen's-street.)

The high trees, of which I have spoken, are not the only ornaments of this alley. On the right it is edged with copses, which render its regularity more agreeable. Here skipped along or grazed the numerous herds of deer in the reign of Charles III, which have been destroyed by his successor.

But the garden of the Primavera, or the spring, is the greatest ornament of the Calle de la Reyna. Under the reign of Charles III, it extended no more than a thousand paces along the Calle de la Reyna. Charles IV, continued it as far as to the Tagus.

Nothing can be imagined more delightful than this garden during the season of which it bears the name. Here the fertility of the soil of the valley appears in all its richness. Useful culture is not forgot. Flowers, vegetables, fruit of every kind flourish in perfection. Groves yield hospitable shelter against the noontide heat. Copses of odoriferous shrubs perfume the morning air, and the balmy vapours they exhale decline again at sun-set to charm at the evening walk. Seventeen years ago, all the ground between the inclosure of the garden and the banks of the Tagus was uncultivated, and overgrown with noxious weeds. His present majesty, then prince of Asturias, by his taste and attention, converted this into one of the most pleasing parts of the valley. He ordered some useless trees, which shaded this fertile spot, to be cut down; grass plats, shrubberies, and parterres have succeeded them, and paths wind across this new treasure of vegetation. In the interval between spring to spring a vast garden was produced, infinitely varied in its form as well as productions.

A little dock yard is contrived within its inclosure, and communicates by an easy descent with the Tagus. In this yard are carried on the works of a navy in miniature, which has its builders, sailors and vessels. Farther on is a kind of port, defended by a proportionate battery. There are likewise little vessels elegantly decorated, the guns of which reply to the artillery of the port. The noise of their cannon, the huzzas of the sailors, and the display of the flags and streamers, induce the spectators to imagine themselves present at the games of Neptune and Mars. Happy were men, if every where content with such mimickry; if a thirst after fame and riches no longer converted into means of destruction the properties of elements which nature intended perhaps but for their pleasures!

Every country amusement may be enjoyed at Aranjuez; hunting, fishing, walking. Walks are no where more varied, more commodious, more agreeable; whether with a book you wander through the shrubberies, or thread the long alleys on horseback or in a carriage.

Formerly the deer there forgot their timidity, and in company with wild boars, were met with in the streets. They might have been taken for domestic animals.

The buffalos brought thither from Naples are substituted for oxen, as working cattle. I even saw camels patiently apply their robust strength to hard labour, but they were unable long to resist the influence of a foreign climate. At the same time, two zebras grazed in a meadow near the high road, as also two guanacos, which seemed as perfectly at their ease as in their own country; whilst an elephant calmly moved his unwieldy frame along, without being in the least discomposed by the crowds of people, whom curiosity brought about him. It is in this manner that sovereigns should openly expose the foreign animals which they crowd together in their menageries. These magnificent prisons accuse man of tyranny without proving his power. The kings of Spain are at least devoid of this reproachful magnificence. In the gardens of Buen Retiro they have lions shut up in small buildings, whence sometimes their threatening roar is

heard. They have a beautiful preserve of pheasants in the interior of the gardens of Saint Ildefonso. But no where have they, properly speaking, a menagerie.

Those which more especially contribute to the embellishment of Aranjuez are horses. There they have room to display all the beauty of their motions and their speed. Thither the king occasionally brings the magnificent sets with which his study supply him.

Formerly the Calle de la Reyna was the course where horses from Barbary displayed their swiftness, and each had his partisans among the courtiers, who betted on his head.

The reigning monarch, then prince of Asturias, substituted instead of these, games, called Parejas. A squadron was formed of four abreast and twelve deep. The files were commanded by himself, one of his two brothers, and one of the principal persons of the court, each with a distinguishing colour. The forty-eight cavaliers were all clothed and accounted in the ancient Spanish manner, a uniform advantageously calculated to give to the whole a military and antique appearance, and to carry back the actors to the age of their ancestors. They were looked upon with all that interest which the image of things past generally excites, as they advanced in column on one of the large courts of the eastle to the sound of trumpets and kettle-drums, preceded by running footmen, and led-horses richly caparisoned, all at once dividing, galloping away from each other, then again approaching, now at full speed round the arena, and now crossing it diagonally, thus displaying all the grace of their beautiful racers. This cold, this feeble representation of the ancient tournaments, reminded the spectators of those regretted festivals at which, under the eyes of the sovereigns, and beauties of the age, the knights obeyed the double impulse of love and fame, and obtained in the suffrages of those who reigned over their hearts an inestimable recompence for their courage and address. And in order even to make the most devoted courtisans take any pleasure in this modern dance of centaurs, it was necessary that the sons of their king, for whose amusement it was established, should be co-actors in the arena.

The king for some years back has laid aside this amusement, and adopted others more conformable to his taste. One that appears to be most pleasing to him, is to attend the trying of artillery in the Huerta de Valentia, the noise of which disturbs the calm of this charming residence, more frequently than is agreeable to the ladies, or those of effemi-

nate manners.

But he particularly delights in embellishing his garden, a part of which is now surrounded by the banks of the Tagus. A sort of pond has been made here, in the midst of which is creeted a kiosk, a small Greek temple, and on a heap of rough stones, or rather a rock, is an Apollo in marble. In the neighbourhood there is a barge in the Chinese taste, fitted up for navigating this artificial lake; whimsical union of irrelevant objects, the trivialty of which is striking, notwithstanding expensive decorations! But nature here has done so much; flowers, exotic plants are found in such plenty; foreign trees, the most singular and beautiful, and particularly long rows of weeping willows and catalpas succeed here so well, and yield so cool a shade; so many means of watering, such a variety of prospects in despite of the evenness of the ground exist here, that the garden of Aranjuez forms, without doubt, one of the most agreeable promenades in Europe. The tribute which thus I pay is due to this spot in return for the delightful hours that I have passed under its leafy shades, as wandering through its mazes of flowers and verdure, I diverted my mind from the cares of a troublesome negotiation with the enjoyment of the vegetable riches of the new and the old world.

The new palace and other edifices are of a pleasing form, void of magnificence. The royal apartments in the reign of Charles III, contained few paintings of value. They have however lately been much enriched by the spoils of St. Ildefonso, and contain now

rdens of e horses. Thither

more than four hundred paintings, among which some by Guido, Guercino, Lanfranc, Poussin, &c. The new chapel of the castle is of a good style. Sculpture and gilding are therein distributed with taste, without profusion, and a few pieces by Mengs contribute not a little to its decoration.

Aranjuez contains three churches. The most recent is that of the convent of Franciscans, called St. Paschal, and was founded by the confessor of Charles III, in the most elevated spot of the whole residence. I remarked, in the vestibule of this convent, pious stanzas of a singular kind.

Opposite to this church is a royal hospital, extremely well placed and worthy of notice for the assistance of every description afforded through its means to the sick.

Sickness is very prevalent in this abode of Aranjuez, in other respects so engaging. As long as the temperature of the air is moderate, every thing about the palace charms the senses, and the happiness of existence is perfectly enjoyed; but soon as the violent heats of summer begin, when the scorehing air, shut in by the valley, is loaded with exhalations from a slow and muddy river, and with nitrous vapours drawn by the sun from the hills between which the Tagus runs, this valley of Tempe becomes a pernicious abode, "capable d'enrichir en un jour l'Acheron."* The inhabitants withdraw from it, and seek, upon the neighbouring heights, particularly at Ocanna, a more wholesome atmosphere. Aranjuez, which, during the month of May and half of June, contains about ten thousand inhabitants, and is the resort of those who wish either for health or pleasure, becomes a desert exclusively inhabited by wild boars and deer. Few persons remain there, except those who are attached to it either by profession or poverty.

Formerly the king did not use to repair hither until after Easter, and remained until the end of June. The new court, which prefers Aranjuez to all its residences, now goes there as early as the beginning of January.

Aranjuez is on the road from Madrid to Cadiz. I shall now trace it in company with my reader.

CHAPTER IV.

ROAD FROM ARANJUEZ TO CADIZ. LA MANCHA. COLONIES OF MORENA. BAYLEN. ANDUXAR. CORDOVA. THE KINGDOM OF GRANADA.

IT is only since 1785 that it has been possible to travel post from Madrid to Cadiz. Until then this mode of travelling was utterly unknown in Spain, excepting on the road from the capital to the residence of the court at the time.†

Two leagues from Aranjuez you meet first with the little town of Ocana, remarkable for its school of cavalry, which, under the anspices of general Ricardos, has been for these several years in a state of prosperity.

On leaving Ocana the eye takes in a vast plain perfectly flat, the first specimen of La Mancha. Next succeeds Guardia, which, if the church be excepted, appears a heap of ruins; afterwards Tembleque, a town of one thousand five hundred houses, not destitute of industry. Some little saltpetre is extracted from the ground about it, no embellishment to its neighbourhood. Tembleque has a tolerably pleasant promenade, an invaluable property in the arid plains of La Mancha.

· Capable of enriching in one day the ferryman of hell.

[†] Within these few years a traveller may go post in several different directions, particularly from Madrid to Cadiz, in small chaises, which are furnished by the post-masters, although the custom of travelling in coches de colleras, drawn by six mules, be still prevalent, as well as in calashes drawn by two. There is a cheaper mode of travelling on the back of a mule preceded by the garde on foot, or with messengers called ordinarios, who go at stated periods from one great town to another, but in Spain, properly speaking, there is no stage, that between Bayonne and Madrid being discontinued.

The following post-house is one standing by itself, called Canada de la Higuera, the most miscrable iun on the road.

Two leagues farther is Madridejos, a pretty village, on leaving which one is agreeably surprised to find, in the midst of plains totally deprived of verdure, a row of white elms, some garden grounds, and a few tufts of trees, rari nantes in gurgite vasto.

At the end of three leagues of perfectly level and unvaried country, you arrive at Puerto Lapiche, a small village at the foot of two hills, near which Don Quixote, at the

beginning of his career, equipped himself as a knight.

At Villalta coarse cotton cloths are fabricated. Before you arrive there, you cross a long and narrow stone bridge, on each side of which is a large pool of standing water covered with marshy plants. This species of morass is the river Guadiana, which, at some distance thence, hides under ground its lazy waves entirely, and re-appears afterwards at a place called Los ojos de Guadiana, traverses Estramadura and a part of Portugal, and then falls into the sea, dividing the latter kingdom from Spain.

Five great leagues separate Villalta from Mancanares, one of the largest towns of La Mancha, and one of the principal quarters of the carabineers; and where to counterbalance the abundance which they spread throughout the district, they are rather too

prone to violate the laws of hospitality, setting good manners at defiance.

The wine of the neighbourhood of Mancanares is little inferior to that of Val de penas, another town four leagues distant. The whole of this district is the true country for good La Mancha wine. It is of two sorts. The first of a deep ruby tint, possesses more body and strength than any of our wines, if those of the banks of the Rhone and Roussillon be excepted; but there is little free from a taste of pitch, which it contracts from the vessels in which it is customarily kept. The white wine is less common than red. Its tint approaches that of Champagne, but it is somewhat rough. It is exported to England and America. The red wine is mostly consumed at home.

Santa Cruz, two leagues beyond Mancanares, is the chief of the estates of that grandee of Spain, who is grand master of the king's household, and governor of the prince of Asturias. After this, you arrive at the small village of Almoradid, where the immense

plains of La Mancha terminate southward.

Perhaps all Europe does not contain a district more level than that which one has to pass over for two-and-twenty wearisome leagues from Tembleque to Almoradid. Nothing can be more monotonous than the prospect of this immense horizon. During two or three hours travelling not one single habitation exists on which to rest the eye; it wanders over vast fields not in the highest state of cultivation, although nothing but the excessive drought prevents a display of the excellence of the soil. Some straggling plantations of olive trees, planted at great distances apart, interrupt at times the uni-

formity that reigns through the country.

This province however is not throughout its whole extent so even as that from Madrid to Cadiz. To the west of Tembleque and Madridejos, are large valleys, less bare than its plains. Charles III, was accustomed to go every other year to the neighbourhood of Yvenes, a village situated twelve leagues from Aranjuez. It commands a large and beautiful valley in which are olive plants in profusion, and on the opposite side rises, above a chain of hills, the old castle of Consuegra. The town of that name, of fifteen hundred houses, is at the foot of the castle. It belongs to the grand priory of Malta, which was held by the infar Don Gabriel. This prince, who will long be regretted in Spain, who loved the arts and his country, delighted in embellishing the environs of Consuegra.

from Ma-, less bare eighbourids a large side rises, of fifteen of Malta, gretted in tyirons of La Mancha, so well known by its wines, so much better by the exploits of Don Quixote, whose historian was as correct as a geographer, as faithful as a delineator of the manners of this part of Spain; La Mancha contains many places more remarkable than those celebrated by Cervantes. Ciudad Real is its capital. It was formerly the principal residence of the old Santa Hermandad, previous to the king St. Ferdinand; its object was to purge the country of the thieves with which it was intested. It has at present a poor-house, which it owes to the humanity of the archbishop of Toledo, who felt for the indigent part of his flock dispersed throughout La Mancha. It is a superb edifice, which in 1790 had already cost more than 2,000,000 of rials. Almagro, another town of three thousand inhabitants, is in the middle of a very extensive plain, four leagues from Santa Cruz. You arrive at the former from the latter place, passing over a country entirely uninhabited through immense pastures.

But let us resume the road to Cadiz. On leaving Almoradid you approach the Sierra Morena. Four-and-twenty years ago, in order to avoid this district, the dread of travellers, you were accustomed to turn more to the west, in order to reach the chain of mountains known by the name of the Sierra Morena, or the black forest. After passing the borough of Viso, one was used to cross it at the peril of one's life in one of its steepest parts, called El puerto del Rey. Le Maur, a Frenchman, attached for a long time to the corps of Engineers in Spain, was selected in 1779 by count Florida Blanca to make this road, the most frequented in Spain, at least passable. He has substituted for the old road one of the finest in Europe, notwithstanding the difficulties opposed by the nature of the ground it had to traverse. He constructed bridges, slopes supported by masonry, and walls high enough to afford support, slight ramparts, sheltered by which you drive fearless and without danger over the brink of precipices. In this manner you arrive at Despenaperros, a spot at which the rocks approaching each other seem disposed to form a vault over the head of the traveller. At the bottom of the valley, a rivulet rushes along with great noise, the waters of which are intended to supply a canal projected by this skilful engineer. A little farther is the post-house of Las Correderas, surrounded by a group of huts in the midst of the mountains.

Hence with little trouble you ascend as far as to La Carolina, a town entirely modern, the chief place of the colony of La Sierra Morena. The flourishing state to which it was carried by Don Pablo Olavides did not long continue after his disgrace. Slight as the funds were, which were set apart for its maintenance, they were not exactly paid. The zeal of the parties diminished, and the works were interrupted. The managers as well were too hasty in imposing taxes on the colonists, with intention of proving to the court, that there was a prospect of the establishment reimbursing in a few years the expences of its formation. So many motives of discouragement caused agriculture to languish and many families left the colony. Nevertheless in 1785 this little capital and its dependent hamlets contained five thousand and forty-four persons. The German families, which at first were numerous, have partly disappeared, and those who remain have become blended with the natives. For more than ten years there have been no priests who speak their language. But lately this interesting colony, an affecting specimen of the wonders of which a government is capable that is sincerely desirous of doing good, continues to justify its cares and hopes. In order to appreciate duly the value of this creation, the spot should have been previously seen, when destitute of inhabitants and waste. But there, as is every where the case, intrigue and envy have rendered in measure abortive the fruits of genius and beneficence.

Guarroman, the first stage from La Carolina, is a town built at the same epoch, whose inhabitants continue to prosper. You leave the Sierra Morena at Baylen, an ancient town, whose district can boast one of the finest breed of horses in all Andalusia.

At about a league from Baylen I remarked to the left a large venta M. Olavide had ordered to be begun, but since his disgrace it has been neglected, as if it had been struck

by the same anathema as its founder.

You afterwards pass the Rumblar, over a stone bridge; a league farther on it falls into the Guadalquivir. From La Casa del Rey, a solitary inn in the middle of the woods, you first perceive the Guadalquivir, and reach it at a little distance from Anduxar. Jaen, the bishop of which has been the grand inquisitor for many years, and which is the capital of one of the four kingdoms of Andalusia, is six leagues from Anduxar. Many Roman inscriptions are seen here, which attest its antiquity. When rain is not wanting, the

country between these two towns is exceedingly fertile.

Anduxar is one of the richest and most ancient towns in Spain, but its unhealthy position exposes its inhabitants to maladies, for which in the spontaneous and numerously variegated productions of the vegetable kingdom prostrate before them, they might readily find a remedy. Not less rich below its surface than above; the entrails of Anduxar are replete with veins of metal, minerals, valuable marble, rock crystal, &c. The environs of the town are agreeable, and fortel the neighbourhood of a river. The Guadalquivir flows at some distance from its walls. From this part, for a long time, has existed a project for rendering it navigable; but previously it will be requisite to destroy three mills, which bar its course from side to side.

A stage of three long leagues and a half brings you to Aldea del Rio, a large village

upon an eminence, on the bank of the Guadalquivir.

Four leagues farther you arrive at El Carpio, a town of one thousand five hundred inhabitants, on the left bank of Guadalquivir; before you arrive there, you discern from the road the pretty town of Bujalanca, situated in the midst of a vast plain, productive of

wine, grain, and oil.

From this place to Cordova is five long leagues, one half of which is across a country entirely naked of trees, but not barren. At about half way you cross the Guadalquivir at Las Ventas de Alcolea, over a bridge, which is one of the finest structures on the new road. Thence to Cordova the Guadalquivir flows on the left, and on the right the back of the Sierra Morena is distinguished. This long chain of woody mountains, of which you do not lose sight from your first entrance into Andalusia, compensates for the perfect nudity of the country you pass through. One is notwithstanding in the centre of that Bætica so much celebrated by the ancients, and of which the magic pen of Fenelon has made a country of enchantment, the abode of happiness and plenty. Such in fact might modern Bætica become; at present maugre the finest climate in the world, and its most valuable and numerous productions, it but excites regret.

As you approach Cordova from Madrid, it possesses nothing striking; but as you proceed to it from Cadiz, it forms a semicircular amphitheatre on a gentle slope along

the Guadalquivir.

The native place of the two Senecas, and Lucan, of Averrhoes, and several learned Arabs, and of that great Captain Gonzalve de Cordova, it now contains nothing remarkable except its cathedral, one of the most curious monuments in Europe. Formerly it was a mosque begun by the Moorish king Abdarame, who, dsirous of making it the principal temple of the Mahometans, next to that of Mecca, adorned it with most rare magnificence. Lengthways it has twenty-nine naves, and in breadth nineteen, upheld by more than a thousand columns, if you include the hundred, which from the interior support the cupola. The eye is more surprised than delighted at the sight of a forest of columns, which perhaps cannot be equalled throughout the world. They are all either of marble of different colours, or of jasper, but somewhat tarnished by time. The whole building, which on the outside p esents to the eye nothing but an unshapen massive

world, and

but as you slope along

veral learned ing remark-Formerly it aking it the th most rare een, upheld the interior of a forest They are all time. The pen massive

edifice, is six hundred and twenty feet in length, by four hundred and forty in breadth. Lengthways in one part, it fronts a large court, below which is an ample vaulted eistern. This court has a dismal appearance, it is planted and particularly with orange trees, whose ancient and tufted foliage serves as an asylum to a number of birds, and shades several fountains, which diffuse a perpetual cool.

After the conquest of Cordova in 1236, St. Ferdinand transformed this mosque into a cathedral, which preserved its ancient form up to the time of Charles V. In his time, and since, it has experienced many changes, and some enlargement. On two sides of one of its sixteen gates, are placed two military columns, which were dug up in the ca-

thedral itself in 1532.

Besides this edifice and a collegiate church, Cordova has 15 churches, 40 convents, and a number of religious establishments. Need we go farther to look for the origin of its destitute state, and its want of population? In so fine a climate, in midst of so many sources of prosperity, it contains no more than 35,000 inhabitants. Formerly celebrated for its manufactories of silks, fine cloths, &c. it has now no other industrious occupations, but a few manufactories of ribbons, galoons, hats, and baize. Its vicinity is the most productive in grain and olive trees of all the district, but one of the most naked in Spain. The traveller, however, ought not to leave Cordova without visiting its breed of horses, the finest and best attended to of any in Andalusia. The stables pertaining to the establishment, which belong to the king, contained, in 1792, 612 horses of all ages, among which 21 stallions.

The kingdom of Cordova adjoins that of Grenada. In going from one capital to the other you cross a great portion of the grounds belonging to Cordova. The most remarkable places on the way are Fernan-nunez, from which one of the late ambassadors to France took his name, and in which he founded some useful establishments; Montilla, whose territory produces an excellent but very dry vin de liqueur, little known out of Spain, but highly esteemed by connoisseurs; Baena, a town of a thousand houses; Alcala la Real, situated on a hill, and containing eight or nine thousand inhabitants; and

lastly Pinos de la Puente at the entrance of the superb plain of Grenada.

I did not see it, and shall ever regret that I did not see this country, so well worthy the curiosity of travellers, in which nature is at once grand and pleasing; in which the most picturesque scenery is found; high mountains whose summits are eternally covered with snow, rich valleys whose freshness is proof against the most scorching heat, torrents of limpid water, which plunge with dashing noise from the heights of precipices, and flow along the meadows which they fertilize, but seldom sweep with floods; this happy country, which, under the combined influence of a burning sun and natural irrigation, produces the most delicious fruits of every climate; plants which seem to belong to the most opposite zones, the hemp of the North even growing beneath the shade of the olive and the mulberry. I did not see that ancient city, which preserves entire the monuments of the magnificence of the Arabs; where every thing recals to memory that active and industrious people, whose expulsion is one of the principal causes of the decline of the arts in Spain. But this picture, which I have only sketched, has been painted in an exact and engaging manner by one of my friends, now no more (Peyron) whose description of the kingdom of Grenada is one of the most interesting parts of his Essays on Spain. But, if the reader be desirous of appreciating as an architect the famous cathedral of Cordova (perhaps too much magnified) and take a view of that magnificent palace of the Moorish kings of Grenada, known by the name of the Athambra, he may refer to the plans of those two monuments engraved by direction of the court of Spain in 1780, a copy of which is in the national library of France.

Shall we confine ourselves to this first specimen of the curiosities of Spain? This kingdom produces them of every description: traces of the sojourn of the Carthaginians still perceptible, master-pieces of Gothic architecture, Roman antiquities, monuments of Moorish magnificence, searcely injured by time, picturesque spots, in the bosom of rocks fantastically grouped. On the summit of hoary mountains, in the maze of vallies, on the banks of the torrents of the kingdom of Grenada, on the coasts of the ocean, and the Mediterranean; in the gardens and neighbourhood of St. Ildefonso, within the residence, about the gloomy palace of the Escurial, in the cheerful basin of Aranjuez, nay in a thousand places of Spain, the pencil of the artist is invited. We have picturesque travels in Greece, Italy, and Sicily. These give room for a desire on the part of the lovers of the arts, and the admirers of antiquity, for still another of this description. Charles IV, might render his reign illustrious in satisfying this common wish of all enlightened Europe. At this price he would have nothing to envy in the monarch who has left him such a great example in reclaiming from the bowels of the earth, and restoring to the living, the ruins of Herculaneum.

Let us turn from this digression, brought on by the kingdom of Grenada, and re-

sume the road to Cadiz.

From Cordova to Ecija, are ten leagues of road, in great want of repairs which it has lately undergone. The country itself has been peopled within these five-and-twen-

ty years by new colonists, whose dwellings are dispersed along the road.

After changing horses at the new and solitary Vinta de Mango Negro, you arrive at Carlotta, a pretty village founded with the same view, and nearly at the same time, as that of Carolina. These are the principal places of the new colonies of Andalusia. The same intendant presides over both colonies. Carlotta, the capital of the second colony, had no more than sixty inhabitants in 1791; but in its neighbourhood were six hundred.

Luisiana, another colony beyond Ecija, had then no more than two hundred and forty. And lastly, a little further Fuenta Palmera, another village belonging to these new establishments, counted within its district three hundred and fifty houses pertaining to

colonists.

It is a spectacle which philosophy delights in contemplating, that of these colonies created by intelligence and humanity. One is yet surprised at their slow progression. Is it owing to any radical vice, to the want of that firm and resolute disposition, without which nothing is well done? Or is it to be imputed to an innate repugnance among Spaniards to expatriate themselves, or change their abode? Whence is it that so few colonists are drawn by the hope of ameliorating their face from the better peopled, but more wretched parts of Spain, nay even from foreign countries, where a territory so fertile invites them to ease, as that particularly of the neighbourhood of Ecija? It is said that the produce of the sand is forty for one, and that the garden grounds, which in great number border the banks of the Xenil, yield three and four crops in a year. Do the Sciotto the Kentucky, which must be sought beyond the main, present more powerful attractions? Yes, for there man enjoys both civil and religious liberty; these are yet wanting in Spain, which is all that it requires to become both prosperous and happy.

Ecija, a tolerably large town, and one of the most pleasant in Andalusia, is situated between Carlotta and Luisiana. Many of its houses, and some of its churches are painted on the outside, in a most ridiculous style. It has six thousand houses. Fragments of marble columns, trunks of statues, stones covered with inscriptions, attest its ancient splendour. Its situation between two hills on the western side of the Xenil, which

s situated re painted gments of ts ancient il, which

flows from Grenada through an ample plain, exposes it to intense heats, and frequent inundations. This town and its neighbourhood possess all the elements of prosperity. Plots of olive trees, luxurious fields, vineyards, and extensive pastures, produce its inhabitants riches in abundance: but they are destitute of those manufactories for which they were formerly celebrated. On entering the town you may behold, but cannot admire, the venerated image of St. Paul, the patron of the town, and at the opposite gate you see the statues of Charles III, the king, the queen, and the infant Don Louis.

From Ecija you may perceive Estepa at five leagues distant on a hill, from the top of which you have a commanding view, over a vast, and very fertile country, covered with

olive trees.

Three leagues from Ecija, you find Luisiana, a new colony, the houses of which some years ago began to go to decay. This afflicting spectacle presents itself again about a league farther, at a spot where these colonies of the Sierra Morena terminate. They begin on the other side of the mountains at La Conception de Almuradiel, and comprise in all a space of forty leagues.

The road to connect them, an object long desired, is at length nearly completed. In order to render it passable in all seasons, it has been found necessary to construct over rivers, rivulets, and marshy places, rendered impracticable in rainy weather, nearly four

hundred bridges, as well large as small.

On leaving Luisiana, on a very bleak hill, you discern some of the houses of the town of Carmona, which commands vast plains covered with olive trees, and extremely fertile, especially in wheat and that of the most superior quality. It is a cheerful animated town. Good taste, however, is offended at its principal belfry, a modern bauble badly modelled after the spire of Seville, and loaded with whimsical ornaments of different colours.

The gate of Carmona is a monument of the solidity of Roman works. It appears to be of the time of Trajan, and in some places has been ridiculously patched by modern

hands.

From Carmona to Seville, is six leagues, which you travel over between vineyards, olive grounds, and robust aloes, which serve at the same time for hedges and ornament to the fields. Will it be credited? This lovely country is almost wholly unin-

habited. The great road from Madrid to Cadiz does not pass as it used to do through Seville, but through the borough of Alcala, two leagues higher up on the banks of the Guadalquivir. Who would not diverge from the road to view this famous town, the second in the kingdom, that of which the Andalusians, who are the Spanish Gascons, have long been used to say,

> Quien no ha visto Sevilla No ha visto maravilla.*

The way about is not bad, but the Sevillians have come to a resolution to join their town to the high road by a superb causeway.

* He who has not seen Seville, has yet a wonder to behold.

CHAPTER V.

SEVILLE. XERES. ARCOS. APPROACHES TOWARDS CADIZ.

THE situation of Seville is admirable, its climate delicious, its environs tertile. But what little advantage has been reaped from so many blessings! Or rather how different is its present to the former state of this town! The historians of the day assure that when taken by St. Ferdinand 400 thousand Moors marched out of its gates, exclusive of those who perished during the siege, and such as chose to remain. If the complaint addressed by the manufacturers to government in 1700, be credited, Seville formerly employed 16,000 looms for silks, and in the different processes for making that article not less than 130,000 persons. At present they have 2318 looms; and no more than from 18 to 19 thousand inhabited houses.

Its cathedral, famous all over Spain, contains a number of statues, many of which possess merit, tombs, more or less decorated, and vast chapels, overloaded with ornaments. Among those of the baptismal fonts, two paintings richly deserve notice; they are by that charming painter born at Seville, and which contains his principal productions, productions which were long wanted for the collection of the kings of France, and which at length make a part of the national museum, they are by Murillo. Nine other paintings, by this artist, are seen in the capitulary hall, in which all other ornament might well be spared, and two in the vestry. In the chapel of kings, among other tombs that of St. Ferdinand is noticed, covered with inscriptions in Hebrew, Arabic, Latin, and Spanish; that of Alphonso X, surnamed the wise, or the astronomer, &c. But the tombs of none of the monarchs make so profound an impression, or so much awakens the mind to the memory of ancient days, as that of Christopher Colon, placed before the choir with the following inscription, remarkable for its brevity:

A Castilla y Arragon, Otro mundo dio Colon.

His son Don Ferdinand who, but for his fame being eclipsed by that of his father, might pass for a great man, has his tomb in one of the chapels; but his epitaph is not so

beautiful, it is longer, not equally simple.

The spire of this cathedral, known by the name of the Giralda, is one of the fine monuments of Spain. You ascend it by a spiral gallery without steps. It is 250 feet high, and has on its top a statue representing Faith; above one of the five naves of the church is the library, which contains 20,000 volumes. This is not a collection merely for ostentation at Seville. Next to the capital, this is the town which contains the greatest number of enlightened men. Its patriotic society may cite more than one member distinguished for learning and patriotism. A taste for the fine arts in particular is much cultivated at Seville; its inhabitants pride themselves on having several masters of the Spanish school, for countrymen, such as Roclas, Vargas, Zurburan, and especially the incomparable Murilla, whose talents cannot be properly valued except by those who have seen the numerous master-pieces which he has left behind him in Spain. The hospital of charity contains ten, which excite the highest admiration in connoisseurs. In one of the cloisters of the convent of St. Francis, are eleven; and lastly, at that of the capuchins, one is delighted with several paintings by this great master, particularly with a Christ, who detaches himself from the Cross, with the most moving expression of kindness, to embrace St. Francis.

Besides these master-pieces of painting, and others of the Spanish school, many remarkable buildings deserve notice at Seville.

At the head of these stands the exchange, or Loriga, a distinct building, each front of which is 200 feet long. It has lately been repaired and ornamented, and is to be the repository of all old papers relative to Spanish America; archives of valorous deeds, of misfortunes, and crimes, in which history and philosophy will long have treasures to find.

The Alcazar is a magnificent edifice, begun and for a long time inhabited by the Moorish kings, it was enlarged by the king Don Pedro, and afterwards by Charles V, who added some tasty embellishments. Many Spanish kings have resided in it, and Philip V, who passed some time there with all his court, felt inclined to fix there his abode; a project which, separate from political considerations, would probably before this have taken place, to the great satisfaction, if those of Madrid be excepted, of all the inhabitants of Spain.

In this Alcazar are collected several fragments of ancient statues, discovered at some distance from Seville. This precious harvest is principally due to the attention of Don Francisco Bruno, an enlightened antiquarian, and a zealous and indefatigable

citizen, who is an honour to his country.

Another building, which shows a deal of taste, is the tobacco and snuff manufactory, completed in 1757; a prodigious establishment, as well for the size of the edifice as the number of hands it employs. There the tobacco in leaves is received as it comes from the Havanna, where but a small quantity is manufactured; the details of the manufacture of this article are not uninteresting. In making of snuff, the leaves are first reduced to powder, a kind of ochre is then prepared (almazarron) with which it is mixt to give it its colour. The snuff thus mixed is inclosed in little tin boxes, registered, ticketed, put into bales, and sent over all parts of the peninsula. A separate apartment is destined to the forming the little rolls, called Cigars, the consumption of which is so considerable in Spain. It would be difficult to find, in so small a space, either greater activity or more variety of occupations.

The foundery of copper cannon, which, with that of Barcelona, supplies all the Spanish arsenals in Europe, is also a building remarkable for its extent and the excellent manner in which it is planned. The method of M. Maritz is still followed there, with some trifling variations. But there is great room for a saving in the expences of this establishment. Each quintal of refined copper, some years ago, cost the king about fifty rials (ten shillings and three-pence.) A little before then, a Frenchman proposed to the king a method which would have made a saving of twenty-two reals a quintal. The proposition was rejected. The Frenchman persisted, and the proofs at which the Spaniards vouchsafed to be present, that they might not too openly betray their ill will, shewed the excellence of the copper refined and cast according to his method: but intrigue, which was not idle on this occasion, found means to prevent the experiment from being any further prosecuted; and I understand that the expensive establishment, formed at Port Rial opposite to Cadiz, is limited to furnishing copper bolts for shipping.

The mint is one of the most ancient buildings in Seville. It formerly was greatly employed. Writers of the day affirm that the coinage in gold and silver together was to the amount of seven hundred marks daily. For a long time no other money was coined there, except for the use of individuals. It is only since 1718 that coin has

been struck for the king's account.

In the vith a kind-

To these are to be added the seminary of St. Telme, which is a school for pilotage, and the golden tower (Del Oro) an old building attributed to the Romans. Its object was, without doubt, to facilitate navigation. Here it was that a chain was extended by the Moors across the Guadalquivir to the suburb of Triana, on the opposite bank. This river has its source on one side of the chain of mountains called Sierra de Segura, and takes its course towards the ocean; while the Segura, which rises on the opposite side, runs towards the Mediterranean; down this stream is floated the ship-timber requisite for the supply of Murcia, Orihucla, and Carthagena, with different other descriptions of wood which abound in the mountains.

It was to the Guadalquivir that Seville owed its ancient grandeur. At the period of its greatest lustre the largest vessels came up to the quays of Seville, and those of inferior burthen proceeded as high up as Cordova. At present ships of great draught come up no higher than Bonauza, a village fifteen leagues from Seville, whence the cargoes are brought up in lighters; none above eighty tons burthen being able to ascend so high

as to the city.

Some principal buildings adorn that part of the banks of the Guadalquivir, which fronts the suburb of Triana. There it was that Lerena, while intendant of Andalusia, began a plantation which has since become a delightful promenade; and which, when its shades shall become somewhat thicker, will leave no room for the inhabitants to envy the capital in this respect. Already was the city indebted to M. Olavides for a part of its wharves and several useful establishments, when he was separated from them. The anathemas of the Inquisition have prevented his name from being publicly mentioned, but have not been able to prevent a general affection for his memory.

The interior of the city possesses a fine walk adorned with fountains, and formed by

five rows of trees, whose roots are watered by little canals.

The neighbourhood of Seville, in common with that of most of the towns of Andalusia, is well cultivated. As you leave the bare and unpeopled plains of Castile and

Murcia, you see with pleasure its orchards and its country houses.

But what above all render the neighbourhood of Seville deserving the attention of the traveller, are the ruins of Italica, an ancient Roman town, the birth-place of Silius Italicus. It was situated north of Seville, a league and a half distant, along the left bank of the Guadalquivir. The monuments of it which yet remain are preserved from the injuries of time and ignorance by the care of some monks, whose convent is in their vicinity. M. Broussonet, having lately travelled through Spain, has since published an interesting account of Italica and its ruins.

The modern road from Carmena to Cadiz presents nothing remarkable before you

reach Xercs, unless it be the town of Utrera, which has two thousand houses.

As you go to Xeres you have a very favourable view of the town. A little energy would make it one of the most interesting that Spain can boast. A more delightful site ould not have been chosen; and its streets are in general both wide and straight. From the summit of the Alcazar, which is greatly frequented, you have the most agreeable

prospects imaginable over the adjacent country.

The territory requires nothing more than a greater attention to its culture to make it one of the most fertile countries in Europe. Produce of every description succeeds there; vineyards, which form its principal reliance, olive-grounds, pastures, fir, oak, hemp, &c. Its vineyards, notwithstanding their imperfect state, yield, communibus annis, 360,000 arrobes of wine (10,000 pipes) of which about 200,000 are exported, principally by the English and French. The cultivation of wheat might be doubled. Neglected as it is at present, it subjects the country to frequent dearth.

Olive-grounds are in a state of still inferior improvement; seldom does the annual crop exceed 32,000 arrobes of oil (110,000 gallons.) Silk-worms would flourish here, and give work to thousands of women who are destitute of employment.

Its breed of horses has greatly declined, as well as every other of its former sources of wealth; its foals, which are yet the best in Andalusia, at three years old are destined for the cavalry; but some years ago they were no more than 600 mares in all its ex-

tensive territory.

Some coarse cloths, made from the 3000 arrobes of wool which it produces, some manufactories of linen, and about a score of looms for making ribbons; these are the whole of the occupations it possesses for the industry of its inhabitants; and even for these they are indebted to the cares of a patriotic school, and some beneficent individuals.

Half a league from Xeres is one of the most famous Chartreuses in Spain, for its wealth and its agreeable position, within sight of Cadiz. Such as admire the fine arts resort hither to view the best works of Turbaran, and some by the inexhaustible Lucc Giordano. The silent inhabitants of this delightful asylum almost extort forgiveness of their opulence, and pious idleness, by their tender solicitude for the two most interesting periods of life. They are beginning to educate thirty poor children belonging to the neighbouring town, and a dozen of old men incapable of labour pass with them tranquilly the ebb of life.

Two great leagues thence the town of Arcos is situated. To reach it you ford through the Guadalete, the river of oblivion of the ancients. Arcos is a town of two thousand five hundred houses, situated in the centre of the most fertile country, surrounded by orange-trees; it is built on an inaccessible rock, whence are perceived the mountains of Ronda, Medina, Sidonia, and Gibraltar. The Guadalete partly encompasses Arcos, and rolls its noisy course through the bottom of a deep and crooked valley,

where it seems to force for itself the channel poets feign.

From the Chartreuse of Xeres to the modern town called Ile de Leon you travel four leagues without seeing even a cottage, After fording the Guadalete, you enter the vast plain wherein the battle was fought which put an end to the empire of the Goths, and placed Spain for some centuries under dependance on the Arabs, and at the same reach the confines of the ancient Bætica. This combination of objects, which recal the ingenious invention of a fable, and great achievements of history, the bounty of nature, and the ingratitude of those who so ill repay her gifts, give stead to deep reflection. One is induced to compare the boundless field of imagination with the narrow limits that idleness prescribes to industry; seducing chimeras to lamentable reality; one admires the illustrious authors of these wonders, and pities the modern actors on so fine a stage who play so ill their rarts. But we approach now the theatre of commerce, Cadiz lays before us.

The first prospect of its bay is from the top of a hill midway between Xeres and Port St. Mary. Thence you view the whole of the bay, as if upon a map. You distinguish clearly the two points which form its mouth, the fort of St. Sebastian on the one side, and the town of Rota on the other, Cadiz laying in front. You see the narrow tongue of low land which divides that town from the II de Leon; the irregular figure

of the bay as it inclines to the Carrack, Port Real, and Port St. Mary.

Thus must chains of mountains, towns, and the sinuosities of rivers, have appeared to those hardy rivals of the inhabitants of the air; those ærial travellers, whose brilliant intrepidity has of late years excited our wonder.

VOL. V.

From Xeres you have the choice of two roads, that which goes round the bay by land, and that which proceeds straight to Cadiz crossing the bay. If you decide in favour of the first, after passing the Chartreuse, you travel through woods of pine, the proprietors of which, by their early felling, prevent them growing to that maturity which might fit them for the navy. Beyond these woods you discover the pretty towns of Port St. Mary and Port Real. You leave them on the right, as well as the Guadalete which a little lower divides into two branches. One empties itself in front of the bar of Port St. Mary; the other directs its course towards Puerto Real, and takes the name of St. Pedro. You afterwards perceive the superb modern road which leads to Cadiz; this little river is crossed over the bridge of Suazo, the opposite side of which is the Isle of Leon, thus called on account of the portion of land which composes it, being surrounded by a very ancient navigable canal, which is from 22 to 24 feet deep at high water. In another place I shall make further mention of this road and of the Isle of Leon.

If in going to Cadiz you determine on crossing the bay, you take freight in one of the large boats, whose owners pester you with their offers of service on your reaching Port St. Mary, and in less than an hour are transported to the quays at Cadiz.

Port St. Mary is situated night he mouth of the Guadalete, which by driving its sands into the bay, forms a bar not passed without some danger, particularly in winter. The boatmen, whose interest it is to keep the passengers alive to fear, never fail exaggerating the danger; and in the moment when it is most eminent, recite a prayer, which they afterwards beg payment for; but the most timid passengers, nay even the greatest devotees, have more confidence in the skill of their conductors than in the efficiency of their prayers.

CHAPTER VI.

DESCRIPTION OF CADIZ, ITS NEW ESTABLISHMENTS, ITS PORT. OF THE CARRACK. OF THE ISLE OF LEON, THE MAGAZINES, THE DOCK-YARDS.

WHEN I arrived at Cadiz, in 1785, O'Reilly was governor, or rather reigned there; and it must be allowed that under his reign this town experienced changes for the better of every description. Cadiz owes to him its embellishment, augmentation and cleanliness; I cannot add its security. At that time murders were very frequent in the city, and since then are not less common.

Under this active management the old houses were pulled down, to give place to new ones regularly built; the streets were paved, made straighter, and constantly kept clean, and the waste ground was covered with new houses. He may be reproached even with excess of œconomy with respect to this ground. In several triangular spaces houses were built which, without convenience for those who inhabited them, seemed to have no object but that of incommoding their neighbours. He even endeavoured to extend the confines of the city by gaining space from the sea. The ground upon which the custom-house stands, and that adjacent, was formerly covered by the watery element, but this was anterior to his administration. He meditated another project of the same kind.

He wished to take possession of the ground of the Alameda, a walk by the sea side near the bay, the trees of which bear the visible marks of its neighbourhood. His intention was to build there, and to lengthen the space, by raising to a level with it that part of the shore which runs towards the inner part of the city; and on the outer bank of the new enclosure he intended to plant a new alley of trees. But to effect this kind of miracle, funds were necessary, and stones and rubbish sufficient to fill up the extensive space he projected to gain from the sea.

He bestowed much attention on the embellishment of the neighbourhood of the gate on the land side, which was formerly covered with briars, and served as an asylum for robbers. Under the administration of one of his predecessors, gardens were laid out, and several houses built there. At the time of the dispute relative to the Falkland Islands, the pusillanimous governor fancied the place in danger, and the enemy close to the gates, entrenched behind these weak experiments of industry, and in consequence destroyed the houses.

Under the administration of the count de Xerena, predecessor to count O'Reilly, it was intended to rebuild them; but they did not acquire an agreeable form till the latter became governor. He extended the cultivation of the isthmus from the side of the great road which leads from Cadiz to the island of Leon, and created a garden (notwithstanding the sand) as agreeable in appearance as a soil of such nature would allow, which he inclosed with an open railing. His example was imitated by the neighbours; so that for a quarter of a league from the land gate the road is bordered with similar fences, which, by their uniformity, seem to belong to the same proprietor. The neighbourhood of the sea, the heat of the climate, and the nature of the soil, the sand of which it is not possible to cover with good earth above a certain height, are visible in the produce of this cultivation; but it is not the less delightful to see verdure, and gather flowers and fruits in a soil which so many circumstances seem to condemn to sterility. While walking in the garden of the assessor Mora, and that of the governor, which joins it, and viewing all the rich productions of Andalusia, the vines, mulberry and olive trees that flourish there, we forget the nature of the ground on which we tread, and the element by which it is almost surrounded. In time, these environs of the land gate were to form a kind of suburb; and a church was already built, a quarter of a league from the city, for those who resided in that neighbourhood.

But these wonders very shortly survived the administration of their author. The sand has resumed its empire over the disputed space, and the traces of the garden of O'Reilly,

and that of the assessor Mora, are now searcely discernible.

But nothing does more honour to the zeal, understanding, and humanity of count O'Reilly than the Hospitium, which owes to him, if not its first establishment, at least the admirable form given it in the course of the year 1785. Within the same edifice succour was afforded to every class of subjects who had claim either to the care or inspection of government; to the aged of both sexes, to incurables, vagabonds, prostitutes, the insane, and children of both sexes whom their parents were incapable of maintaining. Each class was placed in spacious and well aired apartments. Every person was furnished with food and employment according to his age and situation. Poor families found an asylum there, nor did the number of them alarm the beneficence of government. However, to prevent abuses, the commissary of each quarter was obliged to present weekly to the governor, an account of all the persons of both sexes entitled to charitable assistance. The governor examined the statement, and wrote his directions in the margin. In the seventeen divisions of which Cadiz was composed, there were fourteen in which not one person found a difficulty in gaining a livelihood, or was deprived of the succour necessary to render life supportable; and before the disgrace of O'Reilly, these benefits were extended to the whole city.

The good order constantly maintained in this institution was the fruit of his continual inspection. He was well seconded by several citizens of distinction, who, some from sentiments of humanity, and others to make their court to him, divided among themselves the direction of the different apartments of the hospital. Their presence seemed to inspire respect and confidence. They restored serenity, and brought back hope and

joy. Prostitutes and the insane were the only persons deprived of liberty; individuals of every other class went out in companies at certain hours. None but the aged and infirm were exempt from labour. Such as were capable of working were mostly employed in carding, spinning, and weaving the cotton imported from the colonies of America. In 1785, there were more looms, &c. than hands to employ them. The excess of stuffs manufactured above what were sufficient for the consumption of its inhabitants, was sold to increase the funds of the establishment. To those which existed before M. O'Reilly became governer, he added the produce of certain pieces of ground belonging to the city. In addition to these the charity of the citizens was evidenced by considerable contributions. Since the retirement of O'Reilly, this admirable establishment has somewhat degenerated, and in succeeding years beggars again made their ap-

pearance.

It would have been difficult to find successors equally active with him, or who should have taken so much delight in the prosperity of his institution. O'Reilly had a peculiar talent of making every circumstance and every passion subservient to his purpose. His despotic character was dreaded. The mere expression of a wish was to those around him equivalent to a command; while by his insinuating manners he engaged the inhabitants of Cadiz, who were of all people those the least devoted to him, to contribute their time, their carriages, and their horses, to objects which were nominally for the public good, but which were frequently no other than the offspring of caprice. Cadiz owes also to him the repair of the road which leads to Leon. A Frenchman was charged with the work (Du Bournial) an engineer for bridges and highways, whom he had sent for from France to employ in his military school of Port St. Mary. This road, which is on leaving Cadiz a quarter of a league in breadth, narrows so considerably at the distance of a league from the town, that the sea at high water bathes both sides of the causeway on which you travel, which has the appearance of a mole protruded by the bold hand of man on the abyss of the ocean. Du Bournial raised this road, rendered it more solid, and shorter, and acquired a title to the gratitude of the inhabitants of Cadiz.

O'Reilly was desirous of employing him upon a work of more considerable magnitude, or at least of greater parade. It is well known that Cadiz is destitute of good water. As a bad substitute they use an unwholesome brackish water, which they draw from wells that are supplied by the rain, which is conducted into them from the internal court of each house. The remainder of the water which they consume is collected in azoteas. These are flat roofs, in the form of a terrace, with which almost every house in Cadiz is furnished, I may say adorned, and serving as well for a promenade and observatory for the inhabitants; ever anxious and upon the look out for those objects the

darling of their hopes.

From these azoteas the rain-water runs through pipes into the arrive or cistern, which occupies the interior part of the house, not covered over, and thence into a well in the corner of the court. For the sameness of the necessities of the inhabitants (the result of their position) has occasioned in this city a perfect uniformity in the figure and distribu-

tion of aimost all the buildings.

These then are the only resources of the inhabitants for obtaining the water necessary for their domestic wants. As for that which they drink, they are obliged to fetch it from the springs of Port St. Mary, which however in dry weather are not competent to the demand upon them, notwithstanding 96,000 piastres (16,000l.) be annually paid for the precarious contribution they afford; a real inconvenience for a town so populous, a port which is the place of departure of so many merchant vessels and ships of

ecessary fetch it etent to ly paid o popuhips of war. O'Reilly, in order to remedy this inconvenience, projected the plan of conducting a stream of fresh water from the heights of Medina Sidonia, a distance of eleven leagues. Already had he calculated with the engineer Du Bournial that the completion of this canal would not cost more than two millions of piastres (333,000l.) and as early as the month of August 1785 more than half the sum was subscribed. Du Bournial had surveyed and taken the level of the whole extent, and sketched out the whole of the plan. He had discovered the traces of an ancient canal cut by the Romans for the same purpose, the bed of which was to serve in great measure for the new canal. Many detractors opposed this brilliant enterprise; but in spite of them it was begun: it did not, however, proceed more than half a league. The disgrace of O'Reilly put a stop to the project, and the inhabitants of Cadiz continue to fetch their water from Port St. Mary.

Another project of equal magnitude, but of far superior utility, has latterly been completely executed. I speak of the work designed to shelter from the rage of the sea that part of the city of Cadiz which lays towards the south between Fort St. Sebastian and Matadero. It is doubtless owing to its ravage that a great part of the island upon which the city is built has been worn away. In the seventeenth century it destroyed a number of buildings; and at that time some such plan was contemplated as latterly has been put in execution. At the beginning of the present century a kind of rampart in shape of a dam was opposed to the sea, but it had been so much undermined, that Cadiz at high tides, and in stormy weather, was liable to imminent danger. It became necessary every year to repair the injuries committed by the waves; and the engineers employed on the repair's were no ways interested in drying up the sources of such a lucrative occupation. Under the reign of Charles III, the government at length thought seriously of securing Cadiz from the danger with which it was menaced. From among a many plans tendered them in 1786, they adopted that of Don Thomas Manoz, an officer of distinction, and a man of merit, who deserves to be ranked among men of genius, and the benefactors of his country. His plan consisted in forming along the wall a sort of beach, solid, and in talus, against which the waves might spend their first strength, and afterwards flow calmly on to the foot of the city. In the first place, enormous pillars have been built in advance to divide the waves, which afterwards strike upon the artificial beach behind them. It is founded on large flint stones, which it required great pains to fix with any solidity in the ground, and which are joined together by a kind of coment that hardens in water. This work was begun in 1788, and was finished in three years, notwithstanding the work could only be carried on at low water from the beginning of May to the end of September. The happy results of the expedient are daily witnessed. The waves no longer reach the top of the wall, or approach it but in a gentle manner; whereas before the shock of them was so violent, that the neighbouring buildings not only felt it, but were inundated by them, the spray flying over the top of the cathedral. The work is said to have cost fourteen millions of piastres (2,333,000l.) but it was impossible for the Spanish government to have laid out money to greater advantage, or in a more honourable manner. The sea opposite to the shore thus threatened has retired in proportion to its efforts on the south side, so that certain parts of the beach are dry where formerly vessels used to swim.*

The bay of Cadiz is so extensive that there are distinct stations for different ships, according to the places for which they are destined. In front, but at a certain distance from the town, those vessels are moored which arrive from European ports. More to-

^{*} It is with pain we understand that the success of the works at the port of Cadiz is not so lasting as could be desired.

wards the east, in the canal of Trocadero, the vessels employed in the South American trade are moored and unrigged. At the bottom of the canal is situated the pretty borough of Port Real, and on its banks are the warehouses, arsenals, and dock-yards for merchant vessels. The entrance of Trocadero is defended by two forts, one called Matagordo, upon the continent; the other, fort Louis, built by Duguay Trouin, on a little island visible at low water. The fire from these two forts crosses that of one of the Puntales on the opposite shore. You are consequently exposed to the fire of these batteries in sailing from the great bay to that of Puntales, at the bottom of which the vessels of the royal navy when disarmed are moored, close to the magazines. The great space these occupy, and which land and sea dispute with each other, is washed on the west by the river Sacti Petri, and is known by the name of the Carrack (la Caracca.) The court of Spain rigorously interdicts the admission of any strangers. The governor replies to any address for seeing it, that it is not allowed without a formal order from the king. However there are means of doing without it. You may go to the isle of Leon, a modern town, begun about the middle of the last century, and which has increased prodigiously in size within so short a space of time. In 1790 there were 40,000 communicants, a tolerably certain base in Spain for calculating the population of a place. Its principal street is full a quarter of a league in length, and has a good appearance, in spite of the bad taste with which its houses are uniformly decorated. The island of Leon, however, resembles but little the other towns of Spain. There reigns in it an air of cleanliness and comfort. It has a well furnished market, and a spacious square, regularly built. The college of marines has been transferred from Cadiz to the isle of Leon, in the interval of the completion of the new building that is in hand for its reception at the new colony of San Carlos, adjoining the C. rack, where is to be united in one place all that belongs to a perfect establishment of marines.

The isle of Leon is separated from the Carrack by a basin nine hundred feet long, by six hundred in breadth, whence flow two canals, one proceeding to sea, the other to the Carrack. From this city, across an arm of the sea, to the Carrack is about a quarter of a league. You may gain admittance without much difficulty if in company with some privileged person, and survey the contents of its arsenals. The lodgings of the galley-slaves, and the rope-yard, are worthy of admiration; the building is six hundred yards long, and has as good an appearance as that of Brest. Those who have compared the cordage and cables of the principal dock-yards and magazines in Europe, affirm that in this respect the navy of Spain is not inferior to any, and that its cordage is better made and more durable from this circumstance, that in combing the hemp all the towy part others leave in is taken out, and made use of in caulking; whence results the double advantage of having more solid cordage and better caulking materials for vessels.

Until lately the Spaniards imported their hemp from the north, they will very soon be able to do without the assistance, in this article, of any other nation. The kingdom of Granada has for some years furnished them with the greatest part of the hemp they use;

they likewise receive some from Arragon and Navarre.

The warehouses contain a great quantity of sheets of copper; but hitherto they are all brought from Sweden or Trieste. The Spaniards do not yet know how to refine copper well enough to use that from Mexico in bottoming their ships. Their first adoption of this practice was at the beginning of the American war. A few years ago the court established flatting-mills at Ferrol, which it is likely are not yet in full activity. It is a matter of astonishment that an invention of so much utility should not have been sooner adopted in a country possessing a navy, manufactories of every description, and at least the outlines of all the arts. The reason is that in Spain almost every thing, even at

present, proceeds but slowly, that the most beneficial innovations, generally badly patronized, are oftentimes opposed with all the obstinacy of prejudice, with all the bitterness of envy; and that the government itself sees its power limited by the passions of those who usurp and abuse its confidence.

In spite of these obstacles however, modern times display many successful plans resulting from the perseverance of the inventors, and the despotism of necessity. The work of Don Thomas Munoz at Cadiz is a proof of this. The same port exhibits a second. Little more than twenty years ago, vessels of war were neither built here nor refitted, and when it was found necessary to careen a ship, it was used to be affected on pontoons. M. de Valdis, when sub-inspector of the Carrack, recommended the plan of building a dock; and, when raised to the situation of minister of the navy, caused it to be put in execution. The nature of the soil seemed to render the project impracticable. It is a sort of clay which easily gives way, seemingly participating in the mobility of the element which surrounds it, and with which it is saturated. It was in the most elevated part of this ground, that the first basin was begun in the month of August 1785. At that period I saw the forest of piles driven, upon which a bed of stone was to be laid to give the basin a solidity, against which every thing seemed to conspire. The engineers who directed the works scarcely looked for success; their purpose seemed to meet new obstacles daily. Art and perseverance at length triumphed over every difficulty, and in the year 1787, instead of one basin at the Carrack, there were two for the building of vessels of sixty-four guns. At the present moment there are three, two of which are in full activity.

We must not forget to observe, that there is a school for pilots at Cadiz, a naval academy, and a very substantial observatory, extremely commodious and well furnished with excellent instruments. It was for a long time under the direction of Don Vicento Tusino, lately dead, who observed the transit of Venus in 1769.

It is farther a difficult matter at present to find a more complete establishment of marines than that at Cadiz.

CHAPTER VII.

BETAILS RELATIVE TO THE COMMERCE OF CADIZ. TREATMENT OF THE FRENCH AT THAT PORT.
PRIVILEGES ENJOYED BY FOREIGNERS. NEW TARIFF. SMUGGLING.

BUT what above every thing else establishes the importance of Cadiz, that which puts it on a level with the most considerable cities in the world, is the immensity of its commerce. In 1795 it could boast more than one hundred and ten proprietors of ships, and six hundred and seventy commercial firms, without including retailers or shopkeepers, or the French, who had been obliged to quit the city in consequence of the war. A further idea of its trade may be gathered from a knowledge of the number of vessels of different burthen which enter at its port. In 1776 this number was nine hundred and forty-nine, comprising vessels of all nations, of which two hundred and sixty-five were French.

The war which succeeded diminished for a time the extent of our relations with Cadiz; but, on the return of peace, it appeared rather to augment than decrease. Formerly no vessels belonging to our nation entered Cadiz from any port of Europe north of Cadiz. Latterly we have become more familiarized with the northern seas; and many of our ships have been dispatched from that port for Hamburgh and Amsterdam, and been freighted back afterwards for Cadiz.

The relations of this port with the rest of Europe in 1791 were as follows: one thousand and ten vessels entered; of which 180 were English; 176 Spanish from America;

162 Spanish from Europe; 116 French only; 104 Portuguese; 90 Americans; 80 Dutch; 41 Danish; 25 Swedish; 22 Ragusan; 6 Genoese; 2 Venetian; 1 Hamburgher; 1 Russian; 1 Austrian; and 1 Spanish from Manilla.

The 176 Spanish vessels from the colonies with the vessel from Manilla brought in gold and silver, coined or in bars, and plate to the value of 25,788,175 hard dollars,

equal at 4s. 6d. each to 5,800,339l. 7s. 6d.

The trade from Cadiz to Spanish America continued at that period to be very considerable. In the course of that year 1791, 35 vessels sailed thence for the West Indian islands, 20 for Vera Cruz, 16 for Montevideo, 7 for Lima, 8 for Honduras, 5 for

Carthagena; in all 105.

The French ports which trade to Cadiz are Marseilles, Havre de Grace, Rouen, Morlaix, St. Malo, Bayonne, Bourdeaux, Nantes, and St. Valery. The gradation in which they are named shews the pre-eminence of the transactions of the different towns with this port. Before the Revolution, which will occasion more than one modification of our relations with commercial Spain, Marseilles exported to Cadiz, communibus annis, various merchandise to the amount of 12,000,000, in which silk and gilt works formed the principal articles. Woollen goods were the chief exports from Rouen and Havre de Grace. Morlaix and St. Malo shipped linens, which was also one of the principal articles of the trifling adventures from Nantes. From Bourdeaux and Bayonne little but flour and bacon was expedited; and from St. Valery cloths of the manufacture of Amiens alone.

The foreign houses most numerous at Cadiz belong to Irish, Flemings, Genoese, and Germans; of the latter the chief part are Hamburghers, who are much favoured by ancient treaties with Spain, and who, of quiet manners but adventurous and persevering, are addicted to all branches of commerce. They made a good use of their profits; having established among themselves a society for the relief of their necessitous

countrymen.

The English and French have the smallest number of establishments at Cadiz of any of the commercial nations, notwithstanding which the extent of their commerce with this city is very considerable. Fifteen years ago there were fifty French firms at Cadiz, divided into five classes, according to the capital they employed or acknowledged. In the number of these there are some of great consequence, for whom Cadiz is as it were another home, but who, far from losing sight of their native home, add doubly to the wealth of their country, by favouring the sale of its productions, and returning afterwards with the result of their speculations: valuable description of colonists, which cannot be bound by too many ties to their country, but which seem of late years to have experienced discouragement, as well from the treatment which individuals have met with, the vestige of which has not altogether been effaced by the peace of 1795, as by the concurrence of the native merchants towards the promotion of their true interests, by effecting for themselves, what, for too long a period, they saw effected with success by foreigners.

Besides wholesale dealers, there were at Cadiz about thirty French shopkeepers, which with the former made up a nation, an object of jealousy with the Spaniards, and frequently persecuted by the agents of government. This body possessed its funds, its meetings, and prerogatives, and sometimes assembled in order to treat of the interests of their trade under the auspices of the consul-general of their country.

Cadiz contained about the same number of French milliners; and at least a hundred

artisans of different professions.

The spleen which the court of Madrid experienced on the score of our revolution was, even at the beginning of it, vented on the heads of all the French established at Cadiz as well as in other parts of Spain. In the first place, in the month of July 1791, all foreigne s, without particularly designating the French, were constrained to take an oath of exclusive submission to the sovereign of the country; an oath, the purport of which was evidently to make them abjure their native land. The schedule which enforced this law obliged them to renounce all privileges which they enjoyed as foreigners, and every relation, all union with, and all dependence upon the country in which they were born; and this under pain of being sent to the galleys, of being absolutely banished the kingdom, or of confiscation of property, according to the quality of the individuals, or the nature of their contravention of the law. Thus much feelighted in Spain. As for travellers, known under the title of transcuntes they were forbidden to remain at any of the royal residences, or to exercise in any part of the kingdom any trade or profession whatsoever, without express allowance from court.

A measure so severe on the part of an European power towards civilized nations is almost unexampled. One would have conjectured that the court of Morocco and its satellites had been transported to Madrid. Notwithstanding this, Charles IV, is just and benevolent; and whatever be said of him, does not abhor the French. But Charles

IV, the most tolerant of despots, had Florida Blanca for his grand vizier.

The publication of the schedule excited a general clamour. Most foreigners (particularly the English, who were then in favour, or who rather at that time were dreaded, whilst we seemed by no means an object of fear;) most foreigners, I say, easily procured exemptions and favourable hearing; the government acted with rigour only towards the real enemies against which it was issued. However, when put in force, it seemed so much encumbered with difficulties, that modifications took place even in favour of the French. Yet many suffered from it. Some bent before the blast; but the greater part did not pause between the loss of fortune or their country; and France beheld the return of a considerable number of these estimable fugitives. The French who remained in Spain, either from the resolution made of considering them as transcuntes, or, from their becoming such in fact, were more than ever subject to the strictest vigilance. Government suffered the violation of treaties to their injury, and possibly encouraged such infractions, practising them itself. Most of the privileges of the French were disputed. In many places, particularly at Cadiz, the meetings of their nation were suspended. They were, it is true, permitted afterwards, but with the restriction of their being held in presence of the governor of the place; a restriction which annulled the grant. French merchants were in this precarious situation in Spain when our revolution made such progress as became alarming to the neighbouring states. The throne was overturned, and the republic proclaimed. The horizon of Europe became more and more darkened, and already the thunder-cloud of war seemed ready to burst over Spain; count D'Aranda, then chief minister, made some attempts in a dignified, perhaps rugged manner, to avert the storm. His young successor, without professing similar principles, yet inherited his pacific disposition. At that time I thought him sincere, and since then have no reason to doubt his being so. In a few weeks I was satisfied of his sincerity. An engagement to remain neutral was already drawn out, agreed to, and was on the eve of being signed, when that head was severed which could not but be dear to the court of Madrid. All negotiation instantly ceased. I quitted the country without taking leave, but, before my departure, recommended the French whom I left behind, if not to the benevolence, yet to the justice of the Spanish monarch; and received the most satisfactory reply.

I did not apprehend that I should scarcely have crossed the Pyrences, before my countrymen would experience one of the most violent persecutions that national animosity has ever produced. It is well known that even before the declaration of war, they received orders to leave Spain immediately; not giving them even time to adjust their affairs; that many were not able to bring away their clothes; that all their property, furniture, and fixtures, and all the merchandise in their warehouses was sequestrated; and that for several weeks the ports of Spain were full of Frenchmen, pro-

scribed by orders, dragged from a monarch as just as he is humane.

A council was created under the title of Junta de Reprisalias, distinctly charged with all that related to the sequestration of the property of the French exiles, and the indemnities to be taken upon it by the king of Spain. In the schedule which established this council it was argued, in order to palliate the strangeness of the proceeding, that the same measure had several times been adopted in the last century upon similar occasions. But let us draw the curtain over these transitory injuries of rage and fanaticism. I shall not say that they have been expiated by victory; I shall only observe, that a sincere real enemies, and her necessary friends, she will not restrict her justice to the simple restitution of their invaded properties. Let us hope that, without waiting for the conclusion of the treaty of commerce so often demanded, so long expected, and the promise of whic' is repeated in our last treaty of alliance, the French will find no longer in her the jealous and malevolent demeanor of a rival, but, on the contrary, that respect which is due to an intimate ally, and be again invested with the peaceable enjoyment of their privileges. Perhaps the reader may be curious to know what are these privileges.

They are of long standing, and formal; they were confirmed and extended by the famous family compact, now become a national compact. They have nevertheless been (let us declare it, void of spleen, if it be possible) they have nevertheless been scanda-

lously infringed in almost every instance.

The greater part of these privileges are not exclusively enjoyed by the French. They take their date from that period at which the inertia of Spain made it necessary to call in the assistance of the capitals and industry of foreigners, and attach them to its seaports by treaties which then were reciprocally advantageous, but which have become

otherwise now that her drowsy fit no more continues.

The most ancient of these treaties was that of 1647 with the Hanseatic towns. This served as a model for those since made with the English, Dutch, and French. It grants licence to the merchants of those different nations to establish commercial firms in Spanish ports; and to reside there under the protection of their consuls in some degree independent of the sovereign, to form a nation, to have a separate tribunal for the decision

of disputes relative to commercial matters, &c.

To these privileges the family compact, concluded at an epoch at which the two monarchs of France and Spain, without having ever seen each other, were animated with the most tender mutual attachment, and at a time that the policy of the moment prescribed the strengthening of those ties, this family compact added to these privileges some peculiar to the French. Among other stipulations, it covenanted not only that Frenchmen and Spaniards should be treated equally with the most favoured nations in the two countries, but also that the subjects of the one king upon the territory of the other should be looked upon as natives, as far as regarded any right of importation or exportation, and enjoy equal facilities in trading, &c.

In practice, these privileges common to most foreigners are often nugatory; but, even before the French Revolution, they were with none more frequently set at naught

than with the French, owing to their possessing more than other foreigners that species of industry which is importunate, and that marked success which awakens jealousy; owing to Spain, ever since she has been occupied in the restoration of her manufactures, considering them as formidable rivals; owing to the French possessing an unconquerable disposition, and a singular aptitude to smuggling; and, lastly, owing to the same custom existing between governments as individuals, of reserving their fits of spleen for their best friends, while their politeness and attention are shewn to such as are but indifferent to them, or whose interest they are desirous to secure.

Thus, while English ships which, according to treaty, should be searched upon their arrival at the ports of Spain, frequently elude this formality altogether, or are subject to very slight examination, those of the French are minutely visited; nay, oftentimes are subjected to a repetition of search at their own expence, upon the slightest suspicion of

any thing contraband on board.

Thus, notwithstanding by the same treaty no search was to take place, except in presence of the consul of our nation, our vessels were often visited unexpectedly, and some

times without any notice being given.

Thus, although the family compact expresses in formal terms, that the French, in matters of trade, should be treated on a par with Spaniards themselves, this has almost constantly been demanded without success, when our captains of ships have been desirous of bringing ladings of wine and corn coastwice from one port to another in Spain. Certain conventions made posterior to this pact, and designed to explain obscure passages, left room for further litigation. Of this the smuggling of piastres in particular has become a very fruitful source. From an ambiguous passage in the convention of 1774, it was contended that the treatment to be used towards our captains of ships, on board of which piastres were smuggled, should be the same as towards nations found guilty of contraband; that is to say, not only that the piastres became forfeited, with the ship, and remainder of the cargo, but the captain also became liable to imprisonment; so that we were placed upon a footing with the Spaniards in the sigorous punishment to which they are liable alone.

The two governments at length perceived the necessity of introducing more clearness into some of the stipulations relating to our commerce; and, on the 24th December 1786, they concluded a new convention, wherein every thing relative to contraband is distinctly explained, and which limits the penalty upon detection to the simple forfeiture

of the articles smuggled.

This convention, embracing no other objects than what bore reference to smuggling, the search of vessels, and some other objects of minor importance, it leaves room to wish for a treaty of commerce, which may become a principal source of future prosperity to our country.

This treaty becomes so much the more necessary, from the Spanish government having made n.any violent attacks on our commerce; with a view sometimes of encreasing the revenue, and at others of promoting the trade, and industrious habits of its own

population. The principal of these it may not be amiss to enumerate.

As early as the reign of Philip V, the privileges of a great number of Frenchmen were disputed under pretext that they were not simply travellers, transcuntes; but had become domiciliated, and consequently liable to be treated as Spanish subjects. In 1720 there even appeared a schedule, which circumscribed with numerous restrictions the quality of transcuntes (the only one which Spain, wearied with claims respecting foreign privileges, was any longer willing to allow;) numerous claims, arbitrary, and some-

times contradictory decisions, and an uncertainty among all foreigners, such were the

consequences of this ambiguity.

In 1779, upon the representations of many corporations estimated with the laudable desire of reviving industry in their country, and of banishing sloth and misery, government put in force anew an ordinance of the reign of Philip IV, which prohibited the importation of all works completed; vague expression, to which the custom-house officers applied the most vexatious interpretation. In 1782, always under pretence of securing the prosperity of the Spanish manufactures, particularly that of silk, Spain made a new tarif (Araned) which considerably augmented the duties payable on most of our manufactures of luxury, and absolutely prohibited a great number. This tarif, and those prohibitions were so vaguely expressed, that they left a wide margin to the malevolent caprice of the customs' officers. are the risks which our manufacturers ran in expediting, and our merchants resid in Spain in ordering goods, which, when they arrived at the Spanish custom-houses, were either detained to await the decision of government, or were not allowed to enter. Hence the failure of speculations, hence reiterated claims to which the Spanish government did justice rarely.

Some comparisons between the tarif of 1770 and 1782 will suffice to shew the enor-

mity of the increase of duties.

Plain, striped, and figured ribbon, were taxed at 240 maravedies per lb. They were augmented to 1530; gold spotted gauzes were taxed at 48 maravedies per vara; and gauzes with silver flowers at 102. The tarif of 1782 raised the least to 153 maravedies, and some to 612 maravedies per vara.

Different stuffs, which embroidered with circles of spangles cost no more at the manufactory than 30 livres per vara, were subjected by the tarif to a duty of 96 rials, or 24 livres per vara. Had not these impositions a tendency to prohibit them entirely, or at

least to encourage their fraudulent introduction?

Twenty other similar examples of malevolence, or fiscal avidity might be cited.

Spain did not confine herself to these injurious measures; she appeared more inclined to annihilate our manufactories, than to encourage her own. By a private arrangement in 1698 with Eminente, at that period farmer of the custom-dues at Cadiz, we payed but very moderate duties upon the importation of linen from Brittany; which served to place them on a level with those of Silesia, less perfect, but at the same time cheaper than ours, and on that account more attractive. The consequence was, that some of our linens paid no more than 5½ per cent. on their value, whereas those of Silesia, of equal quality, paid from 10 to 12. We quietly enjoyed this concession, precarious it is true, on account of our having neglected to convert it into a right by having it inserted in our different treaties with Spain. We had little reason to expect at the close of a war in which we had been allied, and which ought to have drawn more closely the knot by which we were united, to be deprived in 1783 of a favour which gave encouragement to one of our most considerable branches of industry, and placed ours upon a level with all other foreign linens. We have frequently complained of this innovation, but constantly in vain.

The tarif of 1782, however, increased the duty of importation on all foreign merchandise; they have been afterwards so much augmented by different impositions, that some articles upon their introduction into the interior of Spain, pay as much as from 80 to 90 per cent.; and none less than 30. Since the treaty of peace at Basle, some abatement from this excessive rise on the taxes, has been made it, our favour, but we have yet much to obtain. The tarif of 1782, even as it stands at present, is incompatible with the ready sale of the produce of our manufactories, and it is upon them principally that

certain regulations made posterior to this tarif press heavily.

At first the exportation of all foreign cloth to Spanish America was prohibited, as if the manufactories of Spain were competent to its supply. The inconvenience of this prohibition w 3 shortly felt. It was modified by a regulation which allowed a third part of the cloth exported by every vessel, to be of foreign manufacture; a measure insufficient and frequently eluded both through interest and necessity. It is consequently a fecund source of fraud and litigation.

In 1789 Spain shut out from exportation to her West Indies, all stockings, understockings, and ribbons, of foreign manufacture without exception, &c. &c. The same year, tardy reflection caused an exception to be made in favour of thread stockings, provided that they formed no more than one half of the cargo of that description, on board each ship destined for the West Indies; a restriction which rendered the exception nu-

gatory.

Manufacturers of hats in forcign countries have also suffered materially from the prohibitory regime of Spain. Their importation into Madrid is rigorously interdicted and excepting castor hats all others are excluded from their American trade, and lastly silk stockings are a principal object of their prohibition. All finish white silk stockings are shut out from her colonies, and even from the capital, but it is well understood that the Cataluns find an advantage in introducing our stockings, to which they apply the marks of their different manufactories.

For a long time our manufactories of Languedoc, of Nismes particularly, had been accustomed to furnish the ladies of Peru with stockings. For this they had looms constructed on purpose, in which they worked their stockings with broad clocks, embroidered in different colours; but the Spaniards imagined themselves competent to the supply of the Peruvian ladies according to their taste. They set up similar looms for the manufacture of stockings, and flattered themselves at first with rivalling, afterwards of entirely supplanting, our manufacturers; when all at once their government absolutely prohibited the admission of our Peruvian stockings. Our manufacturers of Nismes thus found themselves overstocked with an article which had no other market than Peru. They had even shipped a large cargo for Cadiz, which was thrown on their hands. In vain, in 1792, did they appeal to the good faith of Spain. They represented the immense loss with which they were threatened. Their statement shared the disfavour with which at that period we began to be treated. At the instant of the rupture there were two or three hundred thousand dozens of these stockings in a state of sequestration in the custom-house at Cadiz.

It will be worthy the equity of the Spanish government, it will but be consonant with the good intelligence subsisting between the two nations, now more closely allied than ever, to interdict mutually, for the future, such prohibitory regulations; since taking those by surprise, on whom the injury falls, it may eventually occasion their ruin. Doubtless every government has the right to exert all its means for the encouragement of the commerce and the industry of its subjects; but where wisdom marks their conduct, they refrain from those sudden measures which carry the appearance of perfidy, and the infallible consequences of which are the alienation of the confidence of all commercial nations, and the furnishing aliment and excuse for smuggling.

Smuggling, the name of which alone excites alarm in the Spanish government, has no wider field for its exertions than that afforded by the port of Cadiz. It becomes naturalized in every part where prohibitions are numerous; the temptations to break through them, frequent and highly seductive, particularly where the profits which result from contraband are sufficiently large to bear the sharing of them, with those who being but meanly paid for preventing it, gain much more by connivance with the smug-

gler. Hence in general it has no agents more active or more faithful than the understrappers of the custom-house. That of Cadiz is under the direction of an administrator, who in general is very severe. Not so much can always be said of the eight inspectors, or Vistas, who are subservient to him, and whose function it is to examine all merchandise that is imported or exported, to value them, and tax them according to this valuation. One readily conceives, how arbitrary all these operations must be, one knows the abundant resources of fraud, especially where its inspectors are accomplices. All the tax makers of Europe may take a useful lesson in this respect from Cadiz. The rigour of the administrator is ineffectual against the stratagems of so many agents conspiring against him. In 1785 this place was occupied by a man as rigorous as virtuous, Don Francisco Vallejo. The abuses of which he complained, but did not repress, occasioned the deputation of a purgatory commission. The avidity and the infidelity of the clerks of the revenue were punished; and the custom house of Cadiz was regenerated. Every thing was to assume its due order. Smuggling was at its last gasp, expiring beneath the lash of authority, and the Argus care of vigilance. These brilliant ideas, however, were fallacious; shortly after Vallejo was replaced by Don Jorge Francisco Estada, a still more rigid director, if such could be, than was his predecessor. But smuggling is a plant which takes such deep root in the soil in which it is naturalized, that although it be lopped, nay felled both branch and stem, its root will yet give suckers. The smuggler keeps at a distance, and conceals himself at the critical period. As soon as it be passed, interest takes up anew her accustomed habits, and cupidity resumes its audacity. In spite of the rigid Estada; this was the condition of smuggling in

If since then it be diminished, it is owing to their being less opportunities for its manifestation. The long residence of one of our squadrons at Cadiz, could not fail to nourish it; but it prospers highly only when commerce is in its full activity, and the trade of Cadiz suffered greatly from the war with us. It suffered still more from that with England, but it is about to resume its ancient extension, and contraband to make

up for lost time.

Cadiz is indisputably the most opulant and the handsomest city in Spain. Notwith-standing it be circumscribed in such a manner by its position as to prevent its being enlarged, its population in 1800 was 75,000. The horrible epidemy of the succeeding year diminished it a fifth part. In order to find shelter for so large a number of people upon so small a space, they have been obliged to be great economists of their ground: hence all the streets of Cadiz, with the exception of La calle ancha, are narrow, and generally dark, owing to the great height of the houses; but the city is remarkably clean, well paved, well lighted, and ornamented with handsome ramparts, which serve for promenades. The neighbourhood of the sea renders the heat here much more tolerable than at Madrid.

The warehouse of the wealth of both worlds, Cadiz abounds in almost every thing. Excepting water, all the requisites of life are here to be found; and all its amusements at the theatre, in the vicinity of verdant meadows, and well cultivated land. Those amusements, however, which are the result of a well cultivated mind, might here be sought in vain; enjoyment, in the most rigorous sense of the word, absorbs here all the faculties; and calculation, all those of the understanding. The one speaks for itself and finds its apology in the climate. The other is the result of a concurrence of circumstances to which Cadiz principally owes its importance and prosperity.

INDUSTRY OF CADIZ AND ITS NEIGPBOURHOOD. ON ITS LINENS. ITS SALT PITS. OF THE BAY OF CADIZ. BOAD FROM CADIZ TO CHICLANE; FROM CHICLANE TO ALGESTRAS. OBSERVATIONS ON AGRICULTURE IN SPAIN.

ALTHOUGH commerce either legitimate or fraudulent absorb almost all the capital and attention of the inhabitants of Cadiz and its neighbourhood, yet are not manufactures entirely neglected. At Cadiz there is a score of looms for ribbons and silk netting, which are seldom at work, but which have an immense sale of their pretended produce. It will be guessed that the chief occupation of these manufacturers is that of affixing their mark to foreign goods. Thus it is as well that stockings from Nismes are shipped as Spanish manufactures for their West Indies.

At Port St. Mary, at the isle of Leon, at Xeres there are manufactories of stained linens which have made great progress for several years back. These linens and those of Catalonia are the only ones allowed to be exported to America; a judgment of the extent of smuggling in this article may, however, be readily formed from a comparison of the quantity sent to America with the whole these looms are capable of furnishing.

At port St. Mary there is a wax bleaching house, through which all foreign wax intended for America is obliged to pass. But its intervention is almost always eluded by the payment of the two ducats per lb. which is its demand for bleaching.

The Spaniards were once on the eve of producing at the Havanna all the wax requisite for the consumption of their colonies. Upon the cession of the Floridas to the English in 1763, some Spanish colonists who withdrew to Cuba carried with them a number of hives. The bees encreased prodigiously in this new country to which they had fled as I may say for refuge from the conquerors; like tribes among men, who escaping from persecution leave their native soil, and bear with them away their riches and their arts. But in the planters of the Havanna they found new persecutors. Intimidated by the loss their sugar plantations experienced from these new guests, they kindled fires to drive them away. This scheme succeeded so well that Cuba, forsaken by the bees, could no longer supply any honey, and Spanish America was again obliged to receive for her consumption the wax of Barbary, of Poland, and Hanover.

It will be asked if any sensible diminution of the trade of Cadiz has taken place since 1780, as was predicted by the jealous spleen of its inhabitants? There has not. These predictions did not then wear the appearance of likelihood. Cadiz is so well situated, so rich, has such fixed possession of the trade to the Spanish Indies, that for a length of time to come she may brave the competition of any other port. Nevertheless, the peculiar situation of Catalonia and Valentia has been of material advantage to them, particularly in 1789. Government a little previous had made a regulation, that of every vessel sailing for America, national merchandise should form at least a third part of the cargo. These ports were enabled to ship wines, brandies, silks and stained linens, and in these articles seemed to vie with Cadiz. But the manufactories of Catalonia and Valentia, not being competent to repeat such considerable sales, nor able to give such long credits, or so easily to wait for returns, as the merchants of Cadiz, whose means are equal to their extent of trade; they soon regained possession of their original superiority.

One of the most considerable articles of export to India, and that on which the profit is most secure, is foreign linens.

They consist of, and almost exclusively, those of Brittany, Silesia, and Ireland. In 1787 and 1788 it was noticed that the demand for those of Britanny had rather increased than diminished, yet in a smaller degree than those of Silesia. The exportation of those of Ireland, the price of which is between that of the two others, is of late years greatly encouraged by the British government. Ours maintained themselves only by their superior quality; but even in this respect they find a formidable rival in those of Silesia, which are recently greatly improved.

The importance of the linen trade to Cadiz may be judged by the tables of its ex-

portation of foreign merchandise in the years 1791 and 1792.

The whole sum of its exports of this description being 164 millions of rials, the article of foreign silks amounted to from 8 to 9 millions of rials; woollen goods to from

22 to 23 millions; and the article of linen alone to upwards of 100 millions.

At that period, the value of national merchandise exported was not equal to that of foreign, but by degrees it has come very near to it. In 1790 it scarcely exceeded 102 millions of rials. In 1791 and 1792 it was from 115 to 120 millions; of this above 60 millions consisted of silk articles; nearly 16 millions of woollen goods; and from 17 to 18 millions of linens. In 1792 it was the opinion of some that Spain was enabled to answer the demand of its colonies for fine and second cloths, but not for that of an inferior quality. At this epoch her importation of foreign silk amounted to from 24 to 26 millions of rials.

But at once to give an idea of the extent of the commerce of Cadiz, it may be sufficient to state that in the year 1792 its exports to the colonies alone amounted to 270

millions of rials, and its returns thence to more than 700 millions!

The existence of funds adequate to the support of such an immense business, will of itself secure to Cadiz for a length of time to come the enjoyment of mercantile prosperity.

The manufacture of salt is the most interesting branch of industry in its neighbour-hood. The salt-pits encompass a great part of the bay from the Puntal to Port St. Mary.

This is their manner of working them.

In the first place, sea water is introduced, by means of a little sluice, into a large basin, cut into wide canals of equal depth. It remains there a certain time, during which its lighter parts evaporate from the heat of the sun. From this first reservoir it runs into other canals not quite so deep, where it is further volatilized. The corrosive quality of the water remaining is so great, that the workmen can no longer remain with their feet uncovered without having them burned as if dipped in aquafortis. The water, in this state, is let into a long and narrow canal, which runs by the side of a square space, divided into quadrangular compartments. From this canal, where it is anew exposed to the action of the sun, it is thrown with scoops into small basins where it receives the last heating, while the workmen continually stir it with long rakes. The sediment it deposes becomes as hard as stone, if it be suffered to assume that consistence, and the workmen are constantly employed in detaching, taking it out, and pounding it. This continued agitation raises a white scum to the surface, which is carefully taken off, and which produces a much whiter, but a weaker salt than the sediment. The rest is laid in great heaps in the open air. The necessary quantity for the king's salt magazines is taken from these heaps, and paid for at the rate of two piastres the last of two hogsheads; but it is sold again at a hundred and twenty piastres to all individuals except fishermen, who have it cheaper. The salt manufacturers dispose of what remains as they please; and as the reigns of the autumn threaten them with considerable waste, they lose no time in selling. The nations which purchase it are Sweden, Denmark, Holland,

England, and particularly Portugal. The cargoes shipped by the Portuguese are mostly sent to the coasts of Galicia and Asturia, where this commodity is wanted, and which they have long had an exclusive privilege of furnishing with their own salt. The fishermen from St. Malo, Dieppe, and Granville sometimes go to the bay of Cadiz to take in cargoes of salt for Newfoundland; and when our salt-pits fail, we take large quantities of it for our own consumption.

Every individual who wishes to establish one of these artificial salt-pits upon his own ground is at liberty to do it. He may sell the produce to foreigners, but not to his countrymen, salt being in Spain, as in France, exclusively sold for the king's account. Guards are placed round the heaps of salt, but do not always secure them from thieves and smugglers.

Cadiz, like the greater part of large commercial towns, contains but few monuments of the arts. Of late years, however, some buildings have beed erected in a good style, mostly the work of strangers. The former Italian opera has been converted into an assembly-room for reading the news, and other innocent recreation. It is called the Comorra, and consists of large rooms perhaps too much adorned. The custom-house is a new building of tolerably handsome appearance. The national theatre is tastily planned, and well laid out. The new cathedral, begun in 1722, had in 1769 cost more than four millions and a half of rials, and will cost two millions of piastres before it is completed. The wretched plan upon which it was begun will prevent its ever becoming a master-piece, notwithstanding the expence of its erection and its sumptuous decoration.

But the church of San-Antonio is a sacred edifice, whose defects are still more striking; it was built as an ornament to the handsome square of the same name, which it only serves to disfigure.

In the church of the capuchins is an Ecce homo of Murillo, worthy of admiration,

and some other master-pieces of his school.

Iolland,

A foreigner arriving at Cadiz will consequently inquire for the exchange of a commercial town so widely celebrated, and will not be a little surprised at understanding there is none. One would imagine that its inhabitants look upon the god of commerce in the same light as the ancient Germans were wont to look upon their god; as somewhat too majestic to be circumscribed by walls of stone, somewhat that could be worthily adored beneath the vaulted roof of heaven alone. But the almost constant fineness of the climate explains this apparent singularity.

The ramparts of Cadiz are more an ornament to the town than a means of defence. Its fortifications are in good condition on the land side. The entrance into the bay would be but very imperfectly defended by fort St. Catharine on the one side, and fort St. Sebastian on the other. The fire of these two forts does not cross. The one is placed on the continent opposite to Cadiz; the other is connected with the town by a very uneven sandy strand which is covered at high water.

The passage from the great bay to the bay of Puntalis is much better defended by the two forts Matagordo and San Lorenzo, placed opposite to each other, where the bay is contracted.

You cross the strait protect. by these two forts to go to Chiclana, a place of amusement, a delightful resort for the inhabitants of Cadiz. For the position of their town, which is of very trifling extent for a population of 75,000 persons, and almost wholly surrounded by the sea, leaves them very little room for exercise. A quarter of a league from the gate towards the land barrenness begins, and maintains its empire over several leagues around, if some few kitchen gardens be excepted, and some orchards in the vi-

VOL. V. 4

cinity of the isle of Leon, where artificial watering has remedied the natural barrenness of the soil.

To Chiclana, therefore, do the inhabitants repair to enjoy that verdure which they want at home. A favourable wind and tide carry them over in two hours. Leaving the isle of Leon to the right, and the Carrack to the left, you pass the bridge of Suaco, that joins the whole island of which Cadiz stands on the north side, to the continent. Under the arches of this bridge the bay becomes so narrow that after passing them, it is nothing more than a wide caual, which soon afterwards separates into different branches. One of these leads to Chiclana, which is built on the right bank, commanded by several

eminences, and particularly by the ruins of an old Moorish castle.

Here several merchants of Cadiz have country-houses, which they embellish and surround with that verdure looked for in vain at their houses in town. During two seasons of the year Chiclana is particularly agreeable, the spring and autumn. The ladies of Cadiz, who unite the most enchanting graces of the Andalusian women to those polished manners which result from their intercourse with foreigners, the lovely Gaditanas naturalize here for some weeks all the enjoyments of the city; grand entertainments, balls, concerts, the whole display of opulence, and the toilet's nicest art. It is, as it were, a list opened by luxury and taste, to which the deepest speculators resort to smooth the wrinkles of care and calculation, and be reminded occasionally that there is something in the world which is even more precious than gold.

From the eminences which command the valley of Chiclana, we see at one scope the isle of Leon, Cadiz, the bay, and the sea beyond it. The eye follows the course of the river Santi petri till it falls into the sea. Turning to the east we perceive Medina Sidonia, whence comes the wind called Solano and de Medina, so dreaded by the inhabitants of Cadiz, from its pernicious breath, exciting both crimes and disorders in the city. From the same point of view we embrace the vast plains of Southern Andalusia,

which we are about to pass over in the way to Algesiras and Gibraltar.

Algesiras is fourteen leagues from Chiclana. I performed the journey on the same horse in one day in summer, crossing the most desert country that can be found amongst those which are not quite uncultivated. It is true I crossed plains, to avoid circuits, which would have led me through some villages. But will it be credited that in all this road, except Vejer on the right at a considerable distance, and Medina Sidonia on the left still farther off, I saw no other human habitations than four or five groups of those miserable cabins, called Cortijos, in which labourers lodge a part of the year.

For ten of these leagues I travelled over the dutchy of Medina Sidonia, through corn fields and pastures. In no part could I discover the vestige of an human habitation. Not an orchard, not one kitchen garden, not a ditch, nor a stile. The great proprietor seems to reign here like the lion in the forest, scaring away with his roar whomsoever might else seek his haunts. Instead of men and women, I met with seven or eight great herds of horned cattle and some troops of mares. On beholding them unrestrained by the bridle or the yoke, wandering over an immense space unbounded to the eye by enclosure or barrier, we may imagine ourselves carried back to the first ages of the world, when animals, in a state of independence, divided with man the dominion of the earth, found every where a property, themselves without an owner.

Andalusia is thus unpeopled in all those parts wholly set apart to corn and pasturage. It has been divided into great possessions as far back as the conquest of it by the Moors. The principal Castilian nobleman, who then accompanied the conquering kings, obtained enormous inheritances in perpetuity, according to the fatal custom introduced into almost the whole of the monarchy. The extinction of males in the great families

hich they

the same amongst circuits, n all this ia on the of those

igh corn bitation. roprietor msoever ght great sined by y encloe world, ne earth,

sturage. Moors. gs, obroduced families

is incessantly increasing this complaint. Rich heiresses earry with them their opulent portions into families not less opulent, so that the greatest part of Spain may in time become the inheritance of the few families which shall survive the rest. As one individual cannot manage such vast estates, the proprietors farm them out to different persons, but this for three years only, or five at most. Another circumstance concurs with these destructive customs to prevent agriculture from flourishing in Andalusia. The land is divided into three portions; one is cultivated, another remains fallow, and the third is set apart to feed the cattle belonging to the farmer, and which he augments as much as possible, to reap what advantages he can from his short lease. This is what gives an appearance of depopulation to vast districts susceptible of rich cultivation. The first improvement requisite, therefore, in the agriculture of Andalusia, would be to grant longer leases. The example of Catalonia, Navarre, Galicia, and the Asturias should serve as a lesson. There the leases are for a considerable number of years, and cannot be broken by the caprice of the proprietors: every kind of cultivation is there in a flourishing state; each farmer creates himself a little establishment, and improves and fertilizes the land which he is sure to hold for a long time. What a contrast between this state of things, and that I had before my eyes for ten leagues after leaving Chiclana.

At the end of these ten leagues you begin to ascend with great difficulty an enormous chain of high mountains, which do not lower again before they reach the western part of the bay of Gibraltar. From their summit you perceive the famous rock of Gibraltar rising from the bosom of the waves like the genius of the stormy cape described by Camoens. From this point the eye commands the fortress, the outlines of which appeared to me perfectly well defined in the serene horizon, and at the same time embraces the town of Algesiras, the whole circuit of the bay, two little rivers which fall into it, the town of St. Roch, the slope which leads from this town to the lines, and the tongue of flat and narrow land that separates them from Gibraltar; and at a distance to the right, at the extremity of the horizon, we imagine, rather than discover the coast of Africa.

CHAPTER IX.

ALGESTRAS. LINES AND CAMP OF ST. ROCH. DETAILS RESPECTING THE FLOATING BATTERIES.

APPEARANCE OF GIBRALTAR.

ALGESIRAS, the extremity of the fourteen leagues which separate Chiclana from the bay of Gibraltar, is a town pleasantly situated on a slope, which terminates in the sea. A very little river (the Miel) which rises in the neighbouring mountains, washes one of its sides, and gently runs on to the sea; upon its right bank is a little dock-yard, made use of during the siege of Gibraltar for the construction of some of the gun-boats. At the time of the freshes, it has water enough to float such little vessels to the sea, which is distant but a few paces. Near this place are the ruins of the old citadel of Algesiras, in which the Moors defended themselves for some time after their city was taken. Algesiras, as well as Saint Roch, was peopled at the beginning of the present century with Spaniards from Gibraltar, unwilling to live under the dominion of the English. In order to draw thither these refugees, privileges which it still enjoys were granted to the town.

The little island of Palomas, called also the Green Island, is very little distant from the strand of Algesiras: it has a fort in which a company detached from the garrison of Algesiras does duty. This island is so fine and regular, that it seems as if traced by the art of man for the embellishment of a garden after the English plan.

Algesiras is supplied with water in a splendid manner. It is brought to it from the

distance of a quarter of a league by a new aqueduct built with hewn stone.

A packet-boat sails twice a week from this town to Ceuta, a Spanish sea port, at five leagues distance, on the coast of Africa, and directly opposite to Algesiras. The passage is often made in three or four hours, but it sometimes takes up nine or ten: the price is four rials; no great sum to be transported from one quarter of the world to another.

The little port of Algesiras is very confined in its commercial speculations; it receives some cargoes of corn and brandy by Catalonian barks; and its exportations chiefly con-

sist in coal from the neighbouring mountains.

A great part of the two leagues from Algesiras to Saint Roch is by the side of the bay. There are two little rivers which fall into it to be crossed in boats, El Rios de los Pulmones and El Guaraipe, which might be taken for an arm of the sea. After passing the latter, you leave the bay to reach the back part of the hill upon which the town of Saint Roch is situated, badly paved, and of a wretched appearance: the environs of

which however are agreeable, and carefully cultivated.

Two years after the peace it continued to be no easy matter to pass the lines of St. Roch. A formal order, the offspring of the puerile spite of Florida Blanca, interd' 'ed all communication between Gibraltar and the Spanish continent. Notwithstandin I obtained from the commander of the lines permission to approach Gibraltar in co with a major of the place. We left Buena Vista to the right, a large house upon an eminence, in which the duke de Crillon, his aides-de-camp, and all their retinue lodged, and whence you have a view of Gibraltar, the two seas and the coast of Africa. At length we arrived on the ground of the famous camp of Saint Roch. Destroyed by peace, as other human establishments are by war, it presented nothing but a heap of ruins. We crossed this ground diagonally to go straight to the Mediterra .can, and follow the coast to fort Saint Barbe which forms the right of the lines; on presenting the order of the commander, the great gate was opened to us which leads from the lines to the fortress: a petty officer besides was sent to watch rather than direct our motions. We noticed the traces of the works carried on during the siege, the trenches and epaulement thrown up by general Alvarez, and which were so much spoken of in the Madrid gazettes; * the tower of the mile, situated between the besiegers and the besieged, the only

* A witticism published at Paris on the subject, and during the siege of Gibraltar, inserted in the first edition of M. Bourgoanne and omitted in his edition of 1803, the translator has deemed possessive of too much pleasantry to fail of being agreeable to the English reader; he has therefore given it in a note.

Illustrious warriors of Saint Roch, Between us, this exceeds a joke, Mean you to tarry here for life, Or one day end the mortal strife? Whence can you not contrive to join Dispatch to valour so divine? Your patience still may last no doubt, But ours is fairly wearied out. Then heroes of the long blockade. Conclude at length your vain parade; And let us hear of your defeat, Or that the enemy is beat. Incessantly your batteries roar, As they would rend the world asunder, While tranquilly the English snore, Unheedful of your mighty thunder:

After coasting the bay for some time, we took a direction towards the Mediterra-

nean, to survey nearer at hand, and in different points of view, the rock which for five years had been the object of so many speculations; but with a conductor so strict as that with us we did not presume to go beyond a small tower, situated close to the Mediterranean, and near which the first English corps de garde is stationed. On this side, the fortress is thick beset with batteries, mostly in a very steep sloping direction. Here we saw the mouth of a mine which the duke de Crillon had hollowed within the rock, and by which he intended to revenge the fate of the floating batteries, when the peace obliged him to desist, and left the foundation of the fortress secure. This was not the only point of the rock the duke de Crillon threatened; on the Mediterranean side, the declivity, though so steep as to be almost perpendicular, does not continue so to the surface of the earth. Between the foot of the mountain and the sea, there is a kind of path which leads to Europa point. At the entrance of this path, a second opening in the rock

Notwithstanding the sareasms thrown out against both these attempts on Gibraltar, I have been assured by persons who were present, that when general Elliot, after hostilities had ceased, walked with the duke de Crillon round the place, he appeared surprised at seeing the progress made in the first of these mines, and said to the French general, if he had known the state of them, he should not have been so easy. Was this expression sincere on the part of the English hero, or a specimen of French complaisance? On

this I shall not undertake to decide.

Utrecht.

had been made.

Rather do I prefer presenting my readers with a succinct but well authenticated account of the grand enterprise which arrested the attention of all Europe, and the catas-

trophe which was so unfortunate.

The court, wearied with the useless blockade of Gibraltar, a source of ridicule to all Europe, and even to the besieged themselves, thought seriously of taking the fortress by some uncommon means, against which neither its steepness, its formidable artillery, nor the skill of general Elliot, might afford any adequate resistance. It received projects from all quarters, some of them hardy even to extravagance, others of such a

> Or if they answer you by chance, 'Tis out of common complaisance, A kind intention to assuage Your wild yet not unfounded rage. Four years experience should suffice To make still greater blockheads wise. Your laboured works grow old, and you, Heroic Sirs, are grown old too. 'Tis time to quit these martial cares, And leave the business to your heirs, Who some few previous races run, May end the siege by you begun. Your trenches, batteries, and mines, Your mortars, and fire proof mechines, Which your gazettes with pride display, The coffee-house alone dismay. In vain you block, in vain you batter, Those you would starve, grow daily fatter, And at the worst will only die Of corpulence and lethargy.

whimsical description, that they could not be mistaken for serious. Of this kind I received some myzelf. One, forwarded to the minister, formally proposed the construction in front of the lines of St. Roch, of an enormous cavalier, rising to a greater elevation than Gibraltar itself, and by this means depriving it of its main defence. The author had calculated the number of cubic fathoms of earth which it would require, the number of hands necessary, and the length of time which this prodigious work would demand; and proved that his plan would be less expensive, and less murtherous, than a prolongation of the siege, in the manner it had been carried on.

Another conceived the idea of filling bombs of such a horridly memphitic quality, as, upon their explosion, should either drive the besieged away from the fortress, or poi-

son them on the spot.

At length, the project of Darcon was received, and fixed more strongly the attention

of government.

This project, conceived by this engineer at a distance from Gibraltar, and the failure of which has not tended to annihilate the reputation he has acquired of a man of great genius, this project was brought to perfection, and modified by himself within sight even of the garcison. But what a number of difficulties it had to encounter! French impatience, national jealousy, the bickerings of rivalry, the vexatious inquietude of commanders, the pretensions of self-love, the thoughtless impetuosity of some of its co-adjutors, the perfidious plots of others, and the presumptuous want of foresight of almost all; conjointly all concurred to cause the ill success of a project which one cannot refrain from admiring in spite of its failure, where one has had an opportunity of studying it in detail.

It was known, as I may say, but by the existence of ten praams, which, on the 13th September 1782, by rashly exposing themselves to the fire of their batteries, were reduced to ashes by the English. Such summaries are very convenient for idleness and malignity, but would form very defective elements for the historian. Enlightened by memoirs of the day, he will rather say, that, if this great undertaking failed of success, it was owing to the concurrence of circumstances, over which the genius of Darcon had no controll whatever. One of the principal of these was the precipitancy with which the project was executed before every thing was in readiness, to secure its success. It is well known, that these ten praams were formed in such a manner as to present towards the battery a broadside covered over with a blind three feet in thickness, which was kept continually wet by a very ingenious piece of mechanism. By this contrivance it was computed, that the red-hot balls would be extinguished immediately wherever they penetrated: but this first contrivance was rendered incomplete by the unskilfulness of the caulkers, which prevented the effect of the pumps, destined to supply the water. It took effect therefore, and that only in a partial degree, on board of one of them, the Talla picdra. But this was not all. Although they had only very carelessly sounded the stations which they were to assume, they had yet pointed out the course to be taken in order to avoid running aground, and keep a suitable distance; another precaution which turned out uscless." Don Ventura Moreno, a brave seaman, but inadequate to the combination of a plan and carrying it into effect, considering his honour called in question by a letter which general Crillon had wrote to him in the evening of the 12th of September, in which he stated, if you delay the attack, you are not a man of honour, he hastened the sailing of the praams, and commanded them to take a different position to that laid down in the original plan. This change of positions was the principal cause of the fate of the day.

position

al cause

From this mistake only two of the praams could reach the distance of two hundred toises, that which was previously concerted; the Pastora, commanded by Moreno himself, and the Talla piedra, on board of which was the prince of Nassau, and Darcon. These two, however, were exposed to the most tremendous of all the batteries, the royal bastion, whereas, according to the plan laid down, all the ten were to have grouped round the old mole, and receive only a side fire from that battery.

The only two praams which occupied this perilous position both caused and experienced considerable damage. The Talla piedra, in particular, received a mortal blow. In spite of the blind, a red-hot ball penetrated to the dry part of the vessel. It was very slow in taking effect. The Talla piedra began her fire about ten o'clock in the morning, the ball struck her between three and five, but the ravage it caused was not deemed irremediable before midnight. The San Juan, which was near it, suffered the same fate. It appears to be evident, that the other ten received no injury.

What however was still more afflicting, every thing was wanting at once: stream anchors astern of the praams to tow them away in case of accident; and boats for the reception of the wounded. The attack was to have been supported by ten vessels, and more than sixty gun boats and bombs. Neither bombs, nor boats, nor vessels, however,

made their appearance.

To conclude, in the position laid down, the praams would have been supported by the fire of one hundred and eighty-six pieces of cannon from the lines of St. Roch. This concert became impossible. More than four hundred cannon were to play at once on the bastions of the North, Montagu, and Orange. With a superiority of nearly three hundred pieces, Darcon lattered himself he should be able to silence the artillery of the place. But what was his consternation when he saw that the besiegers had no more than from sixty to seventy cannon in play, which were answered by the enemy from the mouths of two hundred and eighty pieces.

The combined squadron remained a quiet spectator of this strange disorder. Guiehen, who commanded our fleet, offered his assistance to Moreno, who returned for

answer, it was not wanted.

Bad became worse, and no remedy was at hand. Of the ten praams, eight were at too considerable a distance either to do much harm, or be liable to any great injury, the two others, to use the expression of Darcon, carried the gnawing worm in their sides. Moreno, despairing of being able to save any of them, gave orders to let those continue to burn which were already injured, and that all the rest should be set on fire. I myself have seen this original order. Such was the close of this day, in which ten vessels were destroyed, master-pieces of human ingenuity, which cost 3,000,000 of livres building (£.125,000) and the arming and fitting up of which with cannon, anchors, rigging, &c. cost two millions and a half in addition (£.104,000.*)

Scarcely had this formidable attempt been defeated under the walls of Gibraltar before it was re-victualled by lord Howe, in sight of our armies and navies. His lord-

*In the first moment of consternation the inestimable Darcon confessed, that he alone was blameable for the fatal result of the day. For a long time I was in possession of the short but energetic letter, which he wrote to the ambassador Montmorin, on the shores of Algesiras, to the dying noise of artillery, and by the light of the burning praams.

"I have burnt the temple of Ephesus; all is lost, and all owing to me. My only comfort under my misfortune is, that the glory of the two sovereigns remains unsullied. Accept the homage," &c.

Nevertheless when he recovered from his confusion, Darcon, in a very learned memoir, endeavoured to qualify the confession which had escaped him, and to prove that more than one accomplice were concerned in the failure, or rather that the blame was chargeable to circumstances alone and those of the most fatal and imperious nature.

ship boldly sailing up the Mediterranean afterwards with thirty-six ships. From Buena Vista he was perceived on his course from the one sea to the other; and general opinion pronounced him running on ruin. The fifty-two vessels which were in the bay weighed anchor and pursued him. But Howe laughed at our manœuvres, as fortune had done at our projects; and, after wearying the combined squadron in a cruise of a fortnight,

repassed the strait in as full security, as he had placed the fortress.

So many crosses ereated vexation, but not discouragement. The two French princes alone and their brilliant suite, who imagined that they had only come to the columns of Hercules to be present at the surrender of Gibraltar, deeming success no longer practicable, testified an impatience to be gone, which was far from satisfactory to the court of Madrid, but which nevertheless it granted. I was at the Escurial, upon their return. The reception they found at this second interview, was scarcely so affectionate as at their first appearance. The enthusiasm which they had at first excited had abated, which was to be expected.

The theatre of these events laid now before me, with how much interest did I examine the different approaches, and the whole compass of this famous rock. On the side of the Mediterranean it is most perpendicular, but is more sloping toward the bay of Algesiras. It is on this species of talus, that the art of fortification has displayed means

of defence so prodigiously numerous as can hardly be conceived.

Nature, as if to render Gibraltar inaccessible on all sides, has placed between the foot of this fortress, to the west, and on the side of the bay of Algesiras, a deep marsh which leaves between it and the place, as far as the land gate only, the breadth of a narrow causeway, commanded by an hundred pieces of cannon. A small dyke between the marsh and the bay runs by the sea side to confine the water, and terminates at the land gate; and the marsh is contained in the enclosure of the place by a palissade, which begins at the foot of the mountain and terminates at the sea. This palissade was the first victim at the siege of Gibraltar. It was re-established after the peace. The old mole is distinctly seen from it; it is a kind of narrow bank or causeway, with cannon planted on both sides, and entirely masks the new mole, which is half a league behind it.

After having an interview with three English officers, separated by this palissade, and who pressed us in vain to infringe upon the order of the court of Madrid, but with whom we could not refuse drinking a few glasses of porter to the health of George III, and general Elliot, we trod back the road from the lines. Behold, said I to myself, the rock which for five years engaged the attention of all nations. It is almost useless to the English, but they imagining their honour concerned in keeping possession of this spot of land, in spite of nature, which seems to have "lotted it to the monarch who reigns over the peninsula of which it makes a part, sacrifice millions to fortify, preserve, and defend it. On the other hand, vanity alone excites Spain to attempt its recovery; and to this chimera, under a monarch sparing of the blood and treasure of his subjects, she sacrificed, for four years together, most enormous sums, the most advantageous military plans, and even the glory of the kingdom, were that glory rightly understood.

CHAPTER X.

NALAGA. RETURN TO MADRID BY XIMERA, GAUSIN, RONDA, OSSUNA, &C. DEPARTURE FROM MADRID, ND THE CAUSE THEREOF. THREE ROADS FROM MADRID TO VALENTIA.

THIS would be the proper place for me to conduct my readers back to Madrid, through the kingdom of Grenadas, but I am obliged to confine myself to making them acquainted with Malaga.

itood.

Madrid,

In travelling thither from Cadiz, you traverse a very fine country, where high mountains and beautiful plains succeed each other alternately, as far as Antequera, a town agreeably situated on the summit of a very elevated mountain. Thence to Malaga there is a superb road, begun in 1783, and which winds for seven leagues between hills covered with vineyards.

Malaga itself is delightfully situated in a climate which is a stranger to rain, excepting in the latter season of the year. On the north and eastern sides, it is placed immediately at the foot of very high mountains, whose summits at times are covered with snow. On the west, is a fertile plain watered by two small rivers. The ridges of the mountains which command Malaga are well cultivated, and covered with almond trees, olives, oranges, lemons, figs, and especially with vines whose beneficial produce circulates at table, from one end of the world to the other. There are more than six thousand vine plots (Lagaris) within the jurisdiction of Malaga. The produce of common years is about 70,000 arrobes of wine (2000) butts more than half of which is exported.

It possesses from eight and twenty to thirty different species of grapes, among which the best are those called Tierno, Moscatel, and Pedro Ximenes. This last name, the origin of which it is difficult to determine, even upon the spot, is given to one of the most valuable Malaga wines, but belongs to no district exclusively.

There is another mode of classing the Malaga grapes, by the different periods at which they ripen. The early grapes are gathered in June. These it is that make the best raisins, and a wine also which is nearly as thick as honey. The seasonable grapes, which are gathered in the beginning of September, yield a dry wine of a better quality and stronger; and lastly the late grapes, which produce the real Malaga wine. Among these there are some sorts discounshed by epicures, and which being less usual are sold at a higher price than common wines; such is the wine called Lagrima de Malaga, which is the most excellent of those of the best districts; such also the Guindas wine which is no other than the common Malaga wine in which the tender buds of the black-heart cherry have been steeped the fruit of which is in Spanish called Guinda.

After the vine, the olive tree contributes most to the riches of Maiaga. There are five hundred olive presses in the neighbourhood of that town; but owing to the same causes that exist in other provinces, the oil is not of a prime quality; it is, however, tolerable at Velez Malaga, and still better in the vicinity of the village of Churian.

Few people, even in Spain itself, have knowledge of the sugar cane being cultivated round Velez Malaga, and especially at Torrox, two leagues beyond. It is true, a scarcity of wood has occasioned these sugar plantations, the ornaments of Moorish industry, to fall into decay, most of the canes serving only for sweetmeats to children who suck them. Among some which still exist, those particularly of M. Thomas Quilty de Valois deserve to be mentioned, he keeps two sugar mills employed, the produce of which is little inferior to the sugar of the Antilles. He has likewise established a refinery which has yielded samples of rum equal to the best from Jamaica. He makes use of sea coal for heating his coppers, which comes sometimes from England, at others from the coasts of Spain along the Mediterranean, where for some time back a sufficiency of coal has been worked from the mines, to satisfy the demands of the department of Carthagena. There are mines even at a little distance from Torrox, but the backwardness of the Spaniards in many instances, notwithstanding their improvement in several matters, is here the cause of their not being worked.

VOL. V.

The mountains which surround Malaga are inexhaustible treasuries for the mineralogist. They contain jasper, alabaster, antimony, mercury, sulphur, lead, amianthus, loadstones, &c.

Malaga has no other building which is remarkable than its magnificent cathedral, which is incomplete from a want of hands, and money; and a modern theatre, not

destitute of elegance.

In the time of the Moors, this town and its neighbourhood were much better peopled than what they are at present. The city formerly contained more than 80,000 inhabitants. In 1747 its population was 32,000, and in 1789 about 50,000. In the western part of its territory there were more than fifty villages; at present there are no more than sixteen. These facts prove better than all the declamation of philosophy

how highly injurious to Spain was the expulsion of the Moors.

Policy has not been the only scourge from which this country has suffered. It has experienced some earthquakes, and thirteen or fourteen times has it been subject to pestilence, the last happened in 1750; and the torrent of La Guadalmedina, which passes through it, renders it liable during the rainy season to terrible inundations. It has three suburbs, narrow, dirty, and ill paved streets, and rather bears the appearance of a large than a handsome city; but its territory and its haven unite in making it a town of great importance. Its port is famous for its spaciousness and conveniencies. It will contain four hundred merchant ships, and ten sail of the line. Vessels may enter or leave it with any wind. Two moles form its mouth about three thousand toises distant from each other; but the sea recedes by degrees from this coast; and as the Guadalmedina throws up a great quantity of sand Malaga may eventually be deprived of its port.

In the interim this town carries on a most extensive trade. The two nations which reap the greatest advantage from it, are first the French, and next the English. In 1791 there entered this port 321 French, 342 Genoese, and sixty-two English ships, &c. Nevertheless there are more vessels of this latter nation frequent the port than of any other. In 1789, the proportion was nearly a hundred English to eight or ten French merchantmen. The Spaniards themselves resort thither in greater number than for-

merly. Two only reported there in 1785. In 1793 there were thirty-three.

Smuggling has strangely encreased within a few years upon the coast of Grenada.

Hence severe laws which are attempted in vain to be enforced; hence frequent assassi-

nations which take place with impunity.

A road along the sea shore leads from Malaga to Velez Malaga, a pretty little town a quarter of a league from the Mediterranean, and birth place of the famous minister Galvez. In order to promote industry in this district, he established a manufactory of cards at Macharaviaya, a village in the neighbourhood of Velez, which supplies the whole demand of the colonics of Spain.

But let us return to San Roch, in order to resume the highway to Madrid. By a little deviation from the direct road you pass through Ximena, a town situated on the declivity of a steep rock. About twenty years ago, the minister Galvez established there a loundery for iron cannon, and ball, destined exclusively for the consumption of

Spanish America.

Three leagues beyond Ximena you come to Gausin, a handsome town in the middle of very high mountains, whence the rock of Gibraltar may be distinctly seen. At the foot of it is a deep valley, watered by numerous rivulets in every direction. A great enclosure, belonging to the Franciscans, contributes especially to embellish the scene.

At the A great se scene.

For the possessions of the monks are every where well situated and well cultivated; and serve to enliven the adjacent country.

Beyond Gausin, the road for two or three leagues lies over the side of the mountains, which are covered with vines from their summits to the bottom of the vallies. The country afterwards becomes more rugged; and the road as far as Ronda, lies across enormous mountains, in the windings of which waves the most horrid road imaginable. From time to time you meet with wretched villages hung, as it were, upon the sides of naked rocks. Their situation, their names of Gicatazin, Benali Atajate, sufficiently indicate, that built by the Moors in the bosom of the most inaccessible mountains, they served formerly as asylums from the attacks of the Christians. At present they are the haunts of thieves and smugglers.

The road after passing Atajate ascends again and continues to the summit of the high mountains, whence the rock of Gibraltar, is for the last time visible.

We soon afterwards discover Ronda, a town surrounded by a double enclosure of rocks, between which runs a small river, and forms a natural fortification where not of utility it is extremely inconvenient. This inconvenience, however, has lately been remedied by the construction of a stone bridge for the inhabitants, of a most tremendous elevation.

To the north-east, the environs of Ronda produce fruits of every description, a circumstance not often met with in Spain; for whether the gardeners want skill, or the nature of the soil be unadapted to their growth, the country of oranges, figs, and olives, is not that of the exquisite fruits which constitute the most ornamental and delicious part of our autumnal deserts. What would incline one to suspect the blame to lie with art, is the circumstance of the king's table being covered with excellent fruits of this kind from the gardens of Aranjuez and Saint Ildefonso, under the care of intelligent gardeners.

Paxarete, famous for its wine, is four or five leagues from Ronda, and belongs to M. Giron, one of the principal inhabitants of Ronda, an officer of distinction, known in the last war by the title of the marquis de las Amarillas.

Grazalema, situated, like Ronda, in the bosom of rocks, is only three leagues from the latter town. The inhabitants having abundance of water, and but few resources, employ themselves on one of the principal manufactures of Spanish cloths, for the consumption of the common people.

On leaving Ronda, passing through Cannete, a large unhandsome town, the country is uneven, and of melancholy aspect, notwithstanding its vast fields and plantations of olive trees; and after travelling five leagues you arrive at Ossuna, the capital of the dutchy of that name. The city is considerable, but nothing in it announces affluence, although many of the nobility reside there. It contains an Alameda, or public walk, decorated with a fountain: and the traveller, if so disposed, may amuse himself at the expence of a pompous inscription intended to commemorate a very wretched performance.

From Ossuna to Ecija is but six leagues, across a flat country in the best state of cultivation of any in Andalusia.

From Ecija to Madrid is seventy-five leagues, over a country which I have already described. I have now no more left me than to conduct my readers back to the French frontier by the road which I took in 1793, in consequence of an event which made the first month of that year a remarkable epoch.

The court of Spain had long foreseen the storms gathering over the head of the unfortunate Louis XVI, and principally with a view to its dispersion, and either giving

credit, or pretending to credit, the assurances of that prince, it received me in the month of May 1792 as his minister plenipotentiary. I shall observe on this occasion, that the Spanish monarch and his court did not act up to their professions with respect to me. They appeared to acknowledge my character in a free and spontaneous manner; while from the reception I experienced for the space of four months, it was easy to perceive how repugnant to their feelings this acknowledgment was. In this ambiguous situation was I placed when I was surprised at St. Ildefonso by the news of the event of the 10th of August, on the eve of the festival of St. Louis, the queen's gala day. I did not, however, refrain from attending at court. It was a courageous step on my part; the last I attempted. After that day I conceived it my duty to keep away, as after the downfall of the king I was no longer regarded as his representative. This circumstance, however, did not prevent my holding communication with the count d'Aranda, and his successor the duke de la Alcadia, as frequently as the interests of my country made it expedient.

In the mean time Spain, notwithstanding the pacific disposition which she pretended, and authorised me to give assurance of to the new French government, was making preparations of an hostile appearance. I watched its motions narrowly, and required an explanation. More than once did the Spanish minister take umbrage at a foreign government intermeddling in its interior administration. However as peace was at that time desirable, and hoping above all things to save Louis XVI, it was on the eve of engaging to remain neutral by a formal act. This act was even drawn up in my presence, and sent to Paris, whence it was returned to Madrid with some trifling alterations. Spain looked upon them as of sufficient weight to require fresh explanations.

In the interim the trial of the king was carrying on. Charles IV, used the most affecting but a tardy intercession in favour of his relation. The death of Louis was decided upon. He lost his head. My negotiation was at an end. In vain did I attempt to renew it. The prime minister, who was then with the court at Aranjuez, gave me to understand that for the instant any interview with me would be ill-timed. I insisted, stating that I could have no business any longer in Spain, if I ceased to possess the facility of discussing affairs relative to my country, and demanded my passport. It was sent to me; and I left Madrid the 23d February 1793. As I was then unacquainted with Catalonia, which at the eve of the war with which we were threatened must necessarily be the theatre of the military preparations of Spain, I resolved on taking the route of Valentia and Barcelona, re-entering France by the way of Perpignan.

The first day I reached Aranjuez, where the court was at the time. I saw for an instant some friends which I yet preserved among the Spaniards, and who lamented with me the disastrous rupture of which my departure was the signal, foreboding with me at the same time that it would not be of long duration. I continued my journey, and slept at Ocana.

I entered La Mancha, the western part of which I was about to travel through, in order to gain the kingdom of Valentia. I had already made this journey in 1783, in the finest season of the year, at a period when my mind, the political horizon, and every thing around me partook more of serenity.

There are three roads from Aranjuez to Valentia; one, which is the post road passes. by Taracon, Requina, &c. This is that I travelled over in 1783.

Another, which I made choice of on my return, goes through San Felipe, Almanza, and Albaceti.

The third is the beautiful new road which carries you very commodiously from Madrid to Valentia.

I shall travel rapidly over these three roads. If you take the post road, you pass along La Calle de la Reyna for the space of half a league, then turn to the left, and bid adieu to shade and verdure.

During the first seven leagues you frequently approach the Tagus, no longer now the Tagus of Aranjuez, nor even of Toicdo: you at length arrive at Fuenteduennas, a large

village, in every part of which poverty and idleness are but too conspicuous.

A little beyond Tarancon, a large town, three leagues farther on, you discover the castle of Ucles, which after having been a fortress, no doubt built to prevent the incursions of the Moors, as its form sufficiently indicates, is become the peaceful abode of a religious society.

I pass rapidly over Saylices, Villar del Saz, and Olivarez, the situation of which, in

the centre of a chain of hills, is highly picturesque.

Bonache, three leagues farther on; thence to the borough of Campillo, the distance is five leagues, by a road full of stones, and a country which presents on every side sterility and depopulation. From Campillo to Villargorda you travel over the summit of mountains, by paths where two men would be unable to go abreast without danger of tumbling over into deep vallies. After having thus stumbled for some hours over rocky ground, across a wild and uncultivated country, you descend for the space of a league by a very winding road, and discover the Rio Cabriel, serpentining in a narrow valley covered with verdure, which it leaves, after having passed under a handsome bridge of one arch, called El puente de Pajazo. Near this bridge is a vast cavern, formed by nature, the retreat of smugglers and robbers which infest this unfortunate country.

After climbing again a steep hill, you reach the post-house of Villagorda.

The mountains you have thus travelled over are called Las Contreras, the dread of travellers. The four succeeding leagues conduct you to Requena, across a plain which affords the first specimen of Valentia. The neighbouring stream, from which cuts are made to irrigate the plain, concur with the excellence of the soil, and the mildness of the climate, to make them fruitful in corn, vines, flax, pastures, and above all mulberry trees.

Beyond Requena is another chain of mountains, called Las Cabrillas. This road likewise is very rugged, but not of long duration, and at the end of three leagues you reach

a Venta, which stands entirely by itself, called La Venta del Relator.

As soon as you have passed through Requena you enter the kingdom of Valentia, and are able to distinguish this from the industry and activity of its inhabitants, who make every advantage of the slender portion of soil they find on the back of their rocks.

But the environs of Cheva in particular realize the captivating pictures one takes a pleasure in sketching of this country. It affords an inexpressible delight after crossing the dry and barren plains of Castile, where trees are so uncommon, the grass without verdure, and the lands without inclosures, to find one's self between live hedges, formed by aloe trees, and serving as fences to orchards, pastures, and plantations of olives and mulberries.

This lovely scene is continued for half a league beyond Cheva. The land afterwards is of a poorer nature. Soon however the delightful eye surveys Valentia and the Mediterranean. On arriving at Quartos, about a league from Valentia, you meet with nothing but a continuation of orchards, gardens, and little country-houses, the simplicity of which affords a charming contrast to the luxury of nature. Half a league farther you pass through a second village, which stretches to the suburbs of Valentia.

The road which I took on my return in 1783 is longer by seven leagues than the first. It is not the post road, but yet it may be travelled over either in coches de colle-

ras, or much more economically in little cabriolets, called Calezin, much in vogue in this

country, as well in the neighbourhood of Valentia as in the town itself.

On this second road you travel for six leagues over the richest country imaginable, by one of the best roads in Spain. Plots of mulberry trees intermixed with fields of rice continue all the way to San-Felipe. This town, formerly called Kativa, is built on the sloping side of a mountain, protected by two castles above it, and forms a kind of amphitheatre, thus explaining the long resistance it was able to make to Philip V, and for which it was punished by losing its name and its privileges. It has a church of hand-some appearance, and several fountains which would not disgrace the largest towns.

On leaving San-Felipe, for three leagues the road lays between uncultivated and unpeopled hills, when you arrive at the Venta del Puerto; you are then upon the confines of the kingdom of Murcia, so much extolled for its fertility and excellent cultivation. This praise, however, is well merited only in the plain wherein its capital is situated, upon

the banks of the Sigura, known by the name of La Vega de Murcia.

From La Venta del Puerto the view is confined on all sides to barren mountains, crossed by the road to Almanza. You discover this town at the extremity of a vast plain, famous for the victory which insured the throne to Philip V. This plain is well cultivated, and its fertility seems to increase as you approach Almanza. There is a tradition at Almanza, that the years immediately succeeding the battle, which has received its name from that place, were extremely productive; sad compensation for the destruction that victory occasioned to the human species! About the distance of a cannon shot on this side Almanza is a socle, which bears upon its four sides Latin and Spanish inscriptions, relative to the victory gained by marshal Berwick. Above the socle rises a little pyramid, upon which was formerly an armed lion. The people of Valentia irritated by this image, which seemed to threaten them, beat down the lion with stones, when the small statue the pyramid now bears was substituted in its stead. To eternise a victory like that of Almanza, one would look for a more magnificent monument.

The industry of Almanza is confined to the weavers, who indeed are numerous: the hemp grown in the neighbourhood is not near sufficient for their employment. To the north of the village are the ruins of an old inhabited castle, and to the west, at about a quarter of a league from Almanza, is a mountain in shape of a trapezium, the outlines of which are so symmetrical, that at a distance the traveller is inclined to take it for an enor-

mous intrenchment.

On leaving Almanza before the great road was finished, the traveller had to cross a stony country, wild, and covered with heath; another no very pleasing specimen of the kingdom of Murcia. You next perceive Chinchilla on the left, a town on a barren eminence, but which commands the spacious and fertile plains of La Mancha. One is then but a few leagues from Hellin, a place remarkable for being the native place of Macanaz and count Florida Blanca, who was exiled thither after his disgrace.

You then are near Albacete, the country about which is improved by irrigation. This large town laying between Valentia and Alicant, is a place of rendezvous for a great number of merchants. Its industry is exercised on iron and steel brought thither from Alicant, but in a somewhat rude manner. Still its manufactures are sufficient to banish

idleness and poverty from the city.

From Albacete the road passes through three extensive villages of La Mancha, La Gineta, La Roa, and Minalla; and you travel nine leagues across a vast plain which is not well cultivated, producing only a little corn and some saffron.

Next succeeds El Provenzio, rather a considerable town; the cultivation of saffron

is the principal employment of its inhabitants.

Beyond you pass over well cultivated lands and through two villages, Pedronera, in which there is a manufactory of saltpetre, and La Mota, pleasantly situated. Hence the eye surveys the immense plains formerly the theatre of the exploits of Don Quixote. Shortly after you find yourself within a league of El Toboso, the birth place of Dulcinea; and discover the steeple of El Toboso, the little wood in which Don Quixote waited for the tender interview procured him by his faithful squire, and the house in which Dulcinea received his amorous message.

At length you pass through Quintanar, and arrive at Corral, a large village, within

nine leagues of Aranjuez.

In 1783 the new road proceeded no further. In 1793 I found it advanced to the confines of the kingdom of Valentia, and with the exception of about twelve leagues the road from Madrid to Valentia was one of the finest in Europe. The new road takes a different direction in many points from the old one. It leaves San Felipe a league to the left. It does not cross the vast plain of Almanza, nor near the pillar which commemorates the battle. When you have attained the summit of the plain, you keep for some time along the skirts of it, and afterwards descend into the kingdom of Valentia, which announces itself by its temperature and flourishing state of cultivation. When I entered this kingdom in my last journey (the 27th February) already were the almond trees in bloom, spring shewed itself in myriads of opening flowers; our road ran between plantations of olive trees and carobas, favoured by the shade of which the earth already gave symptoms of its fertility. This early, cheerful robe of nature appeared the more striking, from our having previously travelled over La Mancha, still in many parts covered with snow.

We noticed, however, very few dwellings by the way. A Venta, situated midway on the slope of a hill, commands a view over a fertile valley. Thence to the Venta del Rey, a large new inn, is four leagues; at this place we were agreeably surprised at finding decent furniture, and a chimney place.

Every where throughout this district the eye is cheered with the appearance of comfort. The new road is constructed with the nicest attention, may even with magnifi-

cence.

At intervals you meet with handsome new built houses, fine bridges over even the smallest rivulets, superb raised causeways cased with masonry, numerous parapets for the safety of travellers, the road at times artfully winding round the sides of hills, and stones to distinguish the distance at every league. The fifty-fifth is at the entrance of a long village, at the end of which is built the Venta del Rey. Before you reach it you pass through Lanera, another village, consisting of a group of houses mostly new built, along the side of the road. High roads, particularly in fine countries, are like rivers and streams; they invite population.

CHAPTER XI.

MY ARRIVAL AT VALENTIA, INSURRECTION AGAINST THE FRENCH. DESCRIPTION OF THIS CITY AND ITS NEIGHBOURHOOD. RICE GROUNDS. BARILLAS. OILS. EXPORT ALOES.

WE arrived rather late at Valentia on the evening of the seventh day. The sixty-third column is opposite the first houses of the suburbs, where we deemed it expedient to pass the night; a measure of prudence recommended rather by the terror of the muleteer than any apprehension of our own. Valentia at that period was the theatre of a most violent insurrection, excited by royal and religious fanaticism against the French nation. Every thing that related to France, whether by name or origin, was exposed

to the fury of the populace. In order to repress this tumult, Don Vittoria Navia, who was governor in the kingdom of Valentia, had occasion for all his vigilance, and the whole of the trifling armed force left in his capital. On the night of our arrival the town was illuminated, and numerous patroles prevented disorder. The innocent and peaceable objects of this blind hatred, shut up within their asylums, were apprehensive of their being violated at every instant. Acquainted with some persons thus situated at Valentia, I sacrificed to their security the pleasure I should have had in seeing them; for

which caution they were thankful.

For our part, keeping ourselves still and close shut up within our apartment, we enjoined silence to such of our people as might betray us by their speech, and particularly to our children, who might by their cries have pointed out to passers by the residence of a little French colony. Happily we maintained the most secure concealment, and before the appearance of aurora we quitted this dangerous place. The tumult, which had more than once been at its height, fortunately passed over without any of our countrymen losing their lives; however many of their houses were broke open, and some warehouses were plundered; the Valentians thus gratifying the secret malice which had long before been excited by the prosperity of the commerce and industry of 'e French; a malice more prevalent among the people of Valentia than the other cities of Spain, from the manufacturers of that city considering us as active and formidable rivals.

I shall not make my readers haste with so much speed through the kingdom of Valentia, nor quit its capital so abruptly as I was obliged to do in 1793. This country, one of the finest in Spain, perhaps the most agreeable of any in Europe, deserves a more

ample detail.

Its capital, if not exactly a handsome city, is yet a very pleasant place to inhabit, particularly since a vigilant police has been established in it, occupied as well in adding to its embellishment as its safety. Although its streets be unpaved, they are very clean. The filth from which they are frequently cleansed serves to manure the vast orchard which surrounds it on every side. Idleness and wretchedness are banished from this city, every person being employed. In 1783 nearly four thousand looms were in use for making silks of different breadths, and occupied more than twenty thousand of its inhabitants, without reckoning the workmen in wood and in iron employed upon the construction and repair of so much machinery, those who separate or spin the silk, or those who dye it.

This prosperity has kept increasing since 1783, and I am assured that of late years Valentia kept eight thousand looms at work of every description. The government neglects no encouragement of this particular branch of industry which it can afford. During the war with France it exhibited several instances of this. The war rendered a resort to the quintas necessary upon two several occasions, but the court exempted all young men employed any way in silk manufactures; and this exception comprehend-

ed more than three thousand persons in the city of Valentia alone.

The manufacture of silk is not the only employment of the inhabitants of Valentia,

they furnish a considerable quantity of hemp to the king's arsenals.

Their wines and brandies are also exported in great quantities to England, the island of Guernsey, Holland and to the north by way of Dunkirk, where the greatest part of the brandies of Valentia were mixed. Within a few years past they have found a new market in Spanish America; and they even ascend the Loire as far as Orleans. For our merchants willingly mix these brandies with ours, which are of a superior quality; and their wines with French wines, in order to give colour.

Rice is another source of riches for Valentia, but the culture of it lessens the salubrity of this happy climate; however, they possess a method of sheltering themselves from the malignant influence of the rice grounds. I have known of some who not going out to their work before the sun was risen to some height above the horizon, returning to their close shut homes in the evening, and refraining almost entirely from the use of water, lived with impunity in midst of their fields of rice; but the greater part pay for their vicinity to them by intermittent fevers. Notwithstanding this they are not the less attached to this branch of husbandry on account of its favouring their idleness, being at the same time productive. Rice is sown about the festival of St. John, and is gathered towards the close of September. The crops seldom fail, and is secure of a market. Is it wonderful that such a species of culture should have its partisans? It has so many that government has been obliged to frame very strict laws to prevent the increase of rice grounds. They are met with in abundance along the coast, and particularly south of Valentia from Gandia to Catarrajo. In this part the predilection of the people for this culture is a mania which nothing can restrain. The administration divides the estates into different partitions or cotos, and designates such as within a limited space of time are allowed to be sown with rice; but the bounds specified are almost always exceeded. In vain does the captain-general repair to the spot, to watch over their adherence to the restrictions, his authority is frequently compromised, and his safety occasionally; so that the law is oftentimes eluded and with impunity. In consequence, of late years the crops of rice have been prodigious. They serve for the consumption of all Spain, if the south of Andalusia be excepted, where a preference is paid to the rice of Carolina.

Its numerous markets have greatly tended to increase the price of rice at Valentia. The measure sold in 1785 at from 6 to 7 piastres has risen to 10 and 12; and the farmers of the country affirm, that Valentia receives not less than from 30 to 32 millions of rials (upwards of 350,000l.) for rice alone. There are two modes of cultivating this grain, it may either be planted or sown. The crop of that which is planted greatly surpasses that of what is sown, but requires an extra care, on which account it is almost every where sown. The ground is previously tilled but remains level, without any appearance of a furrow, and is inundated to the depth of somewhat more than a foot. Rice, at least that which is cultivated in the kingdom of Valentia, has the singularity, possibly peculiar to itself, of being constantly in the water even to the time of gathering inclusive. The rice ground never has the water drained from it, except when it is weeded. When ripe the husbandmen proceed in the water up to their knees, followed by carts on which the sheaves of rice are laid; it is afterwards threshed in the same manner as other grain; that is to say, as in the kingdom of Valentia, so throughout almost all Spain, it is trodden out of the straw by horses and mules. After this operation the rice remains in its husk or balle. It is separated from this by passing through mills perfectly resembling flour mills excepting that the mill-stone is coated with cork. Rice however is sold indifferently before or after this last operation.*

Barilla is a production peculiar to the kingdoms of Valentia and Murcia. It is an essential ingredient in plate glass. The annual quantity gathered may amount to one hundred and fifty thousand hundred weight, which is divided between France, England, Genoa, and Venice.

VOL. V.

4 H

^{*} Rice grounds have to the present time continued to increase. A law suit took place between their partisans, and the advocates for mulberry plantation, which was determined in favour of the former; the latter in consequence have abused their triumph to the injury of the healthiness of the air. Notwithstanding, the rice grounds do not yet extend beyond Ria; the rest of Valentia is free from this scourge.

Potash, in Spanish called Sosa, is a species of barilla employed in the soap manufactories of France and England. The kingdom of Valentia produces about twent-five thousand quintals a year.

The Agua azul, is a third sort of barilla. About four thousand quintals of this are

annually produced, most of which is sent to Marscilles.

Lastly, Solicor, a fourth kind, is produced without cultivation, and is employed in

the glass manufactories of France, England, and Italy.

When the plant of these four sorts of barilla is well matured, it is left a day or two in heaps to dry; afterwards it is put into a hole without much pressure, three or four feet deep, then set on fire and turned over or stirred up with long poles; and in proportion as the first plants are consumed, others are thrown in. When they are all sufficiently burned, the hole is covered, and the barilla left to cool. It is too often adulterated by mixing with it bastard herbs produced in the same soil. The cinders that remain after this burning form lumps, which are the barilla in pieces as it is exported.

Oil is one of the most abundant productions of the kingdom of Valentia, but is not allowed to be exported except when the price is very low. It is reputed to have a disagreeable taste and smell, and generally speaking deserves the reproach. Its imperfection is attributed to different causes; 1st, to the custom of despoiling the olive trees of their fruit by bruising, instead of gathering it with caution; 2dly, to keeping the stone too long in the fruit; and 3dly, to the scarcity of oil mills, which occasions the olives to be left several months in heaps, in which they ferment and rot before the juice is expressed.

This third cause appeared to me to be the chief and the most active. It is one of the principal inconveniences attendant on signoral rights which continue yet oppressive to a great part of Spain. In the kingdom of Valentia in particular there are few noblemen without exclusive ovens, and mills, both for grain and for olives. Now this second species of mills are not sufficiently numerous by much, for the use of the proprietors of olive grounds, who are not yet allowed to build any for themselves. The Valentians will consequently continue to have bad oils as long as they remain subject to this abominable slavery. Notwithstanding this disadvantage, with nice attention and care, some of its cultivators manage to produce oil, which even connoisseurs esteem but little inferior to those of Provence.*

The industry of the people of Valentia derives advantage from all the productions of their soil. The province contains a kind of earth of which they make squares, or tiles of coloured delph, called Azulejos, and which are manufactured at Valentia alone. They are used to pave apartments or cover ceilings; the most complicated subjects are

painted upon them; such, for instance, as a masked ball, or a bull-fight.

Espart, although one of the vilest productions of the kingdom of Valentia, is of great use to the inhabitants; of this they make mats and cordage. Formerly great quantities of it were sent to the ports of France and the Mediterranean. This exportation was prohibited in 1783. The measure excited disapprobation, and was much murmured at. It was pretended that all the espart produced could not be consumed in the country. The court of Spain therefore permitted certain individuals to export considerable quantities; and the ports of Toulon and Marseilles, where it is of great use in the dockyards and arsenals, have reaped advantage from the permission.

^{*}Their method of making oil is lately a little improved, especially in the neighbourhood of Alicant. At Elches, for example, and on the hills in the neighbourhood of this little town, a pure oil is made; as clear as water; and inferior in no respect whatever to the finest Provence oils.

The Valentians make use even of the aloe, a parasite plant seemingly destined only to decorate and enclose landed possessions. They draw from its long and thick leaves, a kind of thread, of which they make reins.

Hesides these they export wool of a second quality, the produce of their sheep. It is in the neighbourhood of Gandia in particular that the flocks are fed from which it is shorn, and from the port of this city it is shipped for Marseilles, with numerous cargoes of dry fruit, annisced, and cochineal, the produce of the country.

To conclude, in their abundant crops of oranges, lemons, grapes, and figs, but particularly in their wines and brandies, they possess an immense fund of articles for exportation.

Industry in Valentia, as well as in the provinces of the crown of Castile, is not burthened with the scourge of royal impositions. All those taxes which pass under the denomination of provincial rents are there unknown. For them the Equivalente is substituted, which is a direct tax on all possessions of every description. They are valued in every district with a tolerable precision by the office for taxes (La Contadaria de mopios, y arbitrios;) and this tax, which is moderate, is collected by a person appointed by the alcalde. On the other hand, the signorial rights, and the feudal claims to which they are subject, which are taken in kind from the produce of every crop, and which amount to a seventh, a sixth, and in some places a fourth part, are a tax upon them grievous indeed.

CHAPTER XII.

BUILDINGS OF VALENTIA. CANALS. IRRIGATION. 175 NEW PORT. SILKS. PROGRESS OF 11, MANUFACTORIES.

BUT let us enter the city of Valentia, and examine the objects it encloses worthy of remark.

Its exchange is a large building where the merchants and manufacturers assemble, and where the principal object of their discourse and dealings is that most valuable production of their country, silk.

Arts and literature are rarely much cultivated in manufacturing or commercial towns. However at Valentia there is a public library belonging to the archbishop, which even contains a collection of statues and antique busts.

The last archbishop of Valentia was a man of austere manners, which rendered him adverse to profane enjoyments. His scruples have lessened the value of this collection, by occasioning the mutilation of some of the statues of which it is composed. The playhouse at Saragossa was struck with lightning, he thereupon obtained an order for that of Valentia to be closed, and houses to be built on its site.

Since his death, the friends of the drama are preparing a new theatre under the direction of Fontana; a skilful architect invited some years ago to Madrid to decorate the palace *

El Real, the residence of the captain-general, is more remarkable for its charming situation than for its form. It is an ancient and vast edifice, placed in a most conspicuous quarter. Between the walls of the town and the suburbs, on this side, is a long esplanade, in which five bridges over the Guadalaviar terminate. Were this river full, it would be difficult to imagine a more delightful prospect; but it arrives at Valentia exhausted by the abundant tributes it has afforded in its course: for this is the river

^{*} The building is completed, but Valentia is still without plays.

which supplies the chief means for the irrigation of this fertile country. These irrigations are made under regulations which cannot be too much admired. Different cuts from this river conduct its water into numerous canals for the purpose of watering the land (azequias) and diffuse its benefits over every estate. Each proprietor knows the hour and day allotted for his receiving this salutary visit. He then opens his sluices and introduces the water into the small canals which surround his territory, and which he is most expressly obliged to cleanse twice in a year. There are four azequias run from the Guadalaviar at different elevations. The chief is that which begins at Gestalgar (called Moneada) a borough four leagues from Valentia, where an office for the management of this azequia is kept; for in this kingdom irrigation forms an essential article of the general police; and, in the capital, there is a tribunal exclusively charged with looking to the execution of the laws which relate to it, and of punishing delinquents. Its sittings are held in the vestibule of the cathedral; and, notwithstanding the almost rustic simplicity of its members, who are wholly farmers, it knows full well how to make itself respected.

This general and periodical watering has undoubtedly great advantages. It maintains verdure and fertility. It multiplies productions to such a degree as to maintain the earth constantly covered with fruits. The leaves of the mulberry-trees are three times gathered; the meadows of trefoil and luzerne are mown eight, nay ten times a year; and the earth, not satisfied with bearing forests of olive and mulberry-trees, produces beneath their shade, strawberries, grain, and vegetables. But this watering has also a great inconvenience. This artificial fertility does not bestow on the plants that substance which they receive from nature alone; for which reason aliment in this country is much less nourishing than in Castile. This abundance of water, which changes the nature of the plants, appears likewise to have an effect upon the animal kingdom. Malignity has assumed still more with respect to the human species, nor has it spared the fair; it has invented the following verses, which I am far from adopting, and which with difficulty I

allow myself to transcribe:

En Valentia la carne es hierba, la hierba agua, Los hombres mugeres, y las mugeres nada.*

The finest walks of Valentia, the Alameda, Monte Olivite, and the road of Grao, a little village half a league from Valentia, and by the sea side, are upon the banks of the Guadalaviar.

For a long time Valentia has had no other harbour than the bad road opposite to Grao. Small ships scarcely approached nearer than half a league to the coast, and those of three masts were seldom seen there. Cargoes were put into barks, which were brought almost to the shore, and afterwards drawn by oxen to the beach. Valentia only wanted a port to make it one of the most flourishing towns in Spain. Within these eight or nine years, government has been occupied in procuring for it this advantage. An able engineer, a pupil of Don Thomas Munoz, was charged with this undertaking. Every thing contributed to his success; the special protection of the captain-general of the province, Don Louis de Urbina, the voluntary subscriptions of the merchants and manufacturers, and an advance on the part of the bank of St. Charles, of 5,000,000 of rials. The new port will have eighteen feet of water, and will even be able to receive frigates. It has been made, not by lowering the beach, but by elevating by arti-

ficial means the water of the sea, means similar to those employed in creating a port at Cherbourg.**

Thus the coast of Valentia will no longer throughout almost its whole extent remain as it was wont, the dread of mariners; for before this modern creation, it did not possess one single good port. From the Alfaques, at the mouth of the Ebro, to Carthagena, there were but the roads of Alicant and Santa Pola, the bottom of which could be depended upon, or which afforded the least shelter in case of distress.

Under the administration of M. de Aranda, an establishment was attempted, which did not realize the expectations conceived. A great number of Spanish slaves languished in slavery under the Algerines in the island of Tabarca; Charles III, redeemed them, and afforded them an asylum south of Alicant, in a small desert island, named from its appropriation Nueva Tabarca. The attempt was laudable; it turned out abortive. Nature seems to have condemned this island to continue a desert, by refusing it wood, stone, earth, and water.

A different destiny awaits the new port of the Grao. It has a prospect of great prosperity, and will no doubt much injure the port of Alicant. Previous even to its being thought of, nothing could be more cheerful than the road from Valentia to the Grao; yet this small village was only peopled with fishermen; and the neighbouring shore was covered with wretched cabins. A fire having destroyed a number of them, they were replaced by pretty uniform buildings, which the proprietors were obliged to construct upon a particular plan: hence shortly will result a new town, which will not add a little

to the embellishments of the neighbourhood of Valentia.

In order to be delighted with a view of Valentia and its territory, you should see it from the summit of the tower near the cathedral called the Miquelet. Hence the city appears to be built in the middle of an immense orchard, interspersed with numerous cottages, and the Guadalaviar is seen training its diminished tide towards the sea. Hence you distinguish the Albufera, a lake which runs by a very narrow channel into the Mediterranean; a lake which upon a map, or even at the distance of a few leagues, might be taken for a gulf. This lake abounds in water fowl, the shooting of which is a most intoxicating amusement for the Valentians. They especially follow it up twice in the course of November. At these times the lake is covered with moor-hens, teal, and wild ducks. The sportsmen in boats drive the flocks before them, and oblige them to take shelter among the flags; at length, too closely pressed, they fly away in clouds, and then it is that they are killed at pleasure. The Albufera belongs to the king, who farms it out at 12,000 piastres. The farmer sells his permission to shoot upon it. This is a sport for those fond of shooting less fatiguing, and more productive than any other.

Strangers are shewn the cathedral of Valentia. It is an edifice rather elegant than magnificent, the walls of which are cased with stucco in pannels with gold borders. It contains, among other good paintings, some productions of Joanes, one of the best Spanish painters of the second class. The Temple also is highly extolled, it is a modern church built in a simple yet noble style; and the college of the patriarch, the church of which, blackened with smoke, possesses a relic which is shewn with much ceremony to

those who would see it, and those who would not.

^{*} The works of this port have been continually carried on, but the success attendant upon them does not justify the original expectations. A duty had been laid upon silk, the produce of which is appropriated to the undertaking. Different other funds are assigned, but winter destroys the progress of the summer. The winds continually bring back shoals of sand to the entrance of the port; and it is much to be apprehended, that all these different expences will be a dead loss.

Other churches as well possess paintings by Joanes, Rivalte, and Orente, the three

painters of Valentia who enjoy the highest repute.

What however chiefly give celebrity to the city and kingdom of Valentia are its manufactories. We shall say but little of that of its cloths, although it contributes materially towards the prosperity of a part of the kingdom, that which lies in the mountains towards the west. There are, as it were hidden, the manufactories of Enguerra, Onteniente, Concenteyna, and particularly that of Alcoy. They work up most of the wool of the country, which, notwithstanding it be of an inferior quality, makes very good common cloths, and is much in demand for the manufactories of Languedoc. But silk is for the inhabitants of this kingdom a matter of far different importance. Twenty years pack the produce greatly exceeded their means of converting it into manufactures; * and then the motive of government for preventing its exportation was inconceivable. Now that the number of looms is nearly doubled, the prohibition has a reasonable motive. The inhabitants are even obliged to import silk continually from Italy, and sometimes from France, as was the case after the bad crop of 1784; and as has been the case when our manufacturers have been deficient of hands. However, a part of the silk of Valentia finds its way out of the kingdom in spite of the vigilance of administration. Its emission from that kingdom to the interior of Spain is not forbidden. There passes into Andalusia a much more considerable quantity than its looms can employ; and it is well known, that some descends the Guadalquivir, which is embarked for England.

The progress of the manufactories has greatly encouraged of late years the planting of mulberry trees. Every where are they planted, and every where do they succeed. A few years ago there yet remained between Valentia and Murviedro a large tract of poor and barren land, called El Arenal; at present it is covered with mulberry trees. A planter there was mentioned to me, who gathers annually as much as twenty pounds weight of silk-worm eggs, and possesses a sufficiency of mulberry-trees to furnish them food without necessity of purchasing leaves; and it is common for individuals to possess five, six, and seven pounds of eggs. It may not be improper to observe, that all these mulberries are of the white kind (moreras); for, in some of the provinces of Spain, the kingdom of Grenada for example, they are black (morales.) The leaves of the latter yield

a silk but little inferior to that from the white mulberries.

The leaves of the former are sold by cargas, each carga being equivalent to two hundred and seventy pounds French. They are gathered once, twice, and at most three times in a year; but it seldom happens that the last crop is so abundant, or of equal quality with the first. Beneath so auspicious a climate, the leaf of the mulberry-tree may be gathered through the greater part of the year, but the leaves are plucked only as they are wanted to supply the silk-worms. The number of these leafless trunks, which increases as the season advances, tend greatly to lessen the beauty of these plains, so green and so productive.

The silk of Valentia is comparable for fineness with the best produced in Europe; but there is a defect in the spinning: many thousand hands are employed who do not all spin equally well. Hence an inequality in the tissue. Hence when we import it, it is

never used for fine works.

It is well known, that the beauty of silks depends much on the manner in which the silk is wound from the cod. This first spinning is effected in three different manners, according to the reels employed. That which has long been and continues to be practised in Spain has this defect; the small threads from six, seven, or eight balls,

* It is calculated, that the looms of Valentia work up a million lbs. of silk.

hich the nanners, es to be ht balls,

which are stripped at a time, unite to form one thread on the spindle, without its being previously rubbed against another; so that the thread of silk thus formed is flossy and easily breaks. The second mode of winding is that used by the Piedmontese; it consists in causing each thread of silk to be united with another, and not to be separated until they have first twisted four or five times round the other. The third manner is that of Vaucanson, and is an improvement of the last. In the reel which he invented, the two threads of silk, after their first twisting, unite a second time for the same purpose. This operation is called the double croisade.

If these threads thus wound on the spindles be designed for the woof, they are set in a machine of several stories, where they are separately twisted. Thence they are removed to another machine where they are twisted together; after which they are ready for the loom. The threads designed for the warp are twisted only at the instant of re-

But before the threads are twisted two together, they undergo the operation of la breve, which consists in stretching them over a shallow boiler containing viscous matter, in a state of ebullition, the exhalations from which fit them for uniting one to the other. They are afterwards carried to the machine where they are twisted. Organzine is the silk in the state it leaves this machine. It is only in this shape that it is permitted to be exported from Piedmont, where the operation of twisting was better performed (before the method of Vaucanson was perfected) than in any other country. The method of that skilful machinist, which embraces all the operations relative to the manufacture of silk stuffs, is exclusively practised by the manufacturers of Lyons; but the silk of this country alone can be used with the reels for the double croisade, which go by his name; for foreign silk, a greater part of which is used in these manufactories, must be organised before it is exported.

For a long time machines to save labour, have been known in Valentia as well as at Talavera de la Reyna. In the latter town I noticed one single wheel with teeth, which set in motion a thousand of those little spindles on which the twisted threads of silk are wound. The machinery of Valentia is on a smaller scale than at Talavera, for the former place does not like the latter contain a whole royal manufactory comprised in one enclosure. Each manufacturer here meets in dispersed quarters with the machines and hands requisite.

As to spinning, the Spaniards still adhere to their defective method with an obstinacy, which the government has latterly thought it right to oppose. In 1781 it caused a French merchant, established at Madrid, to enter into an engagement, to supply first the manufactories of Murcia and Valentia, and in succession such others as might desire them with reels after the plan of Vaucanson. But Spanish idleness rejected the adopting of a silk, which twisted in this manner is closer and more fine, and requires greater nicety in weaving, without obtaining an augmentation of price, adequate to the extra labour. In consequence French hands were employed in the first experiments of this description.

La Payesse, an intelligent manufacturer, established a manufactory on a large scale at Milanesa, near Valentia, wherein silk was spun, wound, and organized after the manner of Vaucanson; but this silk being dearer by from 50 to 60 rials the pound than that prepared after the Spanish mode, it was less in demand, so that this estimable citizen was a loser by his experiment. Nevertheless he was not disheartened. He called theory to the assistance of practice, and published a treatise on the art of spinning, winding, doubling, and twisting, after the manner of Vaucanson. He even offered to instruct the proprietors of silk-worms, and direct them in their operations. But it is greatly to be

apprehended that these attempts will be abortive as long as all the implements used in Spanish manufactories are in such a state of imperfection, as disgusts the intelligent observer, although it appear not to have sufficiently struck the government. It must, however, be allowed, that in Spain they give the appearance of mohair to their silk in Valentia in as excellent a manner as in any other part of Europe. The Valentians owe the perfection to which they have attained to Don Manuel Fez, a manufacturer full of zeal, who discovered this secret by stealth among the Levantines, in a voyage to Turkey for that express purpose.

But the other branches of the manufactories of Valentia have not of late years improved as might be expected; this is imputable to the regimen with respect to silks adopted by government, and the almost incurable predilection of the Valentians for their old customs.

The patriotic society of Valentia has however lately attempted to further the progress of industry.* None has more diligently or more successfully exerted itself in favour of useful establishments. This society encourages the planting of mulberry trees, improvements in the preparation of silk, and adjudges prizes to the inventors of new machinery calculated to simplify the process of the arts. The patriotic societies of Spain are a modern institution not yet arrived at perfection, but which already shews and keeps up a public spirit. The French republic, when peace resumes its empire, will possibly find it advantageous to adopt similar institutions, for the perpose of repairing with promptitude the injuries sustained by industry from the revolution.

Much has the commerce of Valentia suffered from the war between England and Spain. Its port has been almost entirely abandoned, and the productions of this beautiful country have experienced, as well in their price as in their sate, a material reduction. The price of the pound of silk, for example, has fallen from five to three piastres; which proves what we have previously observed, that in spite of prohibition during peace a great proportion of the silk of Valentia is exported.

CHAPTER XIII.

ENVIRONS OF VALENTIA. BENIMAMET. BUILJASOT, THE CHARTREUSES. MURVUDRO, THE ANCIENT SAGUNTUM. COAST OF THE KINGDOM OF VALENTIA. MODERN ESTABLISHMENT OF SAN CARLOS. PASSAGE OF THE EBRO.

DURING the fine season, which comprises in Valentia almost the whole of the year, the environs of the capital are delightful to behold. A number of pleasing rural habitations have a claim on the curiosity of the traveller. I particularly recommend to such the village of Benimamet, half a league distant from Valentia, and among its country-houses that especially occupied some years back by Don Pedro Mayoral, canon of the cathedral. It is on an eminence in the centre of a garden wherein orange and lemon trees embalm with their fragrance the purest atmosphere. The coolness of its alleys, the variety of views it commands, the fertility which surrounds it, combine to make it a delicious residence. There it is, nay in a hundred places in Valentia, you will find that the sensible and clegant Swede who filled the embassy to Paris,† erred not widely from the truth when he said, "in this happy country every thing is forgot, you cease to belong to any nation, to have any business, are no more a husband, a father, nor a friend; you feel yourself an insulated being intoxicated with the beauties of nature,

^{*} Notwithstanding the recommendations and encouragement of this society, mulberry trees have rather diminished than increased within these late years, on account of government not interfering sufficiently to prevent the augmentation of rice grounds.

[†] The count de Crutz.

the year, ural hal to such countryon of the d lemon is alleys, make it will find t widely ou cease er, nor a nature,

rees have ring suffi"and relishing existence." In the garden which brings to my remembrance this rhapsody, and which if it could be realized, would realize the statement I met some years ago from the good Canon Mayoral, with a reception which I shall never forget. The serenity which reigned about him seemed to dwell in his soul, and was painted in his features. Towards me he was prodigal of kindness, as nature had been to him of her gifts. He is no more. Sit illi terra levis.

A quarter of a league from Benimamet there is another village on higher ground, called Burjasot. Here, besides the tomb of Mademoiselle L'Advenant, a celebrated actress, the Le Couvreur of France, who, more fortunate than her, was allowed without obstruction an asylum under shelter of the altar, travellers are shewn, as one of the curiosities of the country, the Sichas, or Silhos, which are large cavities from 25 to 30 feet deep, dug in the form of immense jars, and cased with masonry. They are the work of the Moors, who used them as granaries, to which purpose they are applied by the Valentians.

Twenty other sites about Valentia exact the attention of the traveller. If desirous of seeing a fine convent of Franciscan monks, he may visit and admire that of San Miguel de los Reyes. He will have it proposed to him to walk to the three chartreuses, situated in the neighbourhood of Valentia, all of them in a delicious situation. One in particular, that of porta Celi, deserves aspecial notice; every thing shews opulence, every thing tends there to maintain the quiet of the soul. Whatever aversion to monastic life a man may entertain, he cannot resist a sensation of esteem for those silent solitaries, not unmindful of the benefits which nature has spread around them, who tranquilly laborious, austere yet not uncivil, apparently do wrong to none except themselves. I visited some of their cells, the furniture of them was neatly trim and elegantly simple. I walked as well to their cemetery. Its boundaries are marked by palm-trees which shade the tombs beneath; beside them roses grow as if to prevent the morta remains of humanity from infecting the air respired in this sacred asylum. I regretted that it was uncommon thus to represent death under less hideous forms, and banish those images which render it so terrible. Why, said I, why endeavour to strew with mournful objects, to surround with frightful precipices, this road which none can shun? Why not rather assist mortality to tread this path, if not with cheerfulness, yet with serenity? Away then from the bed of death, away from the bier with objects exciting gloom, or what may alarm those who survive. Let us enjoy free from excess, and consequently from remorse, the blessings the earth supplies; and when the organized dust which the breath of life animates for a few seconds, be required again by our common mother, may it serve to make fruitful her entrails, and if possible adorn her face.

But let us leave Valentia and its charming environs, to resume the road to Barcelona. The first remarkable place at which the traveller arrives beyond Valentia is the ancient Saguntum, now called Murviedro. The castles by which it is commanded are discerned at two leagues distance. At arst you are induced to conceive them the remains of the ramparts from which the Saguntines so long repelled the Carthaginian hero, but afterwards learn that these castles were the work of the Moors. They built upon the heights on which these castles are situated seven fortresses, that communicate with each other by subterraneous passages, some of which are still almost entire. It appears that Saguntum was built half way up the eminence, and in particular extended on the other side into the plain approaching the sea, far beyond the site of Murviedro, since Livy says it was not more than a thousand paces from it; whereas the present confines

of Murviedro are a league from the sea.

Murviedro still abounds in stones with Phænician or Latin inscriptions. The latter are numerous in the walls of some of the streets; and there are five of them, remarkably well preserved, in the walls of a church. It is likely that such as are found on the side of the mountain, or even higher, have been carried thither by the Moors, in common with other stones for building. Thus, in the walls of their ancient fortresses, we find a statute of white marble without a head, and some stones with inscriptions placed in an inverted position.

The monuments, the remains of which are still in preservation at Murviedro, date their construction from the period that the Romans, after the brave defence and destruction of their town, rebuilt it, made it a municipal city, and one of the most superb cities to be found out of Italy. They had among others a temple dedicated to Bacchus, the wreek of which is yet visible, on the left near the entrance into Murviedro; its pavement in mosaic, which was suffered to fall to decay through neglect, has been taken up and transported to the library of the archbishop.

The foundation of the ancient Circus of Saguntum is still discoverable, upon which walls, serving as an inclosure to a long continuation of orchards, have been built. This Circus, as it is easy to perceive, was adjoining to a small river, which was the chord of the segment formed by the Circus. The bed only of the river now remains. It cannot be doubted but that, when the mock sea fights, called Naumachiæ, were here exhibited, this bed was filled by the tribute of neighbouring canals which still exist.

But of all that remains of old Saguntum, nothing is in so good preservation as the theatre. In it you may plainly distinguish the different seats which the citizens occupied, each class according to its rank. At the bottom, in the place of our orchestra, are the seats for the magistrates; next, those for the equestrian order; and last of all, those for the people. The two door ways at which the magistrates entered still remain; also two higher up, exclusively reserved for the equestrian order; and almost at the top of the amphitheatre, which continues without interruption from top to bottom, the two galleries by which the multitude withdrew, and for that reason called by the ancients vomitoria; lastly, the four or five highest rows of seats which were destined to lictors and courtesans, are yet entire, as well as the semicircular roof of the whole edifice. On the outside there yet remain the projecting stones, wherein the bars were inserted to which was fastened the great horizontal covering which sheltered the whole assembly from the rain and sun; for the aucients in constructing their theatres foresaw and provided against every thing. Every one had a seat, and all were secure from the inclemency of the weather. Every means was taken to prevent disorder. In a spot still discernible the judges were seated. If any turbulent spectator drew upon himself their animadversion, they had lictors at hand to seize him; who conducted him into a private chamber, between which and the judges seats there was a communication by a private staircase: he was there interrogated, and if found culpable, was confined in a prison, under the chamber in which he was interrogated, till the conclusion of the representation.

Dean Marti, who has given a detailed account of the ancient Saguntum, estimates it capable of containing nine thousand persons; and this appeared to me credible. Many wonder how the actors should, in the open air, have been able to make themselves heard by so numerous an audience with their natural voice. However, in 1783, I convinced myself it was possible by placing a boy where the stage formerly was, whilst I was at the top of the amphitheatre, and making him repeat phrases, of which I lost not a word.

No traces of the stage remain. Beyond the amphitheatre, of which some of the benches towards the centre are sensibly decayed, the vestiges of the place occupied by the actors are with difficulty distinguished; it offers nothing but a few trees and ruin-

latter are markably n the side common we find a ced in an

mates it Many s heard nvinced was at a word. of the pied by d ruinated buildings. The front of the ancient stage has been converted into an alley of mul-

berry trees, where rope-makers have established their moving trade.

No care was taken to preserve this valuable monument. A jailer had his habitation there, which he extended or changed as convenient. A few poor families build within it wretched huts, of which the Romans, almost twenty centuries before, prepared the walls and coiling. Never was time better assisted in its ravages. The sacrilege would have drawn tears from Caylus or Winkelmann. At length, in 1787, they began to be repaired. The Corregidor of Murviedro, raising from the dead as it were this corpse of a Roman theatre, relieved it from degradation, and restored it for some hours to its ancient use, by causing a Spanish piece to be represented within its walls.

One of the late captains-general of the kingdom of Valentia, Don Louis de Urbina, improved upon this solemn reparation. Under his auspices it was attempted to make the theatre of Saguntum fit for its ancient destination. A Valentian poet, Don Francisco Bamahonda, composed a tragedy, the subject of which was worthy of the country and worthy of the theatre; it was the siege of Saguntum itself, it was that noble self-devotion which covered with ashes, blood and glory, that land dear to honour, and dear to liberty; but it appears this fine project has vanished into air, at least it is said there is no longer an intention of reviving the theatre of Saguntum, and it is left as before to the observations of antiquaries.*

From the place which it occupies you ascend with difficulty to the ancient fortresses of the Moors which crown the enclosure. Upon the platform on the summit is an humble hermitage, the inhabitant of which enjoys one of the finest prospects in Spain. It commands the rich plain which separates Murviedro from Valentia. Thence you see the steeples or this capital rising through the orchards by which it is surrounded. Before, you behold in perspective a considerable part of the Mediterranean, the shores of which are covered with vineyards, olive and mulberry trees, from Murviedro to the edges of its banks: on the left a chain of hills bounds the horizon, and insensibly diminishes to a level with the sea, leaving no interval but that formed by the road to Barcelona.

The wine in the environs of Murviedro is strong and well tasted; but most of it is converted into brandy, which is put into barrels and conveyed to a small port about a league from Murviedro, whence they are shipped for the North, for France, or for Spanish America, which, since trade has been thrown open, afford a considerable market for the brandies of the coast of Valentia.

Beyond Murviedro, vast fields shaded by olive trees and carobs, rich vineyards, and pictures of the most cheerful fertility accompany you, as you travel over a superb road, the whole of the way from that town to Castillon de la Plana, a borough seven leagues from Valentia.

At a great league from Murviedro we stopped awhile at Almenara, a village agreeably situated on an eminence. Here I found five curates transported from the Roussillon, to whom government had granted an asylum in a convent of Dominicans. It was consequent that many of these exiles would seek refuge in preference in a neighbouring state of the catholic persuasion; and on the way I scarcely passed a league without meeting with some. At first they took up their residence in the capital, and most considerable towns of the peninsula, hoping to find in these places greater resources than elsewhere. They excited in the beginning a double interest, as objects of distress, and persecuted martyrs of religion. The faithful, in their blind veneration for these victims, went so far as to prefer them to their own priests, the more so, from wretchedness obliging those

^{*}It was Townshend, the English traveller, who first drew a momentary attention to this theatre.

to cheapen, if I may use the expression, the spiritual treasures they dispensed. The interests of mortality soon however spake louder than the interests of heaven. The indigenous priests took umbrage at the prosperity of the intruders; and whether government paid any respect to their representations; whether they conceived it dangerous to suffer those delicate questions, which relate to the rights of kings and subjects, to be discussed in places where numbers were collected together, it dispersed the French ecclesiastics over a larger surface. It ordered some to the convents of the interior, and even fixed the number that each was allowed to receive.

To return to Almenara. From this pretty borough to Castellon the country is rather less fertile, although every where well peopled, and enlivened by industry. We passed through two large towns, Nulis and Villareal; after which we crossed (a thing sufficiently common in Spain) by a very handsome bridge, a large river which was

nearly dry.

After you leave Castellon fine roads are no further continued, and nothing can be more sudden than the transition. Descending by an extremely rugged road, you approach the sea, which is kept in sight for the space of a league. You afterwards have to encounter a very steep hill, and are terribly jolted until you arrive at the castle of Oropesa, situated on an eminence near the margin of the Mediterranean. Thence, as far as La Venta de Senienta, the road is tolerably smooth. After passing Castillon, the soil is perceptibly less rich. The whole country you travel over in surmounting the hill of Oropesa is unpeopled, and presents the most hideous aspect; beyond it, the country is a little cultivated, but stony roads still continue as far as Alcala de Sibert, a kind of town half way up a hill, in a country not the most cheerful or productive.

At length you re-approach the sea, and the last ports of the coasts of Valentia.

The first that you meet with, after having wound about with difficulty amidst the mountains, is Benicarlo, inhabited principally by fishermen. Here begin the flat roofs, and jargon of Catalonia; this is a species of corrupt Spanish, which greatly resembles the patois of Roussillon, without a knowledge of which it would be difficult for a person to make himself understood in Catalonia.

At a great league from Benicarlo is another more in portant port, Venaroz, a large town of pretty good appearance, containing from eleven to twelve hundred houses. The environs of Benicarlo and Venaroz are planted with vines, the produce of which is converted into brandies, which are exported. Venaroz is not, properly speaking, a sea port. I found there, however, about fifty small vessels; these, instead of laying at anchor, were on the beach-out of water. Many of these barks go coastwise as far as Cadiz and Marseilles; some even venture to the Havanna.

At a league beyond Venaroz the fine road began again in 1793, with a small bridge newly constructed on the spot, which forms the limit of Catalonia and the kingdom of Valentia; and was continued three leagues to San Carlos, a new establishment which

deserves detail.

San Carlos is directly on the sea shore. It is the capital of the establishment of the Alfaques, a name given to a sort of port formed by the mouth of the Ebro. The Alfaques, properly speaking, are a long tongue of land, narrow and semicircular, being a prolongation of the left bank of that river. San Carlos is situated opposite to this point of land; and this is the point of the coast which ships make for. It consists of two fine buildings placed along the road. A large oblong square separates them from another row of symetrical buildings, one of which may rank among the best taverns in Spain. It is extremely clean, and tolerably well furnished; it has also a good larder: but with reason we may again ask the Spaniards why, like so many others, is this hotel kept by a

Milanese? The Mediterranean washes its walls. When I passed it in 1793 they were still at work on the new port. The object of this establishment begun in 1780 was to people a peninsula, up to that time a waste, and to render the mouth of the Ebro of service to navigation and trade. In this narrow peninsula there was more than a thousand acres to distribute, but few colonists up to that period had gone thither to establish themselves, on account of the land belonging to individuals of Amposta, and some neighbouring villages for the most part, who go thither to cultivate it, without changing their abode. The project of government was to dig a large port on this spot, and to facilitate the passage from the Ebro, which is much incumbered below Amposta. For this purpose a canal was begun at this latter place which was to end at San Carlos, and on which canal, as early as 1793, all the materials necessary for this establishment were conveyed in flat bottomed boats. By deepening this canal, it will be made navigable from Amposta to San Carlos; thereby rendering the Ebro passable for ships to sea. A deficiency of funds retarded in measure the works. In 1793 a battery was begun in advance before San Carlos. All these works were under the management of a Parmesan of the name of Nodin, a skilful artist to whom is owing all the success of the plan. But here again, why do the Spaniards leave the province of embellishing, enlivening and fortifying their coasts to Italians?

This establishment however was not very far advanced in the spring of 1793, and probably will never produce all the effect expected by the court;* the largest vessels, however, may anchor within musket shot of San Carlos, and at the period I was there, the greater part of the regiments from the different parts of the Mediterranean, intended for Catalonia, came thicker to disembark. But the air of San Carlos is unhealthy; and it is not at the simple signal of a government that commerce, the most capricious of all despots, forsakes its old resorts.

CHAPTER XIV.

ENTRANCE INTO CATALONIA. PASSAGE OF THE COL DE BALAGUET. CAMBRILS. TORTOSA.
REUS. TERRAGONA. ROMAN MONUMENTS. MONTSERRAT.

THE Ebro crossed, you traverse an immense unpeopled district, mostly covered with heath. The whole of this country is intersected by ravines, which renders it extremely laborious to travel over in a coach. Thus did we journey for five wearisome leagues before we descended into the miserable borough of Prellos in the bottom of a basin surrounded by a double rampart of mountains. We here secured two asses which were brought to the place where we slept. The frightful description given us of our next day's journey, had made us think this precaution necessary.

It is in my opinion one of the most striking phenomena in Europe to a traveller, to find in a country so well known as Spain, between two cities so considerable as Valentia and Barcelona, almost close to the sea-shore, near the mouth of a great river, and on a road so much frequented by travellers of all classes, and of all countries; to find, I say, such a vast district so much deprived of resources, and so destitute in appearance of all those comforts which luxury and civilization bring in their train, and every where engender. This is a reflection the most superficial observer cannot refrain from making, particularly between the borders of the Ebro, and the vicinity of Barcelona. I doubt whether in the midst of Siberia, or about the gulf of Bothnia, a traveller would be more bare of resources or consider himself more abandoned by the universe.

* This prediction has been verified; since 1793 considerable sums of money have been expended on the establishment of San Carlos, and yet it is imperfect.

From Perellos the distance is two short leagues to the Venta del Platero, a tavern standing entirely by itself at the foot of mountains, and embosomed in woods. We had some merchants for fellow travellers, who gave us small comfort by their description of our morrow's journey, the more difficult for us according to them, from the number of our party, and our being burthened with two children of a very tender age.

We began this painful journey by six o'clock in the morning, myself on foot, my wife scated on one of the animals we had hired at Perellos, and our two children in panniers on the opposite flanks of the other, sheltered as well as we were able from the keen north wind. Thus did we travel for two leagues and a half over the most horrid country; afterwards we climbed by a long spiral march the famous col de Balaquet, a steep mountain near the sea. As we arrived at the summit we found ourselves at the foot of a diminutive fort, which had in garrison a small detachment of Walloon guards.

Four leagues farther, after having passed through a small village on the sea-shore, by a tower, and the ruins of an old eastle, and after getting through some very rugged passes, we arrived at Cambrils, a town of three or four handred houses on a wretched beach, where some few barks resort for loading wines. Its site is very unhealthy and tertian agues are very common. This scourge had shortly before depopulated a convent of Augustine monks, the solitary walls of which were pointed out to our party.

An unhappy family of pilgrims with which we had climbed the mountain of Balaquet, resided in this place. It had been in search of health to the miraculous image of Vinaroz, and brought back but addition to their misery. A mother, four or five young girls with their feet bare, and with rags, with two infants perishing with cold, and nipped with hunger, were treading back their weary steps, invoking by the way the pity of travellers, sometimes more easily excited than that of heaven. What sad reflections did the sight of these wretched victims of fate and superstition excite in our breasts! Unfortunate family! It returned on foot, without means of support, from a wearisome and fruitless expedition, and yet appeared resigned! And I, and I to murmur, at rough passages that jolted my berline, tight, and well hung, and well provided with necessaries, with whatever was useful, and even with luxuries! I reproved myself for possessing these conveniences as well as for my murmurings. Almost did I reproach myself on account of the modest conveyance for my wife and children. I appeared my remorse by giving them charity, which at first was received with an effusion of gratitude; at length the chief pilgrim chilled my compassion by her importunities, her want of feeling to the unfortunate beings she carried or dragged in her train, and above all by the offer she made me of telling my fortune. At first I imagined I had found a pious and devout woman, a tender mother. My heart was froze at the merc aspect of a mercenary gypsey. How frequently would pity be barren, or even give place to callosity, if the torch of examination were ever to light with its blaze! Is it not a blessing on the part of heaven for the unhappy, that it often possesses the unreflecting promptitude of instinct. I come back to Cambrils.

This bad port is frequented only by some barks which take in lading for Cadiz, Genoa, and some other places. If overtaken off this beach by bad weather, they make for Salo, which is but half a league distant.

From Cambrils we went by a narrow and very rugged road for the space of four leagues, and slept at Serrafina after passing through the pretty borough of Villaseca.

Travelling from the Ebro, we left Tortosa on its left bank, situated on the slope of a mountain, four leagues from the sea. It is an episcopal see, and contains sixteen thou-

f four ca. c of a thousand inhabitants. Its neighbourhood is highly cultivated, and it carries on a bustling trade in wheat, owing to its position on the Ebro, which is sufficiently deep to carry large barks. Less than a league from the town those famous quarries of marble are situated, known by the name of Tortosa jasper. Nothing can be more melancholy, more deserted than the space of fifteen leagues which separate Tortosa from Cambrils; and few roads are less passable than that from Tortosa to Terragona.

From Cambrils the plain spreads, and here you again meet with plantations of olive

trees, carobs, and vines, in tolerable abundance.

From a league beyond Serrafina you perceive the spires of Terragona, an ancient town in a picturesque situation, on a steep and rocky eminence. A colony of the Scipios, it remained for a length of time the seat of the Roman government in Spain. The sea bathes its walls, and forms a little port, the trade of which has greatly diminished

since Reus has become more frequented.

Reus* is a modern town, which industry in a short space of time has raised to a high degree of prosperity. It is situated inland, about four leagues north-west of Terragona, from which it is separated by one of the most fertile and best cultivated plains in Spain. The inhabitants of Reus use the port of Salo for exporting their fruits, wines, and brandies. The prosperity which they enjoy is one of the miraculous creations of industry, and well deserves the traveller should turn out of his road a few leagues to be a witness thereto. Under the direction of an English house at Reus there is one of the finest distilleries in Europe, it has also a pretty theatre, very handsome barracks, and the image of activity and abundance in every quarter. A quantity of hides are dressed here, as well as at the town of Bails or Vells which is not far from it.

The inhabitants of the ancient Terragona struggle as well as they are able with their new rivals. Emulous of restoring to their harbour its former prosperity, they have undertaken at their own expense to improve it, by throwing out jetties, which will render it more commodious and safe. The court has given them assistance in this undertaking, by making some concessions in their favour, and by exempting them from divers impositions. Even war has not deterred them from the prosecution of their

patriotic measures.+

Below the town of Terragona, and before you enter it, you ford the little river Francoli, which empties itself close by into the sea. Terragona was formerly a place of strength, and part of its ancient walls remain. When I passed it in 1793 a fort had just been constructed there with embrasures. Its object was chiefly to prevent an approach to the beach. You may keep on the road to Barcelona, without entering Terragona; but curious to see this celebrated town, I climbed up to it by a steep path. I was struck with the beauty of its position, but found its interior mournful and deserted. Rocks on every side render the approach to it difficult, and most particularly so for carriages. Its cathedral is handsome, but gloomy and supported by pillars of an enormous size.

Terragona contains a number of Roman monuments. Such are the remains of a circus, an amphitheatre, the ruins of the palace of the emperor Augustus, a heap of Roman inscriptions, and above all the remains of an aqueduct, extending for six or seven leagues, which in 1782 it was in contemplation to re-establish.

^{*} The manufactories of Reus have suffered in the last war; but the activity of the Catalans may be relied on for their restoration.

[†] It has not been crowned with success. The works begun at the port of Terragona have been abandoned.

As you leave the gate which leads to Barcelona, you descend almost perpendicularly to regain the great road. The environs of Terragona, are, however, cheerful and well inhabited. You have an almost uninterrupted succession of pretty houses, from

the town to the hamlet of Figurretta about a league distant.

Two great leagues beyond you pass under a handsome triumphal arch, formerly intended, without doubt, to immortalize some exploit on a frequented spot; at present it stands by itself in the midst of the country. It is in tolerably good preservation, except its capitals which appear to have been of the Corinthian order, and which it has been attempted to renew. The learned in Spain have no doubt of its being erected in Trajan's time. A league to the right of the road is another monument, which has received much greater damage, called the tower of the Scipios, from tradition handing down that two Romans of that name were buried there. Notwithstanding the ravage of time has worn away all the forms, you may yet distinguish two slaves in an attitude of grief.

A little beyond the triumphal arch, you find the pretty village of Altafolla delightfully situated, and another called Torre del Embarr on an eminence near the sea. This

last has a sort of port or road which receives a few barks.

The whole of this country, which we travelled over in the beginning of March, with the Catalonians the infancy of the year, appeared to us singularly pleasant from the mildness of the climate, the variety of cultivation, and the loveliness of certain positions. All

that it wants is roads a little less rough.

The great village of Vendrell, where the French consul at Barcelona, Aubert, had an estate, is some leagues from the Torre del Embarr. I observed with pleasure in its neighbourhood a new and pretty chateau, a true country house placed on the side of a hill in an agreeable situation. I learned that it had been recently built and was constantly inhabited by Mr. Peru de Soulis, a modest agriculturist, who, differing from the major part of his countrymen, adopted exclusively a country life. In a country where the fine season of the year is of nine or ten months duration; where the winter never severe scarcely changes the robe of the fields, that this inclination should be so unusual is extraordinary.

Beyond Vendrill you cross a rather arid country, to reach the pretty borough of Villafranca, on leaving which you have before you a chain of mountains, which fringe the borders of almost the whole horizon. There the famous monastery of Montserrat is situated, steep and solitary asylum of those monks, who have fixed the attention of more than one traveller, and among whom I understood some prelates from France had

retired.

The monastery of Montserrat is eight leagues north-west of Barcelona. The only remarkable place in this distance is the borough of Terrasa known for its manufacture of fine cloths. The monastery is situated on the slope of a high mountain, and joins the church, which is one of the most remarkable monuments of sumptuous superstition. It contains eighty lamps of silver, chandeliers, relies, crosses, and busts, all of the same metal, crowns enriched with precious stones, magnificent vestments, &c. the whole destined to the decoration of a miraculous virgin.

What an extravagant profusion in a country in which industry has yet so much need of assistance! I shall not preach either the profanation or violent spoliation of temples. These sudden reforms, these fits of persecution, presuppose and bring on other excesses. Recommended perhaps by reason they are executed by rage; and the obloquy thereof is the smallest damage they occasion. But were these treasures appropriated to render the communication perfect between Valentia and Barcelona, between Barcelona and

Saragossa, and to vivify the interior of Catalonia, of which from the coasts you would form a too favourable opinion; these treasures, would they do less honour to the divinity whoever it may be to whom they are consecrated; and would the guardians of them be less happy, or less revered?

They are thirteen or fourteen in number. Their hermitages are dispersed over the top of the mountain, and occupy the space of near two leagues, as far as to its greatest height. The most elevated, that of Saint Jeremy, commands a magnificent prospect over immense plains. You thence discover the course of rivers, towns, some islands, and an unbounded sea. The inhabitants of these solitary retreats are doubtless little sensible of these beauties daily seen; but setting aside that devotion so much calumniated, the illusions of which are capable of embellishing a desert, they live here a sweet, tranquil, and even agreeable life, without any appointed labour, without any inquietude, as to their subsistence, without remorse, but not without austerity. In the midst of their stagnant wealth, in the very lap of abundance, they remain content with a happy mediocrity; the hospitality which they exercise towards travellers being almost their only expense. Allow that philosophy proscribe, that policy reform, it must be cruelty itself that could speak ill of them. I return to the road to Barcelona.

Beyond Villafranca, the road is traced out, and even begun, but in 1793 it was so much neglected, so uneven owing to pieces of rock, that I wished even a score of times it had never been projected but on paper. The bridge was the only part of the road that had been carefully attended to. To begin with one of them which is a good quarter of a league from the tavern called El Ostal d'orda, you find a small portion of superb highway, after which you turn short on the right to be jolted on as bad a road as any there is in Spain. From shock to shock, one almost falls down a narrow, very steep, and stony road, which follows the side of a profound valley. In order to avoid this really formidable pass, a most bold design was projected no less than to unite the two opposite mountains by a sort of bridge of three stories. It was obliged to be abandoned. But the very attempt was grand. A foot path-way along the valley, passes under the arcades of this bridge, and enables the passenger to form an idea of this gi-

Beyond this valley you find yourself again on a tolerable road, which leads to one of the finest bridges in Europe. It is five hundred and forty paces long, and embraces the whole of the wide river Lorregat. It takes its name from a village on its other side called Molinos del Rey or Remolins. The country you pass over to arrive there, is picturesque but wild. High mountains form almost the whole boundary of the horizon, and industry struggles with an arid soil on their enormous sides; the plough having furrowed every part of it which is not inaccessible.

CHAPTER XV.

NEIGHBOURHOOD AND INTERIOR OF BARCELONA. FORTRESS OF MONTJOY. DETAILS RESPECT ING CATALONIA. CORVERA. DIOCESE OF SOLOSNE. MINE OF CORDONA. LERIDA. COURSE OF THE SEGRE.

FROM Los Molinos del Rey, the road is good for four leagues before you arrive at Barcelona. Nothing can be more cheerful, more animated, or more rich than the prospect as you approach this capital, in every respect so worthy of the curiosity of the traveller. Its port, which however is neither spacious nor very good, greatly contributes to its embellishment. Two small rivers E) Lobregat, and El Besos, which empty themselves near the town, throw up sand in such manner as to make it shallow in spite VOL. V.

of every means of prevention. It is formed by a sort of hedge placed between the citadel of Montjoy, the town, and Barcelonetta, a small modern town built by the marquis de la Mina, governor of Catalonia, whose tomb is in one of the churches. It is in this quarter that the most remarkable objects in Barcelona are seen; the fine promenade in the manner of a terrace, which runs the whole length of the port; the Lonja, a new building in which are united a school for drawing, one for pilotage, and one of trade; the palace of the captain-general, which, in spite of its defects, has a very imposing appearance; and above all the new custom-house, a magnificent edifice which was scarcely finished in 1793.

Every thing at Barcelona wore the appearance of a speedy war, and in the minds of

the common people there existed great animosity towards the French.

In no town of Spain reigns there more apparent activity, or more real industry, notwithstanding the causes of idleness and depopulation which yet exist at Barcelona as well as elsewhere. For here are eighty-two churches, twenty-seven convents of monks, eighteen of nuns, and several congregations. According to the census of 1787 Barcelona contained one hundred and eleven thousand four hundred and ten persons. In no part whatever has population so sensibly increased, if it be true, as is averred, that in 1715 Barcelona numbered no more than thirty-seven thousand souls, and that on the disembarkation of Charles III, in 1759, it still possessed no more than fifty-three thousand. What however may render credible this rapid increase, is the prodigious quantity of buildings erected within these few years, not only within the town, but as well and more particularly in its neighbourhood; insomuch, that Barcelona for the number and convenience of its country houses is inferior to very few towns in France. Marseilles, which resembles it in some respects, which may be likened to it, although in many instances superior, yet cannot compare its territory with that of this town; where at once you meet with beautiful landscapes, a greatly varied tillage, the bustle of industry, and every symptom of opulence. To the charms of such a neighbourhood be there superadded the advantage of a fertile soil, and a climate which, without being torrid, causes all the productions of hot countries to prosper; the great concourse of foreigners met with; a numerous garrison: the means of instruction furnished by several literary societies; an anatomical theatre; some public libraries; a cabinet of netural history, which Tournefort highly prized, and enriched with a precious collection of plants from the Levant; the cabinet of a private individual, for the variety and choice of the curiosities of the three kingdoms which it contains, it might excite the envy of more than one little sovereign; fine walks, numerous and select societies; the variety of occupations in which commerce and industry are employed; let these be superadded, and it must be allowed, that there are few towns in Europe wherein a man can live more pleasantly, or with more numerous resources, than at Barcelona. Barcelona, however, is yet not what it might become by a great deal, the cause of which may easily be divined.

The lovers of the fine arts will admire here three paintings by Mengs; and those of antiquities, six fluted columns of the Corinthian order, the remains of a superb edifice, respecting the design of which the learned do not agree, the remains of an amphitheatre, those of a bagnio, many trunks of statues, and, to conclude, a multitude of inscriptions

which continue to puzzle the learned.

Barcelona, in a military point of view also, is a very important city. It may be remembered, what a long resistance it opposed in 1714 to marshal Berwick, and of how much value Philip considered its subjection, without which he could not deem himself secure upon the Spanish throne; and that in the late war with France, the second division of troops employed in which obtained such brilliant successes on the side of Catalonia, our

victorious generals aspired to the capture of this place as a decisive event. Its principal force consists in a vast citadel which defends it towards the east, and Montjoy which overlooks and protects it towards the west. Montjoy is a mountain of some height, on the summit of which is a large fortress capable of containing a numerous garrison. Fortified with great care on the town side, it is exceeding steep towards the sea. Of an imposing aspect at first sight, it quickly appears to the tactician who examines it, too spacious, too much overloaded with works, more massive and expensive than useful, and particularly too much elevated to be formidable to a besieging army occupying the plain.

Barcelona principally owes its splendour and wealth to its industry, and the number of its manufactories. The these remarkable are Indianas and stained linens, of which there are one hundred and lifty. Their manufactories of lace, blonds, and thread employ twelve thousand hands; and an equal number is occupied in silk articles, such as

galoons, ribbons, and stuffs of different descriptions.

The population of Catalonia amounts to twelve hundred thousand souls. However much favoured by nature, however much in general alive to industry, one should form far too favourable an idea of them judging from a sight of their capital and the coast. In the interior part of the kingdom are many desert cantons, several of which it would be difficult to draw from their state of barrenness; however, industry has shewn itself wherever it could do so with advantage. Notwithstanding the quantity of wood which has been felled since the reign of Ferdinand VI, for different objects of utility, it still possesses a sufficient quantity for firing, for the demand of manufactories, and even for shipbuilding; although it imports considerably from Russia, Holland, England, and Italy. Cork-trees (alcornoques) particularly abound in their forests, so that it annually freights as many as five-and-twenty vessels with cork for the north, and sends a number of corks to Paris. I have been informed there is a cutter who furnishes four thousand per diem. Catalonia contains, beside a number of walnut trees of much use in carpenter's and joiner's work, an immense quantity of almond, small nuts, orange and fig-trees, the fruit of which is exported in quantities to the north. The only wood of which it does not produce sufficient to correspond with the demand is oak for staves.

Notwithstanding the prosperity which Catalonia at present enjoys, it is yet not so populous, and possibly less industrious than it was in the fifteenth century. At that epoch, cloths manufactured at Barcelona were sent to Naples, Sicily, and even as far as Alexandria. The modern Catalans, it must be allowed, are more anxious of doing a great deal than of doing it well. The manner in which their articles are finished, and their taste, do not answer the quality of the primary ingredients they employ. The high roads likewise in Catalonia are in general greatly neglected. It is far from reaping all the advantage it might from its soil. What variety of marble does it not conceal! How many mines might there not be opened! There is in particular several of coal, the working of which, proposed at different periods, has constantly met with obstructions. Among others, one has been discovered of great promise at Mentanola, in the diocese of

Vious

Lerida is, next to Barcelona, the most important town in Catalonia. It is twenty-five leagues from this capital. In the space between them you meet with towns and villages at every hour, except on the four last leagues. The five first cross a country rich in the gifts of nature and industry, and the succeeding four evince more than any other district whatever, the enterprizing activity of the Catalons.

Farther on one meets with La Noya, a small but very capricious river, which is forded a dozen times, which frequently damages the country, but which is constantly its chief

source of benefit. It sets in motion numerous mills, and particularly many for paper, with which the owners supply a great part of the consumption of Spain and the Indies. This is a particular branch of industry which within these few years has made an astonishing progress. In 1777 Catalonia Intained no more than one hundred and twelve paper-mills. In 1778 it had more than three hundred. The annual profit derived from them is reckoned to amount to a million of piastres.

On the road from Barcelon; to Lerida you pass by the towns of Igualada and Corvera. The intervening country is not so fine, nor so well cultivated. Corvera, built on an eminence in the midst of a vast horizon, belongs to the diocese of Sonsona, a part of which is mountainous, but the greatest part abounds in every description of grain and

vegetables.

Corvera, a town containing five thousand inhabitants, has an university much resorted to, which was founded by Philip V, at the period of his suppression of those of Catalonia; for the resentment of the conqueror, irritated by the long resistance he met with, extended to every thing. Notwithstanding this, Catalonia, the theatre of suppressions, and innovations of every description, has deceived the calculations of revenge; for, deprived of its privileges, and subject to particular taxes, it still remains a province the least aggrieved, and the most industrious in Spain; and the faithful Castilians have more than one reason to envy the rebellious Catalans. Hence the Catalans and Castilians remain to our days two distinct people; rivals, and enemies, they nevertheless in the last war with France united in their wishes and their efforts, the priests and the court having succeeded in persuading them that both were fighting in a common cause. Individuals, nations, whatever your habitual passions, it is the interest of the moment by which you are guided; just as in rhetorical discussions, the mob is ever on the side of the last speaker.

The diocese of Solsona however suffers by its distance from the capital and the coasts; and more vigorous efforts are there made for the encouragement of industry; the bishop in particular has been very successful in his attempts at vivifying the neighbourhood of his residence. Iron is manufactured there with advantage; this, with works in silver and gold, cotton, cloth, and lace, employ a great number of its inhabitants, and tillage is very nicely attended to, fallows being unknown. Vines in this quarter do not flourish at the expence of grain, but both species of cultivation are united without injury one to

the other.

Cardona, a small town of the same diocese, has a small mine within its territory, which art has rendered very prolific; it is known to all naturalists, and is perhaps the

only one of its kind in Europe.*

Lerida is situated at the western extremity of Catalonia. Grain, hemp, olives, vines, fruits, and vegetables of every description abound in its neighbourhood. Some canals of irrigation bespeak the active industry of its inhabitants, and increase the fertility of this plain, formerly celebrated by Claudian.

You enter the plain by a fine bridge over the Segre, which bathes its eastern side. It is placed at the foot of a hill, on which are the ruins of a castle formerly very strong.

The banks of the Segre, and the environs of Lerida, cannot be seen without a lively interest by men versed in military lore, nor by those more numerous far, who are fond of treading a ground rendered illustrious by the march of heroes. I mean less to allude

to the sieges and battles of which this country was the theatre at the beginning of this century, than to that ever-memorable campaign, in which perhaps more than in any other Julius Cæsar displayed the talents of a great captain while opposed to the lieutenants of Pompey; a campaign which furnished Guischard with matter for one of his most learned and most interesting commentaries. In travelling from Balaguer to Mequinenza one should have his book in hand, in order to find in a military memoir all the instruction of history combined with whatever can be most striking in romance.

The course of this river, whose caprices and overflowings opposed to Cæsar eighteen centuries ago obstacles which required all his genius and constancy to surmount, continues to be still as it was then at all times beneficial to the country it waters, but frequently a scourge. The town of Lerida especially is much exposed to its ravages; to preserve it from them, its last governor general Drouhot, a Fleming by birth, had a jetty built, which contributes much to the embellishment of the town, and which may be added to the list of useful works for which Spain is indebted to foreigners.

Before you arrive at Lerida, the Segre, which takes its source at the foot of the Pyrenees, has previously traversed the plain of Urgel, the most fruitful in grain of any in Catalonia. But easy communications are peculiarly wanting to the western part of this province. Its roads are so narrow and so bad, that its rich and numerous productions can be transported no otherwise than on mules.

CHAPTER XVI.

ROAD FROM BARCELONA TO THE PYRENEES.

I RETURN from my excursion to Lerida, and resume the road leading from Barcelona to the Pyrenees.

Beginning with this capital, industry and population are in a flourishing state the whole length of the coast. The first specimen of this is met with at Badalona, no more than a league from Barcelona. Four leagues beyond this, you pass through the pretty town of Mataro, remarkable for its cleanliness and bustle. It contains no more than nine thousand inhabitants; but its manufactures of cottonades, silks, and more especially of lace, the excellent state of culture of its territory, its commerce, of which wine forms the principal part, make it altogether one of the most important places upon the coast.

The road from Barcelona to Mataro is very pleasant; but nothing throughout all Spain seemed to me comparable with the succeeding day's journey. A new road parallel to the sinuosities of the coast, ascending and descending at intervals the tops of hills, at periods somewhat steep, at others cut in the rock, passes through most charming towns, which, by the manner in which their simply ornamented houses are built, by their neatness, and even the active but unnoisy bustle of their inhabitants, brought to mind the most agreeable districts in Holland. Forget the wintry atmosphere of that province; give it the climate of a warm country delightfully temperate, and refreshed by breezes from the sea; substitute for the mournful and silent course of the narrow, muddy canals of Batavia, the vast extent and agitation of its waters; retain every thing attracting it receives from industry, and you will have an idea of the country which extends from Barcelona to Malgrat.

Some of these towns, which form a striking contrast with the rest of Spain, deserve to be mentioned. On leaving Mataro, you arrive next to Arens de Mar; where begins the diocese of Girone; and which has its little dock-yard, and pilot's school; Canet de Mar, a town most pleasantly situated, the inhabitants of which trade not only

with all Spain, but even with the West Indies, are also beneficially employed in the fabrication of silks; San Pol, a modern town, which, under the fecundating protection of industry, is perceptibly increasing; Callela, one of the prettiest places on the coast where there are likewise manufactories of cotton, silk, and lace; Pineda, another town, where it is common to stop to dine; and, lastly, Malgrat, after passing through which you leave this delightful road and the sea-coast, for a wild country. You next again descend into a tolerably handsome hollow, in the centre of which is the solitory tavern called La Gunota, where, in 1793, I found the worst accommodation on the road.

The succeeding day I again entered a mountainous country, divided between woods and heath. At length, the town of Girone is discovered on the back of hills, whereon towards the east some redoubts are constructed, and which, sinking towards the west, form a very picturesque amphitheatre. This chain of hills form a semicircle about Girone. When yet a league from the town, you would conceive it to be situated on an eminence, but you go through and leave it without being sensible of an ascent. Its cathedral, a fine monument of Gothic architecture, is the only building on a high situation.

Girone is unequally divided in two by the Ter, which you cross here over a bridge, but which is almost always for dable. This town, famous in the modern wars of Spain, exhibited in March 1793 no military preparations, which confirmed me in the idea, that I have never foregone that the Spanish ministry had not, as was then pretended, a long preconceived intention of breaking with the French republic. The regular force of the garrison of Girone was very small. In some places you could scarcely distinguish the traces of fortifications. The ditches and covered way, peaceably devoted to culture, bespoke the security of the inhabitants, and especially that of the governor Don Ladislaus Habor, an active and plain old man, who, when I presented him my passport, the forerunner of a rupture, appeared far from suspecting it so nigh. I felt no disposition to conceive this a paltry stratagem of war, from my not finding throughout a journey of more than one hundred leagues, any of those symptoms of activity which are usual previous to a war, more than I had seen at Girone. Without dispute, the court of Spain had caused troops and ammunition to file off towards the frontiers of France, particularly to Navarre and Biscay; but if it had had any other design than that which it professed even up to the end of December 1792; namely, to protect herself in case of invasion, with which she might reasonably esteem herself to be threatened, from our mustering of forces together, and from various speeches as well in the Convention, as in different popular assemblies. If it had had any intention of invading the Republic, would it not have collected a considerable force in Catalonia by the time when as I had proof on my arrival at Perpignan there were no more than five thousand men in the whole department of the eastern Pyrenees?

The diocese of Girone, is one of the best cultivated, and most flourishing districts in Spain. The part which is near the sea produces great abundance of wine, lemons, oranges and all descriptions of grain; its mountainous parts are covered with vines, corn, and olives; in its woody parts many cork trees are found, the bark of which forms a considerable branch of commerce; and few are the quarters within the district but what are remarkable for their produce and the industry of their inhabitants. The Lampourdan, which forms its northern part, which was occupied by our troops for a year, and in which I sojourned two months in order to negotiate the peace, which shortly after was signed at Basle, the Lampourdan is a vast plain, extremely fertile in every kind of grain

and fruit.

A small town belonging to the same diocese, situated near the source of the Fluvia, bection of the coast the coast ther town, gh which ext again ry tavern

A small town belonging to the same diocese, situated near the source of the Fluvia, whose name (Olot) is scarcely known, well deserves to be drawn from its obscurity for the astonishing industry of its inhabitants; every one there has employment of some kind, and there is scarcely any work for which they are not calculated. It contains a hundred stocking looms, with manufactories of cloth, ratteens, ribbens, &c. dye-houses, paper-mills, manufactories of soap, cords, &c.

Half a league beyond Girone, is another town of considerable bustle. Two leagues

Half a league beyond Girone, is another town of considerable bustle. Two leagues further, after having travelled over a pleasing country, and passing a streamlet near a mill, and a little hamlet, you arrive at Madrina, the dirtiest and dearest inn upon the whole road. It is, however, charmingly grouped, with respect to the hill that overlooks it.

From Madrina to Figueras (or Figuieres) our last sleeping place in Spain, the country is tolerably well covered, and with the exception of a few heaths is mostly cultivated. Fields of wheat are seen, of lupin and flax, but olive trees and vines are in extraordinary abundance. Many small rivers are passed where during great part of the year you find a gutter of water running in midst of a large bed of pebbles; in this particular, almost all the rivers which run from the Pyrenees to the Mediterranean resemble each other, as well in this part of Catalonia, as in the Roussillon. Of this description is the Fluvia, which we forded two great leagues before we arrived at Figue-Its banks at that period were as tranquil as in midst of the most profound peace. Nothing announced that this small river, which, after the capture of Figueras and Rosa, the bravery of our troops more than once excited them to pass, but which was prevented by the wise combinations of our generals; nothing, I say, announced that its shores would soon become the theatre of the operations of the two armies. I beheld them again but with more interest when two years after I was dispatched to Figueras, which, after our successes in the Lampourdan, became the head quarters of our army of the Eastern Pyrenees.

When I was there in 1793, general Ricardos, who had been appointed commandant-general of Catalonia, was momentarily expected. Figueras, which is an open town, and which must not be confounded with its citadel, had then in garrison no more than 1700 infantry, and 300 cavalry; nor did the whole neighbourhood contain more than 5000 infantry. Such was the disposeable force of Spain in 1793 to effect the pretended invasion of Roussillon!

At the citadel, situated scarcely a quarter of a league from the town on an eminence, workmen were employed on the fortifications. It already contained a considerable quantity of artillery, and all the ammunition and provisions, destined, eighteen months afterwards, to fall into the hands of the French republic.

At the commencement of this war the Spaniards, by a concurrence of causes, from the catalogue of which I certainly do not mean to expunge their valour, made some progress on our territory. They had penetrated by the col des Orts, west of Bellegarde, as far as St. Laurent de Cerda, a town in the gorges of the Pyrenees, peopled with smugglers, and persons but little attached to the French republic, and thence had invaded the two districts of Prades and Ceret, obliged the castle of Bellegarde to capitulate, threatened to fall on Perpignan, and turning short towards the sea, took possession of Elm, Collioure, and the port of Vendres. These triumphs were of no long duration, for the honour of the French arms was mickly avenged by general Dugommier, who drove the Spaniards from the Roussillon, retook Bellegarde, and penetrated into the Lampourdan. General Ricardos, to whose activity the ephemeral successes of Spain are in a measure to be attributed, died about this period, and was succeeded by the

count de la Union, a young and brave general, but of no experience. The French army overcame every obstacle he opposed to their march. Eighty-three redoubts 1 a sort of fortress constructed in a hurry, but some of which were apparently impenetrable, placed on each side of the road for four leagues, which separates Figueras from Janquiere, the last town in Catalonia. Eighty-three redoubts! I say, were carried with a rapidity, an intrepidity which cannot be too highly extolled. In a decisive battle, in which the count de la Union perished, the Spanish army was put to the rout, and the wreck thereof taking shelter in the impregnable citadel, carried terror and discouragement in their train. General Perignon, who at that time commanded our victorious army, advancing to within half a league of the place, imperiously summoned the governor to surrender; and two hours after the capitulation was signed, without either breach, assault, without the trenches being opened, or any work begun. When I was in its neighbourhood in 1783, I endeavoured in vain to penetrate through three hundred workmen, who repaired thither every morning to put the finishing hand to the work. They alone were allowed to pass the gate which led to its interior, and I was only suffered to walk round its glacis, and the covered way of its exterior works. Two years afterwards I was rather better served by circumstances, and under the auspices of conquest I examined this place at my ease, of which I had heard the Spaniards vaunt so much.

The fortress of Figueras was begun in the reign of Ferdinand VI. It was intended to be a master-piece in the art of fortification, and certainly is one of prodigality in that line. All military men who have seen it agree that no place in Europe is furnished in greater profusion with the different means of defence. The besiegers in particular were enabled to convince themselves of this, for on their entrance they were untouched. Notwithstanding their valour would make nothing incredible, they themselves with difficulty conceived how it was possible in so short a time to reduce a place which had a garrison of nine thousand men, whose walls external and internal were all of stone, more than a fathom in thickness; whose principal ditches were all deep, and more than a hundred feet wide; the approaches to which on the only side where trenches could be opened were mined, whose principal* cordon was not discernible from without; where every part was casemated, ramparts, barracks, hospital, stables, cellars, and magazines.

Its means of subsistence were proportioned to its means of defence. Water is preserved there in four large cisterns, dug in the four corners of the place d'armes, and supplied by an aqueduct; and there was store of provisions of every description in the greatest abundance, barrels of flour, biscuit, cheese, salt cod, oil, wines, brandy, &c. &c. Of the quantity of each let one single article suffice for a criterion; such an abundance of bacon covered the immense long floors of the corridors of the casemates of Figueras, that from a calculation made in my presence, valuing the pound at no more than four francs, the stock of it must have been worth 800,000 livres.

On examining this place as well within as without, the most ignorant man would ask himself how it could be so easily taken. Some attributed its ready surrender to the terror with which the garrison was seized by an imperious summons, following so closely at the heels of a decisive battle. Others pretended that this garrison, so well provided with bacon, cheese, and brandy, were destitute of flints and matches. While again some could no otherways explain this extraordinary success than by imputing it to corruption, and affirmed that two large casks of money were seen to be carried to the commander, as the price of his treason. Neither is it surprising if, through respect to the glory of

^{*}The cordon, for which the translator, knowing of no English word that corresponds, has consequently adopted the French, means the summit of the parapet, which is rounded like a cord.

rench army their nation, the Spaniards be most willing to give this interpretation to the matter, the ! a sort of most absurd of any; as if at the period of our greatest financial distress we had money ble, placed to lavish on Figueras, without possessing any for the purpose of securing Luxembourg. quiere, the apidity, an Maestricht, Ehrenbreitstein, Mentz; &c. &c. all of them places of far greater importance than this pretended bulwark of Catalonia, the surrender of which did not occasion which the that province to be invaded; or as if Spanish commanders alone were corruptible. The the wreck most likely reason to be attributed for its hasty surrender, may even the best authentiagement in cated is, that those who were to preside over the different operations of the defence of army, adthe place were taken by surprise, were destitute of foresight and concord, and that for rnor to surthe garrison under their command, it was not their courageous day. The old bye-word, ch, assault, he was once upon a time a brave fellow, comes from Spain. Surely the Spaniards will its neighnot take amiss that it be for once applied to themselves; for what nation is there of whom workmen, at one period or other the same may not have been said? They alone ed to walk

The French army, after rendering itself master of Figueras, was spread about the neighbourhood from Junquiere to the banks of La Fluvia.

But in order to maintain peaceable possession of the Lampourdan, and secure subsistence by means of the sea, it was requisite it should have possession of the port, the for-

tress of Rosas, and the little fort de la Trinite, called by us le Bouton. This conquest, less easy and less sudden than that of Figueras, was still recent when I paid a visit to this theatre of one of the brilliant exploits of the army of the Eastern Pyrenees. Rosas is four great leagues east of Figueras. In order to reach it you pass by Villa Beltran and Peralada, and travel over a very fine country almost wholly a plain. Le Bouton is discerned at a distance of almost three leagues. Situated on a slope of the Pyrenees, at the part where they decline in the sea; it appears at this distance a castle in ruins. On approaching, you discover on very even ground the fort of Rosas, whose fortifications consist in a double range of walls, without either a ditch, covered way, or glacis. It could have made but a very short resistance, had it not been for the assistance it received from the Spanish squadron at anchor in the vast bay, on the shore of which the fort, the village, and Bouton are situated, in a semicircular line along the bay. You pass under the inner battery of the fort to get to the village, which is only a long row of houses whitened over. Beyond the village one has to climb over rocks in order to arrive at Bouton. This little fort has a double object, that of defending the entrance of the bay, and protecting the little town of Rosas, which is distant from it somewhat more than a quarter of a league. On its summit is a light-house for directing ships. Notwithstanding its compass was extremely small, it possessed means of defence in its three platforms, ranged one above the other, against which the French had long to contend. In no part possibly of all the different scenes of this war, so fertile in wondrous events, in no part did the valour of our troops shine with greater lustre than at this fort of Bouton. The artillery designed to batter it was raised by the main strength of man up the declivity to the summit of the steep rocks which surround it; a position to which the most undaunted sportsman would hesitate to pursue the game that should take refuge, hither did they raise, from such situations was heard the thunder of the French artillery; and should the traces of its passage imprinted on the rock be recognized by posterity, it will require the testimony of history to satisfy it as to its cause.

The fort of Bouton was not taken before a considerable breach had been effected; nor did it even then capitulate; for the garrison had time to escape by rope-ladders to the beach, where the boats belonging to the squadron was waiting for them; so that upon the entry of the besiegers they found nothing but the dead. Our army could not

take possession of Rosas until after this capture.

This port is never greatly frequented. It is however formed by an immense bay, in which even ships of the line may moor; but this bay is too spacious, and its entrance fur too wide, to afford shelter either against winds, or attacks from the sea side.

The country about it on the side towards the Pyrenees is very picturesque, and appeared to me to deserve a short excursion. In the first place then after leaving the fort, I climbed up the enormous mountains which separate the bay of Rosas from that which the north, and which you arrive at by sea after making a long round, is opposite and doubling eape of Creus. After travelling for two leagues over a most fatiguing road, I arrived at La Selva alta, a town buried in a basin in the middle of rocks. Half a league beyond you meet with Selva-baxa, a considerable town, placed in an amphitheatre on the bay of Selves or Selva. At both these places our troops were quartered. The second has a little port, which has some trade. It is in this neighbourhood a sweetish wine is made, of an agreeable flavour and colour, and which may be placed as a desert wine on a level with Sherry and Frontignac. There is nothing but "good luck and bad luck" for the produce of the earth as well as mankind. Before our war with Spain this excellent wine of Selva, which has more than once chaced away care from headquarters, was but little known out of the Lampourdan; but I trust the epicures of our army of the Eastern Pyrences will make it amends for the oblivion to which it seemed to be condemned.

The whole country although of wild appearance, in spite of the presence of our troops,

bore the traces of as good tillage as the nature of the soil would allow.

In order to return from Selves to Figueras, you keep along the steep sides of the bay. You afterwards descend into the charming basin wherein the town of Llansa is situated, at some distance from the little inlet of that name. As you travel through this hollow the hills which surround it, covered with vines, have a charming appearance; and after attaining a height on which an old castle is situated, you perceive the town of Peraladas, and at the extremity of the horizon the road which ascends by windings to the fort of

Figueras.

The view of the fine country of the Lampourdan, the limits of which I had attained after having travelled over its wildest but most picturesque division, awakened those regrets which the philanthropist ever experiences, on reflection that every where the finest countries are most liable to the ravages of war, Flanders, the Palatinate, and Lombardy. Still, on the other hand, a man must possess a love of glory and dominion equal to that of Catharine II, who should carry this scourge into deserts and rocks, and amid the frozen lakes of Finland. Let me, however, do the justice to our army of the Eastern Pyrenees to say, that the inhabitants of the Lampourdan will not have had much to lament from their length of stay there. It did no other than such damage as is inseparable from military operations. In midst of our cantonments the fields were in full cultivation. In the neighbourhood of Rosas the vines budded afresh about the large holes which bore witness to the recent fall of bombs; and on the hills in the neighbourhood of Figueras, if those be excepted which formed its glacis by the side of the high road, the spacious olive-grounds were scarcely any where damaged. Our soldiers encamped beneath the shade of the trees, made use of none but the barren trunks for their necessities. Philosophy reconciles itself in measure to this terrible and essentially destructive art, where discipline prevents excess.

But let me be candid. In those fits of rage the consequence of resistance to troops accustomed to conquer, in the intoxication of victory disorders were committed in Catalonia, as well as in Biscay, at which humanity shudders; and other excesses were tolerated which policy should have prevented. At Euguy, at Orbaiceta, towards French.

Navarre, at St. Laurent de la Muga, some leagues north-west of Figuerus, Spain possessed founderies of great value for their arsenals. Our armies treated them as if they were a Portsmouth or a Plymouth, not leaving one stone upon another.

In no part, however, of the peninsula was the religion of the country or its ministers given up to persecution. The pastors indeed, and the greater part of their flock, took to flight at our approach. As has been the case in all wars where religion has been one of its causes, as well as in all those wherein necessity has no law, the French army

" Of many a church a stable made."

Yet all the churches were left standing after our invasion; yet were not the objects of the veneration of the faithful either overthrown or mutilated; and during the time our head-quarters were at Figueras, I saw crosses remaining erect in some of the principal

streets, even in the absence of their adorers.

These precautions, however, were not of sufficient weight to bring over the Catalans to our cause. Fanaticism seemed to have a greater influence on them than the love of liberty. We reckoned too much upon the effect of this sentiment. Among them it is principally made up of an aversion to the yoke of the Castilians, and a vague tendency towards an independent government. But for the extreme vigilance of the court, we certainly could have maintained a good understanding at Barcelona. It is in great cities that discontent is ever most readily excited, and the discontented most easily brought to the same mode of thinking. In these, greater hodies of people collected together, and with more inflammable minds, materially favour the propagation of extraordinary ideas. In these, the same #8 with a combustible matter, a spark is sufficient to occasion a conflagration. But the court pertrived the danger at a distance; and the priests, much more faithful to their own interest than that of the court, easily contrived to counteract the plots of our missionaries. These, at this epoch, discovered sufficient causes of complaint against the government, and found at secret meetings a number of persons ready to give ear to their revolutionary insimuations. Had our successes carried us to the gates of Barcelona, they might have had a with vexatious consequences to the king of Spain. Presilly it might have fiven easy to effect the independence of the Catalan republic, and realise if him remaining the present of further years; in attempting which we should have found a number of well-wishers;

At the same time, a succession of virturies had intilled the west to the gates of Bilboa, and in the south to the banks of the parameters of Pancorvo were the only obstacles which nature, as asted by a little art, had to oppose to the march of our triumphant armies across the two Castiles. Already the inhabitants of these two provinces which was the hearest to us, were infected with panic, and emigrating in the utmost haste and confusion. But our generals at these two opposite points were not only brave, they possessed princence as well as courage. They were sensible, and our government was of the same opinion, that we should have gained nothing by devastating these Spanish provinces in one quarter; or by weakening and subjecting a power to the horrors of a civil war, with whom, after a year of hostility, we felt the necessity of a reconciliation in another. However, even more splendid victories would not have accelerated this re-union in a fuller degree than the arrogance of the English. Thus did our real enemies advance our interests still more than our successful arms; neither is this one of the smallest favours of fortune during the infancy of

the French republic.

The Catalans and Castilians united in their affection for a religion which was represented to them as interested in the French revolution, against which Europe had combined, united as well in their attachment to a monarch known to them only by his titles to their esteem, and to whom individually they never imputed the disorders of which they conceived they had a right to complain: the Catalans and Castilians, I say, suspended their animosities to make a common cause against the common enemy. But shortly afterwards, being satisfied of their inability to cope with us, as they joined their efforts in war, so did they unite in their wishes for peace, as well as in their resentment against the real enemy which had caused them to espouse his hatred to us; and we had the pleasure of reflecting that we had not made them expiate the transitory error of their government by any deep or lasting wounds on their prosperity. What would have been our regret if, on reconciliation taking place, we had left Spain a prey to the horrors of civil war, in dread of insurrection, and under necessity of using vengeance; if we had thus rendered impossible any sincere alliance; or at least if this power, obliged to divide its attention and its means between subjects it might have to restrain, and allies it might have to assist, should for a long time have been able to spare us nothing but barren wishes and reproaches.

But it is time to leave Catalonia, and put an end to my long career.

Italiam! Italiam!

From Figueras you perceive the Pyrences very distinctly. But what do I say? You are at their feet, surrounded by a prolongation of their immense chain, for these hills are a ramification of the Pyrences; some of them, although distantly, towering above the eminence on which Figueras is situated, and making a long circuit round this fortress, sink into the sea at Cape Palamos.

The Lampourdan, thus enclosed, is watered particularly on the north-west to southeast by a great number of small rivers and rivulets. Such are the Lobregat which flows from the Pyrenees, and passes very nigh La Junquiere; La Muga, on the banks of which was the foundery which we destroyed; El Manol, along which were our principal cantonments, that is to say Sistella, where was the extremity of our principal line. Avinonet, Villafan, and Castillon; L'Alga on the sides of which were some others; La Fluvia, the boundary of our conquests, a river which is crossed over the bridges Besalu, and Bascara, notwithstanding it be mostly fordable, and which after running very nearly to the sea at the village of San Perc Pescador, afterwards winds about to empty itself two short leagues farther towards the south, at the extremity of the bay of Rosas; and lastly the Ter, which falls into the sea, eight or ten leagues below Girone opposite to the small islands des Medes.

These rivers and rivulets, which for almost the whole year are fordable, are swollen in the spring by the thawing of the snows, and the rains which accompany the thaw. In April 1795 I was witness to one of these periodical floods. After three days of hard rain, all the small rivers between the Fluvia and Figueras, and even the Fluvia itself, became impassable, and the communication of the infantry between head-quarters and some of our cantonments was nearly interrupted. Such events are common in a great part of Spain, and especially in Catalonia; and during the famous campaign which we have previously noticed, one of these sudden inundations of the Segu, the Cenna, and other considerable rivers, opposed obstacles to the operations of Cæsar, which it required all his genius to surmount.

The road from Figueras to Junquiere was pleasant to travel over, even before it had been strewed with monuments of French Lravery. You at first follow the course of the

e it had e of the chain of hills (for the most part productive) which lie in the neighbourhood of Figueras. As soon as the little village of Pont des Molinos is passed, you begin to see the continued file of eminences on which the Spaniards constructed those redoubts, which would for a long time have stopped an army of less intrepidity than ours. Some of them are on the banks, but on the opposite side of the Lobregat, which flows from the foot of the mountains of Bellegarde, and which is twice crossed over handsome bridges. Shortly after leaving all these redoubts behind, and clearing a hill, the mountains appear before you, on one of which is Bellegarde; and at the foot of them the modest town of Junquiere, which looks as if liable to be annihilated in an instant by the fire from that threatening fortress.

La Junquiere, situated at the entrance of a valley, which enlarges by degrees towards Catalonia, possesses no other resources than tillage and the cork-trees which cover the adjoining mountains. This town is perfectly open on that part which leads from Spain to France. In 1793 I found here no more than a detachment of two hundred men. In consequence, its inhabitants, notwithstanding they professed the most lively attachment to the government of their king, bitterly complained of their state of destitution, in such a formidable neighbourhood as that of Bellegarde.

This fortress, however, has not near so imposing an appearance from this spot as from different others upon the road, which, by many windings through the rocks, comes from the other side of the Pyrenees. This lofty ruler of the neighbouring vales is beheld with pleasure mixed with awe, and lost sight of again at least ten times as you trace the fatiguing maze.

It is full half a league from La Junquiere to the spot on which one is directly below Bellegarde; and along the whole distance the ascent is scarcely perceptible. The first object you meet with upon the road is a small lonely house, near which in 1793 two small columns yet a mained, which marked the limits of France and Spain. The one bore the arms of his catholic majesty, the other that of the French republic and its emblems, fresh engraved. In 1795 I found these limits destroyed by victory. The columns were broken, and the road strewed with the pieces. One would have imagined Catalonia irrevocably joined to the French republic.

A little beyond there is a small village called Perthus, whereat one of the roads begins which leads to Bellegarde. Here during peace is the office for examining the passports of travellers. Here in 1793, in the month of March, did I meet with groups of our brave volunteers, who frequently came down from the fortress to learn the news of the day, and especially to inquire if the signal for war with Spain would shortly be given; my return to France appeared to calm their impatience. It is from this town that the Col de Perthus takes its name, which leads from the Junquiere to Boulou, by windings which one is led to think are endless.

As for as Perthus the road is excellent, but from the spot where our territory begins the road in 1793 was exceedingly neglected. In 1795 it was in toler, ble repair. From Junquiere to Boulou it winds among the gloom of the lofty Pyrenees, and occasionally presents views which are highly picturesque. In this country, which one cannot travel through without pleasure mixed with apprehension, nature is alternately cheerful, majestic, and terrible. As is the case in most mountainous countries, she has displayed a great variety of positions, and appears to delight in uniting opposite climates. At times you leave the plains of Catalonia or Roussillon with nothing but serenity throughout the whole horizon; and shortly after you penetrate the varied abode of tempests. I myself experienced this during the month of March 1795, in one of my excursions from Perpignan to Figueras. On leaving the Roussillon, the weather was perfectly mild; but

when I attained the summit of the Pyrenees, I was overtaken by a violent storm. I trembled for some time by the light of continual electric flashes; and upon my arrival in the Lampourdan I found the earth covered with snow, which had fallen while I was passing the mountains. How trifling does man appear with all his schemes by the side of these grand accidents of nature! How paltry the most formidable armies compared with these ribs of the world! How small do they appear amid deep and extensive vales! What is the noise of terrestrial artillery to that of thunder a hundred times reverberated from their different sinuosities! Generations of heroes pass along and are no more; but the enormous mass of the Canigou, perpetually clothed with frost, remains still the same, as durable as the world.

From Perthus it is something more than a great league to Boulou, which is seen in the middle of a hollow surrounded by an amphitheatre of mountains, some of which are covered with snow even in the spring. Among them Canigou rises on the left and pierces above the clouds. This is one of the most distinguishable points of the Pyrenecs. In vain do you leave it behind, distance scarcely seems to diminish its mass; and on reaching Perpignan you might still think yourself at its foot.

Before you ascend towards the village of Boulou, which is the first post town in France, you arrive at the banks of the Tech, a small river which has its source in the Pyrences, washes Pratz de Mollo, and the fort des Bains, runs close to the little town of Ceret, and empties itself into the sea above Collioure. So late as 1793 you were obliged to ford it with much inconvenience. It was a disgusting sight to behold men with no other clothing than a shirt plunge into the water up to the waist, and push the carriages of travellers by main strength before them to the opposite side. War which laid waste its borders, has however caused a little wooden bridge to be built, which after facilitating for two years the passage of the armies and their train, serves now for communication of a more peaceable description.

I finish with Boulou, which is only the distance of a musket shot from the Tech. I shall now take a farewell prospect of the fine country which I have endeavoured to describe, in order to present my reader with a recapitulation of my observations, my conjectures, and wishes.

RECAPITULATION.

I think I have proved that neither Spain nor Spaniards are deserving of the disdain with which they are treated by ignorance. On the contrary what are they in want of that is desirable? Does not Spain possess all the elements of prosperity? What a delightful climate! What numerous productions which industry more enlightened and better directed might easily bring to perfection; wines, fruit, wool, silk, oil, horses, &c. What riches of every description contained in the bowels of its soil! Of what would not its inhabitants be capable if the government did but second the exuberance of nature!

But a fatal instinct seems to incline it to oppose its beneficence. Continually do we meet with wrong measures perpetuated by custom and obstinacy; or where new ones are proposed by genius, when resolution begins them, envy and prejudice are ever on the watch to stay them in their career. In no country possibly have calumny and intrigue exerted themselves with greater success to the injury of merit and talent. Let us endeavour to enumerate the distinguished characters which in our time have been condemned, some to flagrant disgrace, and others to a state of nullity.

(C) 1985

Shall we mention Maritz and Gautier, * employed one in re-establishing the artillery, the other in ship-building, escaping from their persecutors only by a miracle.

Olavidist snatched from his flourishing colony, to be immured in the dungeons of

the inquisition.

A marquis d'Iranda, t whose vast knowledge in affairs relative to administration, and especially in what regards finance, have been constantly dreaded these thirty years back, yet are scarcely ever consulted.

Ar count de Campomanes, who at the end of his long carcer as a learned man and a magistrate, is left to the enjoyment of that, of which he could not be deprived, a well carned reputation.

A count d'Aranda, paying for the energy of his character, and the wisdom of his

councils, by being twice in disgrace.

A Cabarrus, whose talents and services are remunerated by four years imprisonment.

A Thomas Munoz, whose success in the immortal undertaking at Cadiz, rather excited envy than applause.

A Mazarreddo, less known, less esteemed in his own country than by two neighbour-

ing nations who do justice to his eminent characters.

An Augustin Betancourt, one of the most skilful machinists in Europe, according to the learned in England, and France, who indeed is neither neglected nor forgotten; but for whom no employment could be found in Spain, where notwithstanding all machinery employed in arts and trades is very imperfect, and who is therefore sent to construct roads and canals in Cuba.

A Malaspina, and a father Gil, imprisoned at the instant they are about to publish a

new voyage round the world.

A Francisco Saavedra, who, after evidencing in the Spanish colonies an unusual aptitude for government languishes almost unknown in one of those honourable places reserved as a reward for the long services of mediocrity, or as a quietus for talent, the exercise of which is not desired.**

* Both of them are dead; the one twenty years ago, the other in 1800: but the first left children in

the Spanish service who were to maintain their father's name.

† He is returned to his country, and lives peaceably in a small town of Andalusia, with a pension of 90 thousand rials. His return to Spain was preceded by a religious work entitled el evangelio in triumfo, composed during the latter part of his retirement in France, which has met so great a demand both in Spain and in the Indies that it has run through four editions.

t He died in 1801 at a very advanced age. He obtained towards the end of his useful life the vain

honour of councillor of state.

\$He died exiled at his estate in Arragon.

After regaining some degree of credit, as we before noticed, he retired to private life four years ago. At first he took up his residence near Torrelaguna, fourteen leagues from Madrid, where he amused

himself with agriculture. Lately he has been travelling about anew; and not long ago was at Paris.

¶ His expedition to Cuba was prevented by various circumstances. On his return to Madrid, he fixed the attention of government by his calculations. He was employed in establishing telegraphs, an object in which he was instructed by Mr. Brequet during his last stay at Paris. He has begun one which communicates between Buen Retiro and Aranjuez, and is to be continued to Cadiz. At present he is one of the directors general of the post office, and entrusted particularly with the department of highways and bridges. In this capacity, he has caused one hundred and forty-one bridges to be constructed or repaired recently on the two roads from Madrid to Barcelona, the one by Valentia, the other by Saragossa to facilitate the expedition, which the king and queen are about to make to Barcelona in the month of September 1803.

** He was in 1798 at the head of foreign affairs: but shortly after provisionally succeeded by Mr. d'Urquijo, and definitively by the present minister Cevallos. From the illness which was the cause of his being displaced he was obliged to remain a year at the Escurial: he was afterwards permitted

to retire to Puerto Real near Cadiz, where he at present resides.

A Ramon Pignatelli,* a Gaspard Iovellanos,† citizens full of learning and patriotism, confined to obscurity, the one in Arragon, the other in the Asturias, and who on the narrow theatre where they are placed by circumstances, render service to their country,

and meet their only reward in the esteem of their fellow citizens.

And so many other learned men, artists, men of talents in every known department, who are appreciated, yet suffered to languish inactive, and almost in want; while at the same time pensions and places are found for loobies and intriguing characters. Funds are wanting for useful undertakings, while sufficient yet are found to supply out a pomp which adds no real splendour to the throne, but which is capable of furnishing dangerous matter for discontent to work upon.

And yet, spite of the incumbrances which clog this nation, spite of that injustice which is so discouraging, though prejudice calumniate it still, how much has it not already effected towards withdrawing itself from the debasing inertness to which it was

condemned at the close of the last century?

If inclined to judge of Spaniards with less severity, compare the reign of Charles II, with that of Charles IV, see what in the one period was the state of manufactures,

commerce, the navy, and learning of every description, and what in the other.

And how much more striking would this difference have been, but for her frequent and useless wars, which have accumulated hindrances to that course of prosperity which it has been tracing for almost a century past; and but for the opposition arising out of momentary circumstances to plans, which, in order to insure success, should be permanent.

How lamentable to behold a nation, apparently grave and reasonable, the slave of the paltry passions of those around the throne, and that too in a greater degree than any other, than even our own nation. Did the chancellor Bacon calumniate the one, and flatter the other, where three centuries ago, he said; "the Spaniards appear to

be wiser than they are. The French are more so than they seem."

In fact, how much have the first been the victim of caprice. If we look to the period alone which has succeeded the extinction of the Austrian dynasty; what was gained by the two wars of Philip V, unless the barren honour of seeing his posterity occupy two little sovereignties in Italy? Ferdinand VI, of more pacific disposition, sanctioned with his name some brilliant attempts, but more fond of money than glory, he accumulates wealth, and allows several branches of administration to fall to decay. As Frenchmen we may reprove his partiality towards the court of London. He deserves rather more than pardon judged by a Spaniard, since it retarded the period of Spain taking part in the disasters of the war of 1756. Charles III, shews himself more generous in appearance; but it is on account of his being a Bourbon, and personally an enemy to England, that he joins our quarrel. This devotion to our cause costs Spain a part of her navy and Florida. Spain is indemnified for the loss of this by the cession on our part of Louisiana. But what did the Spanish nation gain by this? What

* He died at Saragossa, to the last intent on the works of the canal of Arragon, without ever obtaining any other recompence than a cool testimonial of esteem. This however was sufficient for one of his bold and independent spirit.

† Enough has been said of him in course of the work. Turned out of administration shortly after his introduction, he was at first banished to the Asturias. At present he is confined in a convent of Carmelites at Majorca.

‡ In this instance, however, we must do justice to the Spanish government, and allow that latterly, in many examples it has done justice to merit, even where distinguished by public opinion alone: that it has brought into action, several estimable subjects who deserve and have justified the confidence with which they have been entrusted; and if some faults, perhaps frivolous in themselves, or but badly proved, have at intervals been punished with signal disgrace, yet have no services been left without reward.

hat latterly, alone: that confidence or but badly eft without

but colonists which its government estranges by the exercise of a horrid tyranny, and afterwards seeks to endear by sacrifices? Seven years afterwards a quarrel on a point of honour threatens a rupture with England.* Fresh ruinous efforts to obtain satisfaction; fresh distraction of funds destined for useful undertakings. Our intervention disperses this storm; but eight years scarcely elapse, before Spain suffers herself in opposition to her interest to be dragged into the American war. Minorca and Florida recovered were the fruits of this war, impolitic at any rate, if not unjust; but the completion of the ufinished canals of Castile and Arragon, so long in hand, would have been of much greater benefit to the nation, and would have been more cheaply purchased. Scarcely had she enjoyed the blessings of peace for seven years entire, before she was disposed on account of some dispute respecting furs from the extremity of America, to resume anew the cruel diversion of war, and put a stop to the most beneficial plans. But projects still more insensate, solicit and obtain a preserence. A vertigo which seized upon all the cabinets of Europe fixed its attention upon the French revolution. The court of Madrid placed itself at the head of those powers who conspired its overthrow. Of a sudden, it changes both its ministry and its plan. It seems disposed to remain a passive spectator of our hurricanes, and to keep in a defensive attitude alone, when an event, more affecting to Spain than any other monarchy, causes her to join, although contrary to her interest, in the general resentment. This error, which would stand acquitted before a tribunal of sovereigns, is however but of momentary duration. The experience of eight-and-twenty months, is found sufficient. It sees the return of peace after making efforts, and meeting with disasters which render alike necessary repose and economy. You conceive it about to become wholly occupied with the payment of its debts, the amelioration of its finances, the construction of roads, canals, &c. But no, it is more gratifying to her pride, to attempt to chastise the arrogance of her late momentary allies. Granted that its resentment were just. As a Frenchman, I can but analysis the part it took, and wish it be justified by success.† But this war, whatever may be its success, will retard its advances to prosperity; but if it should turn out unfortunate, Spain has so many possessions to lose, so much lost ground to regain! Perfect to her above all others a paramount duty, if it can be preserved with safety, and without dishonour; notwithstanding which, it has in less than a century been exposed eight times to the hazard of war, and for what, unless to gratify the quarrelsome disposition of its cabinet, and the paltry passions of those by whom it is governed.

It is not by such conduct that a power, formerly of the first rank, can hope to be some regenerate or resume its ancient state. Every century in a monarchical state will produce at least two weak sovereigns, some ambitious queens, such as Isabella Parrisse, and some restless ministers, such as Alberoni, and Florida Blanca. In every century more than one occurrence will take place of equal importance with the affair of the Falkland Islands, and Nootka Sound. An empire, the fate of which depends on similar rulers, may make a noise in the gazzettes of the day, it can but excite the regret of posterity. An infant state may gain strength from being exposed to storms; arrived

^{*} The question respecting which this quarrel originated was, whether or not Spain had fair pretensions to dominion over the whole of the north-west coast of America. It disputed a claim on the part of England to form establishments at Nootka Sound, between the 49° and 50° of northern latitude. It was decided by a composition, by which the English were allowed to establish themselves between Cape Mendacino in the 40° of latitude and Nootka Sound.

[†]This wish has not been attended with the desired completion. In the war now terminated, the Spaniards have certainly displayed much bravery and talent. It has given them new claims to our esteem and gratitude, but has been of no advantage.

at maturity, and in a healthy condition, it may be able to withstand them; they are inclemencies dangerous to the convalescent.

Of this Spain exhibits a proof. Its inhabitants are endowed with a happy and fruitful imagination, and possess great aptitude for the arts; they have founded establishments of almost every description; streams of wealth run at their feet beneath a transparent surface. Good sense is met with among them, even in the most obscure classes; and of late years intelligence, even in the highest ranks; but with so much versatility, so many plans conceived by one passion, and frustrated by another; can we wonder at its stationary position? These, much too frequent, repetitions of useless war, and peace rather of a shewy than permanent nature, these short intervals of wisdom succeeded by long fits of extravagance, these render the work of her regeneration as arduous as Penelope's web.

In order to consummate the plans for her posterity already begun, more steadiness is requisite, a firmer resolution, supported by greater activity, with less attachment to distant enterprizes. It is fit that the ministry should direct its attention rather to the foundation of schools at home, than to the Philippine company; rather to the vivification of Castile, than the island of Trinidad.*

The present appears to be the most favourable epoch Spain has experienced for a long time. With a minister of unresisted sway, in the flower of his age, who seems to be seriously intent on the public weal; a monarch whose purity of life and robust constitution forebode a long reign; fine plans sketched out, and genius for the conception of others; hands which require nothing but practice and encouragement to render them expert; a people haughty it is true, but unless insulted, tractable and affectionate; a people the government of which is organized in such manner, its temporal and spiritual agents so distributed, and its population so much dispersed, that twenty methods exist of watching over and restraining the disaffected, while they possess not a single rallying point to make them formidable, and are themselves of a temper to be easily appeased by a shew of kindness, the most certain of all means of banishing discontent. With these, what a fund of means for doing good, with all the confidence inspired by undisputed authority, with all the deliberation of wisdom!

As owners, ruling every thing with thought, Fearless of being displaced, and hurrying nought.

And for triumphing over obstacles, which men and circumstances occasionally oppose to the most useful undertakings!

To avail itself of these favourable circumstances, let Spain dismiss that covetous ambition which mistakes glory for prosperity; and which, if I may adopt an adage in the modern law of nations, fancies limits fixed to states by nature; as if any usurpation by such a grant might not be made legitimate.

Let it learn from its own experience, that power is not the consequence of large possessions, when, as is its case, a vast territory at home, sufficiently capable of every species of improvement and prosperity, is continually invoking additional culture, industry and population.

To give an example, what might be expected to be the result of the conquests of Portugal to Spain, a project to which the present government is supposed surely without any reason, to be strongly attached? Can it be blind to the existence of those prejudices in the two nations, which an union must tend to encrease? Hopeless of ever endearing

ests of vithout lices in learing to itself the conquered country, it would be obliged to watch over and restrain its emotions by extraordinary measures; which would divide the attention of its government, increase its expences, and expose it continually to storms. An invasion of this description, which no spurious pretext can justify, which would be a source of and plea for insurrection, would render Spain obnoxious in the eyes of all impartial Europe: it would serve as a warning to a great part of it, to combine against two powers, the renewal of whose alliance should be the signal for the most ambitious undertakings; it would awaken in all its force, the sworn hatred against the two principal branches of the house of Bourbon would shortly create them new enemies, and disturb the repose of years, of which both countries have need for their mutual regeneration.

Yet granted the incorporation should be peaceably effected, consolidated without internal tumult or external wars, in such case the danger would certainly be less imminent to Spain, but not less formidable. Her European states remain thus limited by pretended natural boundaries by the Pyrences, the ocean and the Mediterranean. Irrevocably the ally of France, which she appears to view as her permanent interest, she has no invasion by land to apprehend, and is secure in her distance from the maritime states, from any disembarkation on her shores. In this position she may give herself up to the arts of peace. These are indisputably all that are requisite for the happiness of individuals, and prosperity of empires, but this art of war, however fatal, is likewise necessary. It consolidates power, without which prosperity becomes precarious, and is lost in the quiet of a peace of long duration. When surrounded by allies alone, when exempt for a long time from all alarm of war, a state becomes effeminate, and an easy prey to an usurper, or a conqueror; or should it escape these dangers, it sinks beneath the burthen even of its own prosperity.

Let not those, therefore, who wish to assure a durable prosperity to Spain, seek it in this rounding of territory, which is gratifying to women and children alone. It is undoubtedly in want of allies; but it requires also jealous and rival neighbours to keep its activity on the alert, not to suffer it to neglect its means of defence, or even of attack, which the passions of men will constantly render necessary. It requires long intervals of peace but until the fine dream of the abbe de St. Pierre be realized, it is also requisite that its vigilance should never sleep, and that its courage, one of the distinctive character-

istics of a Spaniard, should not become paralyzed by the absence of danger.

Perhaps one ought further to wish that their government, renouncing old prejudices and false ideas of grandeur, should fearlessly contemplate the prospect of the inevitable future independence of the greater part of its colonies; that preparing itself beforehand for this separation, it migh, prevent its being attended with bloodshed; that instead of treating her colonists as grown-up children, under the yoke of a step mother, she should freely emancipate her children, who thus might preserve a lasting affection for their mother, and become her most intimate allies; that she should become convinced that this pacific revolution, gently brought about by wisdom, would be facilitated by the conformity of manners, language and religion; that she might profit by the example of England, whose tyranny towards its old colonists retarded this approximation, but which for years back has witnessed, as a consequence of the nature of things, the natural predilection of one nation in favour of another, with which it had been long connected, and with which it preserves so many correspondent usages; that this government might learn also from the example of the same English, of the Dutch, and of the French that it is neither the number nor the extent of colonies, but their mode of organization and the excellence of their laws which tend to enrich the metropolis; for the French part of St. Domingo alone, in 1788, was more productive to

4 m 2

France than the island of Cuba, Mexico, and Peru together were to the Spaniards.

——I pause. I call to mind the antiquated prejudices retained in the archives of the council of the Indies, heir looms devolving to each minister of the day, from the period of the conquest of America. I feel how abortive all such hopes must be; but woe to Spain if they be long deferred.

At least I conjure you, Spaniards of the present day, renounce these schemes of aggrandizement with which you are charged. Has not your government, have ye not yourselves a thousand other modes of increasing your prosperity, employing your zeal,

your riches, your talents, and your courage?

Your zeal, which especially within these twenty years is directed to objects worthy of you. It was the parent of those patriotic societies, the opening of which was of such auspicious promise, but which, with some few exceptions, have brought forth nothing but plans and good wishes; but which at the same time ask for encouragement alone to become far more productive. For notwithstanding your government be despotie, you truly possess the amor patriæ; and notwithstanding the efforts that are used to keep you

in the dark, this attachment to your country has promoted intelligence.

Your riches, which lay idle in your money chests, or are placed in banks which receive it at a moderate interest, and employ it for their individual advantage; why do you not dedicate them, not to pious foundations already so numerous, and which seem rather intended to encourage indolence than solace distress, but rather to establishments which might be serviceable to your country, beneficial to yourselves, and spread life and plenty from one boundary of the empire to the other? Imitate in this instance at least those haughty rivals, who never ought to have been your allies. Contemplate the amazing works of this description which public spirit has generated in England, its numerous canals projected and begun, not at immense expence by kings, ministers, or intendants, but by individuals who enliven whole districts for their own particular profit? In some of your provinces, you already have canals of irrigation which might serve for models. Encrease the number of them. Your country, however parched it appear, possesses more resources of this kind than meet the eye of the rapid traveller. It is destitute of shade; second the views of government by a multiplication of plantations. Thus will ye shelter your cattle, your meadows, and yourself from the fury of a burning sun. Invite and pension artists who may furnish you with machinery to lessen labour and save time. Without waiting for the interposition of government, repair the roads of your different neighbourhoods, cultivate breeds of horses, and artificial meads. luxury will ye find more gratifying far than your rich gala dresses, your numerous pensioned satellites, and your various trains of carriages.

Your talents are evidenced in every department. In printing you excel. Your manufactories of cloth, particularly those of Guadalaxara, and Segovia, come nigh to perfection. For twenty years back have your silk works made such progress as to excite alarm among your rivals. In your roads, in Biscay, Navarre, that of La Sierra Morena, and those of the neighbourhood of your capital, in your basin at Carthagena, in the dam opposed to the waves before Cadiz, in many of your modern bridges, in several of your vessels of war, you have exhibited master-pieces of industry. Civil architecture has produced buildings in the capital, at the different royal residences, and in several great towns, remarkable for the excellence of their plans, and for the symetry of their proportions. You have several engravers who deserve to be noticed, and who only want to be better known, and more encouraged. Some of your painters revive the glory of your school, too little known among foreigners, and which, though late, your government at length means to hold out to the admiration of Europe with the assistance

of the engraver.* Other arts less brilliant but more useful are cultivated among you with success. You have brought to perfection the manufacture of iron. You make advances in refining copper. Your works in gold and silver begin to assume somewhat of elegance. Few coins are better struck than yours in Europe. Shortly your government will no longer be under the necessity of leaving to foreigners of genius, and foreign mechanics, the care of conceiving and executing schemes for your own advantage. Too long has genius been with you an article of importation, it has at length become an indigenous production. It is now the duty of your government to seek it out, and turn it to profit.

And lastly, your courage has indisputably sufficient means of exercise in time of peace; for much of it is wanting to attack those abuses which account for and procrastinate your state of languor. It is wanting to diminish the multitude of priests and monks who are a scandal to, and devour you, doing no less an injury to religion than to agriculture. It is wanting to effect the partitioning of those properties, the vastness of which explains the imperfect cultivation and unpeopled condition of the two Castiles and Andalusia. It is wanting to stop in their destructive career those Majorats, an institution of pride, so opposite to the feelings of nature, which unites in a first born male and his race every advantage of fortune, and thus paralyzes a multitude of estates. It is wanting to divest the Mesta of its ruinous privileges, and to restore to proprietors the exclusive enjoyment of their fields and pastures. And especially is it wanted to cure the people of its superstitious practices, and overturn those altars on which they sacrifice with trembling; to deliver it from the tribunal which it dreads as much as it reveres, and which is useless even to despotism, when it combined wisdom with energy.

And as to these different kinds of courage, in possession of which Spain would shortly become regenerate, it is among the governors alone that they have been wanting hitherto; many among the governed possess them fully. How many ministers have there not been in the last century, animated with that daring spirit which actuates man to great actions.

Here an Alberoni giving a shock to the Spanish nation, violent it is true, and ill timed, which however tends to awaken her for some years from her lethargy.

There a Macanas, who dared to oppose the abuses of the Inquisition, and who afterwards became its apologist.

A Campillo, facing the clamours of the farmers general, those cormorants of the revenue, and putting the collection of the revenues of the crown into commission.

An Ensenada, conceiving many bold and useful plans, seeking and finding able co-

A Galvez, trampling on antiquated prejudices which restricted the commerce of Spanish America to a single port.

An Olavide, attacking vigorously the most sacred abuses; creating, organizing, and spreading life through a vast colony, and metamorphosing forests and deserts into a cheerful neighbourhood.

A Carrasco, braving the hatred of great proprietors for the purpose of despoiling them of their usurpations.

[•] For some years back, the court of Madrid has projected, however tardily, the production to the world of the celebrated works of which it is mistress by the means of the engraver, and notwithstanding the war, it appears that the plan is continued, artists being employed for the purpose, as well natives of the country, as those of France and Germany.

A count d'Aranda calling philosophy about the throne, the application of which, tempered by wisdom, would increase the prosperity of the subject without weakening the power of the king.

A Cabarrus, endeavouring in spite of custom and envy to establish beneficial innovations that unfolded resources, of which the Spanish nation had scarcely a conception.

A Roda, a Camponianes, a Florida Blanca, even attempting with the same success to restrict within due bounds the authority of the church, distinguishing properly between a respect for religion, and a stupid veneration for its ministers.

These, and twenty other examples, prove that particularly in this last century, as soon as government has manifested a disposition to patronize useful enterprizes, it has found intrepid agents ready to promote its views. Let it therefore but be bold, its subjects

will not be found deficient.

Despotic governments possess this advantage every where; a single demonstration of their will firmly made, and resolutely adhered to, may effect wonders, even among nations of small intelligence, and without animation. Of what then might not that of Spain be capable with a populace fecund in men of brilliant genius and strong character; with a nation which, properly restored to its natural energy, would only require to be directed and restrained.

What a charming task, young minister, has fate allotted you, you whom I saw at your first appearance! The course is before you. The sovereign's favour levels every obstruction before you; it may conduct you to a fame of greater durability, and much more worthy your ambition. At your age you may conceive extensive plans, and trust to consummate them. If so disposed, you may at once refute the calumniators of your country, cause it to resume its rank in Europe, and establish for yourself a most distin-

guished one in history.

Already do you fill some of its pages which you ought not to wish to see torn. You have been at the head of affairs during a war which was much less disastrous to Spain than what it might have been; and at the establishment of a peace, in which the sacrifices on your part have borne no comparison to the misfortunes experienced. Without denying the part which skill certainly had in a matter which astonished all Europe, one yet may believe that the influence of the fortunate star, under which you were born, has extended to your ministerial operations. The name you have adopted in consequence of these great events, seems to hold out an abridgment of what you conceive your duty-But if for an instant I could forget I was a Frenchman, I should charge you with having already forsaken it, by engaging your country in a new quarrel, the least injurious consequence of which will be that of retarding the return of complete prosperity; of that prosperity, all the sources of which are in your custody, and which if facts, and a crowd of other testimony may be credited, is the most carnest wish of your heart. For we well know that politics and military affairs engross not all your time, that you are desirous of promoting arts and industry, and that far from fearing genius you take pleasure in raising those whom modesty and want of encouragement have placed in obscurity; that you enable intelligent persons to travel abroad in order to obtain instruction on taste which is wanting in your various establishments, for convenience and luxury, and to study by nice inspection those models which national pride need not blush to copy.

We learn more recently that, seconded by eminent persons whose confidence you enjoy, you have resolution enough to make head against a tribunal, once formidable to sovereigns themselves, and that in the contest, the temporal power has proved

victorious.

" sese wise measures, these vigorous acts are of good augury. You appear to be sensible that it were vain to attempt the regeneration of a country while subject to fanaticism. Your country has lately thirsted for information, and now it will be fruitless to oppose the inclination. The waters, whose course a dam would stop, or overflow, or break away the mound, their tranquil course might fertilize and irrigate the adjacent country, which their violent irruption would lay waste. So is it with knowledge, if it still had to contend with institutions which might restrain its progress, it would disturb the tranquility of the country, and might even shake the throne. It is by fostering it, that power will preserve itself from the inconveniences it else might experience. I would willingly compare it to those French revolutionists, whom kings have thought it right to persecute in order to prevent the extension of their alarming maxims. Those French who, before the rupture were watched with vexatious severity, were then by their secret conspiracies much more to be dreaded than they are now, that peace is established between the two nations, and frankness presides in the different relations between the two governments. So is it with knowledge. If you wish to render it dangerous, repulse it, treat it as an enemy. If you would render it beneficial to the

people, uninjurious to majesty, treat it as an ally.

This truth is not foreign to every court. Yours is worthy of hearing it. Your conciliating disposition, your good sense will make light the task of ensuring its adoption. Perhaps it would be the most secure method of securing your country against that revolutionary spirit with which it is said to be threatened. Europe, which has its eyes upon

you, must have to say thus of you.

By the mildness of his administration he managed so as to render despotism tolerable. He listened to the advice of that philosophy which does not stand discredited with him, because of the errors of some of its followers. He wishes the church to continue the support of the throne, but not to rival its power. He allows it should remain the pro-

tector of orthodoxy, but interdicts its persecution.

Firm and faithful to the ties which nature and experience prescribe to his country, he thinks it ought to have perpetual allies, but only transitory enemies. War in his estimation is sometimes inevitable, but he does not consider it a necessary element in the structure of his reputation. He considers that it is under the shade of peace alone that those arts can prosper which he loves, that industry which he encourages, and most especially agriculture, which for so great a length of time has required those gentle and wisely calculated reforms, which war must make impossible.

Your flatterers perhaps will tell you that this is your portrait. Your friends, that I have cast your horoscope, founded indeed upon presumption, but which it is requisite you should justify in order to deserve the gratitude of your country, and the culogy of

posterity.

TRAVELS IN SWITZERLAND,

AND IN

THE COUNTRY OF THE GRISONS:

IN A SERIES OF LETTERS

TO WILLIAM MELMOTH, ESQ.

FROM WILLIAM COXE, M.A. F.R.S. F.A.S.

RECTOR OF BEMERTON."

TO THE COUNTESS OF PEMBROKE AND MONTGOMERY.

MADAM,

THESE letters, relating to Switzerland, naturally claim your ladyship's protection; for they were originally written while I had the honour of accompanying lord Herbert on his travels. I feel myself highly flattered, therefore, in having the permission of inscribing them to your ladyship, and of thus publicly acknowledging that I am, with great respect, and gratitude for obligations received from the earl of Pembroke and your ladyship, Madam, your ladyship's most obedient and obliged humble servant.

WM. COXE.

Vienna, June 26, 1778.

PREFACE TO THE EDITION OF 1789.

TEN years have clapsed since I gave to the public a volume of letters, under the title of "Sketches on the Natural, Civil, and Political State of Switzerland." The favourable reception of that work induced me, in 1779, to make a journey through the country of the Grisons, a part of Switzerland hitherto little known. Having, in 1785 and 1787, opportunities of revisiting the same spots which I had before described, I was axious to revise and augment my former publication. With this view I compared my descriptions at the very places which I attempted to delineate; attentively perused the criticisms of succeeding travellers; and in many of the principal towns I entreated several persons, of political or literary eminence, to correct any errors, or to suggest any improvement, with respect to those particular parts, with which, from situation, they were most conversant.

The materials collected from these and other sources, increased by my own observations and researches, encourage me to hope, that the present improved account of so interesting a country as Switzerland, will not be unacceptable to the public, and may be considered as a new work.

Bemerton, Feb. 20, 1789.

LETTERS, &c.

LETTER I.

Route through the black forest Source of the Danube.

DEAR SIR, Doneschingen, in my way towards Swiggerland, a country long cele.

I AM now at Doneschingen, in my way towards Switzerland, a country long celebrated for the peculiarities of its different governments, and the singular beauties conferred upon it by nature. If it will not be trespassing upon your patience, I propose to trouble you with some account of my tour, for I am persuaded that I shall travel with much greater profit to myself; as the reflection that my observations are to be communicated to you, will render me more attentive and accurate in forming them.

We quitted Strasburgh yesterday, and crossed the Rhine to Kehl, formerly an important fortress belonging to Strasburgh when an imperial city. It was also strongly fortified by the French, who took possession of it in 1648: being ceded to the empire at the peace of Ryswic, the emperor consigned it to the house of Baden, reserving to himself the right of a garrison. Since that period it has been twice attacked by the French, and as during the last siege, in 1733, the works were considerably damaged, the imperial garrison has been withdrawn. At present there are only the ruins of the ancient fortifications; and by way of garrison, a few invalids belonging to the margrave of Baden. From Kehl we proceeded to Offenburgh, a small imperial town, and soon after entered the beautiful valley of Kinsing: we passed through Gengenbach, another small imperial town, finely situated, and continued our journey by the side of the small river Kinsing, rising gradually for several leagues together, until we found ourselves in the midst of the Black Forest. The country, as we ascend, became more wild and romantic, and the river more rapid; on each hand mountains, whose acclivities were finely cultivated, and whose top were richly covered with a continual forest. Several small streams of the clearest water rolled down the sides of the mountain in numberless cascades, and uniting fell into the Kinsing. The views were so exceedingly diversified, the villages so delightfully situated, and the cottages so exceedingly picturesque, that we almost seemed to have anticipated the romantic beauties of Switzerland.

Doneschingen is the principal residence of the prince of Furstenberg, in the courtyard of whose palace the Danube takes its rise. I am this moment returned from visiting the spot, the description of which may be comprised in a few words. Some small springs bubbling from the ground form a basin of clear water, of about thirty feet square; from this basin issues the Danube, which is here only a little brook. And though the two small rivers of Bribach and Brege, uniting below the town, are far more considerable than this stream, which flows into them soon after their junction; yet the latter alone has the honour of being called the source of the Danube. Having gone through the ceremony of striding across the stream, in order to say that we had stepped over the Danube, we soon satisfied our curiosity; the object in itself being by no means extraordinary, but deriving its sole consideration from being the source of so noble a river. Indeed it was this circumstance alone that induced us to enter Switzerland by

the way of Suabia.

I am, dear Sir, very affectionately yours,

WILLIAM COXE.

LETTER II.

Arrival in Switzerland Schaffhausen Fall of the Rhine.

Schaffhausen, July 22.

I FEEL great delight in breathing the air of liberty: every person here has apparently the mien of content and satisfaction. The cleanliness of the houses, and of the people, is peculiarly striking; and I can trace in all their manners, behaviour, and dress, some strong outlines which distinguish this happy people from the neighbouring nations. Perhaps it may be prejudice and unreasonable partiality; but I am the more pleased, because their first appearance reminds me of my own countrymen, and I could almost

think for a moment that I was in England.

Schaffhausen, a tolerably well-built town, situated upon the northern shore of the Rhine, is the capital of the canton, and owes its origin to the inturruption of the navigation of that river by the cataract at Lauffen: huts being at first constructed for the convenience of unloading the merchandise from the boats, by degrees increased to a large town. Schaffhausen was formerly an imperial city, and governed by an aristocracy; but it was mortgaged in 1330, by the emperor Louis of Bavaria, to the dukes of Austria, and was released from its dependency by the emperor Sigismond when Frederick duke of Austria was put under the ban of the empire. In 1501 it was admitted a member of the Helvetic confederacy; and is the twelfth canton in rank. Of all the cantons it is the least in size, being only five leagues in length, and three in breadth: its population is supposed to amount to thirty thousand souls, of which the capital contains about six thousand.

The whole number of citizens or burgesses (in whom the supreme power ultimately resides) is about sixteen hundred. They are divided into twelve tribes; and from these are elected eighty-five members, who form the great and little council. To these two councils combined, the administration of affairs is committed: the senate, or little council of twenty-five, being entrusted with the executive power; and the great council, comprising the senate, finally deciding all appeals, and regulating the more important

concerns of government.

The revenues of the state are very inconsiderable, as will appear from the salary of the burgomaster, or chief of the republic; which barely amounts to 150l. per ann. The reformation was introduced in 1529: the clergy are paid by the state, but their income is searcely sufficient for their maintenance; the best living being only about 100l. and the worst 40l. per ann. The professors of literature also, who are taken from the clergy, are paid by government; and a school is supported at the public expence. Sumptuary laws are in force here, as well as in most parts of Switzerland; and no dancing is allowed, except upon particular occasions. The principal article of exportation is wine, of which a large quantity is made, the country abounding in vineyards: and as the canton furnishes but little corn, it is procured from Suabia in exchange for wine. In the town there are a few manufactures of linen, cotton, and silk.

It will perhaps give you some idea of the security of the Swiss republics, when I inform you that Schaffhausen, although a frontier town, has no garrison, and that the fortifications are but weak. The citizens mount guard by turns; and the people of the canton being divided into regular companies of militia, which are exercised yearly, are always prepared to act in defence of their country. This canton has some troops in France, Sardinia, and Holland; the only foreign services into which the subjects of the

Protestant cantons enlist.

when I inand that the eople of the yearly, are e troops in jects of the Before I take leave of this town, I must not omit mentioning the bridge over the Rhine, justly admired for the singularity of its architecture. The river is extremely rapid, and had already destroyed several stone bridges of the strongest construction; when a carpenter of Appenzel offered to throw a wooden bridge, of a single arch, across the river, which is near four hundred feet wide. The magistrates, however, required that it should consist of two arches, and that he should for that purpose retain the middle pier of the old bridge. The architect was obliged to obey; but he has contrived to leave it a matter of doubt, whether the bridge derives any support from the middle pier; and whether it would not have been equally safe if formed solely of one arch.

It is a wooden structure, and is what the Germans call a hængewerk, or hanging bridge; the sides and top are covered; the road, which is almost level, is not carried, as usual, over the top of the arch, but is let into the middle, and there suspended. The pier is not in a right line with the buttresses, as it forms an obtuse angle pointing down the stream, being eight feet out of the rectilinear direction. The distance of this middle pier from the shore next to the town is a hundred and seventy-two feet, and from the other side a hundred and ninety-three; in all, three hundred and sixty-five feet; making in appearance two arches of a surprising width, and forming a beautiful perspective when viewed at some distance. A man of the slightest weight feels it almost tremble under him; yet waggons heavily laden pass without danger. It has been compared to a tight rope, which trembles when struck, but still preserves its firm and equal tension. I went under this bridge to examine its mechanism, and was pleased with the simplicity of the architecture: I was not capable of determining whether it rests upon the middle pier, but many judges affirm that it does not.

On consulting the greatness of the plan, and the boldness of the construction, it is matter of astonishment that the architect was originally a carpenter, without the least tincture of literature, totally ignorant of mathematics, and not versed in the theory of mechanics. The name of this extraordinary man was Ulric Grubenman, a native of Tuffen, a small village in the canton of Appenzel. Possessed of great abilities, and a surprising turn for the practical part of mechanics, he raised himself to great eminence; and may justly be considered as one of the most ingenious architects of the present century. The bridge was finished in less than three years, and cost ninety thousand

florins.*

^{*}About 8000l. sterling. Mr. Andreæ, in his Letters upon Switzerland, has given two engravings of this bridge, to which he has added a very accurate description of its mechanical construction, communicated by Mr. Jetzler, of Schaffhausen. In this description he represents it as consisting of two arches, and resting upon the middle pier. Several persons well skilled in architecture maintained a contrary opinion; and in the former editions I was induced to adopt it, from the following reasons. The architect himself constantly maintained that the bridge was not supported by the pier; his nephew, who was employed in its construction, confirmed the same assertion; and as at first it did not even touch the pier, it must therefore, at that time, have been considered as forming but one arch. I must, however, candidly own, that in my subsequent visits to Schaffhausen in 1785 and 1786, I had reason to change my opinion. At those periods the bridge was supported on piles, in order to undergo a thorough repair. Mr. Spengler, a native of the town, had lately returned from Russia, where he had passed many years in the capacity of an architect, fortunately discovered that much ill-seasoned wood having been employed in its construction, many of the timbers were absolutely decayed; and that one side had greatly swerved from its original direction. This ingenious artist, after having expatiated on the simplicity and boldness of the design, informed me that the bridge undoubtedly consists of two arches; and that although Grubenman, of whose abilities he spoke with deserved encomium, affected to place the timbers in such a manner as to resemble but one arch, and always asserted that it was not supported by the pier; yet that the whole fabric would undoubtedly have fallen, if that pier had been taken away. He obligingly shewed me his plan for repairing the bridge, and for strength-

This morning we rode about a league, to the Fall of the Rhine at Lauffen. Our route lay over the hills which form the banks of the river: the environs are picturesque and agreeable, the river beautifully winding through the vale. Upon our arrival at Lauffen, a small village in the canton of Zuric, we dismounted, and advancing to the edge of the precipice which overhangs the Rhine, looked down perpendicularly upon the cataract, and saw the river tumbling over the sides of the rock with amazing violence and precipitation. From hence we descended till we were somewhat below the upper bed of the river, and stood close to the fall, so that I could almost have touched it with my hand. A scaffolding is erected in the very spray of this tremendous cataract, and upon the most sublime point of view: the sea of foam rushing down; the continual cloud of spray scattered to a great distance, and to a considerable height; in short, the magnificence of the whole scenery far surpassed my most sanguine expectations, and exceeds all description. Within about an hundred feet of the scaffolding, two crags rise in the middle of the fall: the nearest is perforated by the continual action of the river, and the water forces itself through in an oblique direction with inexpressible fury, and an hollow sound. Having contemplated the awful sublimity of this wonderful landscape, we descended and

crossed the river, which was extremely agitated.

Hitherto I had only viewed the cataract obliquely; but here it opened by degrees, and displayed another picture, which I enjoyed at my leisure, as I sat down on the opposite bank. The most striking objects were, the castle of Lauffen, erected upon the very edge of the precipice, and projecting over the river; near it, a church and some houses; a clump of cottages close to the fall; in the back ground, rocks planted with vines, or tufted with hanging woods; a beautiful little hamlet upon the summit, skirted with trees; the great body of water that seemed to rush out from the bottom of the rocks: the two crags boldly advancing their heads in the midst of the fall, and in the very point of its steepest descent, their tops feathered with shrubs, and dividing the cataract into three principal branches. The colour of the Rhine is extremely beautiful, being of a clear sea-green, and I remarked the fine effect of the tints, when blended with the white foam in its descent. There is a pleasing view from an iron foundery close to the river, which is dammed up, in order to prevent its carrying away the works and neighbouring cottages: by means of this dam a small portion of the river is diverted, turns a mill, and forms a little silver current, gliding down the bare rock, and detached from the main cataract. Below the fall the river widens considerably into a more ample basin; at the fall, the breadth seemed to be about three hundred feet. With respect to its perpendicular height, travellers differ: those who are given to exaggeration reckon it a hundred feet; but I should imagine about fifty or sixty feet will be nearer the truth. I stood for some time upon the brink of the cataract, beheld with admiration, and listened in silence; then crossed the river, remounted my horse, and returned to Schaffhausen.

Some writers have asserted that the Rhine precipitates itself in one sheet of water, and, as I before observed, from a perpendicular leight of a hundred feet. In former ages this might be the fact; as it is probable that the space between the banks was once a level rock, and considerably higher, and that the river has insensibly undermined those parts on which it broke with the utmost violence; for, within the memory of

ening it by means of additional timbers, in order to render it able to support its own weight, when the piles should be removed.

Vid Briese aus der Schweitz nach Hannover geschrieben. Zuric, 1776.

This bridge was destroyed by the French in 1799, when they were driven from Schaff hausen by the Austrians.

several inhabitants of this town, a large rock has given way, that has greatly altered the view. Indeed, I am convinced that the perpendicular height of the fall diminishes every year, by the continual friction of so large and rapid a body of water, and have no doubt but that the two crags which now rise in the midst of the river, will in time be undermined and carried away. The Rhine, for some way before the fall, even near the bridge, dashes upon a rocky bottom, and renders all navigation impossible. I am, &c.

LETTER III.

Isle of Reichenau.....Constance.....Genevan establishment.....Isle of Meinau.....Lake of Constance.

Constance, July 24.

YESTERDAY morning we quitted Schaffhausen, and crossed the Rhine at Diessenhoffen, a small town in Thurgau; a country dependent upon the eight ancient cantons: from thence to Stein the road lay by the side of that river. Stein is an independent town under the protection of Zuric, but governed by its own laws and magistrates. At this place we took a boat to carry us to Constance. A little above Stein the river widens considerably, and forms the inferior lake of Constance, or the Zeller See; which is divided into two branches: from Stein to Constance is about sixteen miles, and from the lat-

ter to Zell, its greatest breadth, about ten.

A fine breeze soon carried us to the island of Reichenau, which belongs to the bishop of Constance: it is about three miles long, and one broad; contains about sixteen hundred inhabitants, all Catholics, three parishes, one village, and a rich abbey of Benedictines, of which the bishop of Constance is abbot. The superior was exceedingly civid and shewed us all the relics and curiosities of the convent: among the latter was a curious tooth of Charles le Gros. That monarch, who was emperor and king of France, and who possessed dominions as extensive as those of Charlemagne, lived to want the common necessaries of life, and to depend for his subsistence upon the charity of an archbishop of Mentz. He was publicly deposed in 887, at a meeting of the principal French, German, and Italian barons, whom he himself had summoned: after having languished a year in extreme want and misery, he died at a small village near Mentz, in Germany, and his remains were conveyed to this convent. The next remarkable curiosity was an emerald, as it is called, of an extraordinary size, which, according to the annals of the convent, was a present from Charlemagne. Take its dimensions, and then judge whether it can be an emerald: it has four unequal sides, the longest is near two feet, and the broadest about nine inches; it is one inch thick, and weighs about twentynine pounds. The superior valued it at £4500; but if it is, as I conjecture, nothing more than a transparent green spathfluor, its value will be reduced to a few shillings. Upon our return to the inn where we dined, we found a present from the superior, more valuable to us than all the relics and curiosities of his convent; two bottles of excellent wine, the growth of the island, which is almost a continued vineyard.

In the evening we arrived at Constance; the situation of which upon the Rhine, between the two lakes, is most delightful. I was much affected with the solitary appearance of a town once so flourishing in commerce, and so celebrated in the annals of history. A dead stillness reigns throughout; grass grows in the principal streets; in a word, it wears the melancholy aspect of being almost totally deserted, and scarcely contains three thousand inhabitants. This city has endured a sad reverse of fortune: it was formerly in alliance with Zuric and Basle, and supported by their assistance, expelled

the bishop, and embraced the reformation. But the Protestant cantons being worsted in 1351; and the league of Smalcade, of which Constance was a member, being defeated by Charles V, the town was obliged to submit to the emperor, and re-admit the Catholic religion. From this period it lost its independence, and, being neglected by the house of Austria, fell by degrees into its present state; exhibiting to some of the neighbouring Swiss cantons, an instructive contrast, which must sensibly endear to them their own invaluable happiness, in the commerce and liberties which they enjoy.

We paid a visit to the chamber where the council of Constance was held in 1415, and had the honour of sitting in the two chairs, in which sat pope John XXIII,* and the emperor Sigismond; if any honour can be derived from a turbulent ecclesiastic, and a perjured sovereign. By a sentence of this council, the celebrated reformer John Huss, trusting to the protection of the emperor, who violated his word, was burnt as an heretic. The house is still shewn where he was seized; upon the walls is his head, carved in stone, but now almost defaced; with an inscription under it in German. Jerome of Prague, his disciple, had the weakness to recant before the same council; but this weakness was amply compensated by the greatness of soul with which he again retracted this recantation, and by the calm and intrepid magnanimity which he displayed in his last moments at the stake. From the top of the cathedral we had a superb view of the town, and of the two lakes; with the rugged Alps of Tyrol and Appenzel, their tops covered with perpetual snow.

Constance may again become a commercial town, through the permission granted by the emperor to the emigrants from Geneva, of settling and carrying on their trade and manufactures, with very considerable privileges. Messrs. Roman and Meilly, watchmakers of Geneva, were the first persons, whom the troubles of their native republic rove to Constance. They received from the emperor the following immunities for

ithemselves and countrymen:

The right of purchasing or building houses; free exercise of religion, entirely independent of the Catholic clergy; the power of erecting a tribunal for the purpose of deciding all affairs relative to their manufactures and commerce; exemption from serving in the militia and quartering soldiers, from all contributions during the space of twenty years, from duties on their tools and utensils; the standard of the gold and silver employed in their manufactures to be invariably fixed. These favourable terms, signed on the 30th of June 1785, attracted so many settlers to Constance, that, in my second visit to this place, on the 25th of October 1787, the new colony of Genevans consisted of seventy families, comprising three hundred and fifty persons; among these were fifty-four watchmakers, who had introduced the different branches of manufacture which belong to their trade. Four hundred watches were already finished, and above fourteen hundred more were preparing.

The emperor has also granted to Mr. Macaire the convent of Dominicans lately secularized, towards establishing a manufacture of printed linens and cottons. The refectory

is appropriated for the chapel of the new colony.

I did not omit visiting a small dungeon, about eight feet long, six broad, and seven high, in which John Huss was confined, wherein I observed the very stone to which he had been chained. I entered it however with very different sensations from those which I experienced in 1776, when this convent was the asylum of monkish superstition. It is now the seat of trade and industry; and it must suggest a pleasing reflection to a philosophic mind, that a successor of Sigismond, who violated his word, should have

d, and seven to which he those which rstition. It flection to a should have consigned to a reformed establishment that very convent in which the Bohemian divine was imprisoned, and from which he was led to the stake, and that the most enlarged principles of toleration should be manifested in the same spot, where persecution was inculcated by precept and example. It is the triumph of reason and religion over bigotry and intolerance.

I am just returned from a pleasant expedition to the small island of Meinau, in a bay of the superior lake: this island, about a mile in circumference, belongs to the knights of the Teutonic order. The bailiff shewed us the house of the commander, which is prettily situated, and has a fine prospect of the lake, but contains nothing remarkable except the cellars, which are well stocked with wine; an article from which the chief revenue of the commandery arises. Our good friend the bailiff was very free in offering it; and we, not to appear insensible of his civility, were constrained to taste several different sorts, which he successively presented, always praising the last as the oldest and most exquisite. The wine was indeed excellent, the glasses large, and a formidable row of enormous casks still remained untasted; so that, after having duly extolled several specimens, we found it expedient to decline the farther solicitations of our generous host: for, had we performed the whole ceremony, we must have taken up our abode in the eastle for the night.

July 25.

We set sail about two hours ago from Constance. This superior lake, or, as it is sometimes called, the Boden See, is about fifteen leagues in length and six in its greatest breadth: it is one of the great boundaries that separate Switzerland from Germany. The borders consist of gently rising hills; on the left hand Suabia, and on the right Thurgau, with a variety of scattered towns, villages, and monasteries: the form of the lake inclines to an oval, and the water is of a greenish hue. I am now writing aboard the vessel, and have been for some time in vain attempting to distinguish (what some travellers have affirmed to be discernible) the waters of the Rhine from those of the lake. The river in its course from the superior lake, being exactly of the same beautiful greenish colour as the inferior lake into which it flows, it is evident that the one can never be distinguished from the other. Probably upon its first entrance into the superior lake it is troubled, and consequently, for some way, its current may easily be traced: but it purifies by degrees, and becomes an indistinct part of the great body of water.

This lake, like all the other lakes of Switzerland, is considerably deeper in summer than in winter; a circumstance owing to the first melting of the snow from the neighbouring mountains: it abounds in fish of various sorts. Yesterday evening, in our expedition to Meinau, there was scarcely a breeze stirring, and the lake was as smooth as crystal: a brisk gale has now raised a fine curl upon the surface, and the surrounding landscape forms an assemblage of the most beautiful objects. In short, the several views which present themselves are so truly enchanting, as to make me regret every moment that my eyes are called off from the delightful scenes. You will not

wonder therefore, if I am tempted to bid you adieu somewhat abruptly.

Yours, &c.

P.S. The following description of the great trout which frequents all the Swiss lakes, but more particularly abounds in the lake of Constance, was communicated by Thomas Pennant, esq. This species of trout is called in this neighbourhood Illankin, and by Linnæus, Salmo Lacustris. The head is conical, and larger in proportion than that of a salmon. The dorsal fin has twelve rays; pectoral, fourteen; ventral and anal, twelve each. The under jaw, in full grown fish, ends in a blunt hook. The colour, as low

as the lateral line, of a deep blue, brightening as it approaches the line, beneath that of a silvery white; all the upper part is spotted irregularly with black. This kind grows to

the weight of forty or forty-five pounds.

These fishes quit the deeps of the lake in April, and go up the Rhine to deposit their spawn. The inhabitants of the shores form wears across the river, in which they take them in their passage. They are also caught in nets. The fishery lasts from May to September; the fishermen avoid taking any on the return, as they are then very lean and quite exhausted. In spring and summer their flesh is of a fine red, and very delicate; but, after they have spawned, it turns white, and becomes very indifferent. They feed on fish, worms, and insects, and are particularly destructive to the graylings. Their great enemy is the pike, which will attack an illankin four times as large as itself. For a further account, the reader may consult the elegant Icthyologie by Mr. Block, vol. iii. p. 155, who is the first naturalist that has given a satisfactory account of this gigantic species.

LETTER IV.

St. Gallen Canton of Appenzel.

July 26.

I WRITE to you from the midst of the Alps, under the shade of a grove of beeches, while a clear stream of water, flowing at my feet, forms a natural cascade down the rock. I have just made a hearty meal upon some bread and cheese; a most delicious repast,

after walking six miles over the mountains of Appenzel.

We this day quitted St. Gallen, and walked to Appenzel. The country is singularly wild and romantic; consisting of a continued series of hills and dales, vallies and mountains, the tops of which are crowned with most luxuriant pastures. I could not have conceived it possible, without having been an eye-witness, that any district within the same compass could have exhibited so numerous a population; the hills and vales being thickly strewed with hamlets, scattered at a small distance from each other. The picturesque mountains, the forests, the currents which we crossed, over bridges resembling those I have observed in some of the best landscapes, added to the beauty of the scenes, and diversified every step with the most pleasing objects. After having reposed for a short time in this delightful spot, I cannot employ myself more to my satisfaction than by continuing my journal.

In my last letter I took my leave of you upon the lake of Constance: we landed at Roshach, a small burgh in the dominions of the abbot of St. Gallen, agreeably situated in the midst of a bay at the edge of the lake, and at the bottom of a rising hill, richly covered with wood and pasturages. From Roshach we went to St. Gallen, the whole territory whereof does not exceed a mile and a half in circumference; and including the town contains near eight thousand inhabitants. Every thing was alive; all persons were the appearance of industry and activity; exhibiting a striking opposi-

tion to Constance, which we had just quitted.*

*The subjects of the abbot of St. Gallen amounted to not less than 90,000. His dominions comprised, first, the ancient territory of the abbey (Alte Landschafften;) secondly, the county of Tockenburgh. That county was purchased in 1468, by Ulric abbot of St. Gallen, from the last count, who died without issue male. As the people possessed very considerable privileges, and the abbot was desirous of extending his prerogatives, frequent disputes arose, which increased after the reformation, when part of the inhabitants embraced the protestant doctrines. These disputes were frequently renewed; the abbot was supported by the catholic, the people by the protestant cantons; and in 170% a civil war broke out in Switzerland, which is usually called the war of the Tockenburg, and was ter-

The abbot and town of St. Gallen are both allies of the Swiss cantons, and each enjoys the privilege of sending deputies to the general diet. The abbot of St. Gallen is titular prince of the German empire, and is chosen by the seventy-two Benedictines, who compose this chapter. He formerly possessed the sovereignty of the town, but the inhabitants shook off his authority, and became independent: the various disputes which since that period have arisen between the two rival parties, have been compromised by the interposition of the Swiss cantons. The town is entirely protestant, and its government aristo-democratical; the subjects of the abbot (whose territory is very extensive) are mostly Catholics. It is remarkable, that the abbey in which the prince resides is situated close to the town, and in the midst of its territory; as the town is also entirely surrounded by the possessions of the prince.

The town owes its flourishing state to the uncommon industry of the inhabitants, and to a very extensive commerce, arising chiefly from manufactures of linen, muslin, and embroidery. In a place so entirely commercial, I was astonished to find the arts and sciences cultivated, and literature in high esteem. In the library there are thirteen volumes in folio, containing manuscript letters of the first German and Swiss reformers.

Luther ends a letter to Melancthon as follows:

Pestis cram vivus, moriens ero mors tua, Papa.

These letters would probably throw much light on the history of the reformation.

The library belonging to the abbey is very numerous and well arranged; and, among a number of monkish manuscripts, contains several of the classic writers, which engaged my chief attention. To this library we owe Petronius Arbiter, Silius Italicus, Valerius Flaccus, and Quintilian, copies of which were found in 1413; it was formerly very rich in curious manuscripts, but several being borrowed during the council of Constance by the cardinals and bishops, were never returned.

The transition from the abbot of St. Gallen to the canton of Appenzel will not appear abrupt, as Appenzel once belonged to the abbot: the inhabitants, however, being loaded with exorbitant and oppressive taxes, revolted in 1400, and maintained their independence with the desperate courage of a spirited people, who fight for their liberties. In 1452 they entered into a perpetual alliance with some of the neighbouring Swiss republics, and in 1513 were admitted into the helvetic confederacy: they hold the last rank among the thirteen cautons.

Before the reformation the whole canton was under one government; but since that period, part of the inhabitants having embraced the Protestant religion, and the other part continuing Catholics, violent disputes were kindled between them, which, after much contest, were at length comprised. By an agreement in 1597, the canton was

minated in 1712 by the pacification of Arau. In 1718 the constitution of the Tockenburg was settled, in which the prerogatives of the abbot and the privileges of the people were precisely ascertained. Still, however, the opposite pretensions of the abbot and the people produced occasional disputes, and in the effervescence of the revolution the inhabitants vied with the Basilians, and the borderers of the lake of Zuric, in their early demands of emancipation. They rose in January, paid the sum of 14,500 florins, the original purchase money, to the bailiff, drove him from the country, planted trees of liberty in different parts of the district, and even in the midstof the abbey. On the 31st January the prince abbot quitted St. Gallen, and took refuge in the Brisgau.

In the new divisions of Switzerland, the dominions of the abbot of the town of St. Gallen are comprised in the canton of Sentis, of which St. Gallen is the capital.

The people soon found the difference betweentheir new and ancient rulers; for in the month of May they were so dissatisfied with their government, that the French were obliged to send troops into the country to quell an insurrection.

VOL. V.

divided into two portions, Rhodes Exterior, and Rhodes Interior; it was stipulated, that the former should be appropriated to the Protestants, and the latter to the Catholics. Accordingly the two parties separated, and formed two republics; their government, police, and finances, being totally independent of each other. Each district sends a deputy to the general diet; the whole canton however has but one vote, and loses its suffrage if the two parties are not unanimous. In both divisions the sovereign power is vested in the people at large; every male who is past sixteen having a vote in their general assembly, held yearly for the creation of their magistrates and the purposes of legislation, and each voter is obliged to appear armed on that particular occasion. The Landamman is the first magistrate; in each district there are two, who administer the office alternately, and are confirmed yearly. They have each a council, which possesses jurisdiction in civil and criminal causes, has the care of the police, the management of the finances, and the general administration of affairs. The Landamman regent presides; and the other, during the year in which he is out of office, is banneret, or chief of the militia.

The Rhodes Exterior is much larger, and more peopled in proportion than the interior, and the Protestants are in general more commercial and industrious than the Catholics. The Protestants are supposed to amount to thirty-seven thousand; the Catholics to twelve thousand: an extraordinary number in so small a canton, entirely mountainous, and of which a great part consists of barren and inaccessible rocks. But the industry of the inhabitants amply compensates for any disadvantage of soil; for, the people are frugal and laborious; their property is secured, and they are exempted from all burdensome and arbitrary taxes. These circumstances, joined to the right of partaking of the legislation, and of electing their magistrates, inspire them with such animated sentiments of their own importance and independence, as excite the most active and vigorous industry, and those necessaries to which this industry is not sufficient, are abundantly supplied by their neighbours, in exchange for manufactures and other articles, of domestic commerce. The chief part of the habitable country consists of rich pastures, and of course their principal exports are cattle and hides, together with cheese and butter. Their manufactures are coarse callicoes and muslins in great quantities, which are entirely made in the houses of the inhabitants. The cotton is spun with the common wheel. The web is bleached at home, and afterwards sent to be printed in the neighbourhood of Neuchatel. The greatest bleachery I saw in the Alps was near Appenzel, which extended over three or four acres of ground. Part of the river Sitler is diverted to turn the mill, which is of the simplest construction. A large wheel on the outside works a long cylinder within, on which are fixed a number of cogs to raise the hammers which beat the webs. In the same place are the boilers and other conveniences for the business.

The only mills for spinning the cottons by water which I observed in Switzerland, were near Neuchatel and Geneva; but greatly inferior in size and ingenuity of machinery to those of England.

The flourishing state of the cotton manufactory has rendered many persons in the Protestant districts easy in their circumstances, and even wealthy; if wealth is estimated from the general state of the natives, and not from the comparative view of distant and greater opulence in large commercial cities. The villages of Trogen and Undevil announce, by their superior neatness, the well-being of their inhabitants.

This canton contains no inclosed towns, but only two or three open burghs, of which Appenzel is the largest in the Catholic, Trogen, Undevil, and Herisau in the Protestant district, and a few villages; indeed the whole country, except amongst the barren

vhich stant arren rocks, is almost a continued village, being thickly covered with excellent cottages. Each cottage has its little territory, or a field or two of fine pasture ground, which are frequently skirted with trees. The mountains are for the most part beautifully wooded; and the canton is supplied with water in such exuberance, that we could hardly walk two hundred paces without seeing a spring bubble from the ground, or a torrent rush down the sides of a rock.

In our way to Appenzel we entered several houses, which were all built of wood; neatness and convenience being the principal object of the owners: such a remarkable cleanliness prevailed throughout, as afforded a most striking proof of the general attention which the people pay to that essential article. A continued chain of these cultivated mountains, richly clothed with wood, and thickly studded with hamlets, which appear to have been placed by the genius of taste in the very spots where they would form the most striking effect, exhibit a series of landscapes inexpressibly pleasing: it seemed as if they belonged to independent clans; independent but social, uniting for the great purposes of legislation, and for the general preservation of their liberties.

Among the chief part of the inhabitants, the original simplicity of the pastoral life is still preserved; and I saw several venerable figures with long beards, that resembled the pictures of the ancient patriarchs. The natives of this canton, in common with the inhabitants of democracies, possess a natural frankness, and peculiar tone of equality, which arise from a consciousness of their own independence. They also display a fund of original humour, and are remarkable for great quickness of repartee, and rude sallies

of wit, which render their conversation extremely agreeable and interesting.

In our way to Appenzel we passed through Tuffen, the birth-place of Ulric Grubenman, whom I mentioned in a former letter:* he has been dead some years, but his abilities and his skill in practical architecture are, if I may use the expression, hereditary in his family. We inquired for one of the same name, who was either his brother or his nephew, whom we found at the alchouse. He is a heavy, coarse-looking man, dressed like a common peasant, has a quick and penetrating eye, and great readiness of conversation. We told him that we were Englishmen, who were making the tour of Switzerland; and that we could not pass through Tuffen without desiring to see a man who was so much celebrated for his skill in architecture. He struck his breast, and replied in German, "Here you see but a boor." Upon our talking with him about the bridge of Schaff hausen, in the building of which he was employed, he assured us, that it does not rest upon the middle pier, but is in reality a single arch. Near Appenzel we observed an old man with venerable white hair hanging over his shoulders, who looked like a substantial farmer: he inquired with a tone of authority, but with perfect civility, who we were, and, upon our asking the same question respecting himself, our guide informed us, that he was the Landamman, or chief of the republic. Happy people, the nature of whose country, and the constitution of whose government both equally oppose the strongest barrier against the introduction of luxury!

Doctor Girtanner, of St. Gallen, found in great abundance, on the top of the Appenzel mountains, the Draba Fyrenaica of Linnaus, not mentioned by Haller, in his cata-

logue of the Swiss plants. Yours, &c.

Appenzel, July 27.

LETTER V.

Valley of the Rhine The Lake and Town of Wallenstadt.

Salets, July 27.

WE are this moment arrived at the village of Salets, where we propose passing the night: while supper is preparing, I will continue my journal. We could procure but three horses at Appenzel, and as one of them was appropriated to the baggage, I preferred walking. After having traversed a league in the canton, over a continued range of mountains, enriched with beautiful meadows, and dotted with cottages, I reached its boundary; here the scene changed into a wild forest of firs and pines, without the least appearance of any habitation. The road is scarcely more than three feet broad, and is either paved with large uneven pieces of rock, or formed of thick stakes laid closely together; but as the ground is in many parts softer than in others, these stakes in some places sink deeper, and form a succession of uneven steps. The mountain by which we descended into the plain is very steep; which circumstance, added to the unevenness of the stakes, makes the ascent and descent exceedingly difficult for horses. Those who are pleased with an uniform view, may continue in the plain; while others, who delight in the grand and the sublime, and are struck with the wantonness of wild, uncultivated nature, will prefer this road to the smoothest turnpike in Great Britain.

I walked slowly on, without envying my companions on horseback : for I could sit down upon an inviting spot, climb to the edge of a precipice, or trace a torrent by its sound. I descended at length into the Rheinthal, or Valley of the Rhine; the mountains of Tyrol, which yielded neither in height or in cragginess to those of Appenzel, rising before me. And here I found a remarkable difference: for although the ascending and descending was a work of some labour; yet the variety of the scenes had given me spirits, and I was not sensible of the least fatigue. But in the plain, notwithstanding the scenery was still beautiful and picturesque, I saw at once the whole way stretching before me, and had no room for fresh expectations; I was not therefore displeased when I arrived at Oberriede, after a walk of about twelve miles, my coat slung upon my shoulder like a peripatetic by profession. Here we procured a narrow cart; in which, the roads being rough and stony, you will readily believe we were not much at our case. The evening however being fine, and the moon exceedingly bright, our journey was not altogether disagreeable; as it led us through a delightful country abounding in vines, fruittrees, flax, and pasturage.

The Rheinthal is a bailliage belonging to Appenzel and the eight ancient cantons. which alternately appoint a bailiff. The people are of both religions, but the Protestants are the most numerous.

Wallenstadt, July 28.

WE quitted Salets this morning, in the same cart in which we arrived, and it would have afforded matter of some speculation to observe how we contrived to arrange ourselves, our servants, a large Newfoundland dog, and the baggage, in so narrow a compass: indeed we were so wedged in that, after we had fixed ourselves in our several places, it was almost impossible to stir. The day was sultry, the road bad, and the cart went barely at the rate of three miles an hour; but the country still continued so picturesque and mountainous, and our attention was so entirely engaged with the perpetual variety of objects presented to our view, as to make us forget the inconveniences of our equipage, and the excessive heat of the weather. From Trivabach, a small village upon

the Rhine, we walked to Sargans, the capital of a bailliage of the same name, belonging

to the eight ancient cantons.

Let me here remark, that in Switzerland there are two sorts of bailliages: the one consisting of certain districts, into which all the aristocratical cantons are divided; and over these a particular officer, called a bailiff, is appointed by government, to which he is accountable for his administration; the other sort are territories belonging to two or more of them, who by turns appoint a bailiff. This officer, when not restrained by the peculiar privilege of certain districts, has the care of the police, jurisdiction in civil and criminal causes with some limitations, and enjoys a stated revenue arising in different places from certain duties and taxes. In case of exaction or mal-administration, an appeal always lies from the bailiff to the cantons, to which the bailliage belongs; and the place, the time, and the members who receive the appeal, are regulated with the utmost exactness. With respect to this of Sargans, and the others belonging to the eight ancient cantons conjointly; at the conclusion of the general diet held annually at Frauenfield in Thurgau, the deputies of these cantons resolve themselves into a syndicate, examine the accounts of the public revenues as delivered by the bailiffs of the respective districts, and receive and judge all appeals; in some cases finally: but in the more important causes an appeal lies from this assembly to the superior tribunal of each canton.

We arrived late at Wallenstadt, a town incorporated into the bailliage of Sargans, but enjoying several distinct privileges: it derives its existence from the passage of the merchandise transported from Germany through the Grisons to Italy. This communication occasions the frequent resort of Italian merchants; and that language is understood by many of the inhabitants. Our landlord speaks Italian, and has been very accurate in his answers to my questions relating to the number of inhabitants, the government of the town, its dependance upon the bailiff, and its privileges. Nor is this a matter of wonder: for the innkeepers in Switzerland are mostly burghers, and are frequently members of the sovereign council; and, from the very nature of their governments, the Swiss in general are well informed of their particular constitutions. I have also held a long conversation with a native of Glarus, who has furnished me with much

information in relation to that canton, which we purpose visiting to-morrow.

Wesen, July 29.

The lake of Wallenstadt, about twelve miles in length, and two in breadth, is entirely bounded by high mountains, except to the east and west. From this situation a breeze generally blows from those two quarters, beginning at break of day, and continuing for some hours; then changes from west to east till sun-set: this breeze is very convenient for the transportation of the merchandise. Sometimes, however, a violent north wind rushes down from the mountains, and renders the navigation dangerous. We were assured by the inhabitants, and by the watermen who rowed us from Wallenstadt to this place, that the breeze above mentioned was generally constant: but we cannot attest it from our own experience, as we set out this morning about eight, and the wind was directly contrary the whole way, blowing from west to east. The weather, it is true, was heavy, overeast, and rainy, which might cause perhaps this occasional variation.

The scenery of the lake is uncommonly wild and picturesque, and affords a perpetual variety of beautiful and romantic scenes. On the side of Glarus, the mountains which form its borders are chiefly cultivated; enriched with wood or fine meadows, and studded with cottages, churches, and small villages; the Alps of Glarus rising behind, their tops covered with snow. On the other side, for the most part, the rocks are grotesque, craggy, inaccessible, and perpendicular: but here and there a few cultivated necks of

land are formed at the very edge of the lake, and at the bottom of these very rocks, exhibiting a beautiful contrast to the barrenness above and around them. Numberless water falls, occasioned by the melting of the snows, fall down the sides of the mountains from a very considerable height, and with an almost inconceivable variety; some seeming to glide gently in circular directions; others forming that torrents, and rushing into the lake with noise and violence; all changing their form and their position as we approached or receded from them. The lake is exceedingly clear, deep, and cold, and, as we were informed, is never frozen.

There is nothing remarkable in this place, being a small village situated almost upon the point where the Mat issues from the lake of Wallenstadt: that little river is joined by the Linth, and both united fall, under the name of Limmat, into the lake of Zuric.

I am, &c.

LETTER VI.

The Canton of Glarus.

Glarus, July 29.

THE canton of Glarus was formerly subject to the abbess of the convent of Seckinguen in Suabia: the people, however, enjoyed very considerable privileges and a democratical form of government, under the administration of a mayor, appointed by the abbess, but chosen among the inhabitants. Towards the latter end of the thirteenth century, the emperor Rodolph I, obtained the exclusive administration of justice; and not long afterwards his son Albert, having purchased the mayoralty, which had gradually become hereditary, re-united in his person the whole civil and judicial authority. Albert, and his immediate descendants the dukes of Austria, oppressed the people, and ruled over them with an absolute sway. In 1350, Schweitz, assisted by Zuric, Lucerne, Uri, and Underwalden, expelled the Austrians from the canton of Glarus, and re-established the democracy. Glarus then entered into a perpetual alliance with its deliverers, and was received into the Helvetic confederacy with some restrictions, which were not abolished until 1450. At that time it was the sixth canton, but is now the last in rank of the eight ancient cantons, as they are called; being so distinguished, because, from the accession of Zug and Bern in 1352, more than a century elapsed before a new member was admitted. These ancient cantons have also several privileges superior to the five others; the latter having submitted to some particular restrictions, upon their reception into the Helvetic league.

The people of Glarus enjoyed their liberties unmolested till 1388, when the Austrians made an irruption into the canton, with a force sufficient, as they arrogantly thought, totally to subdue it, pillaging the country, and massacring the inhabitants. It was then that three hundred and fifty troops of Glarus, assisted by thirty Switzers, resisted the whole strength of the Austrian army: the former were posted advantageously upon the mountains, and the latter, to the number of fifteen thousand, at a village called Næfels. In this situation the Austrians began the attack; but were soon compelled to retreat with great precipitation, by a shower of stones poured upon them from the heights: in this moment of confusion the inhabitants rushed down upon the enemy with redoubled fury, they broke their ranks, and, after an immense slaughter, forced the remainder to retire from the canton. Such surprising victories, gained by a handful of men against an enemy so much superior in number (instances of which are by no means rare in the history of Switzerland) render the wonderful combats of Marathon and Platæa, when the Greeks repulsed the numerous hosts of the whole Persian empire perfectly credible. The same love of independence, the same dread of slavery, and the same attachment to

their country, animated the respective nations to the same deeds of heroism: in both instances victory was followed by the same glorious consequences; for the Swiss, as well as the Greeks, owe the rise and preservation of their liberties to that magnanimous and determined valour, which prefers death to life under the servile domination of an arbitrary despot. The people still celebrate the anniversary of this victory, which insured their independence, and I saw near the village of Næfels several stones, with no other inscription than 1388; an inscription which no more requires explanation to an

inhabitant of the canton, than the glorious area of 1688 to an Englishman.

In the sixteenth century the reformation was introduced into this canton, but not exclusively: both religious are telerated, and the two seets live together in the greatest harmony; an union the more remarkable, when we consider the fatal quarrels that have been kindled in Switzerland on account of religious tenets, and that in Appenzel the division between the two sects is distinctly marked by their inhabiting different districts, and living under separate governments. In several parts of this canton, the Protestants and Catholics successively perform service in the same church; and all the offices of state are amicably administered by the two parties. During the present and preceding century, the Protestants have increased considerably in number; and their industry, in every branch of commerce, is greatly superior; an evident proof how much the tenets of the Roman Catholic church fetters the genius, and depress the powers of exertion.

The government is entirely democratical: every person at the age of sixteen has a vote in the Landsgemeind, or general assembly, which is annually held in an open plain. This assembly ratifies new laws, lays contributions, enters into alliances, declares war, and makes peace. The Landamman is the chief of the republic, and is chosen alternately from the two sects; with this difference, that the Protestant remains three years in office, the Catholic only two. The manner of election is as follows: five candidates chosen by the people draw lots for the charge. The other great officers of state, and the bailiffs, are taken also by lot from a certain number of candidates proposed by the people. The executive power is vested in the council of regency, composed of fortyeight Protestants, and fifteen Catholics: each sect has its particular court of justice; and it is necessary that in all law-suits between two persons of different religions, the person having the casting voice among the five or nine judges, who are to determine the cause, should be of the same religion as the defendant.

Cattle, cheese, and butter, constitute the principal commerce of the canton. The cattle are fed in summer upon the Alps: it is computed that ten thousand head of large cattle, and four thousand sheep, are pastured during that season upon the mountains be-

longing to the canton. The inhabitants also manufacture linen and muslius.

Among the exports a considerable article is slate, with which the canton abounds. The principal quarry is in the valley of Sernft, where large slates are dug up that serve for tables. These quarries, as I am informed by Mr. David Pennant, once furnished Great Britain with slates for writing, or accomptants' slates; but this trade is entirely lost. Of late they have been prepared from the great slate quarries in Caernarvonshire, the property of lord Penryn, and with such success, as bids fair to extend this article of commerce over most part of Europe.

July 30.

I am just returned to Glarus, after having made an excursion towards the extremity of the canton: it is entirely enclosed by the Alps, except towards the north; and there is no other entrance but through this opening, which lies between the lake of Wallenstadt and the mountains separating this canton from that of Schweitz. Passengers indeed may in summer traverse these Alps to the Grisons on one side, and to Uri on the other; but these paths are in winter absolutely impracticable. At the entrance abovementioned the canton reaches, from the banks of the Linth to the farthest extremity of its Alps, about thirty miles; forming a valley, which becomes narrower as you advance, and is scarcely more than a musket-shot in breadth at the burgh of Glarus. It afterwards opens by degrees, and about a league from the last-mentioned burgh, is divided by the Freyberg mountains: at the point of this division the two rivers, Linth and

Sernst, unite.

We continued through the largest of these vallies, which, though very narrow, is exceedingly populous. You have been at Matlock in Derbyshire, and I remember your admiration of its beautiful and romantic situation; the scenery of this valley is of the same cast, but infinitely more picturesque, more wild, more varied, and more sublime. The Linth is much broader and more rapid than the Derwent, and the hillocks of the Peak are mere mole hills to the Alps of Glarus. These stupendous chains of rocks are absolutely perpendicular, approach one another so near, and are so high, that the sun may be said to set, even in summer, at four in the afternoon. On each side are numbers of those water-falls we so much admired during our passage over the lake of Wallenstadt; one in particular near the village of Ruti, foamed down the steep sides of a mountain, from the midst of a hanging grove of trees. I was so captivated with these enchanting scenes, that I could not help stopping every moment to admire them: our guide, not conceiving it possible that these delays could be owing to any other cause than the laziness of my horse, never failed to strike the poor beast, and continually awakened me out of my rapturous contemplations; it was some time before I could make him comprehend that I stopped by choice, and wished to continue my own pace. After having rode about ten miles, we quitted our horses and walked. Near Lugelbach, a considerable rivulet is formed by two streams bursting from the ground at the foot of a mountain, which after a few paces unite and fall into the Linth: beside these two principal branches, several smaller springs, and numberless little fountains, gush from the rock. The clearness of the streams; their rapidity and murmuring sound; the trees that hang over the point from whence they issue; the rude rocks above; the rich meadows and scattered hamlets; altogether form an assemblage of the most lively and pleasing objects that ever composed a beautiful landscape.

I am informed by Mr. David Pennant, that salmons force their way annually from the sea as high as this river, to deposit their spawn. Their progress is up the Rhine, and out of that noble river up the Aar, and through the lake of Zuric into the Linth, a course of many hundred miles. They are taken in these distant parts in September

and October, and about the size of seventeen or twenty pounds weight.

We crossed the Linth several times, which rushes with all the violence of a torrent, and came at length to an amphitheatre of mountains, where the valley ended: on our right hand a fall more considerable than any we had yet seen, tumbling perpendicularly over a bare rock in a large body of water; the Alps on each side crowned with inaccessible forests, and covered with everlasting snow; before us a pyramidical mountain, bare and craggy; and the glaciers of Glarus closing the view. Here the valley and the habitable part of the canton terminate. We then quitted the plain, and ascending through a wild forest of beech and pines, continued more than an hour mounting a very steep and rugged path, till we came to the Panten-Bruck, a bridge over the cataract that forms the Linth, which is here called the Sand-Bach: it roars from the glacier down the steep mountain in one unbroken fall, and, a little way before its arrival under the bridge, works itself a subterraneous passage through the rock, where it is

of a torrent, led: on our pendicularly d with inacal mountain, e valley and d ascending mounting a ver the catai the glacier its arrival where it is

lost only to appear again with increased violence and precipitation. The bridge is a single arch of stone, of about seventy feet in length, thrown over a precipice of above three hundred feet in depth. It serves as a communication with the Upper Alps, and is the passage for the cattle which are fed there during the summer months; on the other side some goats came jumping around us, and seemed to welcome us to their dreary habitations. These mountains are covered with a great variety of rare plants, which made me regret, that I had not pursued my botanical studies. As I leaned upon the parapet of the bridge, and looked down into the chasm beneath, my head almost turned giddy with the height. The rock, down which the Sand-bach drives, is composed of slate. After we had continued some time admiring the sublime horror of the scenery, we descended into the valley, and made a hearty meal upon some excellent bread, honey. butter, and milk, which a neighbouring cottage supplied. As the canton almost entirely consists of rich meadows, the milk and butter are delicious, and the honey of these mountainous countries is most exquisite. Nothing delights me so much as the inside of a Swiss cottage: all those I have hitherto visited, convey a little image of cleanliness, ease, and simplicity; and must strongly impress upon the observer a most pleasing conviction of the peasant's happiness.

If I had never seen these little democratical states, I could have formed no idea of the general equality and indistinction that prevails among the inhabitants. All the houses, like those of Appenzel, are built of wood; large, solid, and compact, with great penthouse roofs that hang very low, and extend beyond the area of the foundation. This peculiar structure is of use to keep off the snow; and, from its singularity, accords surprisingly with the beautiful wildness of the country. The houses of the richer inhabitants in the principal burghs, are of the same materials: the only dif-

ference consists in their being larger.

The police is well regulated throughout Switzerland, and even in these democratical states liberty does not often degenerate into licentiousness; we may except, perhaps, the day of their general assemblies, when it is impossible to prevent some degree of confusion in a meeting where there is scarcely any distinction of persons; and where

every peasant considers himself as equal to the first magistrate.

Our host is an open-hearted, honest Swiss: he brings his pint of wine, sits down to table with us, and chats without the least ceremony. There is a certain forwardness of this kind-which is insupportable, when it apparently is the effect of impertinent curiosity, or fawning officiousness; but the present instance of frank familiarity, arising from a mind conscious of its natural equality, and unconstrained by arbitrary distinctions, is highly pleasing; as the simple demeanour of unsophisticated nature is far preferable to the false refinements of artificial manners. I am, &c.

LETTER VII.

The abbey of Einsidlin....Rapperschwyl.

Einsidlin, July 31.

WE could not pass through this part of the country, without making a pilgrimage to Einsidlin, and paying our respects to this celebrated shrine: an object of much devotion among the Catholics. Einsidlin, or Notre Dame des Hermites is a rich and magnificent abbey of Benedictines in the canton of Scheiwtz, which owes its celebrity to the miraculous image, as it is called, of the Virgin Mary. The ridiculous tales they relate of the origin and aggrandizement of this abbey, are so many melancholy instances of the credulity of the darker ages: that they are still believed in the present enlightened

century, must be attributed to the force of habitual prejudice; and at the same time proves, how difficult it is for the human mind to shake off those superstitious errors,

which it has early imbibed under the name of religion.

In the ninth century a certain hermit called Meinrad, was the first who retired to this place, where he built a chapel, and was assassinated by robbers. But shall I tell you, or (what is more to the purpose) will you believe me if I tell you, that this murder was discovered by two crows, who followed the assassins to Zuric, where they were seized and executed? Soon after, the dead body of St. Meinrad of course works miracles; and all the world pilgrimises to his bones. The sanctity of this place being thus established, some one (for whether it were St. Beno or St. Eberhard, or what other saint I cannot precisely determine) constructed another chapel, which he dedicated to the Virgin, and laid the first foundation of the abbey; having bequeathed for that purpose his whole fortune: and the pious fund was soon considerably augmented by subsequent donations. Shall I tell you also, that in 948, Conrad, bishop of Constance as he was going to consecrate the chapel, heard a voice from heaven, assuring him, that God himself had consecrated it? Whatever was its origin, and whoever was its founder, crouds of pilgrims resort hither from all quarters to adore the Virgin, and to present their offerings: and it is computed, that upon the most moderate calculation, their number amounts yearly to 100,000. The circumjacent country was formerly a continued forest, which since the crection of the abbey has been gradually converted into rich pastures and beautiful meadows: and this is a miracle which the Virgin, in a certain sense, may be truly said to have performed.

August 1.

I have just been visiting the abbey, the chapel of the Virgin, and her immense treasures. The church of the abbey is a large and magnificent building, but exhibits a remarkable specimen of false taste, being loaded with bad paintings, and superfluous ornaments. In the aisle not far from the entrance, is a small and clegant marble chapel of the Corinthian order: this is the celebrated shrine of the Virgin, to which the pilgrims resort. On the outside an angel supports the following inscription:

Hic est plena remissio peccatorum omnium a culpa et pœna.

Over the door is a plate of silver with five holes, into which I saw several persons thrusting their fingers, and praying at the same time with great fervour: upon inquiry I found, that the credulous people believed these holes to be the marks of God's fingers. In the inside of this chapel is the image of the Virgin, which vies with the lady of Loretto in beauty of countenance; her face, as well as that of the child she holds in her arms, being black. She is richly apparelled, and change her garment every week;

her wardrobe consisting of fifty-two different suits.

The riches of the treasury are immense; containing numberless offerings of gold, silver, and precious stones, arranged in the most ridiculous manner; skulls and bones sumptuously ornamented; whole skeletons of saints in masquerade, and ladies with ruffles, fly-caps, and splendid apparel as if dressed for a ball. What a wretched insult upon poor human nature! I could not help considering them with a mixture of pity and indignation, as the offerings of ignorance before the shrine of bigotry and superstition. The miracles which the Virgin has wrought in this country are infinite, if we may judge from the numerous figures of ears, eyes, legs, arms, heads, &c. represented by those, who fancied themselves respectively cured in those several members, by the power of this wonder working image.

I was glad, however, to find in the midst of this superstitious trumpery, a good library, which contained some fine editions of the classics.

In this place there is a considerable traffic in rosaries, crosses, and little images; and there are rows of shops, where nothing is to be purchased but these necessary appendages of the Roman Catholic religion: it has all the appearance of a fair. There is also a room in the abbey, where the same kind of merchandise is exposed to sale; and one of the friars attends to receive your money, and very gravely assures you, that the several articles have touched the sacred image. Among other curiosities of this kind, I purchased two ribbands, for two pence each, with the following inscription upon them: Ce Ruban entier, est la longueur; jusqu'au trait est l'epaisseur, de l'image de Notre Dame des Hermites. Il a touche l'image miraclueuse.

This abbey is very rich, and has considerable revenues in the canton of Zuric. The abbot, who is titular prince of the German empire, is elected by sixty Benedictines, that

form the chapter.*

As I walked to this celebrated convent, I found the whole way furnished with stalls. provided with cakes, whey, and other refreshments for the numerous pilgrims then on their road. I saw several hundreds, in groups of different numbers. Some consisted of a whole parish, attended by their spiritual pastor. More than once I observed some grievous sinner driven from the flock, and walking at a distance counting his beads, bare-footed and bare-headed, doing full penance for his crimes. I also saw several bevies of merry damsels, who seemed to enjoy the pilgrimage as much as Welsh lasses relish a wake. They often turned into the little chapels which lay open on the way, and wantonly sprinkled each other with holy water.

This day's journey reminded me of Chaucer's Tales, in which he exactly describes this pilgrimage, in his account of that to the shrine of St. Thomas of Canterbury:

From every place the pious ramblers stray, But most to good Einsidlin bend their way: There at the martyr's shrine, a cure they find For each sick body, and each love-sick mind.

Rapperschwyl, August 2. The evening, yesterday, being fine and cool, I walked from Einsidlin to this place. After we had ascended about three miles, a view of the take of Zuric, and of the adjacent country, opened upon us at once. The prospect was extensive and beautiful: the solemn stillness of the evening, the calmness of the lake, and the tints of the setting sun, which glowed around the horizon, very much improved its charms. When we arrived at the lake the moon began to rise; and, throwing its beams across the water, formed another scene, more mild indeed, but not less affecting. We then crossed the bridge of Rapperschwyl, built over the narrowest part of the lake: it measured near 1700 paces. The town is pleasantly situated upon a neck of land or promontory. It

The demolition of this building was announced to the new Helvetic diet assembled at Arau, and is thus recorded in the new annals of Switzerland:

"Citizen Haas informed the assembly, that general Schawembourg had resolved to destroy the convent of Einsidlin, and to preserve only such buildings as were necessary for the purposes of agriculture; that no vestige of that den of fanaticism and superstition should remain." Moniteur, 3 Prairial, l'An. 6.

^{*} On the 2d of May 1798, a French column, under the command of general Tresinet, after defeating the Swiss peasants on the borders of the lake of Zuric, and pillaging and burning several villages, arrived at Einsidlin. They found the abbey deserted by all the monks except one, and stripped of all its treasures. The image of the Virgin was sent to Paris as a companion to that of Loretto, and general Schawembourg ordered the abbey to be instantly demolished in his presence. Planta, p. 442.

formerly threw itself under the protection of Uri, Schweitz, Underwalden, and Glarus, with a reserve of all its privileges: but these cantons, shamefully oppressing the inhabitants, and encroaching upon their liberties, Zuric and Bern took possession of the town in 1712, and restored its ancient immunities. From that period Rapperschwyl has continued under the protection of Zuric, Bern, and Glarus; the latter having preserved its right by its neutrality. By this treaty the town having recovered its former prerogatives, the inhabitants, in testimony of their gratitude, placed the following inscription over the gates: Amicis Tutoribus floret libertas.

This small republic is governed by a great and little council, consisting of forty-eight members. The town contains two hundred burghers, and about a thousand inhabitants, all Catholics. Its territory is about a league in circumference, and comprehends three parishes. Yours, &c.

LETTER VIII.

Town and Canton of Zuric.

YESTERDAY we dined luxuriously with the Capuchin friars at Rapperschwyl, who seldom treat their guests in so sumptuous a manner. It was one of their great feast-days; and they regaled us with every variety of fish, with which the lake and the neighbourin.g rivers abound. The convent stands upon the edge of the water, and commands an agreeable prospect: the library is by far the pleasantest apartment, though not the most frequented. The cells of the monks are small, and yet not inconvenient; but cleanliness does not seem to constitute any part of their moral or religious observances. Indeed the very habit of the order is ill calculated for that purpose, as they wear no shirt or stockings, and are clothed in a coarse kind of brown drugget robe, which trails upon the ground. Strange idea of sanctity! as if dirt could be acceptable to the Deity. I reflected with particular satisfaction, that I was not born a member of the Roman Catholic church; as perhaps the commands of a parent, a sudden disappointment, or a momentary at of enthusiasm, might have sent me to a convent of Capuchins, and have wedded me to dirt and superstition for life.

After dinner we took leave of our hosts, and departed for Zuric by water: the lake is near ten leagues in length, and one in breadth. This body of water is of an oblong form, and not near so large as that of Constance; but the borders are studded more thickly with villages and towns. The adjacent country is finely cultivated and well peopled; and the southern part of the lake appears bounded with the high stupendous mountains of Schweitz and Glarus: the scenery is picturesque, lively, and diversified.

Zuric was formerly an imperial city, and obtained from the emperor Frederick II, very considerable privileges; which were acknowledged and augmented by several of his successors. The civil war between the magistrates and the people, in 1335, nearly reduced the city to ruins; but the former being banished, the citizens, in 1337, established a new form of government, which was confirmed by the emperor Louis of Bavaria. The exiles, after several fruitless attempts, were at length re-admitted; but, engaging in a conspiracy against the citizens, were discovered and put to death. In consequence of this execution, the nobles in the neighbourhood took up arms; and Zuric, after having ineffectually applied for assistance to the emperor Charles IV, formed an alliance with Lucerne, Uri, Schweitz, and Underwalden, and was admitted a member of their confederacy. This event happened in the year 1351. The four cantons

yielded the pre-eminence to Zuric: a privilege it enjoys at present; being the first canton in rank, and the most considerable in extent both of territory and power next to Bern. In the same year Zuric was assisted by the four cantons against Albert, duke of Austria, who besieged the town, and was repulsed with great loss.

Zuric was the first town in Switzerland, that separated from the church of Rome; being converted by the arguments of Zuingle. Of all the reformers (the mild and elegant Melancthon alone excepted) Zuingle seems to merit peculiar esteem: he possessed, to a great degree, that spirit of meekness, moderation, and charity, which are the characteristics of true Christianity; and amid all the disputes between the Lutherans and the reformed churches, was a constant advocate for peace and reconciliation. He was perfectly free from narrow bigotry which makes no distinction between points of the merest indifference, and objects of the greatest importance; as from overbearing pride, which, while it violently condemns the opinions of others, assumes infallibility with respect to its own. In a word, it was his opinion, that, provided Christians agree in the most essential articles; they ought meekly to bear with any difference upon subjects less un-

controvertible, and which do not influence morals.

Ulric Zuingle was born Jan. 1, 1484, at Wildhausen, a small village in the Tockenburgh; and, in the twentieth year of his age, was appointed minister of Glarus. Even before the publication of the sale of indulgences by Leo X, which was the more immediate cause of the reformation, Zuingle exposed at Glarus several superstitions of the church of Rome; and gained additional credit, by preaching at Einsidlin against vows, pilgrimages, and offerings. After the publication of the sale of indulgences, while Luther was undermining the fabric of papal authority in Germany, Zuingle was no less successful in Switzerland. By his zeal and intrepidity, and by the irresistible force of truth, he gained so many converts at Zuric (where he had been invited to preach) that in 1524 the magistrates abolished the mass, and other Catholic ceremonies, and introduced the reformed religion. Zuingle had taken such wise precautions, and acted with such extreme moderation, that the disputes between the two sects were carried on with more temper than is usual in religious controversies. The change which had been some time in agitation, was finally determined by a plurality of voices in the sovereign council, and the people readily and cheerfully obeyed the decision of their magistrates. The example of Zuric was soon followed by Bern, Schaff hausen, Basle, with part of Glarus and Appenzel; the other cantons continuing to adhere to the religion of their ancestors. From this period the two persuasions have been established in Switzerland; but that harmony, which had hitherto subsisted between the cantons, has been occasionally interrupted. In 1531, religious disputes broke out with so much violence and animosity, as to occasion a civil war; in which the Protestants were defeated, and Zuingle lost his life, in the forty-eighth year of his age, at the battle of Cappel.* Since that period, two other religious wars have been kindled; one in 1656, in which the Catholics gained the advantage; and the other in 1712, when the Protestants proved victorious. The peace of Arau, which terminated these unhappy disputes, has, it is to be hoped, finally composed all religious animosities. By that treaty, which may be considered as a code of toleration among the Swiss; the treatment of the Protestants and Catholics in the common bailliages is regulated. The first article stipulates, that in all the provinces,

^{. *} It has been urged against Zuingle, as a proof of his persecuting principles, that he was personally engaged in this war against the Catholics. To this it may be answered, that he had used every argument in his power to reconcile the contending parties; that he even openly arraigned the impatient and turbulent zeal of his fellow-citizens; that he acted in obedience to one of the fundamental laws of the republic; and that he accompanied the army by the express command of the magistrates.

which are subject to cantons of different religion, there shall be a perfect equality between the two sects, and that they shall both enjoy the same privileges: to which is added an express prohibition to each party, not to use any terms of raillery or contempt, in speaking of their respective modes of worship.

The canton of Zuric abounds in corn, wine, and excellent pasture. The proportion of grain to the other productions of the earth, will appear from the following calculation. There are 217,424* acres in tillage, 14,466 in vines, 94,553 in meadows, 42,549

in pasturage, and 103,778 in forest.

As sufficient corn is not produced for the interior consumption, the deficiency is chiefly supplied from Suabia; and, to prevent a scarcity of this material article, a public granary is maintained at the expence of government. The grain is retailed at the common price; but, in seasons of scarcity, is sold considerably cheaper than it can be purchased at the market. The good effects of this establishment appeared at the dearth in 1771; when, on account of the dearness of corn, a pound of bread was sold for ten pence, the same quantity was delivered by government for four pence. The wine made in the canton forms an inconsiderable object of foreign commerce; the greatest part being consumed in the country. In 1779 were exported 10,029 casks, each containing 180 bottles; in 1780, 24,568, and in 1781, 11,354.

The canton contained, in 1784, 174,572 souls, including 10,500 in the capital. This large population, in proportion to the size of the canton, is owing to the trade of Zuric; as at least two-thirds of the inhabitants derive their livelihood by spinning thread and

silk, and making linen for the manufactures of the town.

The sovereign power resides exclusively in the burgesses of the town, consisting of about two thousand.

Here I cannot but remark, that a narrow spirit of policy reigns throughout most of the states in Switzerland: as they seldom confer the burghership. This rule, however, in some of the republics, is less scrupulously observed than in others; but in Zuric a new

citizen has not been admitted during these last hundred and fifty years.

It is curious to trace the restrictions which have been gradually laid on granting the burghership. On the 26th of May, 1540, the sovereign council issued a decree, importing that whosoever was desirous of becoming a citizen, should be obliged to produce a certificate of good behaviour, properly witnessed and signed, and bearing the seal of the magistrates of the place in which he formerly resided; and should, before he was enrolled among the burghers, pay ten florins, near 11. if a native of Switzerland, and double that sum if a stranger. An inhabitant of the town or canton was taxed only at three florins for his admission; and all artists and persons of learning, necessary or useful to the state, were to be received gratis. In 1549, it was enacted, that the burghership should be refused to all who were not possessed of considerable riches, or who did not introduce new arts and trades. This decree was repeatedly confirmed; and, in 1593, it was added, that a new citizen should not be entitled to a share in the governnent but on the following conditions: If an inhabitant of the canton, he must have reided in the town during ten years; if a native of Switzerland, twenty; if a foreigner, forty; and he must build or purchase a house within the walls of Zuric: this last article was repealed in 1612. In 1597, the reception of new citizens was suspended for the first time, but only for two years; and in 1610, the admission-money was augmented.

In the commencement of the 17th century, government refused to receive into the sovereign council the noble families of Orel, Peffaluzz, and Muralt, which, in 1555 and 1557, had quitted Italy and settled at Zuric: these families, partly on account of having embraced the reformed religion, and partly as persons of capacity and industry, had been received into the burghership, but rendered incapable of enjoying a share in the administration of affairs. This exclusion, again confirmed in 1592, was revoked in 1673, in favour only of the family of Muralt, which exception was obtained by considerable largesses. In 1674, the family of Orel offered to disburse ten thousand florins towards the expense of repairing the fortifications, on condition of being rendered capable of election into the sovereign council: their petition was then refused, but generously granted in 1679, without the smallest equivalent. Finally, on the 7th of January, 1661, the council determined to make no more burghers; which resolution has been invariably followed.

The burghers, beside the advantage of electing their magistrates, and of aspiring to the administration of affairs, enjoy the sole* right of commerce; all strangers, and even subjects, being excluded from establishing manufactures in the city, or in any part

of the canton.

*The narrow principle of commercial monopoly, which confined trade to the burghers of Zuric, excited a spirit of disaffection among the subjects, and particularly the populous districts on the borders of the lake, who overlooked the advantages which they enjoyed from a mild and equitable government in this partial grievance. To the effects of this principle may be attributed the feeble conduct of this canton on the aggression of the French. The magistrates foresaw the designs of the French rulers to subjugate Switzerland, and were willing to co-operate with Bern in defence of Helvetic independence; but their efforts were defeated by the opposition of the borders of the lake, who instituted committees of reform, and sent deputies to Paris. Hence all the proposals of government to supply the contingent of men for the relief of Bern, were answered by counter-proposals to reform the constitution. A length the supreme council of Zuric, anxious to conciliate their subjects, and apprehensive of the progress of the French arms, made some concessions, which only served as a pretext for new demands. At each order issued by government for a general armament, new privileges were extorted, until the supreme council committed the charge of new-modelling the state to a convention of one hundred persons selected from different ranks. This committed drew up articles of a new constitution, which were ratified by the councils and the whole body of burghers; and the old magistracy was invested with the feeble authority of a provisional government.

But even this innovation did not produce the desired effect: for when the magistracy, in conjunction with the convention, attempted to call forth the contingent of the canton, a small and dispirited number obeyed the summons, and only 1500 men, from a canton whose population amounted to 170,000, marched against the French. These troops were dispirited, uncertain how to act, and, distracted by the wavering counsels of Bern, did not take the field; but, on the capitulation of Bern, sur-

rendered, at Frinisberg, to a body of French troops: two companies were plundered; but the remainder were permitted to continue their march to their capital, with all the honours of war.

A general panic now spread among the inhabitants of Zuric; reports prevailed, that on one side a corps of French were preparing to invade the canton, and on the other a large body of the subjects in a state of insurrection were marching against the capital. A hasty accommodation was arranged between

the two parties; the inhabitants took up arms, and prepared to defend the place

Fortunately these reports proved to be fallacious; for a negotiation was opened with the insurgents, who had erected themselves into an assembly of the people, with central and provisional committees; and after a few conferences an accommodation was effected. A garrison of 1000 militia was admitted into the town; the provisional government was dissolved; a national assembly convoked; the magistrates deposited their authority into the hands of the free and sovereign people; a new provisional regency was established; a tree of liberty planted, with the inscription, "The brethren of the town and country are united;" and a deputation, with the peace-offering of the new constitution, was sent to the French generals, to implore the protection of France, and to request that no foreign troops might enter their territories.

The French generals accepted the submission of Zuric, but inundated the canton with troops. Further alterations were made by the provisional government; and on the 21st of March the national

assembly acceded to the new organization of the Helvetic constitution.

The burghers of Zuric are divided into thirteen tribes; one of which is called Constaffel, or the tribe of nobles, although at present not absolutely confined to persons of that description: it enjoys the privilege of giving eighteen members to the sovereign council, and six to the senate, whereas each of the other tribes only supply twelve to the

former, and six to the latter.

The legislative authority is vested by the burghers in the sovereign council of two hundred; consisting, however, of two hundred and twelve members drawn from the thirteen tribes, and comprising the senate or little council. This* senate, composed of fifty members including the two burgomasters, has jurisdiction in all causes civil and criminal: in civil cases, when the demand is of a certain importance, an appeal lies to the council of two hundred: but in criminal affairs, their sentence is final, and, when once passed, there is no reversal or mitigation. An excellent maxim! provided the judges are cautious and circumspect, and the laws mild: for there is no greater encouragement to the commission of crimes, than the frequency of pardons. Such an institution, however, ought necessarily to exclude severity of punishment; and could never be admitted in a state, where by the letter of the law the same punishment is inflicted

upon a sheep-stealer as upon a parricide.

It is to be regretted, that in this republic, as in most other states of Switzerland, there is no precise code of criminal law. The Caroline, or code of Charles V, is ostensibly followed; but on account of its obsolete usages and extreme severity, the sentence is ultimately left to the discretion of the magistrates. For notwithstanding the most perfect integrity, and upright intentions, yet it is hardly possible to suppose, that party, friendship, connections, and family, should not frequently influence the judges and occasion partial proceedings. It would perhaps well become the wisdom of this enlightened and equitable government to form a penal code, and to ascertain with precision the punishment for each offence. The example of such a republic would in time be followed by the remaining cantons and states of Switzerland; and posterity would bless the name of Zuric for having occasioned the introduction of more settled principles in the criminal courts of justice. Some late decisions have rendered this arrangement more obviously necessary. Several persons disordered in their understandings committed suicide; and, although the circumstances of the crime were nearly similar, yet the most opposite sentences were pronounced on these occasions; so that the families of those to whom a greater degree of severity was shewn, were necessarily more distressed on account of the mildness manifested to the others.

Every judge of delicacy and honour would undoubtedly experience great satisfaction to find himself restrained by precise laws from listening to solicitations from friends and party, and from being biassed by those feelings, of which it is almost impossible to be

divested.

The power of the senate, considered in a collective capacity, is very considerable: it judges finally in all criminal causes, has the care of the police, and supplies the principal magistrates. But, as too great a power of individuals is dangerous in a republic, the members of this assembly are liable to be changed, and a revision or confirmation is annually made, in some instances by the sovereign council, in others by the particular tribes to which the senators belong. This annual revision is a great check to mal-

^{*} Formerly the senate was separated into two equal divisions, which alternately administered the office during six months; and although these divisions still continue, yet for some time past they have re-united and acted together.

administration, and at the same time prevents the senate from gaining so great an influence as to be detrimental to the liberties of the people. A burgher is qualified to vote at twenty; is eligible into the Sovereign Council at thirty; and into the Senate at thirty-five. By these wise regulations, a man must have formed some experience in public affairs, before he is capable of holding an important charge. The revenues of government, though not exceeding 65,000l. per ann. are more than proportionate to the expences; which are regulated with the strictest economy. The state is not only without debts, but an annual saving is deposited in the public treasury, for a resort upon any sudden emergency. From this fund government supported the whole expence of the war, in 1712, against the Catholic cantons, without imposing any additional tax.

The canton of Zuric is divided into districts or bailliages, which are governed by bailiffs nominated by the Sovereign Council. These bailiffs, excepting those of Kyburgh and Groningen, cannot pass capital sentence, or order torture. They can arrest and interrogate the delinquent, and punish small misdemeanors by whipping, or banishment from the bailliage. In capital cases they examine, make out the verbal process, and send the felon to Zuric for further trial. On inquiring into the state of criminal jurisprudence, I learned with satisfaction, that the torture had not been inflicted in the capital for those last nine years; which may be presumed to be a prelude to its total abolition; but it is much to be regretted, that whipping, which is a species of torture, is not unfrequently applied, in order to force confession, both in Zuric and in the bailliages; an abuse of justice repugnant to the wisdom of so enlightened a government.

The city of Zuric stands at the northern extremity of the lake, and occupies both sides of the rapid and transparent Limmat. The environs are extremely delightful; an amphitheatre of hills gradually sloping to the borders of the water, enriched with pasture and wines; dotted with innumerable villas, cottages, and hamlets; and backed on the west by the Utliberg, a bold and gloomy ridge stretching towards the Albis, and

that chain of mountains which rises gradually to the Alps.

The town is divided into two parts; the old part, surrounded with the same ancient battlements and towers which existed in the thirteenth century, and the suburbs which are strengthened by fortifications in the modern style, but too extensive. The ditches, instead of being filled with stagnant water, are mostly supplied with running streams. The public walk is pleasantly situated in a lawn, at the junction of the Limmat and the Sil, an impetuous and turbid torrent, which descends from the mountains of Einsidlin: two rows of lime-trees planted by the side of the Limmat, and following its serpentine direction, afford an agreeable shade in the heat of summer. The inhabitants are very industrious; and carry on with success several manufactures: the principal are those of linens and cottons, muslins, and silk handkerchiefs. The manufactures do not in general dwell within the walls; but the materials are mostly prepared, and the work is completed in the adjacent districts. For this reason Zuric does not exhibit the activity and numbers of a great commercial city. The environs, on the contrary, are so extremely populous, that perhaps few districts in the neighbourhood of a town, whose population scarcely exceeds ten thousand inhabitants, contain within so small a compass so many souls. The streets are mostly narrow; the houses and public buildings accord more with plainness and convenience, than with the elegance and splendour of a

The town contained, in 1780, 10,559 souls, in the following proportions: 2583 male burghers, 3464 female burghers; 860 foreign clerks, 250 foreigners; 372 male inhabitants, 444 female inhabitants; 223 men-servants, 1734 maid servants; and 629

patients in the hospital. The gradual decrease of the population in the town, which arises from the difficulty of obtaining the burghership, will appear from the following table:

1357	1756	1762	1769	1780
12,375	11,102	10,616	10,574	10,559

The increase of luxury and opulence will appear from considering that, in 1357, the number of men-servants amounted to only 84, and of maid-servants to 263; whereas, in 1780, the former were 223, and the latter 1734; or near a fifth of the

whole population.

The manners of the inhabitants are in general simple, and may perhaps in these times be esteemed antiquated. Dinner is usually served at twelve: in the afternoon the gentlemen assemble in clubs or small societies, in the town during winter, and at their respective villas in summer. They frequently smoke, and partake of wine, fruit, cakes, and other refreshments. The women, for the most part employed in their domestic occupations, or devoted to the improvement of their children, are not fond of visiting. When they go out, they generally assemble in separate coteries, to which only a few men, and those chiefly the nearest relations, are admitted: many of the ladies indeed, from a consciousness of their provincial accent, and a difficulty of expressing themselves in French, seldom make their appearance when stangers are received. It has more than once happened to me, that on being shewn into the apartment wherein the ladies were assembled, the master of the house has taken me by the hand, and led me into another room, where he would have detained me, if I had not requested to be reconducted to the ladies. This reserve begins greatly to abate, and to give place to a more sociable intercourse. Such, however, is the prevalence of national habit, that a few families, which form a more agreeable mixture of company are considered as differing from the established customs, and are still known by the name of the French Society.

Sumptuary laws, as well as those against immorality, are well observed. The former indeed may exist, and be carried into execution even among a people much corrupted; for it may be the policy of government to enforce their observance. But the severest penalties will not be sufficient to prevent crimes of an immoral tendency, amidst a general dissoluteness of manner: the popular principles can alone invigorate such laws, and give to them their full operation. Secret crimes cannot be prevented; but it is an evident proof of public virtue, when open breaches of morality are discountenanced, among their sumptuary laws, the use of a carriage in the town is prohibited to all sorts of persons except strangers: and it is almost inconceivable that, in a place so com-

mercial and wealthy, luxury should so little prevail.

The militia of the canton amounted, in 1781, to 25,718 infantry, 1025 artillery, 886 dragoons, and 406 chasseurs; in all 28,235 effective men. There is a military chest at Zuric, established in 1683, and supported by the members of the great council, who, instead of giving an expensive entertainment, are bound on their election or farther promotion to pay a certain sum. From this fund, which has been considerably augmented, 2000l. was taken, in 1770, for the purpose of establishing a magazine of uniforms and arms, which are either distributed, or sold at a low price to the poor peasants who cannot afford to purchase them at their full value; each peasant, according to the military laws of the canton, being obliged to possess his arms and uniform.

The arsenal is well supplied with cannon, arms, and ammunition; and contains a reserve of muskets for thirty thousand men. We saw there, and admired, the two-

handed swords and weighty armour of the old Swiss warriors; as also the bow and arrow with which William Tell is said to have shot the apple from the head of his son.

This canton has a regiment and some companies in the service of France, a regiment in that of Holland, and some companies in the service of the king of Sardinia. The king of France pays annually for a regiment of fusiliers, consisting of 1292 men, 20,3481. The colonel receives about 8401. per ann.; a captain 3601; and a common soldier 71. The pay of a regiment of twelve companies, in the Dutch service, is 25,3771.

LETTER IX.

Ecclesiastical affairs.... State of Literature.... Learned Men of Zuric.... Society of Physics.... Seminaries.... Libraries.

IN ecclesiastical affairs the senate is supreme: the canton is divided into fourteen districts, each governed by a dean, chosen by the synod, from three candidates proposed by the clergy of the diocese. The synod, composed of the whole clergy, and several assessors on the part of the little council, meets twice a year. In the last century it had a more democratical form, and exercised jurisdiction over its members: it examined causes between ecclesiastics, and between the ministers and their parishioners; gave decisions; enjoyed the power of imprisoning, deposing and reinstating the ministers; and exercised an authority dangerous to the state. By degrees their exorbitant prerogatives were annulled; and in 1700 the clergy of Zuric succeeded in the establishment of a more aristocratical form.

The principal ministers and professors in the town constitute, in conjunction with several magistrates and other assessors deputed by the civil power, an ecclesiastical and academical council: to this committee the deans have recourse in all concerns which seem to exceed their jurisdiction: it determines lesser affairs, and refers cases of importance to the senate.

The fourteen deans assemble twice a year in Zuric, and compose a prosynode; in which they depute one of their own body to deliver their requisitions, or pia desideria, first to the ecclesiastical council, and afterwards to the general Synod. The ecclesiastical council takes their requests into deliberation, lays them before the Synod, and, if recommended, they are presented by the assessors to the final decision of the senate. The ecclesiastical benefices in this canton are extremely moderate. The best living may be worth 140l. per ann. and the worst about 30l. The salary of the canonries in the capital amounts to 120l. In general, a clergyman in the town, who has merit, is certain of obtaining a professorship, which adds 50l. or 60l. per ann. to his other appointments.

The charitable establishments at Zuric are the orphan-house, which is regulated with extreme attention and care; an alms-house for poor burghers; an hospital for incurables, and that for the sick of all nations, which usually contains between six and seven hundred patients; and the Allmosen-Amt, or foundation for the poor: this excellent institution puts out children as apprentices, and distributes money, clothes, and books of devotion to poor persons, as well in the town as in different parts of the canton, at the recommendation of the respective ministers. In 1697 it distributed 3001; in 1760 5,0101.; in 1770, 4,7961.; and in 1778, 5,4511.

Among the particular institutions must not be omitted the chirurgical seminary: it is formed by voluntary subscriptions, and chiefly supported by Dr. Rhan, an eminent physician, who reads lectures gratis, and gives the profits of a publication, called the

Magazine of Health, towards maintaining this seminary, for the instruction of young

physicians and surgeons, destined to settle in the country.

At Zuric public education is a concern of state, and under the immediate protection of government. The office of a professor gives rank and estimation, and is often held by a member of the senate and of the great council. The principal literary establishments for the instruction of youth are, the Caroline College for students in divinity; Collegium Humanitatis, or the college for polite literature; and the school of arts: the first has twelve professors, the second two, and the last seven. The learned languages, divinity, natural history, mathematics, and in short every species of polite learning, as well as abstruce science, is taught at a small expense in these respective seminaries.

In consequence of the unremitted attention which, since the reformation, government has paid to the education of youth, many eminent persons have flourished in all branches of literature; and there is no town in Switzerland where letters are more encouraged, or where they have been cultivated with greater success. A learned professor of Zuric has, in a very interesting publication, displayed the important services which erudition and science have derived from the labours of his countrymen. In these biographical memoirs appear, among many others, the names of Zuingle and Bullinger, Conrad Gesner, Hottinger, Simler, Spon, Scheutzer, Heydegger, Breitinger, Bodmer, Hertzel, and

Solomon Gesner.

Of all the luminaries which Zuric, fertile in great geniuses, has ever produced, Conrad Gesner perhaps occupies the first place. He was born at Zuric in 1516, and died in 1564, in the 48th year of his age. Those who are conversant with the works of this great scholar and naturalist, cannot repress their wonder and admiration at the amplitude of his knowledge in every species of crudition, and the variety of his discoveries in natural history, which was his peculiar delight. Their wonder and admiration is still further augmented, when they consider the gross ignorance of the age which he helped to enlighten, and the scanty succours he possessed to aid him in thus extending the bounds of knowledge; that he composed his works, and made those discoveries which would have done honour to the most enlightened period, under the complicated evils of poverty, sickness and domestic uneasiness. A detail of his life and writings, by an author capable of appreciating his multifarious knowledge, would be a just tribute to the merits of this prodigy of learning (Monstrum Eruditionis) as he is emphatically styled by Boerhaave.

Bodmer, born in 1698, was alive in 1776, when I first visited Switzerland; but I was at that time ignorant of the German language, and unacquainted with his great merits in reforming the taste of his contemporaries, and familiarizing them to the sublime beauties of Homer and Milton. He died in 1783. I now regret that I did not cultivate the acquaintance of a man, whom the unanimous voice of his contemporaries deservedly style the Father of German literature; whose just criticisms and correct judg-

ment animated the poetical genius of Klopstock, Haller, and Gesner.

I did not omit waiting upon Solomon Gesner, the celebrated author of the Death of Abel, and of several idyls, which for their delicate and elegant simplicity are justly esteemed. They abound with those nice touches of exquisite sensibility, which discover a mind warmed with the finest sentiments; and love is represented in the chastest colouring of innocence, virtue, and benevolence. Nor has he confined his subjects merely to the passion of love: paternal affection, and filial reverence; gratitude, humanity, and every moral duty, is exhibited and inculcated in the most pleasing and affecting manner.

He has for some time renounced poetry for the pencil; and painting is at present his favourite amusement. A treatise which he has published on landscapes discovers the

elegance of his taste, and the versatility of his genius: while his compositions in both kinds prove the resemblance of the two arts, and that the conceptions of the poet and of the painter are congenial. His drawings in black and white are preferable to his paintings; for although the ideas in both are equally beautiful or sublime, the colouring is inferior to the design. He has published a handsome edition of his writings in quarto, in which every part of the work is carried on by himself: he prints them at his own press; and is at once both the drawer and engraver of the plates. It is to be lamented that he has renouoced poetry; for, while ordinary writers spring up in great plenty, authors of real genius are rare and uncommon. His drawings are seen only by a few; but his writings are dispersed abroad, translated into every language, and will be admired by future ages, as long as there remains a relish for true pastoral simplicity, or taste for original composition. He is plain in his manners; open, affable, and obliging in his address; and of singular modesty. Gesner died of an apoplexy, March 2, 1788.

I called also on Mr. Lavater, a clergyman of Zuric, and celebrated physiognomist, who has published four volumes in quarto on that fanciful subject, illustrated with appropriate engravings. This work, however, is rather a desultory collection of observations and conjectures, than a regular system of physiognomy. That particular passions have a strong effect upon particular features is evident to the most common observer; and it may be conceived, that an habitual indulgence of these passions may possibly, in some cases, impress a distinguishing mark on the countenance; but that a certain cast of features constantly denotes certain passions; and that by contemplating the countenance, we can infallibly # discover also the mental qualities, is an hypothesis liable to so many exceptions as renders it impossible to establish a general and uniform system. But Mr. Lavater, like a true enthusiast, carries his theory much farther; for he not only pretends to discover the characters and passions by the features, complexion, form of the head, turn of the neck,† and motion of the arms; but he also draws inferences of the same kind even from the hand-writing. Indeed his system is founded upon such universal principles, that he applies the same rules to all animated nature, extending them not only to brutes, but even to insects. That the temper of a horse may be discovered by his countenance, will not perhaps strike you as absurd; but did you ever hear before, that any quality could be inferred from the physiognomy of a bee, an ant, or a cockchafer? While I give my opinion thus freely concerning Mr. Lavater's notions, you will readily perceive that I am not one of those who are initiated into the mysteries of his art.

*Mr. Lavater, however, modestly renounces pretensions to infallibility in every case, though he claims it in many instances. This visionary, but entertaining author, thus closes his prefave: "At the moment I write this, my progress (in the science of physiognomy) is such that if there are some physiognomies on which I can pronounce no judgment, there are, on the other hand, a great many lines and features, on which I am able to decide, with a conviction of truth and evidence equal to that which I have of my own existence."

This singular and expensive work was published both in German and French, under the author's inspection. Its title in German is "Physiognomische Fragmente zur beforderung der Menschenkenniss Menschenliebe;" in French, "Essai sur la Physiognomie destine a faire connoitre l'Homme et a le faire aimer." It has likewise been published in English, under the title of "An Essay on Physiognomy, designed to promote the Knowledge and Love of Mankind." A cheaper edition, in four volumes octave, has been recently published.

† "Being on a visit to Mr. Zimmerman at Biough." says Lavater in his preface, "we stepped to the window to notice a military procession, when a face, with which I was wholly unacquainted, so forcibly struck me, that I formed a decided judgment on the case. Reflection had no share in it, for I did not imagine that what I had said deserved notice. Mr. Zimmerman immediately asked me, with signs of great surprise, 'on what do you found your judgment?' I replied, 'on the turn of the neck."

Mr. Lavater has not merely confined himself to physiognomy. He has composed sacred hymns and national songs, which are much esteemed for their simplicity. He has also given to the public numerous works on sacred subjects. I am concerned to add, that the ingenious author extends to religion the same enthusiasm which he has employed in his researches on physiognomy, and in his poetical compositions: the warmth of his imagination hurries him on to adopt whatever is most fanciful and extraordinary; to cutstep the limits of sober reason; to be an advocate for the efficacy of absolute faith; for inward illuminations; supernatural visions; and the miraculous effects of animal magnetism in the cure of disorders. The insinuating address of Mr. Lavater, the vivacity of his conversation, the amenity of his manners, together with the singularity and animation of his style, have contributed more to diffuse his system and principles, than sound arguments or deep learning, which are not to be found in his lively but desultory compositions.*

Among the eminent men of Zuric must not be omitted Dr. Hirtzel, a learned physician, who is deservedly styled the Swiss Plutarch; and has, among various publications, more particularly distinguished himself by the Socrate Rustique, and by the lives of Sultzer and Heydegger.

Leonhard Meister, professor of history and morality in the School of Arts, deserves to be mentioned among the learned men of Zuric. The versatility of his talents will be collected from a bare catalogue of his principal works; which are written in the German tongue: On Fanaticism; the History of the German Language and Literature; Lives of the celebrated Men of Zuric; Swiss Biography; the most memorable Events of the Helvetic History, in chronological Order; Instances of Intolerance and Fanaticism in Switzerland; Public Law of Switzerland; History of the Town and Canton of Zuric; Panegyric on Bodmer; Excursions through various Parts of Switzerland; Character of the German Poets, in chronological Order, with their Portraits; Abridgment of Ancient History, particularly of the Greeks, with an Introduction on the Fine Arts and polite Literature. In all his writings the judicious author has displayed great zeal for the promotion of learning, correctness of taste, liberality of sentiment, and much historical and biographical knowledge. But in his observations on fanaticism and intolerance he has treated those subjects in a new light: he has illustrated their dreadful effects on government and civil society by historical events, and in a political view; he has appealed from theory to experience, and exemplified questionable arguments by unan.

* It was natural to imagine, from the enthusiasm of his character, that Lavater would become an advocate for the specious system of French equality. At a distance, he hailed the dawn of liberty; but he no sooner felt its nearer approach, than he became one of its most inveterate enemies. He found from experience, that the plausible terms of emancipation, liberty, and equality, were used to sanction pillage, oppression, and despotism. While his country was yet suffering under the calamities of French brotherhood, he published his celebrated Philippic against the French Directory, which he dated "the first year of Helvetic slavery." In this animated apostrophe, after inveighing against the perfidy and despotism of the French, he pays a due tribute of applause to the mild administration of the ancient republic, the remembrance of which the pressure of French despotism rendered more endearing.

"We now imagined that we had accomplished all your arbitrary mandates, and that no troops should enter our territories. Vain hope! you came with an armed orce, which you quartered upon our citizens and peasants. You drained our unhappy country; and to crown our humiliation, you imposed a contribution of three millions of livres upon our senatorial families; the families who for ages had constitute anally held the reins of government, and held them without any imputation of abuse or peculation, certainly without extortion; who made no struggle to maintain the exclusive authority our constitution had vested in them, and against whom, therefore, you could not alledge any well-founded charge. The liberty you conferred on us, in return for all these exactions, was the privilege of parting ultimately with our inestimable freedom."

s composed plicity. He concerned to hich he has sitions: the il and extraficacy of abulous effects Ir. Lavater, the singulaand princisi lively but

l become an of liberty; emics. He vere used to the calami-Directory, inveighing nild adminism render-

tered upon on, you imho for ages of abuse or authority any wellthe priviswerable facts. In this instance, he has been no less useful in combating persecution, than in repressing the spirit of fanaticism that prevailed among many of his countrymen, and which is diffused by men of lively abilities and popular manners.*

The curiosity of the naturalist will be amply gratified by a view of the library and cabinet of Mr. John Gesner, professor of physics, and canon of the cathedral, who inherits the zeal for natural history which characterizes his great ancestor Conrad Gesner. His proficienc, in the study of nature, and particularly his accurate skill in botany, has been abundantly testified by the repeated acknowledgments of Haller, whom he accompanied in his herborising excursions through the mountains of Switzerland, and who confesses himself indebted to Gesner for various and important discoveries. Gesner's cabinet is extremely rich in fossils, and remarkable for the drawings of the principal specimens of his museum; and for numerous representations of insects admirably painted by Schellenberg. One of the most curious parts of his collection, is a great botanical work, which Haller calls vastissimum et pulcherrimum opus; and which is much to be regretted, he has hitherto withheld from the public. He has exhibited, in eighty tables, a thousand generical characters of plants, according to the Linnæn system, together with many of the specific characters. These tables, intended to illustrate a general history of plants, which, as appears by his own letters to Haller, the author meditated, were drawn and engraved by Geisler, the same person who distinguished himself by painting the shells of Regenfuss.†

Amidst the various occupations of Gesner, botany, to which he had an early and strong attachment, has engaged a great share of his attention; besides two or three early productions in this line, he began, in the year 1759, to publish a work which he has ex-

tended to eight publications, in the quarto form.

The first seven parts bear the title of Phytographia Sacra Generalis; the remaining, that of Phytographia Sacra Specialis. In this work the author treats on philosophy, of vegetation in general, and on the circulation of the sap through the particular parts of plants; on the Linnæan system against the objections of Alston; on the uses of plants as food to man, and gives a detail of upwards of a hundred edible kinds, with a compendious account of the specific properties of each; on the medicinal uses of plants; on the various economical uses of vegetables, illustrating in a particular manner, among many others, those of the palm tree, flax, and aloes. In the latter volumes of this work, the author treats on other advantages derived to mankind from the vegetable world. He speaks, for instance, on the nature and constituent parts of turf and peat, and enumerates the species of bog and fen plants, which enter into the composition of each; on the kinds of shrubs proper for hedges; on timber for building, and particularly such trees as were used for those purposes by the ancients. In the first part, which is all that is hitherto published, of what he names Phytographia Sacra Specialis, he has given an account of those authors who have written on the plants of the holy scriptures, and enters upon the history of each.

The Society of Physics owes its origin to Messrs. Heydegger, Schultetz, and John Gesner, who first assembled in 1745, and admitted others, in order to attend a course of lectures on natural history. This course was read by Gesner, professor of physics, who so greatly excited the attention, and animated the zeal of his audience, that in a

† See Coxe's Travels into Poland, &c. Book VIII. chap. iv.

^{*} Since the revolution of Switzerland, professor Meister has published a tract, "Üeber den Gang der Politischen Bewengungen in der Schweiz," or, "on the progress of revolutionary movements in Switzerland." This work contains many curious particulars concerning the conduct of the Swiss states, and of Zuric in particular, but must be read with caution, as it was plainly written under French influence.

short space of time the members were increased to seventy. The first regular meeting was held in 1745, in a private house; and in a few years they deserved and received the protection of government, which granted the profits of a lottery towards establishing a fund. There are now about a hundred and twelve members: each pays on his admittance eight florins, or about seventeen shillings, and the same sum annually. Since 1757, a suite of apartments, in a house belonging to one of the tribes, has been assigned for holding their assemblies, and for containing the library and apparatus.

The Society is divided into five departments: 1, Physics. 2, Mathematics. 3, Natural History. 4, Medicine. 5, Application of Physics to Arts and Trades. But the grand and principal object of the society, is the encouragement and improvement of practical agriculture. For this purpose the members correspond with the landholders in different parts of the canton; visit various districts in rotation; summon to Zuric some of the best informed farmers; acquaint them with the state of husbandry; giving them instructions; offer prizes for improvements in cultivation; furnish small sums of money to the poorer peasants: and communicate to the public the result of their inquiries and observations.

The public library at Zuric contains about twenty-five thousand volumes, and a few curious manuscripts. Among which, the following principally attracted my attention. 1, The original manuscripts of Quintilian, found in the library of St. Gallen, and from which the first edition of that great rhetorician was printed. 2, The psalms in the Greek tongue, written on parchment dyed of a violet colour. The letters are silver, excepting the initials, which are in golden characters, and the marginal references, which are red. It is similar to the celebrated Codex Argenteus,* in the library of Upsala. It is supposed to have once formed part of the Codex Vaticanus, preserved in the Vatican library at Rome: as both these manuscripts are similar, and the Roman volume is deficient in the psalms. The learned Breitinger has published a dissertation on this Codex.† 3, Several manuscripts of Zuingle, which prove the indetatigable industry of that celebrated reformer. Among these I particularly noticed his Latin commentary on Genesis and Isaiah, and a copy of St. Paul's Epistles from the Greek Testament, published by Erasmus. At the end is written an inscription in the Greek tongue, signifying, "Copied by Ulric Zuingle, 1415." It was presented to the public library by Ann Zuingle, the last survivor of his illustrious race. 4, Three Latin letters from lady Jame Grey to Bullinger, in 1551, 1552, and 1553. These letters, written with her own hand, breathe a spirit of the most unaffected piety, and prove the extraordinary progress which this unfortunate and accomplished princess, though only in the sixteenth year of her age, had made in various branches of literature. The Greek and Hebrew quotations shew that she was well acquainted with those languages. These letters, though given in several publications, yet are not printed with that accuracy, which the relics of such a personage deserve. The library is rich in the best editions of the classics; and particularly in the early impressions of the fifteenth century.

The library of the cathedral belonging to the Caroline College, contains several manuscripts of the reformers Bullinger, Pelican, Bibliander, and Leon Juda: particularly the translation of the Talmud by Pelican and Bibliander, which has never been printed; also sixty volumes of letters from Zuingle and the early reformers, with a complete index. This collection, so interesting to ecclesiastical history, was formed by Henry Hottinger,‡ the learned author of the history of the Reformation, renowned for his ex-

tensive erudition, and particularly for his profound skill in oriental literature. The librarian pointed out an ancient manuscript of the Latin Vulgate, called Codex Carolinus, and supposed to have been a present from Charlemagne, but without foundation; for it is certainly of much later date, probably of the eleventh century. Among the rare books is the Latin Bible, translated by Pelican, Bibliander, and Leon Juda, printed at Zuric in 1545.

The lover of literary and ecclesiastical history will not fail to inspect the reverend Mr. Simler's ample collection of letters, which passed between Zuingle and the other reformers of Zuric, and their correspondents in different parts of Europe. The learned professor proposed to print by subscription, in two volumes folio, the letters of the English reformers, several of which Burnet has published in his History of the Reformation, but with many errors. Not finding, however, sufficient subscribers for so expensive a work, he was obliged to relinquish his plan, to the regret of all lovers of biography.

The library of M. de Heydegger, senator of Zuric, deserves the notice of the learned traveller. The ingenious possessor inherited from his father only three thousand volumes, which he has extended to fifteen thousand. His principal aim is directed to those books, that were unknown to Maittaire, which might assist in correcting his typographical annals, and in forming an accurate and connected history of printing. In this collection are found many rare and elegant impressions by the Alduses, Juntas, Giolitos, Torzentino, Stephens, Elzevirs, Comino, Tonson, Wetstein, Baskerville, Bodoni, Barbot, and Didot. It is particularly rich in the carliest impressions, of which there are no less than seven hundred printed in the fifteenth century.*

LETTER X.

Expedition along the borders of the Lake of Zuric....Rychterschwyl....Isle of Ufnau.... Rapperschwyl...Grunengen....Ustar....Greiffensee....Excursion to Regensberg, and to the summit of the Lagerberg.

DURING my first tour through Switzerland, I passed too short a time at Zuric to have an opportunity of visiting the delightful environs, which, for mild beauties of nature, numerous population, and well-being of the peasantry, is scarcely surpassed by any spot on the globe. Having, on subsequent occasions, resided longer at Zuric, I did not omit making several excursions into various parts of the canton; an account of which will form the subject of the present letter.

The weather clearing up after several continued and heavy rains, on the 24th of June, 1785, I accompanied M. de Bonstet of Bern, professor Meister, and some other gentlemen of Zuric, in a delightful tour round the lake. We had no need of guides, as the country was well known to my companions, and we had no incumbrance of baggage. Having made an early dinner, according to the custom of the place, we departed at mid-day; walked about three miles, through vineyards and corn-fields, to

*Among many rare books, I noted down the following: Ciceronis Officia. Fust et Scheiffer 1465, pet in folio. Jo. Sanuensis Catholicon, folio. Aug. Vin. del. Gunther, et Zeiner Reutlingen, 1649. First edition of Petracha Venet. Vindel de Spira, 1470. See Cat. de la Valliere, 1783. No. 3579. First edition of Dante, C. Fulginei Neumeister 1472. See la Valliere, No. 3558. Boccacio Genealogia Deorum et liber de Montibus et Sylvis. Venet. Vindel. de Spira, 1472 and 1473. First edition. De Claris Mulieribus Ulma Sv. Zeiner, 1473. First edition, with wooden cuts, very singular. See Catalogue de la Valliere, No. 3310 and 5609. Boccacio Decamerone Venet. Gio. et Gregor. de Gregorii fratelli, 1492, folio, wooden cuts. The Decameron translated into German about 1475, folio. Mamontreclus Beronæ p. Helian Heliæ, 1470, folio. This book was printed at Munster, in the canton of Lucerne, and is curious, because it is the first instance of typography in Switzerland.

OL. V.

Kussnach, a small village on the east side of the lake, where we paid a visit to a gentleman, and were served with tea, slices of bread and better, and cherries.

In 1778, Kussnach was considerably damaged by the rise of a small torrent, which rushed down the mountains, carried away twenty-five houses, and destroyed about sixty persons. This torrent, now only a little rill, swelled to such a degree, as to rise at least thirty feet above its usual level; an increase owing to the sudden melting of the snow on the neighbouring heights. Every assistance was instantly afforded to the wretched inhabitants, and a collection of £3000 raised in one Sunday at the different churches of Zuric: an astonishing collection for a town which does not contain 11,000 souls.

I am indebted to professor Meister for several observations* on the population, industry, and productions of Kussnach, and the neighbouring villages.

Having reposed ourselves about an hour at Kussnach, we continued our walk through vineyards and corn-fields, sometimes on the sloping banks of the lake, sometimes on a small foot path formed on terraces a level with the water; or along narrow roads that resemble gravel walks winding the ough pleasure grounds and parks in England. We enjoyed, during great part of the way, the most agreeable shade from large beech and oak, walnut and other fruit-trees, that overhang like weeping willows; many of which are planted almost horizontally, either stretching from the sides of the hill, or from the margin of the water, their boughs dipping into the lake: the scattered cottages, the numerous villages, the picturesque villas placed on the banks, and several neat churches, added to the beauty of the ever-changing scenery.

Having continued our walk about three miles, we stopped at a peasant's house in Meile, who regaled us with our usual fare, milk and cherries, but would receive no recompense. Here we embarked and crossed the lake, enjoying a most agreeable view of each border studded with villas, churches, and villages, half concealed by the intervening trees. As we passed near a bold promontory, richly covered with wood, we observed the sun, which was hid under a cloud, gilding the distant t wn of Rap-

*Kussnach contains about 1700 souls, and the neighbouring villages are no less peopled: this astonishing population in so small a compass is occasioned by the trade of the capital, which employs many hands. The proportion between the produce of the soil, and the profits derived from working for the manufactures, may be estimated from the following calculation: five parishes and two villages, situated near the lakes of Zuric and Greiffen, contain 8498 souls; and comprehend only 6050 acres of arable land, 698 of vines, and 3407 of pasture, or scarcely an acre and a quarter for each person. Their subsistence is principally supplied by 2016 looms, by means of which they prepare silk and cotton for the merchants of Zuric. In these parts an acre is sold for 100 or 120l, whereas the same quantity in the inferior part of the canton is worth only 20, or 30l. The acre here mentioned contains from 32,600 to 36,000 square feet.

In sixteen parishes, situated on the borders of the lake, the number of inhabitants, in 1784, were 32,581. There were 271 marriages, 1135 births. The proportion of the marriages to the births, as 1000 to 4188; of the births to the deaths, as 1000 to 882; of the births to the living, as 1000 to 18,705; of the deaths to the living, as 2000 to 32,515; of the males to the females, as 1000 to 1097.

I have already observed in the note (p. 663,) that these borderers of the lake were the first to adopt the French principles, and had a chief share in promoting the subjection of the canton.

During the effervescence of the revolution their grievances were exaggerated, and they were compared with the African slaves in the West Indies. They were certainly excluded by the commercial government of Zuric from some rights, which they ought to have enjoyed; but their condition upon the whole was extremely easy and comfortable, as sufficiently appeared from the flourishing state of the country. Even general Schawembourg, as he sailed up the lake, and observed the borders, luxuriant in cultivation and industry, and with every mark of prosperity, could not avoid exclaining, "Il est cependant difficile de retrouver ici les traces du despotisme."

In fact, these borderers had no sooner effected a change in the constitution, and obtained possession of power, than they wished to retain it; and, attempting to resist the aggression of the French, they were disarmed, pillaged, and fined.

ere commmercial ion upon ate of the luxuriant , " Il est

ossession nch, they perschwyl, the hills towards Zuric silvered by a milder ray, and the sublime mountains

of Glarus rising in gloomy majesty from the southern extremity of the lake.

We landed at Weddenschweil, which is agreeably situated on the west side of the lake. It is the capital of a bailliage, that stretches to the limits of the cantons of Zug and Schweitz, and was formerly an independent lordship. In 1287 it was sold by Rodolph of We denschweil to the knights of Jerusalem; and became a commandery until 1459, when Zuric purchased it from the master of that order for 20,000 florins. The inhabitants, having revolted in 1466, were deprived of several privileges, and particularly the criminal jurisdiction, which was transferred to the senate of Zuric. Notwithstanding the loss of these immunities, the mildness of government is sufficiently manifested, by the considerable increase of the population within this last century; the number of souls, which in 1678 consisted of only 4867, amounted in 1782 to 8189.

Near Weddenschweil, a beautiful meadow, skirted with wood, and fertilized by a lively stream, tempted us to quit the road, and we had scarcely proceeded fifty paces before we saw a silver rill gushing from the crevice of a rock fringed with wood. While we were contemplating this pleasing landscape, we heard the noise of falling waters, and caught a glimpse of a torrent tumbling from an elevated rock glistening through the dark foliage, and richly illumined by the rays of the sun, which was concealed from our view. Having penetrated by the side of the torrent, we saw it bursting from the height, amid surrounding trees, fall about six feet upon a ridge, and then roll fifty feet in mid air. The effect was peculiarly striking. Nor could we sufficiently admire the amphitheatre of rock, the beeches suspended on its top and sides, the beams of the sun darting on the faling waters, and the noise of the torrent contrasted with the mild and tranquil beauties of the lake.

Our walk to Richliswick, where we passed the night, was no less agreeable than that on the other side of the lake. The road ran sometimes through meadows, at a little distance from the lake, sometimes close to the water, under the shade of trees scattered by the hand of nature, in the most capricious shapes: we scarcely advanced a hundred steps without passing a neat cottage, and meeting with peasants, who saluted us as we went along; every spot of ground is highly cultivated, and bore the appearance of indus-

try and plenty.

At Richliswick, which, like Weddenschweil, contains many good houses of stone, plaistered and white-washed, ornamented with green window-shutters, and Venetian blinds, we found an inn with comfortable accommodations. This place is the passage of much merchandise to different parts on the shores of the lake, and is greatly resorted to by the pilgrims, in their way to Einsidlin.*

Early the next morning we embarked for the isle of Ufnau. The weather was uncommonly fine, the lake quite still, the reflection of the white houses quivered on the surface of the water; the hollows of the distant mountains seemed to be filled with a transparent vapour, which induced me to cry out, in the language of poetry,

^{*} These once happy districts on both sides of the lake of Zuric, after an undisturbed tranquility of three hundred years, became, in May 1798, the scene of devastation and carnage, in the unequal conflict between the French and the Swiss peasants of the small cantons, who rose to defend their liberties, and, after entering Luccrne, marched in two bodies on each side of the lake, to drive the French from Zuric. After an obstinate resistance against superior forces, the corps on the north side of the lake were deseated with great slaughter, and Rapperschwyl stormed and pillaged. Five thousand Swiss, stationed near Richterschwyl, repulsed the French at the first onset, but with the aid of artillery were at length overpowered. Their spirited resistance even extorted the applause of the French com-

.

"Pleasant the sun,
"When hast on this delightful land he spreads

"His orient beams, on herb, tree, fruit and flower.

"Glist'ning with dew."*

About a mile from Richliswick is a single house standing on a gentle activity, the walls of which divide the canton of Zuric from that of Schweitz, and at the same time set instant bounds to that industry and population which had attracted our wonder and delight.

In two hours we landed at Ufnau, which is about an English mile in circumference and belongs to the abbey of Einsidlin. It contains only a single house, inhabited by a peasant's family, two barns, a kind of tower summer-house, seated on the highest point, a chapel never used, and a church in which mass is said only twice in the year. Within is the tomb of St. Alderic, who built an hermitage on the island, to which he retired. He died in 1473, and was highly revered for his supposed sanctity; as a Latin inscription informs us, that "he was fed with bread from heaven, and walked upon the surface of the waters." This island is sometimes called Hutten's Island, in memory of that extra-

ordinary person, who retired and died in this obscure spot.

Hutten, descended from an illustrious family, was born at Seckenberg in Franconia, and receiving an education suitable to his birth, prosecuted his studies with that impetuous zeal which was the leading mark of his character. He passed a life of almost unparalleled vicissitude; sometimes in the camp, signalized for personal courage: in universities, where he distinguished himself by various publications; in courts, received with respect, or driven away for insolence; and wandering over different parts of Europe in extreme indigence. Having, at an early period of his life, embraced the opinions of Luther, he used both his pen and his sword in defence of the new doctrines; was so intemperate in his ardour, that he was frequently imprisoned, and alarmed even the daring spirit of Luther by his repeated outrages. After rendering himself an object of terror both to Lutherans and Catholics, he in vain sought repose until he found it in this sequestered island. He expired in 1523, in the 36th year of his age: a man as remarkable for genius and learning, as for turbulence and presumption.

The island is agreeably broken into hill and dale, is extremely fertile in pasture, produces hemp, flax, a few vines, and a small tufted wood, which overhangs the margin of the water. It is the only island in the lake of Zuric, except an uninhabited rock, which

yields a small quantity of hay.

Having re-embarked, we soon landed at Rapperschwyl,† and continued ascending amid hanging enclosures of pasture and corn, commanding a fine view of the lake, hills, mountains, and Alps. Passing the little territory belonging to Rapperschwyl, we came into the canton of Zuric, and entering a neat cottage, to inquire the road, we saw a peasant teaching about thirty children to read and write. On expressing my satisfaction, I was informed that each village has a peasant schoolmaster, either entirely or partly paid by government; and that in this canton there is scarcely a child who is not instructed in reading and writing. A little further we entered another cottage, where the mistress of the house offered us milk and cherrics, and placed upon the table nine or ten large silver spoons.

We continued our walk through an enclosed, hilly, and well-wooded country, and arrived about mid-day at Grunengen, a small burgh, capital of the bailliage. After dinner we paid a visit to the bailiff, who resides in the castle, which stands on an elevated

rock, overlooking an extensive prospect; towards the south wild and romantic, towards the west rich and well cultivated, and watered by a lively stream which flows from the lake of Pfeffikon.

The bailiff possesses considerable authority. He judges civil and criminal affairs, in the presence of certain jury men and the under-bailiff; but can pass sentence without their concurrence, as neither of them enjoys a vote. He can punish all crimes which are not capital; can order whipping, or even the torture, to be inflicted, when the criminal is convicted, and will not confess; and I was greatly shocked to find that this horrid expedient had been lately practised. Even in capital cases he can condemn to death, provided he summons eighty jurymen from the different districts to be present at the trial; but as this custom is attended with much expence, he usually sends the culprit to Zuric; in civil proceedings an appeal lies from his decision to the senate of Zuric.

If the bailiff abuses his power, the senate readily listens to the complaints of the oppressed, and would not fail to punish the unjust judge. An instance of this impartiality occurred in 1754, when the bailiff was proved guilty of extortions, and, though son-in-law to the burgomaster, was fined and banished from Switzerland. I learned this fact, on observing a vacant place in the series of arms belonging to the several bailiffs, which are painted in the hall of the castle; those of the extortioner, which once filled this vacant place, had been crased by order of government. From Grunengen we pursued our course through lanes, fields, and enclosures along a most delightful country, abounding in vines, corn, pasture, and wood. As the setting sun gradually descended below the horizon, we frequently looked back upon the distant Alps, the lower parts were dusky and gloomy, and the summits,

"Arrayed with reflected purple and gold, "And colours dipt in heav'n."

At the close of the evening I arrived at Ustar; regretting that our day's journey was concluded, and not feeling in the least fatigued with a walk of eighteen miles, from Rapperschwyl to Ustar; so greatly was I delighted with the beauties of this romantic country. Ustar is a large parish, containing 3000 souls; the wooden cottages are neat and commodious, resembling those in the canton of Appenzel, and are dispersed in the same manner over hills and dales.

The sun had scarcely risen before we quitted our beds, and walked to the castle of Ustar; it stands boldly on an elevated rock, planted to its very summit with vines, and commands a most extensive view, bounded by the Jura, the mountains of the Black Forest, and the chain of Alps stretching from the canton of Appenzel to the confines of the Vallais. Below and around, the country resembled the most cultivated and enclosed parts of England; a small lively stream winded through an immense plain; while the lake of Greiffen appeared like a broad river, washing the bottom of the adjacent hills.

This castle was formerly a strong fortress, and the residence of the counts of Ustar, who held it and the district as a fief from the counts of Ravenspurgh; and on the extinction of that house, in the middle of the fourteenth century, it was transferred to the family of de Bonstet; was purchased, in 1552, by Zuric, and united to the bailliage of Greiffensee. M. de Bonstet, whom I have mentioned as one of our party, derived great satisfaction in tracing the antiquity and history of this seat, formerly possessed by

* Milton.

his ancestors, and in observing the family arms painted upon the glass windows. This castle is now a private gentleman's house, and belongs to Mr. Teyler of Wedden-

schweil.

From Ustar we crossed the fields, and arrived at the lake of Greiffen. We walked for some way on a belt of turf, along its borders, under the pendulous branches of oak, beach, and elms. This lake is about six miles long and a mile broad; on one side the shores are flat or gently rising, on the other side hills richly wooded. The dearth of cottages and inhabitants, in this delightful but solitary spot, formed a striking contrast with the numerous villages we had recently quitted; while the southern extremity of the lake seemed almost bounded by that magnificent chain of Alps, which constantly en-

gaged our attention.

Having embarked in a small boat, we passed the village of Greiffen, pleasingly situated on a small promontory embosomed in a wood, and landed at the northern extremity of the lake. Here I bathed, and walked on gently, ascending through fertile grounds, delightfully planted with oak, beech, and poplars, and innumerable fruit-trees. At a small village we stopped at the parsonage. You can scarcely form to yourself an adequate idea of the neatness and simplicity which reign in these parts. The elergyman's two daughters, about fifteen or sixteen years of age, neatly dressed, with straw hats, like the peasant girls of the country, politely brought milk and cherries for our refreshment. From this retreat of innocence and simplicity we ascended about a mile, then burst upon a charming view of Zuric, the lake and environs; and gently descending, arrived at Zuric, quite enchanted with this short expedition.

An expedition to the summit of the Lagerberg was no less agreeable than the former excursion. I procured a guide and a horse; but the weather proving fine, I gave the horse to my servant, and preferred walking across the corn fields, and meadows tufted with thickets, and enlivened by the numerous labourers employed in the harvest. In these parts as well as the neighbouring districts, I observed with pleasure, that the oxen, which were not yoked to the teams or ploughs, but harnessed like horses, performed their labour with much more ease, and with greater effect. This custom has been lately introduced into some parts of England; and all unprejudiced farmers allow its superior advantage; as the yoke is extremely galling, and four oxen harnessed with collars will

do as much work as six when yoked by the neck.

A few miles from Zuric, I passed through the village of Affholteren, near the church, which is prettily situated in the middle of a large field; skirted the small lake Kasten, at a little distance from the picturesque ruins of Old Regensberg, and gently ascended to New Regensberg, which stands on an elevation, at the foot of the Lager-

erg.

The counts of Regensberg were powerful barons during that period of anarchy and confusion which distinguished the twelfth and thirteenth centuries; they were involved in constant wars, or rather desultory skirmishes, with the town of Zuric, until they were finally repulsed by Rodolph of Hapsburg, then captain-general of the troops of Zuric. On the extinction of the counts of Regensberg, in the fourteenth century, their territory

devolved to the House of Austria, and in 1409 became subject to Zuric.

The present burgh contains about 200 inhabitants, who enjoy considerable privileges: a burgomaster, and a council of six members, form the civil court of justice, from whose decision an appeal lies to Zuric; the criminal jurisdiction belongs to the bailiff, who resides in the castle. This building was formerly of great strength, and frequently defied the attacks of Zuric. The greater part of the present edifice was constructed in the last century; the only remains of the ancient fortress being some stone walls,

and a round tower, which commands a distant prospect. A well in the middle of the burgh, hollowed in the rock to the depth of 216 feet, but now dry, furnished the garrison with water during the obstinate sieges maintained before the invention of gunpowder. Near this well is a copious fountain, supplied from a spring that rises in the Lagerberg. The adjacent country is a most delightful intermixture of hill and dale. The rock on which Regensberg is built, terminates in an abrupt precipice, and forms the eastern extremity of that vast chain of mountains known by the general name of Jura, the branches of which are distinguished by different appellations. The branch that rises from this point is called the Lagerberg, to the summit of which I mounted on horseback. I passed for some way through cultivated enclosures, and afterwards through forests of pine, fir, and beech, until I reached the highest point, on which stands a signal house. From this point, which overlooks the whole country, I enjoyed one of the most extensive and uninterrupted prospects, particularly the finest distant view of the Alps, which I had yet seen in Switzerland.

To the north, the eye expatiates freely over the wilds of the Black Forest; to the east, beyond the confines of Bavaria; towards the west, traces the branches of the Jura extending in multifarious directions; to the south, looks down upon the fertile and enclosed regions in the canton of Zuric, on the lake and its populous banks, and admires the vast expanse of country swelling from plains to acclivities, from acclivities

to hills, from hills to mountains, and terminating in those stupendous Alps,

"Whose heads touch heaven."

This wonderful and sublime prospect detained me insensibly till the close of the evening, when I descended through the dark forests that clothe the sides of the Lagerberg; and, filled with those pleasing but melancholy reflections which the indescribable beauties of nature leave upon the mind, rode slowly on, and did not arrive at Zuric till the gloom of night had overspread the horizon.

LETTER XI.

Winterthur Castle of Kyburg.

WINTERTHUR stands about twelve miles from Zuric; a town which, although situated in the canton, and under the protection of Zuric, yet retains its own laws, has its own magistrates, and is in a great measure independent. Wintherthur was formerly governed by its own counts, who were probably a branch of the Kyburg family, for both houses bore the same arms. In the fourteenth century it was possessed by Hartman, count of Kyburg, who first surrounded it with walls; and upon his death devolved to his nephew Rodolph of Hapsburg. Rodolph, afterwards emperor, conferred upon the inhabitants considerable privileges, for assisting him in the war in which he was engaged with Ottocar, king of Bohemia. It continued subject to his descendants until 1424, when the inhabitants claimed the protection, and obtained the alliance, of Zuric. In 1467, the archduke Sigismund having sold his rights to Zuric, that canton succeeded to his prerogatives. A deputy from Zuric resides at Winterthur, but for no other purpose than collecting the toll, half of which belongs to Zuric.

The government is aristocratical; the supreme power, in all things not interfering with the claims of Zuric, resides in the great and little council. These two tribunals united are final judges in criminal procedures, and pass sentence of death without appeal. The little council is invested with the general administration of affairs, and determines civil causes in the first resort; from their decision an appeal lies to the

great council, and in all processes between a stranger and a burgher, to the senate of Zuric.

Although the town is considered as independent, and only under the protection of the canton, yet Zuric claims the right of restricting the inhabitants from manufacturing silk, and from establishing a printing press, as interfering with the natives of Zuric. This claim has occasioned great discontents, and giving rise to much litigation: and though Zuric does not prohibit the manufacture of silk, yet by forbidding the peasants of the canton from preparing and spinning the materials, this order amounts to a virtual prohibition. A similar dispute is in agitation concerning the establishment of a printing press at Winterthur. The right will scarcely be controverted; but as the cause will be finally determined by Zuric, it remains a doubt whether that government will be sufficiently disinterested to decide in favour of Winterthur against its own burgher.

In all other respects, excepting in these two articles of trade so profitable to Zuric, the commerce of Winterthur lies under no restraint. The principal manufactures are muslins, printed cottons, and cloth; some vitriol works are carried on with considerable success.

The town is small and the inhabitants, who amount to about two thousand, are for the most part remarkably industrious. The schools in this petty state are well endowed and regulated. The public library contains a small collection of books, and a great number of Roman coins and medals, chiefly found at Ober-Winterthur; among the most rare I observed a Didius Julianus and a Pertinax. Ober-Winterthur, or Upper Winterthur, at present only a small village near the town, in the high road leading to Fruenfield, is the site of the ancient Vitodorum, a Roman station, and the most considerable place in this neighbourhood. It exhibits no other remains of former consequence, but the foundations of ancient walls, and the numerous Roman coins and medals which are continually discovered. The Roman way, which once traversed the marshes between Winterthur and Fruenfield, is no longer visible, because it forms the foundation of the present high road.*

The castle of Kyburg, towering on the summit of an eminence overlooking Winterthur, is a picturesque object, remarkable in the history of this country, during the times of confusion which preceded and followed the interregnum of the empire.

In the beginning of the twelfth century, the counts of Kyburg possessed the counties of Kyburg, Lentzburgh, and Baden; and their territories were further increased by the accession of Burgdorf and Thun, which fell to Ulric† in right of his wife Anne, sister and heir of Berchtold V, duke of Zæringen. These domains devolving, in 1273, to Rodolph count of Hapsburg, on the death of his uncle Hartman the elder, the last count of Kyburg, rendered him one of the most powerful princes in these parts, and probably opened his way to the imperial throne. Before his decease, the emperor ceded to his son Rodolph the county of Kyburg, and his other dominions in Switzerland; and, on his demise, confirmed this grant to his grandson John, the same who assassinated his uncle, the emperor Albert,‡ and was called the Parricide.

Upon the death of Albert, his sons seized and kept possession of Kyburg, and the other hereditary domains in Switzerland, and transmitted them to their posterity. In

^{*} Winterthur is now incorporated in the canton or department of Zuric.

[†] Some authors assert that Werner, son of Ulric, was the husband of Anne. Great confusion reigned in the early history of the counts of Kyburg, until Fuessli cleared it up. See article Kyburg in Fuessli's Erbeschreibung.

on reignyburg in 1424, the emperor Sigismund put under the ban of the emperor Frederick duke of Austria, and granted for a sum of money the county of Kyburg to Zuric. In 1442 it was restored to the house of Austria, but, in 1452, finally ceded to Zuric by Sigismund, archduke of Austria, to liquidate a debt which he owed to the canton. From that time it has formed a bailliage in the canton of Zuric; but the title of Count of Kyburg has been always used by the house of Austria, and is still retained by its present illus trious descendant Joseph the Second.

The castle of Kyburg, which stands in a romantic and wild situation, has been constructed at different periods. Part is ancient, and not improbably the same as existed in the time of Rodolph; although I could not discover a date anterior to 1424, the year in which it was granted to Zuric. In an apartment which was formerly a stable, are the portraits of all the bailiffs who have resided in the eastle from the time of its cession. The bailiff enjoys greater powers than are usually delegated by any aristocratical government; in criminal proceedings, he is only required to consult the jury of the district, though he is not bound by their opinion, and can even inflict capital punishment without the necessity of referring the sentence to be confirmed by Zuric.

LETTER XII.

Frauenfield ... Of the Helvetic confederacy ... Diets.

FROM Winterthur I passed to Frauenfield, a small town, or rather village, the capital of Thurgau* containing scarcely a thousand inhabitants; and only remarkable as the place where, since 1712, the deputies of the Swiss cantons assemble at the general diet.

This confederacy owes its origin to the treaty contracted between Uri, Schweitz, and Underwalden, at the memorable revolution of 1308.† The subsequent accession of Zuric, Bern, Lucerne, Zug, and Glarus, gave strength and solidity to the union, and a century and a half elapsed before a new member was admitted. At length, in 1501, Friburgh and Soleure being, after much difficulty, received into the league; upon that occasion the eight ancient cantons entered into a covenant, called the Convention of Stantz, by which the articles of union and mutual protection were finally settled.‡

No change was effected by the subsequent reception of the three remaining cantons, Basle, Schaffhausen, and Appenzel; as they subscribed to the same terms which Friburgh and Soleure had accepted. Without entering, however, into a minute detail, I shall endeavour in this letter, to ay before you a short view of the Helvetic confederacy.

The code of public law between the combined republics of Switzerland, is founded upon the treaty of § Sempach 1393; upon the convention of Stantz: and upon the

* Thurgau was a bailliage subject to the eight ancient cantons. In the beginning of February the people in some parts of the country rose, elected deputies, and demanded their emancipation, which seems to have been granted to the inner district on the 5th. The people, however, were in general much incensed against the French, and their troops were marching to the assistance of Bern, when the capture was announced.

In the new division of Switzerland, Thurgau was formed into a canton, of which Frauenfield is the capital.

See Letter 25.

‡ See Letter 26.

§ This treaty, which regulates the articles of war, was contracted between the eight ancient cantons, in conjunction with the republic of Soleure. It ordains that no Swiss soldier shall quit his ranks in

treaty of peace concluded in 1712, at Arau, between the Protestant and Catholic cantons. It appears from these several treaties, which include or enlarge those that preceded, that the Helvetic union is a perpetual defensive alliance between the thirteen independent contracting powers, to protect each other by their united forces against all foreign enemies. Accordingly, if any member of the union should be attacked, that particular canton has a right to demand succours from the* whole confederate body; and in case of war the several forces to be supplied by each canton are precisely specified. It appears, however, from the stipulations to which the five cantons agreed that they do not, in every respect, enjoy equal prerogatives with the eight ancient cantons, which reserved to themselves a right, if the question for declaring war against any foreign state should be unanimously carried in their assembly, to require the assistance of the five other cantons, without assigning the motive. But the five cantons cannot commence hostilities without the consent of the confederates; and should the enemy be willing to enter into a negotiation, the dispute must be referred to the arbitration of the eight ancient cantons. It is further stipulated, that, in case of a rupture between the eight cantons, the five must observe a strict neutrality.

The next essential object of the league is to preserve general peace and good order. It is therefore eovenanted, that all public discussions shall be finally settled between the contending parties in an amicable manner; and for this purpose particular judges and arbiters are appointed; who shall be impowered to compose the dissentions that may har pen to rise. To this is added a reciprocal guarantee of the forms of governme established in the respective commonwealths; for, in order to prevent internal factions, and revolts in any of the allied cantons, it was agreed by the convention of Stantz, that, in time of rebellion, the magistracy of such canton should be assisted by the forces of the others. Accordingly the history of Switzerland affords many instances of protection and assistance reciprocally given between the confederates, in defence and support of the respective governments.

time of action even although he should be dangerously wounded: Nous entendons aussi que siquequ'un s'estoit blesse en quelque facon que ce fust en combatant ou en assailant, de sorte qu'il seroit inutile pour se dessendre; il demeurera non obstant aussi avec les autres, jusques a ce que la bataille soit expiree: et pour cela ne sera estime suyard et ne l'en faschera-t-on en sa personne n'y en son blen aucunement."

* The respectable author of the account of Switzerland has fallen into a mistake in his description of the Helvetic union; and his error has been adopted by the Abbe Mably, in his Droit Public de l'Europe; by the compilers of the Encyclopedie; and by several other writers of distinction.

After having given a description of the Helvetic union, he concludes the relation as follows: "So far are they (the thirteen cantons) from making one body or one commonwealth, that only the three old cantons are directly allied with every one of the other twelve. There is indeed such a connection established between them, that in case any one canton were attacked, all the other twelve would be obliged to march to its succour; but it would be by virtue of the relation, that two cantons may have to a third, and not of any direct alliance subsisting between every one of them. As for example: Of the eight old cantons, Lucerne has a right of calling but five to its succour, in case of attack; but then some of those five have a right of calling others, with whom they are allied, though Lucerne be not; so that at last all must march by virtue of particular alliances, and not of any general one amengst them all."

The above-cited account of the Helvetic union would better have suited the league of the eight cantons before the convention of Stantz; when the confederate states were not so absolutely and directly united together as they are at present; and their alliance did not perhaps totally exclude every treaty of the same kind with other powers. It was only by the articles of that celebrated convention, and the alliance of the eight cantons with Friburgh and Soleure, that the union became absolutely fixed and general. It must be confessed, however, that several Swiss historians have given the same idea of the Helvetic union as that above mentioned; and that even now authors differ considerably upon some important articles of the league.

No separate engagement, which any of the cantons may conclude, can be valid, if inconsistent with the fundamental articles of this general union; for the reciprocal contract between the members of the league supersedes every other species of public obligation. With these exceptions, the combined states are independent of each other: they may form alliances with any power, or reject the same, although all the others have acceded to it: may grant auxiliary troops to foreign princes; may prohibit the money of the other cantons from being current within their own territories; may impose taxes, and, in short, perform every other act of absolute sovereignty.

The public affairs of the Helvetic body and their allies are discussed and determined

in the several diets; and these are,

1. General diets; or general assemblies of the thirteen cantons, and of their allies.

2. Particular diets; as those of the eight ancient cantons; those of the Protestant cantons, with the deputies of the Protestants of Glarus and Appenzel, of the towns of St. Gallen, Bienne, and Mulhausen, called the evangelical conferences; those of the Roman Catholic cantons, with the deputies of the Catholics of Glarus and Appenzel, of the abbot of St. Gallen, and of the republic of the Vallais, called the golden alliance; as also the diets of particular cantons, which, beside being members of the general confederacy, have distinct and separate treaties with each other.

The ordinary meetings of the general diet are held once a-year, and continue sitting one month; the extraordinary assemblies are summoned upon particular occasions. It is principally convened in order to deliberate upon the best measures for the security of the Helvetic body. The canton of Zuric appoints the time and place of meeting, and convenes the deputies by a circular letter. The deputy of Zuric also presides, unless the diet is held in the territory of any other canton; in that case, the deputy of that can-

ton is president.

This diet formerly met at Baden; but since the conclusion of the civil war in 1712, between Zuric and Bern on one side, and Lucern, Uri, Schweitz, Underwalden, and Zug, on the other (when the five latter renounced the co-regency of Baden) it has been assembled at Frauenfield† in Thurgau. Each canton sends as many deputies as it thinks

proper.

It would be descending into a tedious detail, to enter into the particular connections of the several allies, either with the whole Helvetic body, or with some of the cantons; and the different nature of these respective alliances. Suffer me only to remark, that the allies may be divided into associate, and confederate states: of the former are the abbot and town of St. Gallen, Bienne, and Mulhausen; of the latter, are the Grisons, the republic of the Vallais, Geneva, Neufchatel, and the bishop of Basle.

† Frauenfield is no longer the scene of a free diet; in the French division of Switzerland it became the capital of the canton or department of Thurgau.

^{*}The five cantons which agreed not to conclude any treaty without the consent of the eight, are necessarily excluded from this power, together with those particular cantons, which have bound themselves by private treaties not to contract any foreign alliance, without the reciprocal consent of the others; as for instance, Uri, Schweitz, and Underwalden, by the alliance at Brunnen in 1315. But this depends upon particular treaties, and has no relation to the general union. In fact, every canton is restrained by the general articles of the Helvetic union; but, conforming to those, no one republic is, in any other instance, controlled by the resolutions of the majority among the confederate cantons.

The last diet of FREE SWITZERLAND assembled at Arau in January 1798, and all the deputies, that of Basic excepted, which withdrew from the confederacy, took an oath to defend the Helvetic constitution to the last extremity. But this solemn appeal to heaven in defence of their liberties proved a mere ceremony, and produced no substantial effect.

The states thus comprised under the general denomination of associates and confederates, enjoy by virtue of this union, a total independence on all foreign dominion; and partake of all the privileges and immunities granted to the Swiss in other countries. And notwithstanding some of these states are allied only with particular cantons; yet if any of them should be attacked, those cantons with whom they are in treaty would not only supply them with succours, but would also require the joint assistance of the remaining cantons: if therefore any part of the whole body should be invaded, all the other members should unite in its defence, either as immediate guarantees, or as auxiliatives of the actual guarantees.**

LETTER XIII.

Route by Water from Zuric to Baden....Bridge of Wettingen....Baden....Castle of Hapsburg.

INSTEAD of following the usual route by land from Zuric to Basle, we proceeded the greater part of the way by water. We embarked about two in the afternoon on the Limmat. The navigation of that river has been described as extremely hazardous; yet it is only dangerous upon the melting of the snow, or after violent rains, when in several places the rocks and shoals are covered with water. At other times there is no danger, provided the watermen are sober and experienced.

Our boat was flat-bottomed and long, and was rowed, or rather steered by three watermen, who used their oars merely to direct the vessel; the stream being sufficiently rapid to carry us along at the rate of six, eight, and sometimes even ten miles in the hour. The water is beautifully transparent; and its surface was occasionally raised and agitated with high waves by a wind opposite to the current. The borders of the Limmat, at first somewhat flat, afterwards gently rose into hills clothed with pasture and wood, or divided into vineyards, were lastly quite perpendicular, and fringed to the water's edge with hanging trees.

About a mile from Bader, where the Limmat flows with the greatest rapidity, we shot under the bridge of Wettingen with such velocity, that in the moment of admiring its bold projection on one side, I imperceptibly found myself on the other. This beautiful piece of mechanism is a wooden bridge, two hundred and forty seet in length, and suspended above twenty feet from the surface of the water: it was the last work of Grubenman, the self-taught architect, and is far superior in elegance to that of Schaffbausen

We landed at Baden, and walked to Hapsburg, Schintznach, Koningsfelden, and

Windish: of which places I shall give you a short description.

Baden derives its name from the neighbouring warm baths, which are mentioned by the ancients under the names of Aquæ and Thermæ Helveticæ. It was a Roman fortress, erected to curb the Allemanni or Germans, and was raised, when the Helvetians, who supported Otho, were routed by Cæcina, general to Vitellius. Being rebuilt, it was taken by the Germans; fell afterwards under the dominion of the Franks; was, in the tenth century, incorporated in the German empire; and became successively subject to the dukes of Zæringen, to the counts of Kyburg, and to Rodolph of

^{*} Such was the theory of the Helvetic government, but unfortunately the practice did not accord with the theory. The Swiss states, instead of resisting in a compact body the aggression of the French, acted without concert or unanimity, and were compelled, one after the other, to dissolve their ancient confederacy.

not accord the French, neir ancient Hapsburg. In 1418, when his descendant Frederic, duke of Austria, was put under the ban of the empire, the canton of Zuric took possession of the town and country; and, having purchased them from the emperor Sigismond, admitted to a joint share in the sovereignty, Lucern, Uri, Schweitz, Underwalden, and Zug, Bern in 1426, and Uri in 1445.

Baden continued a bailliage of these eight cantons until the year 1712, when the civil war breaking out between the Protestant and Catholic cantons, it was besieged and taken by the troops of Zuric and Bern; and at the peace of Arau was ceded to those two cantons and Glarus, which, on account of its neutrality, preserved its right of joint-sovereignty. Zuric and Bern did not, however, prove their disinterestedness, when not content with finally settling the religious disputes in favour of the Protestants, they exacted from the Catholic cantons the cession of Baden, contrary to the convention of Strantz, which forms the basis of the Helvetic constitution. The umbrage conceived by the Catholic cantons at this step was the principal inducement to conclude a perpetual alliance with France in 1715, and to throw themselves under the protection of that power. And this separate league has not been annulled by the general treaty which Louis XVI, contracted with the thirteen cantons in 1776. Until 1712, the diet assembled at Baden; but has been since transferred to Frauenfield. The three cantons alternately appoint a bailiff, who resides in the castle.

The inhabitants elect their own magistrates, and have their own judicial courts. In civil proceedings, an appeal lies to the bailiff, and from his decision to the syndicate, composed of the deputies of the three cantons, and in the last resort to the three cantons themselves. In penal causes, the criminal court condemns, and the bailiff enjoys the power of pardoning, or mitigating the sentence. The county or bailliage contains about

24,000 souls.*

From Baden we walked through an agreeable and well-wooded country for some way, along the side of the Limmat, whose steep banks are covered with vines to the edge of the water; and in about two hours crossed the Reuss into the canton of Bern. Having passed through a plain, we arrived at the baths of Schintznach, a place remarkable for its agreeable position on the banks of the Aar, and its tepid mineral waters. It is also well known as being the first place where the Helvetic society assembled. This society, formed by some of the most learned men in Switzerland, both of the Catholic and Reformed religion, first helped to extend the spirit of toleration, and to lessen that antipathy which subsisted between the members of the two persuasions. Its publications have tended to promote a general zeal for the diffusion of polite literature. The meeting of this liberal society is now transferred to Olten, a small town in the canton of Soleure.

Near Schintznach stands, on a lofty eminence, the ruins of the castle of Hapsburg, to which we ascended through a wood of beech, that seemed almost coeval with the date of the castle. The ruins consist of an ancient tower, constructed with massive stones, in a rude style of architecture, and part of a small building of much later date.

It was erected in the beginning of the eleventh century, by Werner, bishop of Strasburg, came to his brothers Radebot and Latzelin, and devolved to their descendants. Otho, grandson of Radebot, was probably the first person upon record who styled himself count of Hapsburg, and it continued to be the principal title by which

^{*}In the new division of Switzerland, the bailliage of Baden was converted into a canton or department, of which that town is the capital.

his posterity was distinguished, until it was lost in a greater dignity, when Rodolph of Hapsburg was elevated to the imperial throne. His successors granted the castle and its dependencies as a fief, first to the lords of Wildeck, and afterwards to the lord of Wolen: in 1415 it was occupied by Bern, during the contest between the emperor Sigismond and Frederic of Austria, and given to the family of Segesern of Bruneck. In 1469, it was sold to the convent of Konigsfelden; on the dissolution of that monastery at the reformation, was secularised, and seized by government; has gradually gone to decay, and is now inhabited by a peasant's family.

This castle commands an unbounded view over hills and dales, plains and forests, rivers and lakes, towns and villages, mountains and alps; emblem of that extent of power to which the talents of one man, who derived his title from this castle, raised himself and his descendants. You will readily perceive I allude to Rodolph of Hapsburg, who, from a simple baron of Switzerland, became emperor, and founded the House of

Austria.

Rodolph was born in 1218. Having signalized his youth in constant scenes of warfare and contention, he was, in 1273, unexpectedly raised to the dignity of emperor, and conferred honour on that exalted station, no less by his political sagacity than by his military provess. He died in 1291, after a long and glorious reign, and in the seventy-

third year of his age.

Impressed with these ideas, as I considered on the very spot, the origin of the house of Hapsburg, and its gradual progress towards that height of power which it has since attained under the more distinguished appellation of the house of Austria: I compared it to a small rill in the Alps, whose source is uncertain, which, having received several streams, forms no inconsiderable river. Flowing through Switzerland still almost unknown to its neighbours, it no sooner enters Germany, than it loses its name by its junction with the Danube; and, having collected the tribute of numberless rivers, rolls, with accumulated and still increasing waters, through a large extent of country, and falls by a hundred mouths into the Euxine sea;

Che guerra porta e non tribute al mare.*

Rodolph, during his residence in this castle, would not have given credit to a person endowed with the spirit of prophecy, who should have informed him, that, in little more than a century, a few small republics would drive his descendants from their hereditary dominions in Switzerland, and erect upon their ruins, and on the basis of equal liberty, a formidable confederacy, which would be courted by the most powerful sovereigns. Still less perhaps would he have believed, that he himself should possess the imperial throne; that his lineal descendants should rule over Germany, Hungary, Bohemia, Austria, Spain, Burgundy, the Low Countries, Milan, Nagles, and Sicily, and extend their dominion and influence from the shores of the Euxine to the New World beyond the Atlantic.

LETTER XIV.

Konigsfelden Windish Voyage down the Rhine.

Having gratified our curiosity at the castle of Hapsburg,† that cradle of the house of Austria, which still confers a title on the present emperor of Germany, we de-

scended into the plain of Konigsfelden, to a convent of the same name, built by Elizabeth, on the spot where her husband the emperor Albert was assassinated. Albert, as guardian to his nephew John of Hapsburg, had taken possession of his hereditary dominions in Switzerland, and refused, under various pretences, to deliver them up to Wearied with repeated and fruitless solicitation, John entered into a conspiracy against the emperor, with Rhodolph de Warth, Ulric de Palme, Waither de Eschen-

bach, and Conrad de Tagerfeld.

The emperor dined at Baden, in his way to Rheinfelden, a town in the circle of Suabia, where the empress his consort had collected a considerable body of troops, for the purpose of invading the three cantons of Uri, Schweitz, and Underwalden, which had revolted against him. Contemporary historians, who have recorded the minutest circumstances in this whole transaction, relate, that Albert was in high spirits during the repast: and that, his nephew again entreating to be put into possession of his hereditary dominions, the emperor, with an air of banter, placed a garland upon his head, adding, at the same time, "this will be more suitable to you for the present, than the cares of a troublesome government." This taunt so deeply affected the young prince, that he burst into tears, flung away the flowers, and could not be prevailed upon to sit

After dinner Albert continued his journey on horseback, accompanied by his son Leopold, the conspirators, and his usual attendants; and came near the town of Windish, in the canton of Bern, to the Reuss, over which river passengers were usually ferried upon a raft. The conspirators first passed over, and were followed by Albert: as he was riding gently on, expecting Lcopold and the remainder of his suite, he was suddenly beset by the assassins. One of them having seized his horse's bridle, John of Hap-burg reproached him for his injustice in detaining his dominions, and struck him on the neck with his sword: Rhodolph de Warth wounded him in the side, and Ulric de Palme clove his head with a sabre. In this condition they left him expiring upon

This assassination was perpetrated the first of May 1308, in the open day, and in the sight of his son and the rest of his suite, who had not as yet passed the river, and who, though spectators of the murder, yet could not assist the emperor. The field lies between the Aar and the Reuss, not far from the junction of those two rivers; and the very spot where he was massacred is marked by a convent, erected by his wife Elizabeth and his daughter Agnes; the place was called Konigsfellen, or King's field; a name it retains to this day. The remains of the emperor were buried in the convent of Witterling, from whence they were afterwards transported to Spire, and there

The assassins escaped into the cantons of Uri, Schweitz, and Underwalden, expecting to find a sure asylum in a nation which Albert was preparing to invade. But the generous natives, detesting a crime of so atrocious a nature, although committed upon the person of their greatest and most formidable enemy, refused to protect the murderers. D'Eschenbach concealed himself in the disguise of a common labourer during thirty years, nor was his rank discovered till he confessed it upon his death-bed; De Palme, destitute of common necessaries, died in extreme poverty; de Warth, tied to a horse's tail, like a common malefactor, dragged to the place of execution, was broken upon the wheel. John of Hapsburg, commonly known by the appellation of parricide, did not reap the expected benefits of the crime; for, by order of the emperor Henry the Seventh, he retired into a monastery of Augustine friars, where he died in 1313.

The widow of Albert turned her whole thoughts-towards revenging the death of her husband, and in this pursuit involved the innocent as well as the guilty: all who had the smallest connexion with the assacians, being sacrificed with undistinguished cruelty. Meanwhile the three cantons were, for a few years, left to the undisturbed enjoyment of their liberties, and to strengthen themselves against any future attack: and thus they innocently reaped the sole advantage which was derived from this assassination.

The convent or abbey of Konigsfelden comprised within its extensive precincts a nunnery of the order of St. Clare, and a monastery of monks of the order of Minesites, separated from each other by a wall. It was richly endowed by Elizabeth, her five sons, and her daughter Agnes, queen of Hungary, who assumed the habit of a nun, and here passed the remainder of her days. At the reformation the abbey was secularized, and its lands appropriated by government: part of the building became the residence of the bailiff, part was converted into an hospital, and part was suffered to fall to ruin. Many of the cells formerly occupied by the nuns, still exist in their original state; and one, in particular, is distinguished as the habitation in which queen Agnes lived and died.

The chapel still remains entire, but it is no longer used for divine service. The glass windows are beautifully coloured, and painted with various histories of the Old Testament; with the portraits of Elizabeth and Agnes, of the emperor Albert, and his sons.

On the walls are coarsely represented the figures of Leopold duke of Austria, and the principal nobles who perished at the battle of Sempach. Elizabeth and Agnes, and several princes and princesses of the house of Austria, were buried in this chapel; but their bones were a few years ago removed to the abbey of St. Blaise, in the Black Forest, where they were deposited with great pomp, and magnificent sepulchres erected to their memory.

Near Konigsfelden is the small village of Windish, standing at the confiux of the Aar and the Reuss, and supposed by antiquarians to occupy the site of Vindonissa, a Roman fortress mentioned by Tacitus. In traversing the place I did not observe the least signs of any antiquities; but various lapidary inscriptions, mile-stones, sepulchral urns, medals, coins, and gems, which have been found in great abundance, sufficiently prove that it must have been the station of a large Roman colony. The reader, who is inclined to reflect on the vicissitude of human possessions, will recollect with pleasure the following quotation: "Within the ancient walls of Vindonissa, the castle of Hapsburg, the abbey of Konigsfeld, and the town of Bruck, have successively arisen. The philosophic traveller may compare the monuments of Roman conquest, of feudal or Austrian tyranny, of monkish superstition, and of industrious freedom. If he be truly a philosopher, he will applaud the merit and happiness of his own time."**

Early the next morning we embarked on the Aar, which, though here a trifling stream, yet, being considerably swelled by the tribute of waters from the Reuss and the Limmat, soon becomes a considerable river. Its banks are agreeably enlivened with meadows and woods, and spotted occasionally with villages, castles, and ruins, hanging on the water's edge. Having made a small turn, it falls by a straight channel into the Rhine, vying in size and rapidity with the great river in which it loses its name: its waters, which are of a silvery hue, are for a long way distinguished from those of the Rhine; which, being transparent, and of a sea-green colour, seem to disdain the union.

The banks of the Rhine are far superior in wildness and beauty to those of the Aar, in many parts rising perpendicularly, yet feathered with wood; in others sloping in gentle declivities, richly bordered with vines, forest, and pastures; and exhibiting a continual succession of towns and villages. The rapid stream carried us above eighteen miles in three hours, and we landed at Lauffenburgh, where the Rhine forms a cataract, which, though greatly inferior to the fall of the same river near Schaffhausen, yet deserves to be visited by travellers for the beauties of the scenery. As I stood upon the crags of the northern shore, the principal objects were, a high bridge, partly open and partly covered, supported by three lofty stone piers; on the south a row of houses, with an old ruined castle on a summit, boldly overhanging the water; a perspective of woods and meadows under the arcades of the bridge; and the river dashing over its craggy bed, in a sloping cataract, until it is suddenly lost among the rocks which close the view.

About half a mile below this fall we re-embarked, and found the waters in many parts more agitated than those of the Limmat; particularly near Rheinfelden, where they rush with such increasing velocity, that they were troubled like the waves of the sea, and, beating against the boat, turned it obliquely by their violence. Here we were hurried along with such rapidity, that though I had a pencil in my hand, I had no time for observation, much less for description; I could only catch a general glance of the romantic scenery, as we passed under a picturesque bridge of several taches, suspended high above the surface of the river, and joined to a steep rock, on which towered some majestic ruins. In many parts, and for a considerable way, our vessel passed within a few inches of the shelving rocks, and was only prevented from striking them by the dexterity of the pilot.

As we approached Basle, the stream became less rapid; and we disembarked, highly

delighted with our expedition.

LETTER XV.

The Town of Basle....Erasmus....Library....Holbein.

I ARRIVED at Basle or Basel, I supposed, about twelve at noon; but was much surprised to find, that all the clocks* actually struck one: and, on inquiry, I was informed, that they go constantly an hour faster than the real time. Different reasons have been assigned for this singularity: some assert, that it was first practised during the council of Basle, in order to assemble, at an earlier hour, the cardinals and bishops, who, being lazy and indolent, always arrived late. Others maintain, that a conspiracy being formed to assassinate the magistrates at midnight, one of the burgomasters, who had notice of the design, advanced the town-clock an hour; by which means the conspirators, imagining they had missed the appointed time, retired; and that the clocks are still kept in the same advanced state, as a perpetual memorial of this happy deliverance. But there is a third reason given for this strange custom, which seems the most probable. It is well known that the choirs of cathedrals are constructed towards the east: that of Basle declines somewhat from this direction; and the sun-dial, which is placed upon the outside of the choir, and by which the town-clock is always regulated, partakes of the declination; a circumstance which, according to the celebrated Bernoulli, occasions a variation from the true time of about five and forty minutes.

VOL. V.

^{*}The clocks of Basic, as well as the government, have undergone a revolutionary change in the new order of things. The motion for altering the clocks according to the real time was made by M. de Mechel.

The inhabitants of Basle are still so strongly attached to this whimsical custom, that, although it has been often proposed in the sovereign council to regulate their clocks properly, yet the motion has been invariably rejected; and the people would suspect that their liberties were invaded, if their clocks agreed with those of the rest of Europe. A few years since, several leading men of the town determined to alter the hand of the sun-dial half a minute a day, until the shadow should imperceptibly point to the true hour. This expedient was accordingly practised, and the clock had already lost near three quarters of an hour, when an accident discovered the design; the magistrates were accordingly compelled to place the hand of the sun-dial in its former position, and to regulate the hours as usual. Indeed, long-established customs, however indifferent or ridiculous, are apt to make so strong an impression upon vulgar minds, as to become sometimes dangerous, and always difficult to be abolished; especially among a people, like those of this country, who are averse to any change, even in the minutest articles. I need not remind you, how long it was before the English could be persuaded to reckon their years according to the general mode of computation in Europe.

Basic is beautifully situated upon the banks of the Rhine, near the point where that river which is here broad, deep, and rapid, after flowing some way from east to west, turns suddenly to the north. It consists of two towns joined together by a long bridge; the Large Town lies on the side of Switzerland, and the Small Town on the opposite banks of the river. It stands very favourably for commerce; an advantage which the inhabitants have by no means neglected; for they have established a great variety of manufactures, particularly of ribbons and cottons; and an extensive trade is carried on

by the principal merchants.

The cathedral is an elegant gothic building, but strangely disfigured by a daubing of rose-coloured paint. It contains the ashes of Gertrude Anne countess of Hohenberg, wife of the emperor Rodolph I, who died at Vienna, in 1281, and her body was conveyed to Basle. Her two christian names gave rise to much confusion, and led many historians to conclude that Gertrude and Anne were two different personages, and successive wives of that emperor; while others ridiculously supposed that both were married to him at the same time: nor were these erroneous opinions confuted, and the controversy finally settled, till Hergot, the laborious genealogist* of the house of Austria, proved, from the most unquestionable authorities of ancient diplomes, the identity of this divided personage; and that the mistake arose from her being uniformly styled Gertrude before her coronation, and Anne after the performance of that ceremony. She bore to her busband fourteen children; and though the mother of so large a family, yet such was her extreme sensibility, that the grief which she suffered at the departure of her daughter Clementina to Naples, on her marriage with Charles Martel, hurried her to her grave.

In the same church are deposited, under a marble tomb, the venerable remains of the great Erasmus. That distinguished writer joined to superior learning, and a peculiar elegance of style, the keenest wit, which he pointed, not only against the vices and ignorance of the monks, but the general corruptions and disorders of the Roman church. He was indeed the forerunner of Luther, in his first attacks upon the Catholics, respecting the sale of indulgences: but afterwards, when the controversy appeared more serious, and an open breach with the church of Rome seemed inevitable, he condemned the proceedings of that bold reformer. He considered them, indeed, as altogether unwarrantable; and, although he had himself censured and exposed the corruptions that infected the Catholic religion; yet he zealously inculcated submissive

mains of la pecuvices and Roman e Cathoappeared he conas altothe corbmissive obedience to the decrees of what he called the "universal church." Agreeably to these sentiments he advised the protestants to endeavour at obtaining, by mild and patient measures, what they might indiscreetly lose by a warmer and more violent opposition.

Such temperate counsels were ill suited to the daring and impetuous spirit of Luther. Accordingly, while Erasmus was acting the part of a mediator, and endeavouring to moderate and allay the flame on each side, he drew upon himself the displeasure of both parties: in allusion to this temporising conduct, one of his adversaries applied to him, not unaptly, that line in Virgil,

Terras inter cælumque volabat.

The impartial truth seems to be, that he was by no means disposed to become a martyr in the cause: the natural timidity of his temper, a too great deference to persons of superior rank and power, and perhaps the fear of losing his pensions, induced him to take a decided part against the reformers, and condemn their separation from the church of Rome.

But it would be uncandid to impute his conduct wholly to selfish considerations: something may fairly be ascribed to the powerful impressions of early prejudices; and something to that rooted love of peace and studious tranquility, which seems to have been the spring of all his actions. But, whatever imperfections may be discovered in some particular parts of his character, his memory must be revered by every friend of genius, learning, and moderation. Liveliness of imagination, depth and variety of erudition, together with great sagacity of judgment, were in him eminently united. He infused a spirit of elegance even into theological controversies; and contributed to disencumber literature from that scholastic jargon with which it was disgraced. Erasmus reflected much honour upon this town, by choosing it as the favourite place of his residence, and publishing from hence the greatest part of his valuable works. In the public library are preserved, with great veneration, his hanger and seal, several of his letters, and his last testament, written with his own hand.

The university of Basle was formerly eminent in the literary history of Europe. Who, in the least conversant in letters, is unacquainted with the celebrated names of Occolampadius, Amerbach, the three Bauhius, Grynæus, Buxtorf, Wetstein, Iselin, the Bernoullis, and Euler. If it has fallen from its pristine state of renown, its decline must be principally imputed to the casual mode of electing the professors; but it still boasts several members who do honour to their native town by their learning and abi-

lities.

The public library contains a small collection of books, remarkable for several rare and valuable editions; particularly of those printed in the fifteenth century. The most curious manuscripts are numcrous letters of the first reformers, and of other learned men in the fifteenth, sixteenth, and seventeenth centuries; and an account of the proceedings at the council of Basle. The minutes of that council were taken by John of Segovia; and are supposed to be the same which are preserved either in the library, or in the archives of the town: the former is written on paper, the latter on parchment. A question has arisen which of these is the original. Some conclude in favour of that in the archives, on account of the many false readings and mistakes in the other, which are plainly the faults of the copyist. Others give the preference to that in the library, because it is written in different hands, and with different ink, which seem to imply that it was noted down at various intervals, according as the acts of the council were passed; whereas that in the archives, being penned on parchment, in the same hand

4 T 2

and with the same ink, was probably copied from the original minutes; for who, it is urged, would take minutes on parchment? A third opinion, still more probable, is, that neither of these is the original. Several passages are wanting in both; which omission may have proceeded from the transcriber not being able to read every part of the original. It is probable that John of Segovia took away the minutes, and deposited them at Rome; and that one of these manuscripts was the copy transcribed by order of the council; of these, the manuscript on parchment appears to be the most authentic.

In a suite of rooms belonging to this library, is a cabinet of petrifactions, collected in the canton of Basic by the Rev. Mr. Annoni: some ancient medals and gems; a few antiquities found at August; a large number of prints; and some fine drawings and paintings, consisting chiefly of originals by Holbein, who was a native of this town. These pictures are, most of them, in the highest preservation: the connoisseur can here trace all the different manners of Holbein, and compare the productions of his youth with those of his maturer age. A few are preserved, which he painted before he had reached his sixteenth year; and one, extremely curious, which he drew upon a sign for a writing-master. The portraits of himself, his wife, and children in the same group, are much admired for nature and simplicity of expression. The most valuable of these paintings is an altar-piece, in eight compartments, which represents the passion of our Saviour: a performance, in which this admirable artist has carried to the highest perfection that singular brilliancy of colouring so peculiar to his best compositions. I was much struck with a profile of his friend and patron Erasmus, writing his commentary upon St. Matthew; there is a spirit and animation in the countenance, finely expressive of his sagacious and penetrating talents.

Among the works of Holbein, that discover the liveliness of his fancy, must be mentioned the sketches he drew on the margin of the Eulogium of Folly by Erasmus, which he received as a present from the author. This curious volume is preserved in the library, and has been lately published by Mr. Haas, in French, Latin, and German, with

fac-similes of the original designs, engraved on wood.

The dance of death, in the church-yard of the predicants of the suburbs of St. John, is frequently shewn to strangers as being of Holbein's pencil. It is painted in oil-colours upon a wall which encloses the burial-ground: but, as it has several times been retouched, no traces are discoverable of that great master's hand. In fact, the hon. Horace Walpole, and other unquestionable judges, have proved, that this performance was painted before Holbein was born, and that he was not employed even in retouching it. It is probable however, that, from this ancient painting, he took the first hint towards composing his famous drawings on the dance of death. In treating that subject, he has displayed such richness of imagination, and discovered so much judgment in the disposition, and so much spirit in the execution of the figures, that Rubens studied them with particular attention, and took drawings from them.

The originals of Holbein's dance of death were purchased by M. Fleichman of Strasbourg, at the sale of the famous collection of Crozat, at Paris; of which Mariette has published a catalogue. They are now in the possession of prince Gallitzin, minister from the empress of Russia to the court of Vienna. They consist of forty-four small drawings: the outlines are sketched with a pen, and they are slightly shaded with Indian ink. I had frequent opportunities of seeing them, during my continuance at Vienna, and particularly admired the variety of attitudes and characters in which death is repre-

sented.

Prints have been taken from some of these drawings by Hollar, which are very scarce. Mr. de Mechel, a celebrated artist of this place, has already engraved them after the

original designs; a work which cannot fail of being highly acceptable to the admirers of the fine arts; he has added four engravings, which are not in the prince's collection, and which are taken from the prints of Hollar. He ingeniously conjectures, from the dresses and characters of several of the figures in the dance of death, that the author sketched them while he was in England. They were, probably, in the Arundelian col-

lection when Hollar engraved them.

Mr. de Mechel has finished also a set of prints from the fine paintings of the Dusseldorf gallery, and likewise engravings of the famous Hedlinger's medals. This able artist has a small but well chosen collection of paintings; and his magazine of prints (in which article he carries on a very considerable trade) is perhaps one of the largest and most complete in Europe. I am acquainted with no person to whom the curious traveller can address himself with greater advantage than to Mr. de Mechel, nor from whom he can receive more useful information. To a particular knowledge of the physical beauties of Switzerland, he joins a thorough acquaintance with the different governments, customs, and manners of the several cantons. As he is intimately connected with the principal men of learning in this country, his letters of recommendation are the most desirable, and the most beneficial, that can be procured, and he enjoys as much satisfaction in conferring, as can be received by accepting, his good offices. He indeed possesses a great fund of good humour, an amiable frankness of disposition, and a certain originality of manner, which, together with his other valuable qualities, recommend him as a no less pleasing than useful acquaintance.

I visited also the small but pleasing collection of pictures, mostly of the Flemish and Dutch schools, belonging to M. Facsch, member of the Great Council. In the courtyard before his house is a wooden statue of Rodolph I, sitting on a throne, and clothed with the imperial insignia: underneath I observed the date of 1273, the æra of his coronation. The rudeness of the sculpture renders it probable that it is an original of that great emperor, who was besieging Basle when he received the unexpected news of his election. The gates were immediately thrown open; and he was instantly admitted as a friend into that town, which had shut its gates against him as their enemy. On this occasion he resided a short time at Basle, and, as tradition relates, in this very house.

LETTER XVI.

Government of Basle.

THE bishops of Basle once possessed the sovereignty over the city and canton; but were gradually deprived of their prerogatives; and, in 1501, finally quitted this town, when the canton joined the Helvetic confederacy. They retired at first to Friburgh in Brisgau; and afterwards, establishing their residence at Porentru, entirely lost the trifling authority and inconsiderable prerogatives which remained to them. Upon the introduction of the reformation in 1525, the constitution was in some measure changed; and the power of the aristocracy limited.

It would seem in theory scarcely possible to divide the aristocratical and democratical commonwealths into so many different species as exist in Switzerland: for, in this country, every republic has its peculiar modification; and there is none more singular than that of Basle. To view the general outlines of the constitution, it has the appearance of an absolute aristocracy; * but, upon considering it in detail, it will be found to incline

^{*} An aristocracy (strictly speaking) means that form of government, which places the supreme power in the nobles, exclusively of the people; but here I mean by it, the confining of the sovereign

towards a democracy. The supreme legislative power resides in the great and little councils, consisting of about three hundred members; and the authority of these two councils combined is without controul. They enact laws, declare war and peace, contract alliances, and impose taxes: they elect the several magistrates, appoint their own members, nominate to all employments, and confer the right of burghership. The general administration of government is committed by the great council to the senate, or little council; that is, to a part of its own body. This senate, composed of sixty members, together with the four chiefs of the republic, two burgomasters, and two great tribunes, is divided into two bodies, which act by rotation. The acting division continues in office one year, decides finally in all criminal causes, superintends the police, and exercises several other powers subordinate to the sovereign council. The collective body of citizens assembles only once a year; when the magistrates publicly take an oath to maintain the constitution, and preserve the liberties and immunities of the people inviolate. The reciprocal oath of obedience to the laws is administered to the citizens in their respective tribes.

But, notwithstanding the boundless prerogatives of the great council, yet the meanest citizen is legally capable of being admitted into that body, and by the singular method of election may possibly be chosen. For the vacancies in the two councils are supplied from all ranks of citizens, one class only excepted, the members of the universit. These citizens are divided into eighteen tribes, called in German Zuenste, fifteen of which belong to the larger town, and three to the smaller; each of the first-mentioned fifteen tribes returns four members to the senate, and each of the whole eighteen sends twelve to the great council. Formerly these elections were determined by a plurality of voices; but as by these means the richest person was always certain of being chosen, a ternaire was established in 1718, that is, three candidates were nominated, and from these the successor was appointed* by lot.

Although this mode of election in some measure put a stop to corruption, yet it was not sufficient to counteract entirely the influence of the wealthy; and as the poorer citizens could seldom succeed to the most honourable or lucrative employments, they procured an act to be passed in 1740, changing the ternaire into a senaire; by which six candidates, instead of three, were put in nomination, and drew lots for the charge. Six tickets, containing the names of the respective candidates, and separately placed in silver eggs, are inserted into one bag; and the same number of tickets, five of which are blanks, and one is marked with the vacant employment, are placed in another. The reigning burgomaster and the great tribune, appointed to be the drawers of this official lottery, both at the same instant take a ticket from each bag, and the candidate whose name comes out at the same time with the ticket on which the employment is written, obtains the post.

It would be too tedious, and indeed too uninteresting a detail, to enter into a minute account of the forms and circumstances requisite to be observed in selecting the several

authority to a certain limited number of persons, without considering whether they are patricians or plebians, nobles or commons; for at Basic every citizen who is noble, and who chooses to retain his title of nobility, is incapable of being elected a member of the sovereign council.

*The fifteen tribes in the great town are called Zuenste, and the three in the small town Gesell-schaften, or companies. It may also be remarked, that the citizens of the small town enjoy more advantages than those of the great town; inasmuch as the former may be appointed to public employments either in the tribes or in the companies; whereas a citizen of the great town cannot be admitted into the companies, unless he resides in the small town.

tricians or retain his

vn Gesellnjoy more c employc admitted eandidates. To give, however, some general idea of this matter: upon a vacancy in the great council, for instance the six candidates must be taken from the citizens of that tribe, to which the person who occasioned the vacancy belonged, and be nominated by such of the members of the great and little councils as arc of the same tribe. The candidates for the senate and for the tribunes or chiefs of each tribe, called in German meister, are appointed by the great council. But there is one case in which the senaire is not practised; for, upon the death of a burgomaster, his colleague, who is the great tribune, succeeds of course.

It should seem that many inconveniences must flow from this absurd method of supplying vacant posts in the government, as they are left entirely to the capricious disposal of fortune. In fact, it has not unfrequently happened that a candidate, whose knowledge and abilities rendered him capable of being serviceable to the state, has never obtained the successful ticket; while chance has bestowed it upon another by no means qualified to fulfil the duties of the employment. However, notwithstanding the ill effects resulting from this casual mode of election, the management of public affairs is in general well conducted; and there are few instances of civil justice unwisely adminis-

tered, or of innocence sacrificed to wealth or power.

But the counsellors of state and magistrates are not the only persons chosen by lot; even the professors in the university are elected in the same manner. The three candidates (for in this instance the ternaire is still in use) must be nominated from those who have taken the degree of doctor. Hence a candidate not unfrequently offers himself for the professorship of a science which he has never made the peculiar object of his studies, if the chair of that particular branch of literature in which he excels is already occupied; for, under these circumstances, the respective unqualified professors change places with each other. Thus (to mention an instance from a family well known) John Bernoulli, the famous mathematical professor in this university, who died in 1748, left three sons, Nicholas, Daniel, and John, all justly celebrated for their skill in that science, in which their father and uncle so eminently excelled. Nicholas died at St. Petersburgh, member of the imperial academy of sciences; and Daniel, having followed his brother into Russia, returned to Basle on obtaining the professorship of anatomy, which he afterwards had an opportunity of happily exchanging for that of natural philosophy; he died in 1782.* A similar circumstance happened to the third son John; after being several times an unsuccessful candidate in the lottery of professorships, chance at length

* The following curious epitaph on a lawyer, interred in the cathedral, complains that the deceased, notwithstanding his advanced age of 84, which had afforded many opportunities of being nominated candidate for various offices of state, had been continually excluded by fortune:

conferred on him the chair of rhetoric, for which he was wholly unfit; but upon his father's death he changed with M. Rumspeck, to whom fortune had assigned the professor-

ship of mathematics.

The sumptuary laws are very strict at Basle. The use of coaches in the town is not indeed prohibited, as at Zuric; but what is more singular, no citizen or inhabitant is allowed to have a servant behind his carriage. Laws of this kind may be carried, in some instances, to a scrupulous and even ridiculous minuteness; upon the whole, however, they are excellent regulations, and not only useful but necessary in a small republic. They have certainly operated with great advantage in this town; for although it contains several families who are considerably rich, yet a happy simplicity of manners is still so predominant, that you would smile if I were to particularise those articles which

pass under the opprobrious denomination of luxury.

The lower ranks of citizens are in general so strongly prejudiced in favour of their own country, as to seem convinced that true felicity is only to be found at Basle; and indeed that class of people are in no part of the world more happy. Every person boasts that he is free, and is so in reality; and as the citizens not only possess very considerable privileges, but each individual may also indulge the hope of being one day chosen into the sovereign council; he enjoys a certain degree of respect and consideration extremely flattering to his self-importance. In fact, several of the magistrates exercise the meaner trades; and the present treasurer, whose name is Muench, is a baker: he is indeed a person of distinguished knowledge and merit, and has been twice appointed one of the candidates for the office of great tribune; which, had fortune favoured him, would have been followed on the next vacancy by his succession to the office of burgomaster. In general the burghers sons receive an excellent education: they always learn the Latin, and not unfrequently the Greek tongue; and it is by no means unusual, even for the lower sort of tradesmen, to employ their leisure hours in the perusal of Horace, Virgil, and Plutarch.

The conduct of magistrates is no where more freely, nor more severely, criticised than at Basle. The people may sometimes, no doubt, extend this privilege beyond its proper limits; but they can never be totally restrained from exercising it, without striking at the vitals of their liberty: it is essential to their existence, and no free government

can long survive its extinction.

Basic is the largest, and seems formerly to have been one of the most populous towns in Switzerland: its extent is capable of containing above a hundred thousand inhabitants; whereas it can scarcely number more than fourteen thousand. Many particular causes may have concurred to occasion this remarkable decrease; but I will mention

only one or two to which it may be attributed.

It is proved, from undoubted calculations, that in all great cities the number of burials exceeds that of births; consequently, unless this unequal proportion is compensated by a constant accession of new inhabitants, in process of time every great town must necessarily become depopulated. Now the citizens of Basle are so jealous of the burghership, and pride themselves so much upon the privileges which accompany it, that they seldom deign to confer it upon foreigners: a supply therefore to balance that gradual waste of people I have mentioned, can never be derived from an influx of strangers, who are not permitted to carry on commerce, or to follow any trade. A few years ago some of the magistrates, sensible of the impolicy of this prohibition, procured a law, by which the freedom of the town and the right of burghership was allowed to be con-

on his faprofessor-

Every principle indeed of private interest and ambition concurred to prevent its efficacy: and no wonder, for bodies of men are seldom actuated by so generous a spirit as to sacrifice their personal and immediate advantages to the future welfare and prosperity of their country.* I am, &c.

LETTER XVII.

Combat at the hospital of St. James, between the forces of Louis dauphin of France and a corps of Swiss troops....Ruins of August....Mulhausen.

CURIOSITY led me, during my continuance at Basle, to visit the hospital and burying-ground of St. James, not far from the town, and near the small river Birs, celebrated for a desperate combat in 1444, between the Swiss and the dauphin of France, afterwards Louis XI. Never was Swiss valour and intrepidity so signally displayed, as by

a few battalions of their troops on that memorable day.

This famous battle was fought in consequence of some disputes which arose between the canton of Zuric and those of Schweitz and Glarus. Zuric refusing to abide by the mediation of the five neutral cantons, who had decided in favour of Schweitz and Glarus, a civil war ensued; upon which occasion Zuric formed an alliance with the emperor Frederic the Third. The seven ancient cartons, in order to obtain a renunciation of this alliance, which they justly considered as an infringement of their league, laid siege to that town. Frederic, unable to send a sufficient body of troops to its relief, applied for additional succours to Charles the Seventh, king of France; who, as well with a view of dissolving the council of Basle as for the particular purpose required, ordered a considerable army to march, under the command of his son Louis. Accordingly the adjacent provinces, appeared before Basle. Upon this occasion, a detachment of fifteen hundred Swiss from the army of the confederates (at that time employed in besieging Farnsburg) were ordered to throw themselves into the town of Basle, which was but slightly garrisoned.

This handful of men advanced without interruption to the plain of Brattelin, where they charged, with such determined and well conducted valour, eight thousand of the enemy's cavalry, as to drive them back to Muttenz, at which place the repulsed were joined by another corps; but notwithstanding this re-inforcement, the Swiss renewing

*Basle was the first canton which separated from the old Heivetic confederacy, and adopted the new constitution fabricated in France. Its situation near the frontiers exposed it to the intrigues of the French agents, and without foreign support rendered it incapable of resistance. The peasants of the canton were likewise dissatisfied with the monopoly of power and commerce vested in the burghers of the town; encouraged by the French, and excited by their own turbulent demagogues, they peremptorily required emancipation and independence. The magistrates could only lament in secret the progress of disaffection, and were compelled to submit without a struggle; the French having over run the bishopric of Basle, and annexed it to their own dominions, claimed the episcopal palace as succeeding to the rights of the bishop, and under that pretence introduced a corps of troops into the town.

The progress of the revolution in this canton was almost instantaneous: the peasants rose in different districts, demolished the castles of the bailiffs, planted on the 18th of January, at Liechstall, the first tree of liberty, and sent deputies to Basle with their declaration of rights, which they styled Magna Charta. The magistrates acceded to their demands, admitted 600 militia into the town, and recalled their deputies from Arau. On the 24th the tree of liberty was planted at Basic, and on the 5th of February the old magistrates resigned their authority, and sixty delegates, appointed by the people, were invested with a provisional government, until the new constitution should be consolidated. Thus the magistrates of Basle were first compelled to set the fatal example of a separation from the Helvetic Union; an example which was soon followed by the other parts of the confederacy.

VOL. V.

the assault with fresh intrepidity, forced them to repass the river Birs, where the main body of the army was chiefly drawn up. Such was the firmness and solidity of the Swiss in these several recounters, that to use the expression of an old French chronicle, when the cavalry charged "they could make no more impression than if they had attacked a rock, or an impenetrable wail." The Swiss, encouraged by this wonderful success, and exasperated with the most spirited indignation against the invaders of their country, disregarded the remonstrances of their officers, and rashly attempted to force their passage over a bridge which was guarded by a large body of the enemy; but this effort of inconsiderate valour proving ineffectual, these gallant soldiers, throwing themselves into the river, gained the opposite shore, in the face of a battery of cannon that

was playing against them.

What could the desperate courage of so small a number avail against an army of thirty thousand men advantageously posted in an open plain? They had no alternative but to throw down their arms, or gloriously expire. They bravely preferred death: five hundred took possession of a small island near the bridge, and, after resolutely defending themselves to the last extremity, were cut to pieces. A like number forced their way through the ranks of the enemy, and marched towards Basle; when they were opposed by a large body of horse, posted to prevent the inhabitants of the town from sallying to the relief of their countrymen. Being now surrounded on all sides, they threw themselves into the hospital of St. James, and, lining the walls of the burying-ground, resisted for some time the united assaults of the whole French army. At length the hospital being set on fire, and the cannon having battered down the walls of the burying-ground, they fought no longer in hopes of victory; but still resolving to sell their lives as dear as possible, they continued to defend themselves to the last gasp.

Æneas Sylvius (afterwards pope Pius II,) relates, among other actions of singular valour exerted by this heroic troop, a particular instance which I cannot forbear mentioning. Four French soldiers assaulted a single Swiss, and having killed and stripped him, proceeded to insult the corpse: one of his companions, incensed at this brutal action, seized a battle-axe, rushed upon the four, slew two of them, and drove the others to flight; then flinging the dead body of his friend upon his shoulders, carried it to a

place of security; and returning to the attack, fell by the hand of the enemy.

Of the whole number but sixteen escaped from the field of battle; and these, agreeably to the old Spartan discipline, were branded with infamy, for not having sacrificed their lives in defence of their country. Among those who were desperately wounded, and left upon the field, only thirty-two were found alive. The names of many of these

glorious combatants were registered, and still remain upon record.

It is not easy to ascertain the number of forces on both sides in this ever memorable engagement. As far as we can judge, by comparing the several relations of the French and German historians, the army of the dauphin consisted of at least thirty thousand. Charles and his son Louis, in their letters to the German princes on this occasion, assert, that three thousand Swiss fell on the field of battle; and perhaps that account is not much exaggerated. With respect to the slain on the side of the dauphin, the amount is still more uncertain: his loss, however, must have been very considerable, for he remained three days upon the field of battle; and, the better to conceal the number of the killed, ordered the dead bodies to be secretly interred in different parts of the neighbourhood. He was effectually prevented from prosecuting his designs upon Switzerland, and compelled to retire with his shattered army into Alsace. Louis himself, indeed, declared, that such another victory would ruin his army; and generously confessed, that he derived from it no other advantage, than to know and esteem the valour of the Swiss. Accordingly, this combat may be considered as forming a re-

ere the main lidity of the ch chronicle, they had atis wonderful aders of their pted to force ny; but this owing themf cannon that

· memorable f the French ty thousand. is occasion, hat account dauphin, the iderable, for the number parts of the signs upon Louis himgenerously esteem the ming a remarkable are in the history of the Swiss: for it gave rise to their treaty with Charles the Seventh; the first alliance which they contracted with France.

The war, however, between the house of Austria and Zuric on one side, and the seven cantons on the other, continued until the year 1446, when a peace was concluded by the mediation and decision of certain arbiters: Zuric renounced its connection with the house of Austria; and the Helvetic confederacy was again solemnly renewed and confirmed between the eight cantons. Upon this occasion two very important articles in the public law of Switzerland were finally settled: first, that all disputes between any particular cantons should be decided by the mediation of the neutral cantons; and if either of the two contending parties should decline to acquiesce under their judgment, the neutral cantons are empowered to have recourse to arms, in order to compel the recusant to abide by their determination; secondly, notwithstanding the right which either of the cantons might have reserved to itself, of contracting alliances with foreign powers, yet the other confederates are to judge whether such alliance is contradictory to, or incompatible with, the articles of the general union; and if it should appear to be so, it is declared null and void.

The Swiss still talk of this famous action with the warmest enthusiasm. Accordingly, the inhabitants of Basle form parties every year, to an inn situated near the hospital and burying ground, in order to commemorate, in a red wine produced from some vineyards planted on the field of battle, the heroic deeds of their brave countrymen, who so gloriously sacrificed their lives. This wine, which they call the "Blood of the Swiss," is highly prized by the Basileans, though it has little to recommend it in point of flavour; nevertheless, I am much mistaken if that line of Horace,

Non missura cutem nisi plena cruoris.

was more applicable to the teazing poet he mentions, than it is to those jovial patriotic

parties, at the anniversary compotations of the "Blood of the Swiss."

Near Basle are the ruins of Augusta Rauricorum, formerly a large town under the dominion of the Romans, now a small village in the canton of Basle, close to the Rhine. Its ancient remains are very inconsiderable, consisting of a few columns of marble, still standing, and some scattered fragments of pillars, together with a semicircular range of walls upon a rising ground, the greater part of which has fallen, and is almost overgrown with under-wood. From the present appearance of the ruins I should hardly have conjectured that they once composed part of a theatre, capable of containing above twelve thousand spectators. But the celebrated Schæfflin has given, in his Alsatia Illustrata, a particular description of this theatre, and of the temple, to which the marble columns formerly belonged. I noticed also the remains of some small aqueducts, which conveyed water to the town from the distance of above twelve miles; but none of these ancient relics are sufficiently remarkable to merit the trouble of a particular visit.

The peasants, in turning up the ground, frequently find medals of the Roman emperors, from Augustus to Constantine; and are become, by experience, able to distinguish, with some degree of precision, those that are rare from the common coins. I purchased of a labourer two medals which he had just found; a Trajan and an Albinus; and though the former was by far the most perfect, yet he exacted three times as much for the latter,

because he had never seen it, he said, before.

From Basle I made an excursion to Mulhausen, a town in alliance with the Swiss cantons; which, though situated at the distance of several miles from the frontiers of Switzerland, and entirely enclosed within the dominions of France, is yet considered and respected as a part of the Helvetic confederacy; and entitled to all the privileges enjoyed by that body.

Mulhausen stands in Sundgau, a district of Alsace, about fifteen miles from Basle; in a fertile plain, at the bottom of a ridge of hills, and at a small distance from the Vosges. The walls of the town enclose a circumference of not more than two miles, and its whole territory is comprised within a precinct of eight miles.

This little republic maintained its privileges, which had been granted by the emperors during the times of feudal tyranny, by contracting an alliance, at different intervals, with Basle, Strasburgh, and the towns of Alsace and Suabia; and afterwards, in the middle of the fifteenth century, with Bern, Friburgh, and Soleure. At length, in 1515, it was received into the Helvetic confederacy; which league has preserved its liberty and independence from the encroachments of the empire, on one hand, and, on the other, from the attacks of France. The inhabitants are of the reformed religion. The town contains about eight huncard houses, and six thousand souls, and there are two thousand subjects in the villages within its little territory. Mulhausen owes its present flourishing state to its manufactures, which consist principally of printed linen and cottons.

The government is aristo-democratical. The supreme power resides in the great and little councils, consisting both together of seventy-eight persons, and drawn from the burghers, whose number amounts to seven hundred, distributed into six tribes.

Mr. Koehlin's commercial school deserves to be mentioned. It is a private institution for about thirty scholars, who are instructed in the German, French, and Latin languages; in fencing, dancing, and all polite accomplishments; and more particularly in accounts and book-keeping. The expence, including an uniform, amounts to £50 per annum. The plan is very judicious, and the whole appeared to be well conducted.**

LETTER XVIII.

Bishopric of Basle....Porentru....Abbey of Bellelay....Arlesheim....Delmont....Valley of Munster....Pierre Pertuis....Valley of St. Imier.

ALTHOUGH great part of the dominions subject to the bishop of Basle, or, as he is called by the Protestants, the prince of Porentru, is not comprised within the limits of Switzerland; yet as, till lately, he was in alliance with the Catholic cantons, and as many of his subjects, even in those districts which lie within the German empire, are comburghers with Bern, and under the protection of that republic, his territory is usually included in all the topographical accounts of Switzerland. It merits also the notice of the traveller for its romantic scenes, of the mineralogist for the variety of its petrifactions and fossils, and of the politician for the peculiarity of its government, and the numerous and complicated immunities of the people.

Having made various excursions into this country, I shall lay before you a general account of its political state, and a particular description of those parts which I had an opportunity of visiting.

The bishopric of Busle may be classed under two general divisions: the first lies to the south of Pierre Pertuis, and forms a part of Switzerland; the second, to the north of the same boundary, includes that district situated within the German empire.

^{*} Mulhausen is no longer an ally of the Helvetic body. In 1798 it surrendered to the French, after a blockade of two years, and was incorporated with the French republic.

om Basle; he Vosges. es, and its

rench, af

The sovereign is chosen by the chapter of eighteen canons, resident at Arlesheim, and confirmed by the pope. He is prince of the German empire, and does homage to the emperor for that part of his territory which lies in the circle of the Upper Rhine. He was always considered as an ally of the Swiss, by his union with the Catholic cantons, first formed in 1579, and renewed at different intervals, particularly in 1671 and 1697; and, by being included in the treaty which those cantons contracted with France in 1715. But as he was not comprised among the allies of the Swiss, in the league between the thirteen cantons and Louis the Sixteenth i 1777, he can at present scarcely be deemed a member of the Helvetic confederacy.

The first particular alliance with France was concluded in 1739, between the bishop and Louis the Fifteenth, and was renewed in 1780. By virtue of this treaty the bishop has troops in the French service; and his subjects enjoy all the privileges which are

granted to the natives of the thirteen cantons.

In case of a rupture between France and the empire, he is bound to remain neuter. But this neutrality did not in 1675 prevent the French troops from being quartered in his dominions, as forming part of the empire; and they were only removed at the intercession of the Catholic cantons. If a misunderstanding should arise between France and the emperor, the bishop's situation would be extremely embarrassing; as his doubtful connection with the Swiss would scarcely preserve his territory from being invaded by

one of those two powers.

The form of government is limited sovereignty: the bishop being bound, on all important occasions to consult his chapter; and his prerogative being confined by the great immunities enjoyed by his subjects in general, and particularly by those of the reformed communion. He nominates to all employments, both civil and military, and appoints the bailiffs or governors; criminal justice is administered in his name, and he has the power of pardoning. In civil proceedings, he receives an appeal from the inferior courts; but in his German dominions, when the cause exceeds the value of a stipulated sum, it may be carried to the chambers of Wetzlar or Vienna.

The subjects of the bishop are partly Protestants and partly Catholics. The Protestants, of whom a more particular account will be given, inhabit the greater part of the valley of Munster, and the whole district of the south of Pierre Pertuis, and are about

15,000; the Catholics amount to 35,000.

The French and German languages being both spoken in the bishop's dominions, several places have two names, that scarcely resemble each other; namely, Munster and Moitier, Dachfield and Tavannes, Delmont and Delsberg, Corrandellin and Rennen-

dorf, Elay and Seehof.

Porentru, capital of the bishop's dominions, and his principal residence is situated in the bailliage of Elsgau, about three miles from the frontiers of France. It is a small but neat town; and its position, in an oval plain, surrounded by well-wooded hills, and watered by a serpentine rivulet, is exceedingly pleasant. The episcopal palace, which has been lately repaired and augmented, stands on an eminence overlooking the town, and the environs fertile in corn and pasture. One of the towers, built of stone, and said to be of Roman workmanship, still remains a monument of its antiquity.

The highways, which lead from all quarters to Porentru, and have been formed at a considerable expence, do honour to the sovereigns of this country. The road to Bellelay and Bienne is a magnificent causeway; is carried upon hanging terraces; through "twilight groves," and along continued ascents and declivities. I passed it by moonlight; and the reflection of the rays quivering through the thick foliage was inconceiva-

bly beautiful.

Bellelay, which I visited in my journey from Bienne to Porentru, is a rich abbey of Benedictines, about twenty miles from the capital, in a solitary but not unpleasant situation, surrounded by mountains, and sheltered by forests. This abbey is not merely confined to religious purposes; the late abbot, Nicholas de Luce, having instituted a military academy for the young nobility and gentry. For this purpose he erected a large building near the abbey, and provided suitable masters and professors. When I was there, the number of scholars amounted to forty. They are instructed in various branches of polite literature; they wear uniforms; and are trained to military manœuvres and exercises. The cheapness of this school, and its distance from the dissipation of large towns, render it of great public utility. The whole expence of each scholar for his board, lodging, instruction, and various lessons, scarcely exceeds £20 per annum. It is curious to find a military academy established in the midst of rocks and forests, and within the walls of a convent; and to observe Benedictine friars, instead of wasting their time in monkish ignorance, rendering themselves beneficial to society.

The chapter, composed of eighteen canons, who, upon a vacancy in the see, possess the right of electing the bishop, was fixed at Friburgh in Brisgau from the period of the reformation, which drove them from Basle, to 1677, when Friburgh was occupied by the French troops. In the following year the chapter was transferred to Arlesheim, where it now resides. The vacant canonries are filled alternately by the pope and chap-

On the 14th of August 1786, I made, in company with several friends, an excursion to Arlesheim, which is a small but pleasant place, almost four miles from Basle. We had the honour of dining with the baron de Ligertz, one of the canons. After a repast, no less elegant than agreeable, our host politely accompanied us to a garden styled The Hermitage, about a quarter of a mile from Arlesheim; which was laid out at the joint expence of the baron and of Madame d'Andlau, the bailiff's lady, with a view to employ the poor in a time of great scarcity, and to provide walks for the inhabitants of the town; the grounds are very extensive and pleasant. The walks are carried along the sides of the rocks, which are richly wooded, and through a delightful semicircular plain; bounded by fertile hills, and watered by a small lake, the borders of which are peculiarly wild and picturesque. Several caverns, hollowed and arched by the hand of nature, add to the romantic singularity of the scenery; while many transparent streams, conveyed from a considerable distance, fall in small cascades, or bubble from the ground like real springs. A fastidious observer might perhaps remark of this enchanting spot, that in a few circumstances nature has been too much sacrificed to art; and that there are some buildings less calculated to please than to surprise.

An elegant inscription for this charming hermitage was extemporarily composed by

professor Oberlin of Strasburgh, one of our party.

through ry in the of SwitWe quitted Basle early in the morning, and passed through a fertile plain watered by the Birs, and bounded by two chains of the Jura; one whereof terminates abruptly, supporting on its summit the castle of Wertenburgh. As we continued our route, the plain gradually narrowed, the mountains approached each other, and we entered the rich valley of Lauffen, enclosed between the rocks, sprinkled with groves of oak and beech, and exhibiting many romantic points of view. Lauffen, which gives name to the valley, has its own magistrates, and inferior courts of justice. The natives are industrious: those who are not employed in agriculture gain a comfortable livelihood from making cloth, spinning yarn, and knitting worsted stockings. The inhabitants of the valley talk German, and those of Sautier, a small neighbouring village, French; which language is spoken through the valles of Delmont, Munster, and St. Imier.

About three leagues from Lauffen we came to a narrow pass, entered the valley of Delmont, near Sautier; quitted the high road, and gently ascended to Delmont, which stands pleasantly on an acclivity, backed by a ridge of rocks embrowned with

In this small town reside the provost and canons, who compose the chapter formerly established at Munster; which was removed here, in 1630, on the introduction of the reformed religion into the valley of Munster. At the extremity of the town is the episcopal palace, built, in 1718, by Conrad Baron of Reinach, and bishop of Basle: it commands a fine view of the adjacent country. The bailiff, who holds his court in this town, has jurisdiction over the vallies of Delmont and Munster. In criminal proseedings he arrests and examines, and can inflict small penalties for trifling misdemeanors; but in all cases of notoriety, the delinquent is either tried at Porentru, or the bailiff's sentence must be confirmed or amended in that supreme tribunal. Civil causes are first adjudged in the provincial courts; from whose decision an appeal lies to the episcopal tribunal at Porentru, and from thence to the imperial chambers of Wetzlar or Vienna. Delmont contains eight hundred inhabitants, who are all Catholics: they have their own magistrates and inferior tribunals.

About a mile from Delmont I stopped at Corrandelin, a small village in the Catholic district of the valley of Munster, in order to examine an iron foundery belonging to the bishop. The ore is drawn from the valley of Delmont, near the villages of Corou, Wick, Recolens, and Sepres; it is taken from the ground in small pieces, seldom larger than a pea. The director informed me, that it is usually found in that state, and very rarely in masses. The largest mass he ever remembered to have seen was ten feet long, two thick, and two broad. He added that the mountains in the neighbourhood abound with ore, which would yield considerable quantities of iron, if sufficient charcoal could be procured for the furnaces. As he was but lately appointed director, he could not give any accurate intelligence concerning the annual quantity of iron smelted in this foundery; but informed me, in general, that the different ores yielded altogether two thirds of pure mineral, the quality whereof was extremely fine, and scarcely inferior to the best sort exported from Sweden

Corrandelin, together with the villages of Chatillon, Rossemaison, Vellerat, Courchappois, Corbaon, Mervellier, and Elay, though connected, in regard to ecclesiastical affairs, with the valley of Delmont, form that part of the valley of Munster, which is called the Catholic, or lower district. It is denominated the Catholic district, because the inhabitants are exclusively of the Romish church; and lower district, because it is situated unter den felsen, or below the ridge of rocks which separate it from the upper, or protestant district. Before I proceed further, it will be necessary to describe the general divisions of this valley, and the civil and religious immunities of the

natives, that you may be enabled to comprehend its complicated topography and curious political state, by which, though subject to the bishop of Basle, it is under the

protection of the canton of Bern.

The valley of Munster, or Moitier, extends from the valley of Delmont to Pierre Pertuis; and is included in that part of the bishop's dominions which lie within the German empire. But, as the inhabitants have, for above three hundred years, been under the protection of Bern, the valley is considered by many authors as forming part of Switzerland. It is divided into two principal districts; the Catholic or lower district, which lies at the extremity of the valley of Delmont, and comprises the eight villages above-mentioned; the protestant or upper district, which stretches from the chain of rocks near Corrandelin, to Pierre Pertuis, its southern boundary; and containing, 1, the greater valley, or valley of Tavannes; and 2, the lesser valley, which is subdivided into Grand-Val, or the great valley, and the little valley, or the valley of Sornetan.

The inhabitants of both districts are comburghers with the canton of Bern. The first treaty of comburghership was contracted in 1484. In that year, Bern and the bishop of Basle respectively supporting two candidates for the provostship of Munster, the former took possession of the whole valley, and exacted homage from the inhabitants. These disputes being compromised at the treaty of Corrandelin, Bern restored the valley to the bishop on the following conditions: that the inhabitants should be maintained in all their privileges; continue as comburghers with Bern, under the protection of that republic; remain neuter in case of a war between Bern and the bishop; and follow the standard of Bern, when engaged in hostilities against any other power. This treaty of comberghership, renewed at different intervals, has excited frequent disputes between Bern and the bishop, and particularly in 1705 and 1711 occasioned an open rupture. These disputes were finally adjusted at the pacification of Arau; when the bishop ratified the treaty of comburghership, confirmed all the rights and immunities

of the inhabitants, and consented to the mediation and interference of Bern.

The affairs of religion excited for some time no less contest between the bishop and Bern, than the treaty of comburghership. The reformation being adopted, in 1531. by a considerable number of the inhabitants in the valley of Munster, civil commotions ensued; Bern interfered in behalf of the protestants, and the bishop protected the ancient church establishment. It was at length amicably settled between both parties; that the majority of each parish should freely decide, whether the inhabitants should profess the Roman Catholic or the reformed religion; and that the chapter of Munster should continue to receive the tythes, on condition of discharging the salaries of the protestant ministers. In consequence of this rational compromise, the eight villages, which now form the lower district, voted for the maintenance of the Catholic religion; and the parishes of the upper district for the reformed church. Accordingly the two persuasions were respectively established in these two districts; the chapter retained its estates and tythes, and quitting Munster, where the new doctrines were admitted, retired first to Soleure, and afterwards settled at Delmont: but, as several protestants and Catholics continued promiscuously to inhabit the two districts, disturbances were occasionally renewed. Nor were the religious differences entirely composed till the peace of Arau; which enjoined, that all the members of the two persuasions should be finally separated; that all the inhabitants of the upper district, who then professed or should hereafter profess the Catholic religion, should retire to Elay; and that, in the same manner, the protestants in the lower district should remove to the upper district. Since this period, the most perfect harmony has subsisted between them.

By virtue of the alliance with Bern, that republic annually deputes one of its magistrates and an ecclesiastic to this valley. The magistrate inquires if the civil and religious immunities have been preserved inviolate; the ecclesiastic who is called inspector of the churches in the valley of Munster, examines into the state of the church discipline, and distributes among the inhabitants of the Upper district catechisms and psalters. Bern also approves the nomination of the ministers to the vacant benefices, some of whom are appointed and paid by the bishop, others by the chapters of Delmont and Bellelay;

as the bishop or chapters possess the tythes in the respective parishes.

Soon after quitting Corrandelin, I entered the Protestant district through a pass between two rocks, which nearly approach each other, and just leave an opening sufficient for the river Birs and the road, and continued along a narrow glen, about four miles in length. The road winds above the impetuous Birs, and at the bottom of rocks of white limestone, of inaccessible height, and though in most places absolutely perpendicular, yet agreeably feathered with trees, particularly towards their summits, which overhang, and scarcely admit the light of the sun. In the midst of this glen is La Roche, the first Protestant village in the valley of Munster; the houses stand on both sides of the Birs, where the rocks recede a little, and present a gentle slope.

On issuing from this glen, we entered a fertile plain encircled by hills, in the midst of which is situated the village of Munster or Moitier; it takes that appellation from the chapter of canons, who, upon the reformation, quitted this place of their resi-

dence, and settled at Delmont.

VOL. V.

About half a mile from Munster we came into another glen, near three miles in length: it is called Chaluet, of a similar nature with that which we traversed between Corrandelin and the plain of Munster, but still wilder and more eraggy, deeper, and more obscure. It is also divided by the Birs, which rushes through it with great impetuosity; and is so narrow, that the road occupies the whole space between the torrent and the mountain, and the wheels of our carriage frequently on one side brushed the rock, and on the other ran close to the precipice which overhangs the river. This causeway, over broken crass and steep precipices, does honour to the prince who carried it into execution. An inscription, which I observed near a bridge in the midst of this obscure glen, may perhaps seem exaggerated to a person unacquainted with the natural impediments of the country; but to me on the spot appeared strictly consonant to truth:

> Josephus Gulielmus Ex Rinchnis de Baldenstein Basiliensium Episcopus Princeps Viam Veteribus Inclusam Rupibus et Claustris Montium Ruptis Birsa Pontibus Strata Opere Romanis Digno Aperuit. Anno. D. M.DCC.LII.

Although in various parts of Switzerland I had frequently observed the justness of the remark, that in all deep vallies which intersect the mountains, the salient angles on one side alternately correspond with the cavities on the other; and that parallel strata of rock answer to each other, in all directions and at all heights; yet I never saw this fact more strongly exemplified than in the two ridges of lime-stone bordering this glen. They are of a stupendous height; and the strata horizontal, inclined, or almost perpendicular on one side, are exactly similar and of the same thickness on the other: a circumstance which, joined to the corresponding situation of the angles, seems to prove, that they were formerly united, and either rent asunder by a sudden convulsion, or se-

parated by the gradual attrition of the waters.

At the extremity of the Chaluet we entered another plain, well cultivated, and agreeably spotted with villages; and arrived towards the close of the evening at Molleray, where we passed the night. The people appear happy and contented, and are extremely industrious. The greater part are employed in agriculture; a few, encouraged by their neighbours of Locle and Chaux de Fond have lately introduced several trades into these mountains; and Bélleval, a small neighbouring village, already contains five watchmakers.

From Molleray we continued along a fertile plain by the side of the Birs; through several pleasant and well looking villages, of which Tavannes, in German Daehfeld, is the largest. In about two miles we arrived at the extremity of the plain, which is closed by a rock, through which opens the celebrated pass called Pierre Pertuis. At the bottom of this rock, the Birs bursts from the ground in several copious springs, and

turns two mills within a few paces of its principal source.

Pierre Pertuis is a large arched aperture through a solid rock, about thirty feet long, forty-five broad, and thirty high in the lowest part, which some aver to have been formed by nature, others by art. A Roman inscription over the arch, extremely defaced, has given sufficient employment to the ingenuity of antiquaries. Having seen several fac-similes, greatly differing from each other, I copied it as exactly as the height would permit.

of this inscription many solutions have been attempted; but the most probable are the two following:

Numini Augustorum via facta per Titum dunnium Paternum II virum Colon Helvet. Others read, per montem durvum Paternus.

Both these solutions imply, that a road was formed through the mountains by Paternus, a duumvir, during the reigns of Marcus Aurelius and Venus. From the latter explanation, per montem durvum, some antiquarians have endeavoured to prove, that he cut through the rock; and consequently, that the arch is the work of art, not of nature: while others maintain, that it by no means follows, even from this reading, that the rock was pierced by order of Paternus: but merely that the road was carried through the rock.* On examining the inscription with attention, the words which antiquarians have supplied, to support their particular systems, are extremely doubtful; and to me, who observed the arch without partiality to an hypothesis, it appeared to have been originally a great cavern, either totally formed by nature, or, if assisted

by art, that only a small part of its southern extremity was opened by the labour of man. The southern extremity of Pierre Pertuis leads into the valley of St. Imier, sometimes called Enguel, which comprises the bishop's dominions lying in Switzerland. The inhabitants are Protestants, and governed by a bailiff appointed by the bishop. He resides at Courtelari; but his authority is exceedingly limited by the various privileges, both civil and religious, possessed by the natives. Their religious immunities, confirmed by the bishop, are guaranteed by the four reformed cantons. The whole district lies within the Jura mountains, and is fertile in pasture: the inhabitants are industrious.

On arriving at the extremity of mount Jura, a sudden prospect burst upon our view, commanding the undulating country fertilized by the Aar, backed by that majestic chain of Alps which extends beyond the frontiers of Savoy. Descending gently into the plain with this glorious prospect before us, and which was heightened by the luminous splendour of the mid-day sun, we crossed the Sure, and finished our delightful ex-

pedition at Bienne.

From Pierre Pertuis to Bienne, a superb causeway is carried along a continual descent for six miles; it winds through thick forests, and overhangs the deep abyss, in which the Sure, a turbid and impetuous torrent, precipitates its course, always roaring, and frequently unseen, in its rocky channel.*

* The whole bishopric of Basle is now annexed to France. In 1792 their troops overran the country of Porentru, or the German part, under the pretence of delivering the natives from slavery, and took possession of the famous pass of Pierre Pertuis. This district was ceded to France by the treaty of Campo Formio, and is formed into the department of Mont Terrible.

In December 1798 the Helvetic part of the territory was entered by the French general St. Cyr; he took possession of it in the name of the republic, declaring that France succeeded to the property,

dominions, rights, and prerogatives of the bishop.

This district was also annexed to the department of Mont Terrible; and the proclamation of Mengaud to the unoffending natives, which subjected their country to the dominion of France, is a combi-

nation of arrogance, insult, and mockery. "Peace and safety to all his friends! Mengaud, commissary of the executive directory, to the inhabitants of all the countries not yet occupied by the French republic, dependencies upon the old bishopric of Basle, on the left bank of the Rhine,

"The re-union of a part of the old principality of Porentruy, equally decided the incorporation of

your country with the French republic.

"This proceeding of France is that of a free people, substituted to the rights of a government against Nature, which overwhelms you. And because the exercise of those rights, become ours, did not sooner take place, by purging them of all that is incompatible with the dignity of man, it does not follow, that we have forgotten that you are still in chains. We come to break them.

"Happier than your fathers, whose blood flowed in the wars which founded the different species of government in Switzerland, and which have only bequeathed you a burthensome and degrading existence, you are at length going to enjoy the blessings of Providence, who only created men to make

them members of one and the same family.

"You knew nothing but tithes, corvees, &c.; you had only priests, nobles, and privileged persons: your commerce, your industry, your arts, in short your very subsistence, all bore the stamp of the sacerdotal despotism so dexterously combined with a no less odious tyranny. Now you are men: liberty and equality will no longer permit among you any other distinction than that of merit, talents, and virtue. Called all indiscriminately to the helm of the society, in the support and safety of which you are all equally interested, your subsistence will in future be secure, the granaries of the French republic being the property of all its children. Your trade, encouraged within, protected without, will no longer be shackled. Industry, the arts, agriculture, will receive encouragements to be expected only from a nation victorious, free, powerful, and generous, enlightened on the nature of rights, and on the manner of exercising them.

"Learn to appreciate these advantages, and merit them by turning a deaf car to the interested and treacherous insinuations of the evil-minded, and fools, who endeavour to appreciate them, and to mis-

LETTER XIX.

The Town of Bienne.

THE small territory of Bienne, containing scarcely six thousand inhabitants, lies between the lake and a chain of the Jura mountains; it is surrounded by the cantons of Bern and Soleure, the bishopric of Basle, and the principality of Neuchatel. The town is situated at the foot of the Jura, and at a little distance from the lake; which is here about nine miles in length, and four in breadth: the borders are pleasing and picturesque; and the town of Nidau forms a very beautiful object upon its eastern side.

The bishop of Basle is the sovereign of this little state: his power, formerly considerable, is at present exceedingly limited. Indeed the constitution of Bienne is of so very peculiar a nature, that I know not well by what name it can be distinguished: it eannot properly be called either a limited monarchy, or an independent republic; but seems rather to be a mixed government, partaking somewhat of both.

The bishop of Basle receives, upon his promotion to the see, the homage of the citizens and militia of this town, with all the apparent ceremonials of the most absolute submission; but at the same time he confirms, in the strongest manner, all their privileges and franchises. He is represented by a mayor of his own appointing, whose power and office consist in convoking, and presiding in, the little council, as the chief court of justice; in collecting the suffrages, and declaring the sentence; but without giving any vote himself. And, although justice is carried on, and executed, in the name of the bishop, yet neither that prince nor the mayor has the prerogative of pardoning criminals, or of mitigating the sentence. All causes, civil as well as criminal, are brought before this council in the first instance; and, in more important proceedings, an appeal lies to the sovereign council: in both cases, each party chooses a member of the council to act as his advocate; which office he is obliged to discharge without fee or recompence.

The sovereign's revenue amounts only to about £300 a year; but mean as his civil list is, it is still more considerable than his power; for he does not possess the least share of the administration. The legislative authority resides in the great and little councils combined: the former consists of forty members, and the latter, in which the executive power is vested, is composed of twenty-four; the members of each must be married men. Both these councils elect their respective members; so far the constitution is entirely aristocratical. The burgomaster or chief of the regency, is chosen by the two councils, and presides at their meetings; he continues in office during life; but he, as well as the several magistrates, must be confirmed annually by the two councils. The salaries annexed to these posts are exceedingly moderate, and indeed the general expences of government are so very small, that, in proportion to them, its revenues may well be considered as abundantly ample.

It appears, therefore, that this Protestant republic, notwithstanding the sovereignty of its Catholic bishop, enjoys in the fullest extent the power of imposing taxes, contract.

[&]quot;We come among you as friends. We are your brothers. Do not be afraid of any ill treatment. Persons and property shall be protected, as much as the enemies of liberty shall be oppressed. The most exact and strict discipline shall be observed by the warriors, who never had, nor ever will have, any other enemies than those of liberty. Such are the orders of the Executive Directory.

[&]quot; MENGAUD, Commissioner of the Executive Directory."

ing alliances, declaring war and peace; and, in short, of exercising every other act of absolute and independent legislation. This singular constitution is guaranteed by Bern, Friburgh, and Soleure, with whom the town is closely allied; in consequence of which, it becomes a member of the Helvetic confederacy. This alliance between those cantons and the town of Bienne, is of a superior nature to that of the same cantons with the bishop of Basle: for the town enjoys the right of sending deputies to every general diet, ordinary and extraordinary; whereas the bishop does not possess the same privilege.

The language of the country is a provincial German; but, as the territory borders apon the principality of Neufchatel, the inhabitants speak also a corrupted French. They are a very active and industrious people; several manufactures are established in

the town, which, considering its size, carries on a tolerable trade.

I have often had occasion to observe, that the middling class of people in Switzerland are far more intelligent than those of the same rank in any other country. Accordingly, I invited last night my landlord of the Crown inn to sup with me; and found him by no means disposed to be a silent guest. He gave me a long account of the late ceremony, when the citizens did homage to their new bishop. I was pleased to hear him expatiate, with all the enthusiasm of national pride, upon the beauty and grandeur of the scene; the magnificence of the procession; the number of spectators, as well strangers as natives, who were assembled; together with the entertainments and balls that were given upon that occasion. By the lofty terms in which he spoke of this procession, you would have imagined, at least, that he had been describing the coronation of the emperor of Germany, or the king of France; and, in truth, to an inhabitant of Bienne, whose government is administered without the least degree of external pomp, and where luxury has as yet made but little progress, the ceremony must have appeared a very striking spectacle. My host's narrative recalled to my remembrance the accounts of those ancient feudal sovereignties; when the great vassals of the crown did homage to their liege lord; and, while in terms they promised him unlimited obedience, maintained in fact, every essential of independence.

I have been amusing myself in some pleasant walks, that lie by the side of the lake, which is here prettily skirted with country houses. In my way I passed over a plain between the town and the lake, which the sovereign council, by a kind of agrarian law that does honour to the legislature, lately allotted, in distinct portions, to each burgher, for his own particular use; and it is entirely laid out in little kitchen-gardens. The general government, indeed, of this miniature state, is well administered. It has lately adopted the liberal policy of conferring the burghership at an easy rate: a wise regulation, which cannot fail of increasing the population of the town, and extending its com-

merce.

I know your sentiments much too well, my dear sir, to apologise for calling your attention in the present instance, as in some others, to these diminutive commonwealths. The various modifications of government, into which civil society is divided, is a speculation that will always afford matter both of entertainment and reflection, to a philosophic mind; and I am persuaded, that you consider the meanest spot of this globe consecrated by liberty, to be an object worthy, not only of your curiosity, but your veneration.* I am, &c.

^{*}Bienne, which forms an important pass into the Swiss territories, was occupied by the French on the 8th of February 1798, and annexed to France as subject to the bishop of Basle, whose rights they

LETTER XX.

The Town and Canton of Soleure....Detail of the Government....Ancient and New Burghers....Assembly of the Rosengarten.

THE direct road from Basle to Soleure lies through the midst of the Jura mountains, along the romantic vale of Balstal, which is remarkable for its fertility. The road from Bienne to Soleure traverses a well-cultivated valley, watered by the Aar, at the foot of a piked ridge, which forms a branch of mount Jura; its sides, from the bottom to the summit, are so embrowned with overhanging forests of pine and fir, as to exhibit only occasional intervals of naked rock, beds of torrents, and a few solitary specks of pasture, and are so wild and steep as, within the extent of five leagues, scarcely to display the appearance of a single house, or a trace of the slightest foot-way. Near Soleure this chain of the Jura, called Weissenstein, abruptly diminishes in height, becomes gradually sloping, and is chequered to the summit with fields of corn and pasture.

assumed in consequence of having seized his territories. It is difficult to decide whether the French accounts of the seizure of this little republic, are more burlesque or insulting:

"20 Fluriose....The day before yesterday, at half past four in the afternoon, the French republicans under the command of general Nouvion arrived at the gates of Bienne, and were met by the two councils, who poured forth their vows for the re-union to the great nation. After a short interview, the republicans entered the town, drums beating and colours flying; and on their arrival at the town-house, the general read the proclamation, in the name of the French republic, which produced a surprising effect. Those who were seduced by the oligarchy of Bern were struck motionless with astonishment; but, on recovering their senses, they could not help declaring that Wisdom herself had dictated the proclamation. During a space of four hundred years no troops had been seen in the town of Bienne; the impression, therefore, was deeply felt. How glorious is the triumph of virtue and friendship!

"The brave general Nouvion has already gained all hearts. His mildness, wisdom, and republican virtue, will make a deeper impression on the Helvetic people than the terrible and always victorious bayonet. I rejoice to hear him exclaim, "Without morals, without virtue, there is no true happiness!" for, as Racine observes,

"La gloire des mechants en un moment s'eteint."

"Citlzen Bresson constituted mayor of Bienne by the French government, has acquired by his mildness and civism the general confidence and love of the inhabitants. He has several times appeared in the council, decorated with the national scarf. To him we owe the happy disposition of the people. To-morrow we shall solemnly plant the tree of liberty Long live the Republic!"

The account of this ceremony is thus detailed in another letter:

4 Announce to the French republic the solenin ceremony of planting the tree of liberty, which took

place at eleven in the morning.

"The republican phalanxes, led by general Nouvion, assembled in the square before the townhouse, and were met by the French mayor and the magistracy. Instantly the tri-colour flag waved on the town-house, and warlike music struck up. Several energetic harangues, by the general, the mayor, and many citizens both of Bienne and France, made the deepest impression. Every sentence breathed the purest civism and the mildest phitanthropy, Patriotic songs were then sung, a grand dinner was given by the general, and toasts drank to the immortality of the great nation, and to the wished-for union of the republic of Bienne to the first republic of the world. The festival was terminated by a ball, which continued the whole night, and every thing was conducted with the greatest decorum, and the most pleasing fraterinty prevailed. The general was present for a short time, and his heart was penetrated with the view of this delightful picture; all feeling souls experienced the most exquisite sensations. The joy of the people was announced by a brilliant illumination, allegorical devices and patriotic songs. Beautiful young women appeared at the ball decorated with tricolour ribbands and sashes. What a noble triumph for the French republic is that made by friendship and sweet fraternity!"

Soleure is pleasantly situated upon the Aar, which here expands its banks and opens into a fine and broad river. I will not exert the privilege of a traveller, and tell you, what some extravagant antiquaries do not scruple to assert, that it was built by the patriarch Abraham; but you will have no difficulty, perhaps, in believing what others maintain, that it was one of the twelve towns which were destroyed upon the emigration of the original inhabitants into Gaul. It appears probable, from a great number of inscriptions, medals, and other antiquities, which have been found in the neighbourhood, that it was re-peopled by a Roman colony; and it certainly was a Roman station, as its ancient appellation, Castrum Salodurense, implies. During that period of barbarism which succeeded the downfall of the Roman empire, it was sacked and destroyed by those northern nations who overran the greatest part of Europe. From the time of its re-establishment, until its admission into the Helvetic confederacy in 1481, its state was similar to that of many other imperial towns, which acquired a gradual accession of territory, and, after various struggles, finally secured independence.

Soleure is a small but extremely neat town, surrounded by regular stone fortifications, erected in the beginning of the present century; the walls enclose scarcely more than fifty square acres, and, including the suburbs, contain about four thousand souls. Among the most remarkable objects of curiosity in the town is the new church, which was begun in 1762, and finished in 1772; it is a noble edifice, of whitish gray stone. drawn from the neighbouring quarries, which is a species of rude marble, and receives a good polish. The lower part of the building is of the Corinthian, the upper of the composite order: the facade, which consists of a portico, surmounted by an elegant tower, presents itself finely at the extremity of the principal street. Pizoni was the architect, and the expense amounted to at least £90,000; a considerable sum for so small a republic, whose revenues scarcely surpass £12,000 per annum. The interior is simple yet elegant, and decorated with a few modern paintings of inconsiderable merit, of which the most esteemed is the last supper, by Corvi, a Roman artist. A picture by Rubens and his scholars, in the church of the Cordeliers, and one by La Suer, in that of the Capuchins, deserve perhaps to be noticed by the traveller who is fond of The town-house is not in itself worthy of observation, but is mentioned only as being the place of meeting for the great council and senate.

The public prison newly constructed, is a solid edifice of stone, and well adapted to the purpose of the building; the prisoners being confined in separate cells. Although the penal laws are severe in theory, yet the judicial sentences in criminal affairs are so remarkably mild, that a prisoner, on his acquital, wrote the following inscription on the wall of his cell: "he who is inclined to rob, and escape hanging, let him rob in the

eanton of Soleure."

The public library deserves to be mentioned, not for the number or rarity of the volumes, but for the literary zeal of the abbe Herman, canon of the cathedral, to whom it owes its origin. On my first visit to this town, in 1776, there was no public collection of books; but a few years ago, that ingenious ecclesiastic amassed about four hundred volumes, obtained from government an apartment in the town-house, where he deposited them, and requested to be appointed librarian without a salary. His petition being granted, he continued to augment his little collection; and from this small beginning has increased it already to eleven thousand books, among which are above a hundred-and-fifty printed in the fifteenth century. At the two extremities of the room are inscribed the names of the benefactors to this library; but there is no fund yet established for its support or augmentation.

The abbe has also begun to form a cabinet of medals; which, though at present extremely small, will increase like the library. He pointed out to me a very rare medal,

discovered in digging the foundation for the new cathedral; it is in bronze, of the middle size; on one side is the head of Septimius Severus, with the inscription, L. Septimius Severus Pius Aug. P. M. Tr. P. xviii. Cos. iii. P. P. On the reverse, a figure sitting, before it a prow of a ship, and a genius or little boy. Great merit is due to the abbe for laying the foundation of this library, in a town where literature is not much encouraged; and his disinterestedness is worthy of notice, as his income does not exceed £160 per annum. This learned ecclesiastic is now employed in writing an account of Soleure at the period of the Reformation, and is collecting ample materials for a complete history of the canton.

With respect to natural history, the only cabinet in the town is that formed by senator Wallier: it is a small collection, but well chosen, and particularly interesting to the naturalist who travels into these parts, because the ingenious collector has chiefly con-

fined himself to the minerals and petrifactions of the canton.

The circumjacent country is exceedingly pleasing and diversified, and exhibits several points of view which are as agreeable as wild, and as beautiful as romantic. Among these we were particularly struck with the situation of the hermitage called des Croix, about half a mile from the town, near the stone quarry: it stands in a recess between two ridges of perpendicular rocks, watered by a lively stream; one extremity is closed by a small wood, and the other opens into fertile grounds backed by the dark Jura. Among the villas, in the environs, remarkable for their position, may be mentioned. Ricaberg, built by M. de Vigur; it stands at the bottom of a gentle hill, declining towards the winding Aar, and commands a view of Soleure, half hid by the intervening trees, and Bleikenberg, belonging to major de Roll, situated amid waving grounds divided into enclosures, similar to the fertile counties of England, the Jura rising like the highlands of Scotland, and at a distance the sublime Alps, which characterise this romantic country.

The canton of Soleure, which holds the eleventh rank in the Helvetic confederacy, stretches partly through the plain, and partly along the chains of the Jura, and contains about fifty thousand souls, including the inhabitants of the capital. The soil for the most part, is fertile in corn, and those districts which lie within the Jura, abound in excellent pastures. The trade both of the town and canton, is of little value, although the situation is commodious for an extensive commerce. It is divided into eleven districts or bailliages, called interior and exterior; the former are governed by bailiffs, who are senators, and remain in the towns: the latter, by bailiffs, drawn from the members of the

great council, who reside in their bailliages.

The following is a list of the bailliages, with their average annual value; the four first are interior, the remainder exterior.

Buckegberg			£166	Beckburgh			£750
Kriegstetten	-	-	146	Goesgen	-	-	500
Laeberen, or				Onen	-	-	333

Flamenthal	-	-	62	Tierstein	-	-	417
Falkenstein	-	-	546	Gilgenberg	-	-	375

The inhabitants of the canton are Catholics, excepting those in the bailliage of Buckegberg, who profess the reformed religion. In spiritual affairs the Catholics depend on three bishops: the greater part of the capital, the bailliages of Laeberen and Flamenthal, are in the diocese of the bishop of Lausanne, resident at Friburgh; the remainder of the capital, the bailliage of Kriegstetten, and the villages in the bailliage of

of Buckdepend on and Flah; the repailliage of Olten, in that of the bishop of Constance; while the other bailliages, and the town of Olten, depend on the bishop of Basle. But neither of these bishops can issue any ordinance, or even visit their dioceses, without the approbation of the senate. There are two chapters in this canton; one at Soleure, founded in 930 by queen Bertha, widow of Rhodolph II, king of Burgundy, composed of a provost, whose salary amounts to 360l. per annum, and of eleven canons, each of whom enjoys a revenue of 160l. The provost is chosen by the senate, and the canons are appointed alternately by the pope and senate. The other chapter, of Schænenwerth, founded by the ancient counts of Falkenstein, consists of a provost and five canons, nominated by the senate; the annual salary of the provost is 125l. and of each canon 100l. There are also an abbey of Benedictines, four convents, and three numeries; the revenues of which amount to 2,250l.

The principal charitable instances are, an hospital at Soleure, and another at Olten, for the reception of burghers, subjects, and foreigners; the foundation of Thurigan, for old persons of both sexes, belonging to the burghership; a foundling hospital for orphans, and for children of poor burghers; and the hospital of St. Catharine, for the

insanc and incurables.

The only persons in the canton of Soleure, who profess the reformed religion, are those who inhabit the bailliage of Buckegberg. In ecclesiastical affairs, the inhabitants though subject to Solcure, are under the protection of Bern. Formerly this complication of political and religious interests created frequent misunderstandings between the two cantons, but matters were amicably and finally adjusted, on the 18th of November 1681, at the treaty of Winengen. The inhabitants take the oath of fidelity, every third year, to the government of Soleure; but if aggrieved in their religious establishment, can have recourse to Bern. The senate of Bern nominates to the vacant benefices, but the priests are under the necessity of obtaining the confirmation of the chapter of Soleure. A deputy from Bern presents the new minister to his parishioners; but the bailiff is obliged to be present at this ceremony, as deputy from the republic of Soleure. Bern enjoys also supreme jurisdiction in criminal affairs. If a criminal is arrested for any capital offence, he is tried by the bailiff of Buckegberg, and the jury of the bailliage; and if condemned to death, he his delivered for execution to Bern, provided that republic defrays the expence of the trial. Soleure enjoys all the other rights of sovereignty; such as the power of levying taxes, appeals in the last resort: and even decides all matrimonial and ecclesiastical concerns, with this proviso, that the decision shall be regulated according to the articles of the treaty of Winengen. Among the natives in the canton, several inhabiting the bailliages of Thierstein and Gildenberg were serfs; but, in 1785, their servitude, so contrary to the principles of that equal liberty which pervades this country, was to the honour of the present government, abolished.

The canton furnishes France with two companies for the Swiss guards, and several companies in the different marching regiments, according to the capitulation concluded between the king of France and the Catholic cantons, in 1764, for the term of twenty-five years. It has also a regiment in the Spanish service; of which the colonel and

companies of fusileers can only be taken from the ancient burghers.

With respect to the militia, all the males from the age of fifteen to sixty, are formed into six regiments, consisting of about 8000 men, exclusive of 240 dragoons, and the corps of artillery, amounting to 600. The colonel of each regiment is always a senator, and the major a member of the great council, who is usually an officer retired from foreign service; the captains are either members of the great council, or ancient VOL. V.

burghers; the first lieutenants are generally ancient burghers, while the rank of second

lieutenants and ensigns is usually filled by the principal peasants.

The militia are assembled and reviewed in May and September, and in the spring and autumn exercised in the respective villages by the under-lieutenants and ensigns. According to a plan of defence, regulated in 16.3, between the members of the Helvetic confederacy, the canton of Soleure is bound to furnish 600 for its first contingent; for this supply, 100 men, together with officers, are annually selected from each of the six regiments, who are to hold themselves in readiness to march at a moment's warning. In case of necessity, this contingent may be doubled or tripled in the same manner. The burghers are incorporated in the company of fusileers, and exercise themselves on Sunday's and saints' days, after divine service, by shooting at marks: government furnishes powder and ball, and distributes prizes to the best marksmen. The remaining inhabitants of the capital and environs, who are not burghers, form a separate body, commanded by the captain of the town; they are also occasionally exercised, and mount guard on the day of St. John the Baptist, when the Rosengarten, or the general meeting of the burghers, is assembled.

The sovereign power resides in the great council, which consists of a hundred and two members, chosen by the senate, in equal proportions, from the eleven tribes or companies, into which the ancient burghers are distributed; and in all instances, the new

member is taken from the company to which the last member belonged.

The prerogatives of the great council are, to enact and abrogate laws; to explain obscure parts of the constitution, and make alterations in the form of government; to levy taxes, declare war and conclude peace: to contract alliances, receive appeals in criminal causes from the burghers of the capital, and in civil processes, above the sum of 100 Swiss livres, or 6l. 3s. to confer the new burghership; elect the treasurer, or fourth chief of the republic, from the ancient eleven senators; nominate to the seven exterior bailliages, and to the four Italian governments of Lugano, Locarno, Mendrisio, and Valmaggia, when the appointment belongs to Soleure; choose the deputies for the diet of Frauenfield, and those for extraordinary meetings of the Helvetic confederacy; though in both these cases it is the custom to appoint a senator, and usually one of the four chiefs, the reigning avoyer excepted, who is not permitted to be absent during the year of his administration.

There are generally a few supernumerary members in the great council, which circumstance proceeds from the method of appointing the bailiffs. On the nomination of a bailiff, his seat in the great council being deemed vacant, is on the next day filled up by a member of the same company in which he is inscribed. At the conclusion of his bailliage he again takes his seat, preserving his ancient rank, though considered as a supernumerary, until one of the six members of his tribe makes a vacancy. To be qualified for admission into the great council, the candidate must be twenty years of age, an ancient burgler, and a member of the same tribe in which the vacancy happens; but it inscribed in a company different from that of his father, he must, according to a decree passed in 1764, have been a member of that company during a year.

The great council assembles ordinarily once every month; and extraordinarily, when

convened by the senate.

The setate, or little founcil, a constituent part of the great council, is composed of the two anyers of the republic, who annually alternate; the chancellor or secretary of state, who has no vote; and thirty-three senators drawn from the remaining sixty-six members of the great council, divided into eleven seniors, and twenty-two juniors. From the seniors the two avoyers, the banneret, and treasurer, are always chosen. Upon a vacancy among the eleven, the right of election, though residing in the

juniors, is always exercised according to seniority: the most ancient in rank among the three junior counsellors, of the same tribe to which the late member belonged, is immediately appointed, or rather confirmed, by the juniors. Upon the death or promotion of a junior, his place is immediately filled up by the two avoyers and eleven seniors.

The senate examines and digests all affairs before they are submitted to the great council; is entrusted with the executive power and care of the police; receives all appeals in the first instance from the inferior courts of justicel; gives judgment in all civil processes not exceeding the value of 100 Swiss livres; and possesses supreme and final jurisdiction in criminal causes, except those in which a burgher of the capital is concern-

ed, who may appeal to the great council.

The senate also nominates, either directly or indirectly, to most of the important charges of the republic, and confers the principal ecclesiastical benefices; it assembles regularly three times a week, and is convoked on extraordinary occasions by the reigning avoyer. A senator must be twenty-four years of age, member of the great council, and drawn from the same company to which the last senator belonged.

The salaries of the principal magistrates are:

Government draws its principal revenues, which do not exceed 12,500l. per ann. from the following sources. 1. A tax, called the tax for fortifications, laid on the funds of the tribes and monasteries in the town, and on those of parishes in the bailliages. 2. Tythes, and rentes foncieres belonging to the state. 3. Tolls. 4. Excise on wine. 5. Interest of money placed out in the canton and in foreign countries. 6. Monopoly of salt. 7. Revenues from the bailliages. 8. Subsidy from France; about 1108l. 9. Sundry small sources, such as demesnes, estates, salaries of vacant benefices, &c.

The principal departments of government are, 1. The tribunals; which comprise the inferior courts of justice, and the secret council, consisting of seven members, namely, the two avoyers, the banneret, the treasurer, the first senior senator, the chancellor, and the attorney-general; should any of these persons be absent, their places are supplied by the ancient senators, according to seniority. 2. The boards of war. 3. Of the rights, called droits regaliens. 4. Of finances, agriculture, and public buildings. 5. Of the

police. 6. Of ecclesiastical affairs, charitable institutions, and schools.

The burghers are divided into ancient and new; the ancient are alone capable of being members of the great council, or enjoying any share in the administration of affairs. The origin of this distinction is dated from 1681. Several foreign families, which settled at Soleure and obtained the right of burghership, being admitted into the great council, gave umbrage to those illustrious families whose ancestors had, by their valour and prudence, laid the foundation of the republic. To prevent the farther participation of honours and emoluments, to which they conceived themselves solely entitled, the great council confined the offices of government exclusively to those families, which at that epoch enjoyed the rights of burghership, until they were reduced to the number of twenty-five. It was at the same time enacted, that these families and their descendants should be distinguished by the name of ancient burghers; and that those who

4 y 2

afterwards received the burghership, should be called new burghers; and to enforce these regulations, that any burgher who made any proposition contrary to this law,

should be banished from the canton, and his goods confiscated.

Besides this exclusive privilege, the ancient burghers enjoy the sole right of being appointed canons in the chapters of Soleure and Schænenwerth, and of holding any ecclesiastical benefice in the gift of the senate. But as there is at present a great deficiency of clergymen among the ancient burghers, it will probably soon be thought necessary to dispense with this law, and permit the new burghers, and all subjects of the canton, to be candidates for vacant livings.

About eighty-five families possess the right of ancient burghership; and of these, about thirty-four of the most illustrious supply the members of the great council, and

fill the various departments of government.

The rights of the new burghers consist in nominating and annually confirming the avoyer, the banneret, and grand sautier, or lieutenant of the police; but as they always choose those persons who are selected by the senate, as they exercise this privilege in conjunction with the ancient burghers, and as by the edict of 1681 they must retire from the assembly, should there be any opposition, this right of election is little more than a mere formality. In all other instances, excepting in those concerns which relate to government, the new burghers enjoy the same privilege as the ancient, such as freedom of trade and commerce, the property of houses and land in the capital and its district, and are also entitled to hold ecclesiastical benefices in the gift of the chapters and individuals.

The burghers, both ancient and new, are distributed into eleven tribes or companies, each whereof furnishes three senators and six members of the great council. Every person may choose the company in which he inscribes his name; but he cannot afterwards change it. For the purpose of obtaining a place in the government at an early period, a young noble selects that company in which there is a probability of a vacancy; but should he fix upon one different from that in which his father is incorporated, he must have been received a member during a whole year, before he can be a candidate for admission into the great council.

The general assembly of ancient and new burghers, called Rosengarten, who meet on the day of St. John the Baptist, for the purpose of electing or confirming the charges of avoyer, banneret, and grand sautier, deserves to be described for its singularity, and will convey to you some idea of those annual elections, or rather confirmations, of the prin-

cipal officers, which take place in most of these aristocratical states.

This assembly is held in the church of the Cordeliers, and denominated Rosengarten, or garden of roses; either because a nosegay, which every burgher carries in his hand, was formerly composed of roses, or because this meeting used to be convened in the garden of the Cordeliers, which is said to have been called the garden of roses.

About six in the morning the avoyer out of office, the senators, members of the great council, and the ancient and new burghers, assemble in their respective companies. After the repetition of certain signals, the reigning avoyer, accompanied by the chancellor, the secretary of the finances, and several other officers of state, repair, with drums beating and trumpets sounding, from the town-house to the church of the Cordetiers, where, after presenting his offering upon the altar of the Virgin, he seats himself on a throne near the altar. Soon afterwards the senators and remaining members of the great council appear at the head of their respective tribes; and having presented their offerings, the avoyer out of office places himself near his colleague on the throne. At the conclusion of a mass accompanied with music, all but the burghers retire, and

o enforce this law,

meet on rges of ind will e prin-

garten. hand, in the of the

ompaby the , with e Cors himmbers sented hrone. , and

the doors of the church are closed. The reigning avoyer, with a sceptre in his hand, pronounces an harangue; then delivering up the sceptre and scals, resigns his dignity, and receives the thanks of the assembly, by the mouth of the attorney-general, for his zeal and attention during the year of his government. Next follow, in the same manner, the resignations of the banneret and of the attorney-general; the former of whom is thanked, in the name of the assembly, by the attorney-general, and the latter by the avoyer

who has just resigned.

This ceremony being finished, the two avoyers, bannerets, attorney-general, and ancient senators, retire from the choir to another part of the church; and the chancellor summoning the junior senators into the choir, pronounces the name of each ancient senator, and of the attorney general, and demands whether the junior senators are pleased to confirm them in their charges for another year. This being obtained, the chancellor and junior senators repair to the assembly in the body of the church, where the chancellor recites the names of the senior senators and attorney general confirmed by the juniors. and demands the approbation of the whole assembly of burghers. Upon this the avoyer, who has just resigned, and all the senators, except the avoyer out of office and the banneret, come into the church, and take the usual oaths. The chancellor then acquainting the assembly that they must elect the reigning avoyer; the avoyer who has just resigned proposes his colleague; the officer of state, called the Grand Sautier, cries out, "Let all those who choose to elect the right noble A. B. reigning avoyer, hold up their hands under oath;" and immediately notifying his election, the avoyer enters the church, takes the oath from the chancellor, and administers it to the grand sautier. The election of the banneret is made in a similar manner: having resigned his office, he is proposed to the assembly by the reigning avoyer, and being accepted, gives his hand to the reigning avoyer, as he never takes the oath but in time of war. The grand sautier is likewise recommended by the reigning avoyer, and, re-entering the church, takes the oath to government.

At the end of these elections, several decrees of the great council are read, particularly that which relates to the right of ancient burghership, and the election of the avoyer, banneret, and grand sautier; by which it is enacted, that should any opposition be made to the regular order of appointment, the new burghers shall retire from the assembly,

and the election be vested solely in the ancient burghers.

The same magistrates are always re-elected or confirmed in their several places: the evoyer out of office is nominated reigning avoyer; on the death of either of the avoyers, banneret is of course appointed to the vacant office, and succeeded by the treasurer, after the formality of a nomination. When the ceremony is concluded, the reigning avoyer, at the head of the senate, passes through a double line of troops, under arms to the town-house, where the first magistrate and the ancient senators confirm the junior senators; he then returns to his own house, accompanied by the senate and members of the great council, and is complimented first by the banneret, and afterwards by the chancellor.

From this detail we may conclude, that those authors have erred who call the government of Soleure aristo-democratical, for it is certainly a most complete aristocracy; inasmuch as the supreme government resides in the great council, of which the members are exclusively taken from the ancient burghers; as there are only eighty-one families which enjoy that right, and no more can be added until they are reduced to twenty-five; as of these scurcely more than thirty enjoy any share in the government; and lastly, as the election and annual confirmation of the principal magistrates is confined to the ancient burghers, should there be any opposition in the general assembly called Rosengarten. The government, however, under whatsoever title it may be classed, is mild and equitable, and the people are tranquil and contented.*

LETTER XXI.

Treaties with France ... Reflections on Foreign Service.

THE French ambassador to the Helvetic body resides in Soleure, and distributes those annual pensions which the king pays to the Catholic cantons. Louis the Eleventh was the first French monarch who employed Swiss troops, and granted subsidies to the states, since considerably augmented by his successors. The perpetual alliance which Francis the First concluded with the Swiss cantons, soon after the battle of Marignano, is considered as the basis of every subsequent treaty, and greatly contributed to increase the power of France; the Swiss infantry aided Henry the Fourth in establishing himself

* The truth of this remark was fully proved by the conduct of the people during the effervescence of the Swiss revolution. Although the offices of government were exclusively confined to a small number of persons, and notwithstanding the vicinity to the canton of Basle, where disaffection had made a rapid progress; yet, a few seditious persons excepted, the inhabitants of the whole canton, both in the town and country, rallied round the whole constitution. Even after the French troops were ready to enter the canton, and after the government of Bern had tamely consented to reform their constitution, the people of Soleure manifested an extraordinary dread of innovation.

A printed paper from the agents of France, under the title of the Patriots of Solcure, was dispersed, in which, after declaring their resolution to maintain the religion of their fathers, and to preserve their independence and connection with the Helvetic body, they required the union of the citizens of the town and canton, and the convocation of a national assembly.

These insidious propositions excited general indignation; and on the 6th of February the militia of the canton marched to the town, the artillery was planted on the ramparts, many suspected persons were arrested, and all the inhabitants prepared to defend their liberties to the last extremity

were arrested, and all the inhabitants prepared to defend their liberties to the last extremity.

But the magistrates, intimidated by the fluctuating counsels of Bern, and threatened with the instant approach of the French, declared their resolution to adopt the new principles, and summoned representatives of the people to arrange a new constitution. Yet these very representatives, thus convened to alter the constitution, were positively instructed by their constituents to insist that the ancient form of government should be maintained in all its parts. With a view, however, to conciliate the French, and yet to prevent hasty innovations, a decree was issued on the 11th of February, in the name of the avoyer, great and little councils, and deputies of the towns and country, "for effecting such alterations in the form of government as should introduce an equality of rights between the inhabitants of the towns and those of the communes."

This decree was preceded by a solemn oath, taken by all the members of the government and the deputies, "to maintain inviolate their holy religion, as transmitted by their forefathers; to defend to the last man, against all enemies, that precious jewel of liberty and independence, purchased with the blood of their ancestors; and acting in the character of free Swiss, never to separate themselves from the Helvetic confederacy; but, on the contrary, to fulfil all the duties contracted in virtue of existing alliances."

It then abolishes all distinctions between the inhabitants of the towns and country with respect to representation and eligibility to the offices of government, and establishes a committee to arrange with the representatives the new constitution.

It ordains that, in the mean time, the established government should continue to exist provisionally; that it should be respected, and remain in force until the formal establishment of the new constitution.

But the people were so little inclined to exercise their new rights, that no steps were taken to carry the decree into execution, and the dissolution of the ancient government was only effected by the capture of Soleure. The body of the people manifested the greatest ardour. Seven thousand troops cooperated with the army of Bern, and all the forces of the canton would have come forward in defence of their country, had not the post of Lengnau been surprised, the advanced guard at Grange defeated, and Soleure captured.

The extraordinary circumstances which led to these events are related in the introductory chapter. Schawembourg in accepting the capitulation, promised security to persons and property; but in defiance of this promise, four-and-twenty villages in the viemity were given up to plunder, the inhabitants were disarmed, the arsenals seized, and some of the magistrates, after being paraded round the town in barbarous triumph, were inhumanly put to death.

tory chapter. erty; but in er, the inhaed round the on the throne of his ancestors, repressed the contending factions during the turbulent minorities of Louis the Thirteenth and Fourteenth, and distinguished themselves during the continental wars in which France was engaged, by fidelity, valour, and discipline.

The general alliance between France and the whole Helvetic union, ratified by Louis the Fourteenth in 1663, was to remain in force during the joint lives of that monarch and his son the dauphin, and for eight years after the death of either. Towards the end of his reign, Louis, on his son's death, proposed to renew the treaty in his own and his successors name; but the Protestant cantons refusing their consent, it was concluded

only with the Catholic cantons and the republic of the Vallais.

This alliance differed from the former treaties in three essential articles: 1, if France was invaded, the contracted republics permitted an additional levy to be raised at the king's expence, not exceeding sixteen thousand men; 2, if the Helvetic body, or any particular canton, should be attacked by a foreign power, the king engaged to assist them with as many forces as were judged necessary; and 3, should dissentions arise between the contracting cantons, the king was, at the request of the aggrieved party, to employ his mediation, and that failing, he bound both himself and his successor to compel the agressor to abide by the treaties concluded between the cantons and their allies. This last article, as it authorised the interference of the king of France with the politics of Switzerland, appeared dangerous to many of the Swiss, and inconsistent with that absolute independence which they had hitherto prized above all other advantages.

France having long in vain attempted to persuade the Protestant cantons to join the alliance, for the purpose of renewing a general treaty with the whole Helvetic body, at length succeeded, after much opposition. This important league was concluded at Soleure in May 1777, between the king of France on one side, and the thirteen cantons and their allies on the other, to continue in force during fifty years. By this treaty it is agreed, that on the invasion of France the cantons and their allies shall furnish an additional levy of six thousand men; and if the cantons or any of their allies are attacked, the king, if required, engages to furnish them, at his own expence, with such succours as may be deemed necessary. That article of the treaty with the Catholic cantons in 1715, which related to the mediation of the king, in case of any disputes between the

thirteen cantons, is very wisely omitted.

Before this alliance, none of the Protestant states received pensions from France; but by the sixteenth article, the Protestants of Glarus and Appenzel, and the town of Bienne, agreed to accept les argents de paix et d'alliance, as these subsidies are here called. The acceptance of pensions derogates greatly from that spirit of absolute independence, which all the Protestant states of Switzerland have hitherto affected to profess; and it would have reflected much greater houour on the Swiss nation, had the whole body imitated Zuric, Bern, Basle, and Schaffhausen, in forming the league upon terms of perfect equality, and rejecting the professed pensions, which give an air of venality to their treaties with France.

It has long been a controverted question, whether Switzerland gains or loses by furnishing troops, according to the tenor of her alliance with France, Spain, Sardinia, Naples, and Holland. It has been urged, that without these supplies to foreign nations, Switzerland would be overstocked with inhabitants, and the natives compelled, like the northern hordes of old, to emigrate for subsistence, as in many parts there is no commerce, and the mountain tracts cannot supply sufficient provision for the inhabitants. In reply it may be alleged, that the Swiss do not use all the resources in their power: commerce might be more generally cultivated and encouraged; as there is no part of Switzerland far removed from the principal rivers and great lakes, most of which have a direct communication with the sea.

But, to be convinced that they have not exhausted all the advantages to which they might resort, let them look back on ancient Greece, and the immense populousness of so confined a country; or, what is more open to their observation, let them consider the present state of the United provinces, and the abundance which those industrious people enjoy on a tract of land snatched from an element perpetually reclaiming its prior occupancy! But the Swiss need not be reminded of ancient or foreign examples: Geneva and St. Gallen are, for their extent, exceedingly populous; and yet the productions of their lands are by no means sufficient to support all the inhabitants. Appenzel and gin are entirely mountainous; nevertheless both those districts are remarkably and derive from commerce and industry all the necessaries of life in great abundance. Indeed Switzerland is so far from being overstocked with inhabitants, that in most of the great towns there is a manifest deficiency; and in several parts of the country, hands are frequently wanting for the common purposes of agriculture.

These reflections seem to prove the mistaken policy of Switzerland, in letting out her troops to foreign states. On the contrary, many circumstances may be alledged in its favour. This practice has tended to keep up the military spirit of the Swiss, even during a state of profound peace, which has now continued, with few interruptions, for three hundred years. The states not only have in constant reserve, and without expence, a body of well disciplined forces, which they can recal at a moment's warning; but it becomes the interest, for that reason, of those powers whom they furnish with men, not to foment any divisions, which might render the presence of their troops necessary at home. Add to this, that the privileges which the Swiss enjoy in France, and the advantageous articles relating to commerce secured to them in all their treaties, seem to strengthen the argument for continuing their military connections with that kingdom.

This argument, however, would be more conclusive, if those privileges were still preserved in the same latitude as was granted by the ninth article of the perpetual peace concluded with Francis I, in 1516, and confirmed by several successive treaties. But the case is far otherwise. The immunities have been gradually and almost imperceptibly violated: the Swiss merchants were subjected to the poll-tax, and fresh duties, contrary to the tenor of their rights, imposed on their merchandise. During the administration of the duke D'Aiguillon, the Swiss complaining of these infractions, a negotiation was begun at Soleure with the French ambassador, which produced, however, no other effect than a short letter from the minister, declining to redress the grievances.

On the late renovation of the perpetual peace in 1777, it was expected that this matter of dispute would be amicably adjusted; and the count de Vergennes insinuated that such was the intention of the court of Versailles. Many cantons, and particularly Zuric, were principally induced by these expectations to accede to the alliance; but not wholly trusting to the promises of the French cabinet, it was insisted that an article explaining and confirming the said privileges should be inserted in the new treaty. The minister, with his usual address, eluded a direct mention of the demanded rights; but not to lose the confidence of the nation, at a time when he most wished to obtain it, the king engaged, by the 18th article, to preserve to the Swiss those privileges and advantages to which they had a legitimate right, and which they had hitherto enjoyed in France; and the Swiss agreed to postpone the precise determination of the nature and extent of the said privileges to future conferences, wherein those matters should be regulated with fidelity and equity.

It is a matter of astonishment that the Swiss were contented with so ambiguous a declaration, or were induced to believe that the French court would preserve to them their legitimate immunities, in the moment when that legitimacy was a subject of contention. which they tousness of m consider ndustrious laiming its examples: et the pronuts. ce; and

nt of the

ed with

The Helvetic body had soon occasion to repent of their credulity: for, in 1781, the king of France issued an edict, irrevocably subjecting the Swiss who possess lands in France to the poll tax, and to all national imposts, and laid the same duties on their merchandise imported into France, as are paid by the merchants of other countries, cheese and linens excepted, which were taxed at a reduced value.

But a still severer blow was levelled against the Swiss in 1786; when, notwithstanding the express reservation granted in the perpetual peace, the importation of their linens was prohibited in France. The prohibition of this branch of commerce, which furnished employment to so many hands in various parts of Switzerland, particularly in the cantons of Zuric, Glarus, and Appenzel, and was almost the sole resource of the natives, spread a sensible alarm, but was not productive of scrious consequences, after the first surprise and agitation, the industry of the Swiss was not abated; and the linens found their way into France either by contraband trade, or by contract with the French East-India Company.

LETTER XXII.

The Canton of Zug.

Zug, August 5.

WE yesterday quitted Zuric,* and walked to Albis, a small village about three leagues distant, situated near the summit of a mountain, much visited by travellers for

the variety and extent of the prospect.

We fortunately escaped a violent shower of rain, accompanied with a storm of thunder and lightning, which had threatened for some time, and began immediately upon our arrival; but we were well housed, and our host gave us a good supper, and an excellent bottle of Muscat wine. We were abroad this morning by five, and had a very agreeable walk to Zug; the weather, which had of late been very sultry, being cooled by the lightning and rain. We passed over the field of Battle at Cappel, where Zuingle was slain; regretting this instance of disunion between the Bwiss republics, and lamenting the premature death of that great reformer. We pursified our journey through a pleasant country; so thickly planted with fruit-trees, that I could hardly distinguish any other sort. Indeed, we had before remarked the predigitors number of fruit-trees in several other parts of Switzerland, which is in many whiles almost a continued or chard.

other sort. Indeed, we had before remarked the proligious number of fruit-trees in several other parts of Switzerland, which is in many places almost a continued orchard. Zug, the capital, stands deligibilly upon the edit of a beautiful lake, in a fertile valley, abounding with corn, pasture, and word. The canton formerly belonged to the house of Austria, and continued faithful to that faithful the neighbouring states had formed themselves into independent to the lattille will be neighbouring states had formed themselves into independent to the lattille will be neighbouring states had formed themselves into independent to the lattille will be neighbouring states had formed themselves into independent to the lattille will be neighbouring states had formed themselves into independent to the lattille will be neighbouring states had formed themselves into independent to the house of Austria of invading and harassing the Swiss. Under these circumstances, the six allied cantons, in 1351, laid siege to Zug, which was resolutely definited by the inhabitants; but as Albert duke of Austria was unable to assist them, the town at length surrendered upon the most honourable conditions. The generosity of the conquerors was equal to the

^{*} I have, in this part, arranged the preceding letters differently from the former editions, and according to the journal of my tourin 1785; though I did not at that time proceed from Soleure to Zuric, yet I have thought proper to resume the order of my first journey in 1776, and to bring the reader back to Zuric, from whence I take my departure, as before, to Zug. The traveller who enters Switzerland at Schaffhausen, and quits it at Geneva or Neuchatel, will perhaps find this timerary from Zuric to Basle, Bienne, Soleure, and thence to Bern and Lucerne, more convenient than that from Zuric immediately to Zug and Lucerne; while those who quit Switzerland at Basle will prefer the latter.

courage of the vanquished; for, in consequence of this submission, the canton of Zug was delivered from the yoke of a foreign master; obtained liberty and independence;

and was admitted into the Helvetic Confederacy upon equal terms

The government of this little canton is exceedingly complicated; and the inhabitants of the town have somewhat more influence, and enjoy a greater share in the administration of affairs, than those of the capital burghs in the five other democratical cantons. The supreme power resides in the inhabitants of Zug, Bar, Egeri, and Meutzingen, who assemble yearly to enact laws and choose their magistrates. The Landamman, reciprocally elected from each of the four districts, continues three years in office when taken from Zug, and but for two years when chosen from each of the three other districts. The general administration of affairs is entrusted to the council of regency, composed of forty members, of whom thirteen are supplied by the district of Zug, and twenty-seven selected equally from the three remaining communities. This council, as well as the Landamman, resides always in the capital.*

Oswald, one of our old British kings, is the tutelar sain: of this place; and in the

church is his statue, with the following inscription:

Sanctus Oswaldus Rex Angliæ Patronus hujus Ecclesiæ.

Oswald† was a king of Northumberland in the seventh century; and is much renowned among the monkish writers for his chastity, piety, and power of working miracles. I have endeavoured to discover the connection between a British king, under the heptarchy, and a small canton of Switzerland; without reflecting how fruitless is the attempt to give any reason for long established customs. In the church of Rome saints are easily transplanted into any soil; and caprice, as well as superstition, may have inclined the inhabitants of Zug to adore a saint whose name is barely known in his own country. I am, &c.

LETTER XXIII.

The Town and Canton of Lucern General Pfiffer's Model.

WE took boat at Zug and being rowed across the lake, which is about three leagues long and one broad, were landed at a village in the canton of Schweitz. From thence we walked to Kussnach, capital of a bailliage subject to Schweitz, and in our way passed by a small chapel sacred to William Tell, erected on the spot where, it is said, he shot the Austrian governor. At Kussnach we embarked upon the lake of Lucern, and were much struck upon our approach with the fine situation of that town, and the noble amphitheatre of mountains, which border the lake.

Lucern, originally subject to the house of Austria, was exposed to the inroads of Uri, Schweitz, and Underwalden, when those cantons had secured their independence. Her commerce to Italy was interrupted, and her citizens compelled to be continually under arms, in order to protect their territory from incessant depredations. Under these circumstances, the house of Austria, imprudently loading the citizens with exorbitant taxes, Lucern made her peace with the confederate cantons; and, expelling the

Pennant's Tour to Wales, vol. i. p. 258.

^{*} Zug was the only one of the small cantons which did not send its contingent to the army, but made a show of resistance to the imposition of the new constitution. On the 29th of April Zug was invested by French troops, surrendered on the 30th, and on the first of May accepted the new constitution.

The accession of Lucern gave additional credit and power to the confederacy, and enabled it to resist all the efforts of a great and implacable enemy. In 1386 Leopold duke of Austria invaded the canton with a numerous army, when the combined troops gained a bloody victory at Sempach, in which Leopold lost his life. In the accounts of this battle, an instance of private valour is recorded, which would have done honour even to a Greeian or a Roman name, and only requires the pen of a Thucydides, or a Livy, to equal in fame the exploits of the most admired heroes of antiquity. The Austrian army, far superior in number, was drawn up in firm battalion, accoutred in heavy armour, and furnished with long pikes, which they presented before them. The Swiss troops were led to the attack in the form of a wedge, in order to open their way into the ranks of the enemy, and to break the solidity of the battalion. The Austrians nevertheless continued impenetrable, till Arnold de Winkelried rushed alone upon the enemy to certain death, and, seizing as many pikes as he could grasp, endeavoured to force through the ranks, but he was killed in the attempt. His patriotic valour, however, was not exerted in vain: it inflamed the Swiss with new courage, and taught the only method of penetrating into the battation, which they at length effected, after the most desperate efforts.

Leopold himself might have escaped, when his troops first began to give way; but, with a magnatimity worthy of a better fate, he would not survive so ignominious a day, and, rushing among the troops of the enemy, was slain. In the arsenal are still preserved his armour, together with a large quantity of cords, with which, according to tradition, he intended to bind the citizens of Lucern. The keeper of the arsenal displayed them to us with the same kind of triumph, as the man who shews the Tower of London points out the chains taken on board of the Spanish armada, which Philip II, is said to have

destined for the principal nobility of England.

The government of Lucern is entirely aristocratical, or rather oligarchical. The sovereign power resides in the council of one hundred, comprising the senate, or little council. The great council is the nominal sovereign; but the whole power actually resides in the senate, consisting of thirty-six members, who are formed into two divisions, exercising the office by rotation. The members of the senate are neither confirmed by the sovereign council, nor by the citizens, but are only dependent upon themselves; the division which retires at the end of six months confirming that which comes into office. Besides the vacant places in the senate being filled by its own body, the power remains in the possession of a few patrician families; and as the son generally succeeds his father, or the brother his brother, the senatorial dignity may be considered as hereditary.

The administration of the current affairs, the care of the police, the management of the finances, and the whole executive power, reside in the senate, which sits constantly; whereas the sovereign council is assembled only upon important occasions. The senate has cognizance of criminal causes; but, in case of capital condemnation, the sovereign council is convoked, in order to pronounce the sentence; a practice worthy of imitation! for the condemnation of a criminal cannot be too maturely weighed; and great solemnity used in pronouncing the sentence, must make a deep impression upon the minds of the people. In civil causes an appeal lies from the senate to the sovereign council; but this must be a mere formality; as, in fact, it is an appeal from the senators in one court to the same senators in another. Indeed their influence over the sovereign council must necessarily be absolute; for they themselves constitute above a third of

that body, choose their own members, and confer the principal charges of government. They nominate also to the ecclesiastical benefices, which are very considerable; near

two thirds of the revenues of the canton belonging to the clergy.

The chiefs of the republic are two avoyers, chosen from the senate by the sovereign council, and confirmed annually. In all elections, the relations of the candidates, to the third degree, are excluded from voting; and neither the father and the son, nor two brothers, can be members of the senate at the same time. Excellent institutions, one should think, to prevent the too great influence of family connections! excellent indeed in theory, but useless in practice: this circumstance proves, that when the spirit of the constitution is oligarchical, all laws enacted for the purpose of counteracting the power of the nobles, are mere cyphers. In some few instances, however, the authority of the nobles is controlled; for, in declaring war and peace, forming new alliances, or imposing taxes, the citizens must be assembled, and give their consent.*

Lucern being the first in rank and power among the Catholic cantons, is the residence of the pope's nuncio, and all affairs relative to religion are treated in the annual diet which assembles in this town, composed of the deputies of those cantons. The town contains searcely three thousand inhabitants, has no manufactures of any consequence, and little commerce. Learning no where meets with less encouragement, and consequently is no where less cultivated. What a contrast to Zurie! Yet, under these disadvantages, a few persons have made no inconsiderable progress in literature. Among these the most conspicuous is M. Balthasar, member of the senate, who possesses a library rich in books relative to the history of Switzerland, in which he is extremely conversant, and his publications already given to the world, and those now preparing for the press, prove that he knows how to use them. His works are, for the most

* Lucerne, like Soleure, affords a striking example, that the subjects of an oligarchical state may be not only antisfied with the government from which they are excluded, but even averse to all innovation. Not all the cabals of the French agents, not all the clumours of the disaffected, not all the exaggerations of the grievances under which they were supposed to labour, could induce the people to hink themselves oppressed. They rejected the proffered equality, and it was not without great opposition that the magistrates, rather than the people, on the 31st of January, declared themselves a provisional government, and announced their readiness to accept a democratical constitution. Yet such was the aversion of the people to the new order of things, that the ancient magistrates were invested with the provisional government, and the national delegates did not assemble independently of the provisional government till the 14th of March, when Bern had surrendered to the French arms.

During the progress of the French revolution, Lucern acted with great spirit, and was inclined to

join in defence of her own independence, as well as in support of the Helvetic union.

In answer to a summons from Bern, the magistrates, on the 2d of March, replied: "We observe that the demands of general Brune, if acceded to, would endanger not only the liberties of Bern, but the independence of the Helvetie confederacy. We have therefore determined, with the unanimous approbation of the representatives of the people, that the regiment in the canton of Bern shall march wherever necessity requires, and that a second regiment shall speedily follow." On the 3d a declaration was sent to Zuric: "We and the people are unanimously resolved to sacrifice our lives and property in defence of liberty against foreign invasion. The alarm-bell will be instantly sounded; and we exhort you to adopt the same resolution: our religion, liberty, property, and every thing that is dear to us are in danger. We will shew ourselves worthy of our forefathers; like free people, we will either conquer or die. These are our resolutions: these are the resolutions of all our people." (Meister, p. ii. p. 8.) But it was now too late; Bern had already surrendered, and the troops of Lucern, disgusted with the insubordination of the Bernese, retreated to the defence of their own territory.

Notwithstanding the surrender of Bern and the desertion of Zuric, a numerous body of peasants demanded the re-establishment of the ancient government, and joined the troops of the small cantons, to resist the entrance of the French; and the whole canton did not acquiesce without much opposition and bloodshed. A corps of French, after a short investment, entered Lucern on the 30th of April.

and reduced the people to unconditional submission.

Soon after this event, Lucern became the seat of the new Helvetic government.

part, in the German and Latin tongues; they contain biographical anecdotes of several illustrious Swiss, elucidate various important parts in the general history of Switzerland, but more particularly relate to the canton of Lucern. His son, a member of the great council, deserves to be mentioned for his collection of English books, and the zeal with which he endeavours to propagate a knowledge of our literature. I have also no less satisfaction in adding, that, since my first expedition into these parts, science is more cultivated; that the principles of toleration are better understood and more widely diffused, and that a literary society is established for the promotion of polite learning.

The population of the canton has considerably increased within this century; a sure proof of a mild and equitable government. The inhabitants are principally engaged in agriculture. The southern parts of the canton are chiefly mountainous, and furnish for exportation cattle, hides, cheese, and butter. The northern district is fruitful in corn, which being more than sufficient for the consumption of the canton, there is a constant exportation from the weekly market held in the town, to which the inhabitants of the small cantons resort, for the purchase of that and other necessaries. The overplus for the supply of this market is drawn from Suabia and Alsace. This commerce, which, together with the passage of the merchandise for Italy, is the chief support of the town, might be exceedingly improved and augmented, considering its advantageous situation; for the Reuss issues from the lake, passes through the town, and, having joined the Aar, falls into the Rhine.

The cathedral and the Jesuits church are the only public buildings worthy of observation; but are overloaded with rich ornaments, and disgraced by bad paintings. In the cathedral is an organ of a fine tone, and extraordinary size: the centre pipe, as the priest assured us, is forty feet in length, near three in diameter, and weighs eleven hundred pounds. The bridges which skirt the town round the edge of the lake are the fashionable walks of the place, and remarkable for their length; being covered at top, and open at the sides, they afford a constant view of this delightful and romantic country; they are decorated with coarse paintings, representing the histories of the Old Testament, the battles of the Swiss, and the dance of Death.

On our arrival at Lucern we sent a letter of recommendation to general Pfiffer, a native of this town, and an officer in the French service. He received us immediately, with his usual civility, and shewed us his topographical representation of the most mountainous part of Switzerland, which well deserves the attention of the curious traveller. It is a model in relief, and what was finished in 1776 comprised about sixty square leagues, in the cantons of Lucern, Zug, Bern, Uri, Schweitz, and Underwalden. The

model was twelve feet long, and nine and a half broad.

The composition is principally a mastic of charcoal, lime, clay, a little pitch, with a thin coat of wax; and is so hard as to be trod upon without receiving the least damage. The whole is painted with colours representing the objects as they exist in nature. It is worthy of particular observation, that not only the woods of oak, beech, pine, and other trees, are distinguished, but also the strata of the rocks marked; each being shaped upon the spot, and formed with granite, gravel, calcareous stone, or such other natural substances as compose the original mountains. The plan is indeed so minutely exact as to comprise not only all the mountains, lakes, rivers, towns, villages, and forests; but every cottage, every torrent, every bridge, every road, and even every path is distinctly and accurately represented.

General Pfiffer has already been employed in this work about ten years, with astonishing patience and assiduity; he himself took the plans upon the spot, and laid down the elevations of the mountains in their respective proportions. In the prosecution of

of this laborious performance, he was twice arrested for a spy, and in the popular cantons frequently worked by moonlight, in order to avoid the jealousy of the peasants, who think their liberty would be endangered should an exact plan be taken of their country. Being obliged to remain some time upon the tops of the Alps, where no provision can be procured, he generally carries with him a few she-goats, whose milk supplies him with nourishment. Indeed his perseverance in surmounting the difficulties that have arisen in the course of this undertaking, is almost inconceivable. When he has finished any particular part, he sends for the peasants and chasseurs who reside near the spot, and bids them examine accurately each mountain whether it corresponds, as far as the smallness of the scale will admit, with its natural appearance; then, by frequently retouching, he corrects the deficiencies. He takes his elevations from the level of the lake of Lucern, which, according to Saussure, is about fourteen hundred and eight feet above the Mediterranean.

This model, exhibiting the most mountainous parts of Switzerland, conveys a sublime picture of immense Alps piled one upon another; as if the story of the Titans were realized, and they had succeeded (at least in one spot of the globe) in heaping Pelion upon Ossa, and Ossa upon Olympus. The general informed me, that the tops of the Alps which crossed Switzerland in the same line are nearly of the same level; or, in other words, that there are continued chains of mountains of the same elevation, rising in progression to the highest range, and from thence gradually descending towards Italy. He is exceedingly polite and affable to strangers, and ever ready to be of any service to travellers, in pointing out the best roads, and in acquainting them with the places most worthy of observation.

Near Lucern is Mount Pilate, formerly called Mons Pileatus, from the Latin word pilea, because its top is generally covered with a cloud or cap. This word has been corrupted into Pilatus, from which alteration a thousand ridiculous stories have been invented; among others, that Pontius Pilate, after having condemned our Saviour to death, was seized with remorse, made an excursion into Switzerland, and drowned himself in a lake at the top of the mountain. This corruption of a word, and the absurd legend fabricated from its alteration, will naturally remind you of several fables of similar absurdity, seriously related by the Greek writers; a circumstance which my very worthy and learned friend Mr. Bryant has so amply and ably discussed in his Analysis of ancient Mythology. I am, &c.

Having, in three successive visits to Lucern, observed the gradual progress of general Pfiffer's model, and in August 1786 seen it completed, I am enabled to add some particulars, partly from my own observation, and partly communicated by the ingenious artist himself.

This model is composed of a hundred and forty two compartments of different sizes and forms; they are respectively numbered, and the whole can be taken to pieces and united with almost as much ease (if we may compare great things with small) as the dissected maps, by which children are instructed in geography.

The lake of Lucern, nearly the centre of Switzerland, forms also the centre of the plan, which comprehends part of the circumjacent cantons of Zuric, Zug, Schweitz, Underwalden, Lucern, and Bern, and a small portion of the mountains of Glarus. It comprehends a space of $18\frac{1}{2}$ leagues* in length, and 11 in breadth; and the dimensions of the model being 20 feet and a half in length, and 12 in breadth, $203\frac{1}{2}$ square

† French feet.

luare h feet. leagues are represented on a parallelogram of 246 feet, or about two English miles and 1 by a square English foot. The highest point of the model from the level of the centre is about ten inches; and as the most elevated mountain represented therein rises 1475 toises, or 9440 feet, above the lake of Lucern, at a gross calculation, the height of an inch in the model is equivalent to about 900 feet. And it is a matter of astonishment to observe the stupendous works of nature delineated with such perfect resemblance in so small a compass.

Though I received considerable satisfaction from the first view of this extraordinary performance; yet I again contemplated it with much more pleasure, and still greater astonishment, when I was able to trace many of my various expeditions, and to recog-

nise its surprising accuracy.

The general began this elaborate work at the age of fifty, and though now in his seventieth year, continues his annual expeditions into the Alps, with a spirit and ardour that would fatigue a much younger person. It is likewise no less entertaining than instructive, to hear him expatiate, with an agreeable vivacity, on the most interesting objects, which are observed on the model. He kindly supplied me with the following remarks, which I transcribe from my journal. According to a rough calculation, the height on which snow usually remains during summer, may be estimated at 1360 toises, or 8704 English feet, above the level of the sea; and on which it never melts, at 1448, or 9264 feet.

Among the phænomena of nature he mentioned the Rigi, an insulated mountain near the lake of Lucern, twenty-five miles in circumference, and rising to a perpendicular height of more than four thousand feet above the surface of the lake: it is entirely composed of gravel and pudding-stone, and must have been formed by the waters. The Rigi joins to a small ridge of sand-stone running towards Schweitz.

Mount Pilate offers a most singular curiosity. At the elevation of five thousand feet, and in the most perpendicular part, near the pasture of Brunlen, is observed, in the middle of a cavern hollowed in a black rock, a colossal statue, which appears to be of white stone. It is the figure of a man in drapery, leaning one elbow on a pedestal, with one leg crossed over the other, and so regularly formed, that it can scarcely be a lusus naturæ. This statue is called Dominic by the peasants, who frequently accost it from the only place in which it can be seen, and when their voices are re-echoed from the cavern, they say, in the simplicity of their hearts, "Dominic has answered us."

It is difficult to imagine by whom, or in what manner this statue could be placed in a situation, which has hitherto proved inaccessible to all who have endeavoured to approach it. About the beginning of the present century, one Huber, a native of Krientz, a neighbouring village, attempted to descend into the cavern by means of ropes, let down from the summit of the rock; he succeeded so far as to gain a near view of this singular phænomenon, and was again drawn up in safety. On a second trial, as he was suspended in the air, and endeavoured to draw himself into the cavern by fixing a grapple to the statue, the cord broke, and he was dashed to pieces. Since that dreadful accident, no one has ventured to repeat the experiment from the same quarter. Another trial to penetrate to the statue was made in 1756, by general Pfiffer and eight persons, from a small opening on the opposite side of the mountain, in which the natives collect a white substance called mondloch, or cream of the moon. As this opening is supposed to communicate with the cavern, the general and his companions crept on their hands and knees, one behind the other, and winding in the bed of a small torrent, through several narrow passages, at length discovered the light of the sun through a remote chasm; but as the distance seemed very considerable, and as the fall of a single stone might have obstructed their return, they thought it imprudent to venture any further, and retreated without effecting their purpose.

LETTER XXIV.

Valley of Entlibuch.... Zoffingen.... Lake of Sempach.... Anniversary of the Battle.

IN my first expedition to this country, I had no opportunity of visiting the interior parts of the canton of Lucern, which I afterwards traversed in 1785 and in 1786.

On both these occasions I passed from Bern to Lucern, one time along the high road leading through Zoffingen, Surzee, and by the lake of Sempach; at the other through Langenau, the Emme-thal, and the valley of Entlibuch, a district which though not

usually frequented by travellers, yet highly deserves their attention.

In the 13th century, Entlibuch was subject to the counts of Wolhausen, and came by purchase, in 1299, to the emperor Albert. In the following century it was held as a fief from the house of Austria by several successive counts; till the natives grievously oppressed by Peter of Torrenberg, in 1386, threw themselves under the protection of Lucern. That republic continued to possess Etlinbuch, as a feudal tenure under the house of Austria, until 1405; when the archduke Frederic renounced all the rights of sovereignty.

For above a century and a half, the inhabitants, inflamed with a desire of independence, and excited by the example of popular cantons, frequently rose in arms, and attempted to establish a democracy; but without success. Their last insurrection broke out in 1653; since which time they have continued in a state of perfect tranquility, under the wise administration of Lucern; and have enjoyed, with contentment, the con-

siderable privileges with which they are endowed.*

The bailliage of Entlibuch extends from the Emme-thal in the canton of Bern, to the bridge near Wertenstein, about fifteen miles in length, and nine in its greatest breadth; and contains 11,000 souls. It is governed by a bailliff, who is always a senator of Lucern; he continues in office two years, and generally resides in that capital. The bailliage is generally divided into three districts; the upper, or Eschlismat; the middle, or Shuepfen; the lower, or Entlibuch: each of these has its separate courts of justice,

from which an appeal lies to Lucern.

That part of the bailliage which I traversed, is a valley watered by several lively rivulets, winding for some way between two ridges of well-wooded hills, and abounding in picturesque scenery. Afterwards the country was undulating, and the road which was narrow and rugged, continually ascended and descended through well-cultivated fields of pasture. I passed through several villages, of which the principal were Eschlismat, Shuepfen, and Entlibuch, which takes its name from the rivulet Entle, and gives it to the whole district. These places are small; but the whole country is strewed with cottages, and seems a continued village. The inhabitants chiefly follow agriculture; they rear large quantities of horned cattle, sheep, goats, and swine; make and export cheese in great abundance. Though usually richer than the inhabitants in the other parts of the canton; yet they did not appear so well clothed, or to possess such neat cottages, as their neighbours in the Emme-thal.

The peasants of Entlibuch are much esteemed for their independent spirit, vigour, and strength; remarkable for keenness and vivacity, for great quickness in repartee,

^{*} The peasants of Entlibuch were remarkable for their attachment to the government, and for their decided opposition to French principles, during the late revolution.

for a peculiarity of garb, and for many striking customs which distinguish them from the natives of the circumiacent districts. Of various usages, which escaped my notice during my short stay among them, I chanced to gain information of one custom, which reminds me of the Fescennina licentia mentioned by Horace, that prevailed among the Roman Peasants. Two neighbouring parishes send a challenge to each other, and, at the conclusion of the carnival each dispatches a man, bedizened with flowers and shells, called shrove-monday ambassador: he rides to the neighbouring village, and reads or rather sings, two satirical compositions in verse. The one, a general satire against the parish, usually begins by celebrating a period of Swiss history accommodated to the circumstances of time and place, then draws a comparison between the two parishes, giving the preference to his own, either for the superior learning and picty of the priest, the wisdom and impartiality of the president, the industry and spirit of the men, the beauty and chastity of the women, or the education of the children. The second composition consists of a string of epigrams in ridicule of particular persons; recording any scandalous adventures, or ludicrous circumstances, which have happened since the last year. The poet finishes his harangue with expressing a wish, that on the next shrove-monday the inhabitants may improve, and not deserve such a severe repri-

At the conclusion of this lecture, which creates much laughter, the mock ambassador returns; and the men of the two parishes repair, with drums beating and colours flying, to an open place, called the Field of Battle, followed and encouraged by the inhabitants of their respective parishes. The two armies being drawn up in order of battle, the combatants, in imitation of the old Swiss custom, kneel, offer up a short prayer,

and start up at the sound of the trumpet.

Having formed themselves into two columns of several ranks, they march arm in arm, with uniform step and military attitude; both the foremost lines meet in front, and jostle against each other, being supported and pushed forwards by the hinder files, frequently assisted by the women, until one phalanx is broken. The victorious party is dignified with the name of the Swiss, and those who gave way are called Austrians, in allusion to the ancient animosity between those two powers. The jurymen of the district are present as umpires, and to prevent any violent disputes and quarrels. After the rencounter both parties sit down to table, and the day is concluded with feasting. As these satirical compositions occasionally created much ill will between the neighbouring parishes, and the rencounters were attended with various accidents, the government of Lucern abolished the custom; but has lately permitted it to be revived, with certain restrictions calculated to prevent future mischief.

The valley of Entlibuch may be considered as one of those parts which unite the mild and cultivated with the wild and rugged scenery of Switzerland; its acclivities gradually ascend and terminate in Mount Pilate, whose barren top is seen towering above

the fertile and well-wooded hills.

Quitting this valley, we crossed the Emme over a covered bridge, admired the romantic position of Wertenstein, a convent of Cordeliers, overhanging the perpendicular banks of the torrent, and passed through a very steep and rocky country to Malters, a small village within a league of the capital. Here being a considerable fair, I stopped and dined at the table d'hote, in company with some gentlemen from Lucern. In walking through the fair, I observed several booths for the sale of artificial flowers, which were purchased by the country girls. With these flowers, and with four bows of ribbands, they ornament their hats, which they adjust obliquely, with a degree of rustic coquetry not unbecoming.

VOL. V.

Another district of this canton is that part which I visited in 1786, along the high road leading from Bern to Lucern. I passed the night at Zoffingen, a small town in the canton of Bern. The inhabitants enjoy greater immunities than any other place in that canton; they have their own magistrates, and, what is peculiar, their own courts of justice, both civil and criminal, which decide in the last resort, without an appeal to Bern. A bailiff resides there; but his whole employment consists in collecting the

tithes. The town contains about two thousand souls.

Near Zoffingen I entered the cauton of Lucern, and passed through a narrow valley bounded by a chain of hills remarkable for the richness and variety of the hanging woods. As I proceeded, the valley expanded; I traversed a gentle waving country, and descended to Surzee, a small neat town near the lake of Sempach. From thence I coasted the western side of that lake, a small but beautiful piece of water about three miles in length and one in breadth; the grounds on each side slope gently to the edge of the water, and are prettily chequered with wood. On the opposite banks of the lake, I observed the town of Sempach, celebrated for the battle which established the liberty of the Swiss, and which I have already mentioned in the preceding letter. The anniversary of that battle, which happened on the 9th of July, 1386, is still commemorated with great solemnity, both at Sempach and Lucern, and supplies a copious subject for many poems and ballads in the numerous collection of national songs.

On the anniversary, a large body of persons of all ranks assemble on the spot where the battle was fought; a priest ascends a pulpit erected in the open air, and delivers a thanksgiving sermon on the successful efforts of their ancestors on that happy day, which ensured to their country liberty and independence. At the conclusion of this sermon, another priest reads a description of the battle, and commemorates the names of those brave Swiss who gloriously sacrificed their lives in defence of their freedom. Having exhorted those who are present to pray for the souls of their countrymen, and of the enemies, who fell in that battle, they all repair instantly to a small chapel, where masses are sung for the souls of the deceased. During this service, the people, falling on their knees, pray for their glorious ancestors, either in the chapel, on the walls of which are painted the deeds of the Swiss who immortalized themselves in this conflict,

or near four stone crosses which distinguish the place of combat.

LETTER XXV.

The lake of Lucern....Gerisau....Schweitz....Origin of the Helvetic confederacy....William Tell....Altdorf.

THE Waldstætter See, or lake of the four cantons, is, from the sublimity as well as variety of scenery, perhaps the finest body of water in Switzerland. The upper branch, or the lake of Lucern, is in the form of a cross, the sides of which stretch from Kussnach to Dallenwal, a small village near Stantz. It is bounded towards the town of Lucern by cultivated hills sloping gradually to the water, contrasted on the opposite side by an enormous mass of barren and craggy rocks. Mount Pilate rises boldly from the lake, and is perhaps one of the highest mountains in Switzerland, if estimated from its base, and not from the level of the sea.* According to general Pfiffer, its elevation above the lake is more than six thousand feet: nevertheless its heighth above the Medi-

^{*} Soon after the French took possession of Lucern, general Brune creeted, with great solemnity, the standard of liberty on the top of Mount Pilate; thus conferring on the Swiss the shadow, while he deprived them of the substance of freedom.

well as branch, n Kuss. of Lu. ite side om the d from evation Medi-

emnity, v, while terranean is trifling, in comparison with that of the Alps we are going to visit; nor indeed does the snow continue all the year upon its summit.

Towards the end of this branch, the lake contracts into a narrow creek scarcely a mile in breadth; soon after again widens, and forms the second branch, or the lake of Schweitz; on the western side is the canton of Underwalden, on the eastern that of Schweitz. Here the mountains are more lofty, and infinitely varied; some covered to their very summits with the most lively verdure; others perpendicular and craggy; here forming vast amphitheatres of wood, there jutting into the water in bold promon

On the eastern side of this branch is the village of Gerisau, at the foot of the Rigi: it is the smallest republic in Europe. Its territory is about a league in breadth, and two in length; situated partly on a small neck of land at the edge of the lake, and partly lying upon the rapid declivity of the Rigi. It contains about 1,200 inhabitants: they have their general assembly of burgesses, their Landamman, their council of regency, their courts of justice, and their militia. I was informed that there is not a single horse in the whole territory of the republic, as indeed might well be supposed; for the only way of arriving at the town is by water, excepting a narrow path down the steep sides of the mountain, which is almost impassable. Gerisau is entirely composed of scattered houses and cottages of a very neat and picturesque appearance; each dwelling is provided with a field or small garden. The inhabitants are much employed in preparing silk for the manufactures of Basle. This little republic is under the protection of the four cantons, Lucern, Uri, Schweitz, and Underwalden; and in case of war furnishes its quota of men. To the ambitious politician, who judges of governments by extent of dominion and power, such a diminutive republic thrown into an obscure corner, and scarcely known out of its own contracted territory must appear unworthy of notice; but the smallest spot of earth on which civil freedom flourishes, cannot fail to interest those who know the true value of liberty and independence, and are convinced that political happiness does not consist in great opulence and extensive empire.

Towards the end of this branch the lake forms a bay, in the midst of which lies the village of Brunnen,* celebrated for the treaty concluded in 1315, between Uri, Schweitz, and Underwalden, which gave birth to the Helvetic confederacy. Here I landed,

On the 31st of April 1798, Brunnen was again distinguished, as the place where deputies from the cantons of Uri, Schweitz, Underwalden, and Glarus, unanimously determined to maintain their independence, and to resist the innovations of the French. Even after the subjugation of the other parts of Switzerland, these intrepid mountaineers defended themselves with such spirit, and made such havoc among the French forces, that general Schawembourg engaged by treaty to respect their territory, and accepted their promise to admit the new Helvetic constitution. The French, however, not satisfied with this partial submission, yet unwilling again to encounter the efforts of courage and despair, contrived to disunite the small cantons, and separately to complete their subjugation. They obtained from the diet of Arau a decree for imposing a civic oath of allegiance to the new constitution; but the cantons of Uri, Schweitz, Underwalden, and Zug, refused compliance. The Helvetic Directory having represented to them the danger of resistance, general Schawembourg accompanied this exhortation with a threat, that unless they complied, "he would instantly march his troops into the rebellious districts."

Their answer deserves to be recorded for its pathetic simplicity: "Receive, citizen general, from a people ever true to their engagements, who among their craggy mountains have no comfort but their religion and their liberty, whose only riches are their cattle; receive the sincere assurance that they will ever give the French republic every proof of their devotion compatible with their liberty and independence. Accept also, citizen general, our solemn promise never to take up arms against the great republic, and never to join its enemies. Our liberty is our only blessing; nor will we ever grasp our arms except to defend that liberty." This artless remonstrance had no effect; Uri, Schweitz, and Glarus, deeming all resistance unavailing, took the civic oath; and the lower part of Underwalden, which alone refused, was left to its fate. See the note at the end of the next chapter.

Planta, p. 456.

and walked through an agreeable and fertile plain, laid out in meadows, and planted with fruit trees, to Schweitz, which stands on the slope of a hill, at the bottom of two high, sharp, and rugged rocks, called the Schweitzer-Haken. Its position is extremely agreeable. The church, which is a large magnificent building, stands in the centre of the place; near it the houses are contiguous; but in the other part are prettily dispersed about the gentle acclivities, in the midst of lawns and meadows, and sheltered by groves The principal object of curiosity in Schweltz is a complete collection of the celebrated Hetlinger's medals, possessed by his nephew. This collection, which he inherited from his uncle, is very valuable, the medals being all of the finest impressions, and several extremely rare. From these medals M. de Mechel published his much-esteemed engravings, to which he has prefixed a life of the artist, who was born in the canton of Schweitz, on the 28th of March 1691, and died in 1771, in a very ad-

vanced age.

Having re-imbarked at Brunnen, we soon entered the third branch, or the lake of Uri; the scenery of which is so grand, that its impression will never be erased from my mind. Imagine to yourself a deep and narrow lake about nine miles in length, bordered on both sides with rocks uncommonly wild and romantic, and, for the most part, perpendicular; with forests of beech and pine growing down their sides to the very edge of the water. On the right hand upon our first entrance, a detached piece of rock, at a small distance from the shore, engaged our attention; it is wholly composed of stones of the size and shape of bricks, so as to appear quite artificial. The same kind of natural masonry may be observed in the lofty cliffs which impend over this lake not far from Brunnen. It rises to about sixty feet in height; is covered with underwood and shrubs, and reminded me of those crags that shoot up in the fall of the Rhine near Schaffhausen: but here the lake was as smooth as crystal, and the silent solemn gloom which reigned in this place was not less awful and affecting than the tremendous roaring of the cataract. Somewhat further, upon the highest point of the Seclisberg, we observed a small chapel that seemed inaccessible; and below it, the little village of Gruti, near which the three heroes of Switzerland are said to have taken reciprocal oaths of fidelity, when they planned the famous revolution.

On the opposite side appears the chapel of William Tell, erected in honour of that hero, upon the very spot where he leaped from the boat in which he was conveying as a prisoner to Kussnach. It is built upon a rock projecting into the lake under a hanging wood: a situation amid scenes so strikingly awful, as must strongly affect even the most dull and torpid imagination! On the inside of this chapel, the several actions of William Tell are coarsely painted. While we were viewing them, we observed the countenances of our watermen glistening with exultation, as they related, with much spirit and sensibility, the cruelties of Gesner governor of Uri, and the intrepid behaviour of their glorieus deliverer. Indeed I have frequently remarked with pleasure the national enthusiasm which generally prevails in this country, and greatly admired the fire and animation with which the people discourse of those famous men among their ancestors; to whom they are indebted for that happy state of independence they now enjoy. This laudable spirit is continually supported and encouraged by the numerous statues, and other memorials, of the ancient Swiss heroes, common in every town and village. Among these, Tell is the most distinguished, and seems to be the peculiar favourite of the common people; the reason is obvious; for his story partakes greatly of the mar-

A few years ago a treatise, entitled Fable Danoise, was published at Bern; in which the author calls in question the history of William Tell. Though his arguments in gend planted om of two extremely c centre of dispersed by groves tion of the which he st impresplished his was born a very ad-

ke of Uri: my mind. rdered on t, perpenedge of the at a small nes of the atural maom Brunhrubs, and ff hausen: th reigned e cataract. mall chawhich the when they

which in general are by no means conclusive, yet he mentions two circumstances which, if true, are convincing proofs, that much fiction is interwoven with the whole account. He asserts that the incident of Tell's shooting the apple from the head of his son is not recorded in , of the contemporary historians, although they give the minutest accounts of the governor's tyranny; and that the first writer who takes notice of it is Etterlin of Lucern, who lived in the latter end of the fifteenth century, near two hundred years after the fact is supposed to have happened. Besides, a story of the same kind is related in the Danish annals by Saxo Grammaticus, with scarcely any difference but that of names: Harold king of Denmark supplies the place of the governor of Uri, Tocco that of William Tell; and this event which is said to have happened in 965, is attended also with nearly the same incidents, as those recorded in the Swiss accounts.* It is far from being a necessary consequence, that because the authenticity of the story concerning the apple is liable to some doubts, therefore the whole tradition relating to Tell is fabulous. Neither is it a proof against the reality of a fact, that it is not mentioned by contemporary historians. The general history of William Tell is repeatedly celebrated in old German songs, so remarkable for their uncient dialect and simplicity, as almost to raise the deeds they celebrate above all reasonable suspicion: to this may be added, the constant tradition of the country, together with two chapels erected some centuries ago, in memory of his

The three cantons were so much offended with the author for doubting the exploits of their ancient hero, that they presented a remonstrance to the sovereign council of Bern, and the pamphlet was publicly burnt at Uri. In this instance their national prejudices (if they really deserve that name) become, in some measure, meritorious and res-

pectabl

Landing at Fluellen, I had an opportunity of observing that the cross-bow is still much used, as I saw several very young boys, each with that instrument in his hand. Observing a butt at a small distance from the place, I told them, that those who hit the mark should receive a penny for their dexterity. Upon this intimation, three boys took aim successively, two of whom touched the very centre of the butt, and obtained the prize: but the third missing, I made him shoot till he hit the mark; which after two or three trials, he performed.

From Fluellen we walked to Altdorf, the capital burgh of the canton of Uri, situated in a narrow vale almost entirely surrounded by stupendous mountains. It contains several neat houses; the tops whereof are covered with large stones, in order to prevent the roofs being carried away by the hurricanes frequent in these mountainous

countries.

When the greater part of Helvetia was subject to the empire, the inhabitants of Uri, Schweitz, and Underwalden, had long enjoyed the most considerable privileges, particularly the right of being governed by their own magistrates: the clergy and many of the nobles, indeed, had fiels and subjects in those respective territories; but the bulk of the people formed several communities almost independent. During the twelfth century, various disputes between the three cantons and the emperors united them more firmly, and they were accustomed, every ten years, to renew formally their alliance. Such was their situation at the death of Fredéric II, in 1250. From this period, or soon afterwards, commenced the interregnum in the empire: during that time of

^{*} As Saxo Grammaticus is an author but little known, and the passage in question is exceedingly curious, the reader will find it inserted at the end of this volume — It is but justice to add, that some persons question the authenticity of this passage, and suppose it to be spurious.

anarchy and confusion, the nobles and bishops endeavouring to extend their power, and to encroach upon the privileges of the people, Uri, Schweitz, and Underwalden, threw themselves under the protection of Rodolph of Hapsburg, who, in 1273, being chosen emperor, terminated the interregnum. Rodolph received a small revenue from these cantons, and appointed a governor, who had cognizance in all criminal causes, but expressly confirmed the rights and privileges of the people.

Rodolph, sometime after his accession to the imperial throne, listened to the ambitious sehemes of his son Albert, who was desirous to form Helvetia into a dutchy. For this purpose the emperor purchased the domains of several abbeys, and other considerable fiefs in Switzerland, as well in the canton of Schweitz as in the neighbouring territories.

The three cantons alarmed at this great increase of power, obtained a confirmation of their privileges, which, upon the death of Rodolph, was renewed by his successor Adolphus of Nassau. But when Albert was elected emperor, he refused to ratify their rights, and, in order totally to subdue the people, placed over them two governors, who committed many flagitious acts of tyranny and oppression.

Under these circumstances Werner de Staffach of Schweitz, Walther Furst of Uri, and Arnold de Melchthal of Underwalden, planned the famous revolution which took place January 13, 1308, and restored liberty to the three cantons; and Albert, as he was preparing to attack them, was assassinated by his nephew John of Hapsburgh.* In 1315, Leopold duke of Austria marched against the confederate cantons, at the head of twenty thousand troops, and, endeavouring to force his way into Schweitz at the pass of Morgarten, received a total defeat from thirteen hundred Swiss posted upon the mountains. If we may believe contemporary historians, the Swiss lost but fourteen men in this memorable engagement, which insured their independence. In the same year, the three cantons contracted a perpetual alliance, which was ratified at Brunnen, and is the grand foundation of the Helvetic confederacy. Such were the feeble beginnings of a league, since become so formidable by the accession of ten cantons, and by the additional strength of its numerous allies; and it is remarkable, that Switzerland is the only country which, on the one side, has confined the limits of the German empire, and, on the other, has set bounds to the French monarchy.†

The name of Schweitzerland, or Switzerland, which originally comprehended only the three cantons of Uri, Schweitz, and Underwalden, was afterwards extended to all Helvetia. It derived that appellation either from the canton of Schweitz, as having particularly distinguished itself in the revolution of 1308, and also at the battle of Morgarten; or because the Austrians called all the inhabitants of these mountainous parts by the general denomination of Schweitzers.

Switzerland was the rock on which the house of Austria split, during more than a century. Blinded with resentment against their former subjects, and anxious to recover their lost domains, the several dukes led in person considerable armies to subdue a nation, whose spirit was unconquerable, and to obtain possession of a country, which was easily defended against the most numerous troops. They neglected several opportunities of aggrandizing themselves in other parts, and, slighting what was more feasible, bent their whole efforts to acquire what in its very nature was unattainable. The consequence of this mistaken policy was, a succession of defeats, attended with a prodigious expence, and

the loss of their bravest troops, until at length, convinced of their error, they totally relinquished an attempt, in which they had expended so much fruitless blood and treasure. But although several emperors of that house occasionally made alliances with the Swiss cantons, yet it was not till the treaty of Westphalia that their independence was fully and finally acknowledged by Ferdinand III, and the whole empire.

The government of Uri and Schweitz is entirely democratical, and nearly the same. The supreme power resides in the people at large, who are divided into several communities, from which are chosen the councils of regency. In the Lands-gemeind, or general assembly, the Landamman, and the principal magistrates, are elected; and every burgher, at the age of fourteen, in the cantons of Uri and Underwalden, and of fifteen in Schweitz, consist each of sixty members, and reside at the capital burghs; in these councils the executive power is vested, and from their bodies the principal magistrates are chosen.

These two cantons contain, including their subjects, about fifty thousand souls, and in case of necessity could furnish above twelve thousand militia. All the Catholic cantons enjoy considerable subsidies from France. Every burgher, at the age of fourteen, in Uri, receives annually about six livres, or five shillings: the Landamman and the magistrates more in proportion. The canton of Schweitz being for some time discontented with France, withdrew its troops from that service: but this year (1776) the matter has been accommodated; and the king pays annually to every male child of a

burgher four livres, commencing from the time of his birth.

The same kind of soil, and the same productions, are common to the two cantons: the whole country being rugged and mountainous, consists chiefly of pasture, produces little corn, and has no vines. We cannot but observe with astonishment, to what a degree of fertility the natives have improved a land, naturally barren, and for which they fought with as much zeal and intrepidity, as if they contended for the richest plains of Sicily or Asia Minor. In these little democratical states, sumptuary laws are not necessary; for they scarcely know what luxury is. The purity, or (as some perhaps would call it) the austerity of morals, which still prevails among these people, cannot easily be imagined by the inhabitants of opulent cities; and I cannot reflect on that affectionate patriotism which so strongly attaches them to their country, without calling to mind that beautiful description of the Swiss peasant, in Goldsmith's Traveller.

"Dear is that shed to which his soul conforms, And dear that hill which lifts him to the storms: And as a child, when scaring sounds molest, Clings close and closer to the mother's breast; So the loud torrent, and the whirlwind's roar, But bind him to his native mountains more."

Every step we now advance, we tread, as it were, upon sacred ground; monuments continually occur of those memorable battles, by which the Swiss rescued themselves from oppression, and secured the enjoyment of their invaluable freedom. I am now indeed in the very centre of civil liberty; would I could add of religious too! but the church of Rome is here exclusively established. It must be acknowledged, however, that this intolerant spirit is not wholly confined to the Catholic cantons; for, in the Protestant districts, Calvinism is alone admitted: thus a nation, who prides herself upon her freedom, denies the free exercise of religion to every other sect except that which predominates. Is not this striking at the first principle, and most valuable privilege, of genuine liberty?

Long as my letter already is, I connot forbear mentioning a peculiar custom observed in some of these democratical states: every person who is chosen for a bailliage, or lucrative office, is obliged to pay a certain stipulated sum into the public fund. This practice is attended with one ill consequence at least; as the successful candidate is in some measure authorised to stretch his prerogatives, in order to swell the profits of his charge. Accordingly, it is a general remark, that in the common bailliages, the bailiffs appointed by the popular cantons are more apt to be guilty of exactions than those of the aristocratical republics. I am, &c.

LETTER XXVI.

Canton of Underwalden.... Sarne.... Saxelen.... Tomb and character of Nicholas de Flue....

Stantz... Engelberg.... Passage over the Suren Alps to Altdorf.

INSTEAD of proceeding, as in my former tour, from Lucern to Altdorf by water. I made an agreeable excursion to Sarne, Saxelen, and Stantz, in the canton of Underwalden, visited the abbey of Engelberg, and traversed the Suren Alps to Altdorf.

Having dispatched my baggage by water to Altdorf, I walked, in company with M. Meyer, member of the great council of Lucern, through a pleasant plain, lying between Mount Pilate and an opposite ridge of hills, to Winkle, a village situated on an inlet of the lake of Lucern. There I took boat, and rowing across the inlet, disembarked near Alpnach, in the canton of Underwalden, and continued along a foot way, which winds through enclosures of rich pasture land, browsed by numerous herds of fine cattle, and prettily chequered with scattered cottages. Having crossed a small river, I arrived at Sarne, the capital burgh of that division of the canton called Oberwalden, wherein the Land-rath, or supreme court of judicature, assembles for the purpose of deciding civil and criminal processes. This tribunal is composed of fifty-eight judges, who are chosen by the people, and continue in office for life. In criminal affairs of any notoriety, each of these is empowered to bring into court two individuals; and this tribunal, thus consisting of a hundred and seventy-four members, assembles in a large open hall in the town-house, and passes final sentence.

At Sarne I embarked upon the Aa, and ascending its stream entered the lake of Sarne, a piece of water about three miles long, and one and a half broad, pleasantly enclosed between the mountains, and its rising borders richly variegated with pastures and trees. I landed at Saxelen, which stands on its western shore; a neat village much frequented, as the native place of the celebrated saint and patriot Nicholas de Flue, to whose honour a church has been lately erected. The interior is ornamented in a pleasing style of architecture. Ten elegant columns of black marble support the roof; they are about twenty-four feet in height, and many of them of a single piece. They were hewn out of a quarry in the Melchthal, about nine miles from Saxelen, and dragged from thence by the peasants, who voluntarily performed this task, which they considered as an act of religious duty: a laborious enterprise, to convey such heavy burdens down steep precipices and over pathless rocks, where they could neither be assisted by horses nor

oxen!

Under a glass case in the midst of the church are deposited the bones of this favourite object of national worship, fantastically ornamented, according to the Roman Catholic custom, with gold and precious stones. His real burial place is still to be seen in
a small adjoining chapel; it is a simple grave stone, on which his figure is coarsely carved
in stone, the work of the age in which he lived. A little above this ancient monument
is placed another grave stone, bearing also his figure, executed in later times, less rude,

or lu-This e is in of his bailiffs

On entering this chapel I observed numerous pilgrims of both sexes, who were kneeling before his tomb, and praying with the greatest fervency; many, in the ardour of devotion, threw themselves between the two grave stones, and stretching themselves upon the most ancient figure, repeatedly kissed and embraced is

Nicholas de Flue, this object of national enthusiasm, was born at Saxelen in 1417. Descended from an ancient family, he signalized himself in defence of his country, and particularly during the war which the Swiss supported against Sigismond archduke of Austria. He was no less remarkable for humanity than valour. To his countrymen preparing to pillage and burn the convent of St. Margaret near Diessenhosen, he exclaimed, "if God grants you the victory over your enemies, use it with moderation, and spare those edifices which are consecrated to him." This remonstrance was attended with effect, and the convent was saved from destruction. To the most excellent qualities of the heart and understanding, to great political sagacity, he added the exterior graces of figure, dignity of character, and the most winning affability. Raised by his countrymen to high employments in the state, he repeatedly declined the office of landamman from motives of delicacy, because he disapproved the principles of the governing party. At length, hurried away by his detestation of evil, and a zeal for monkish devotion, he quitted his family in the fiftieth year of his age, and, retiring from the world in a fit of gloomy superstition, turned hermit. The place of his retreat was at Ranft, a few miles from Saxelen, where he built an hermitage and a small chapel, and practised all the severities required by that austere mode of life with the strictest ob-

But the flame of patriotism, although smothered in his breast by an ill-directed zeal for mistaken duties, was not extinguished; and he was the happy instrument in rescuing Switzerland from the impending horrors of civil discord. At the conclusion of the war with Charles the bold, Friburgh and Soleure having contracted an alliance with Zuric, Bern, and Lucern, the treaty was considered by Uri, Schweitz, Underwalden, Zug, and Glarus, as a breach of the former union. After various disputes and fruitless conferences, the deputies of the eight confederate cantons assembled in 1481 at Stantz, in

order to compromise the differences.

Both sides were so heated with mutual animosities, that the deputies were on the point of separating without effecting a reconciliation, and a civil war appeared inevitable. In this crisis of affairs, de Flue no sooner heard of the public dissentions, than his patriotism prevailed over his superstition; and he quitted his unprofitable hermitage to exert those active and public virtues, the lowest of which singly outweighs whole years of useless mortification. Accordingly this extraordinary man, though in the 64th year of his age, travelled during the night, and arrived at Stantz on the very morning in which the deputies were preparing for their departure. He earnestly conjured them to remain; and having prevailed upon them once more to assemble, he so forcibly represented the destructive consequences of disunion, that they chose him arbiter of the dispute. By his sole mediation all differences were amicably adjusted, and by his advice Friburgh and Soleure were instantly received into the Helvetic confederacy: such was the effect of his persuasive and conciliatory eloquence! Having thus happily composed the public dissentions, he returned to his hermitage, where he died, in 1487, in the 70th year of his age, regretted and esteemed by all Switzerland. Such a general opinion of his extreme piety prevailed among his contemporaries, that the bigotry of those times ascribed to him an exemption, from the common wants of human nature.

In the register of the church of Saxelen, the following notice is inscribed for 1485, the year antecedent to his death: "in 1417, Nicholas de Flue, a saint, was born in the parish of Saxelen; who afterwards retired into a desart called Ranft, where God sustained him during eighteen years, without eating or drinking for a long time, namely, when this was written; and he is now in good estate, and of holy life."

On his tomb is inscribed: "Nicholas de Flue quitted his wife and children to go into the desart: he served God nineteen years and a half without taking any sustenance.

He died in 1487."

This frivolous epitaph strongly marks the bigotted spirit of that dark age in which it was composed: the narrow-minded author, totally overlooking the patriot in the hermit, saw nothing so truly meritorious in the life of the deceased, as the suppression of those social energies which dignify human nature, in order to practise the debasing austerities of a superstitious religionist. He ought to have inscribed, "to the memory of Nicholas de Flue, who quitted this hermitage to appear in the world; who restored peace and harmony to the republics of Switzerland, and who served God by serving his country."

From Saxelen we intended to visit Ranft, de Flue's hermitage, and from thence to proceed down the Melchtal and over the mountains to Engelberg; but as the evening was already beginning to close, we durst not venture along so difficult a passage, which would have employed us at least five hours; we thought it therefore most prudent to continue our route towards Stantz. We followed the footpaths, which wind agreeably, sometimes through forests, sometimes over the fields and meadows; and passed through a fertile but wilder and more romantic part of the canton, than that which we traversed in the morning. We continued for some way at the foot of the Stantzberg, crossed a small plain formerly a lake, in which staples for mooring vessels are occasionally discovered; and in about three hours after our departure from Saxelen arrived at Stantz, in the dusk of the evening.

About three miles from Stantz is a small wood called the Kern-wald, which we traversed in our route from Saxelen; it would not be worthy of mention, did it not separate the canton into two divisions, called Oberwald and Underwald.* Formerly the whole canton was under the same general administration; but disagreements arising between the inhabitants of the two districts, they have since formed two republics, and have each their lands-gemeind, or general assembly, their landamman, and council of regency: for the management of external affairs there is a joint council, chosen equally by the two divisions; at the Helvetic diet they send but one deputy, and regulate their vote by mutual consent. Stantz is the seat of civil and criminal judicature, and it is worthy of remark, that every male of the age of thirty is permitted to give his vote

for the acquittance or condemnation of a criminal.

Stantz the capital of Underwalden, is situated in a beautiful plain of pasture, about two or three miles in breadth, at the foot of the Stantzberg, and at a little distance from the lake of Lucern. The town and environs, delightfully sprinkled with numerous cottages, are extremely populous, containing, perhaps, not less than five thousand souls. The church is a tolerably handsome building, and is decorated in the inside with ten black marble pillars of large dimensions, but not so beautiful as those at Saxelen. The women in these parts dress their heads in a singular manner, and extremely

unbecoming: they wear black-beaver cocked hats, similar to those of the men, with black ears to their caps, which almost conceal their hair.*

The next morning the abbot of Engelberg, previously informed of our intended visit. politely sent horses to Stantz; and we rode through a fertile valley, enclosed between the Stantzberg and a chain of hills, until we arrived at Graffen-ort, a small villa belonging to the abbot, about two leagues from Stantz. Here we began to ascend along a road winding by the side of a steep precipice, and through "unsunned forests" of beech intermingled with poplar, mountain ash, Spanish chesnuts, and pines, the torrent Aa impetuously foaming in a stony channel, and forming a succession of cataracts. The wild horrors of the circumjacent rocks, the incessant roaring of the waters, and the solitary gloom of the forest, reminded me of Gray's beautiful Ode on the Grande Chartreuse, in which he describes similar scenes with a sublimity and truth which every person of taste, who travels through these magnificent regions, must feel and admire:

*This tranquil and happy district became the scene of unexampled carnage, and the handful of natives who ventured alone to resist the aggression of the French were almost wholly exterminated. The inhabitants of Schweitz and Underwalden, being required to take the civic oath, sent deputies to Lucern, and afterwards to Arau, who appealed to the stipulations of the treaty granted by general Schawembourg. They were received with insult and indignity, and returned with the following answer: "You, as well as the other cantons, must take the oath; and you must further give up to us, alive or dead, nine of your principal leaders, and among them three of your clergy. Many hundreds more shall share the same fate. The consequences of your obstinary shall be held out as an example to the whole world."

Intimidated by this threat, Schweitz and the upper district of Underwalden complied with the injunction; but the message of the Swiss Directory having been read to a general assembly of the lower district, excited indignation and horror; and they unanimously resolved to be buried in the ruins of their country rather than surrender their fellow-citizens in so dishonourable a manner. About 1500 took up arms, and, without the smallest hope of forcign assistance, prepared to resist the whole force of the French, and to die rather than survive their expiring liberty. Having entrenched themselves on the borders of the lake, and at the entrance of the valley of Stantz, with their women and children, they firmly waited the attack. The French advanced to the assault in separate columns, some crossing

the lake in armed vessels, and others marching over the mountains.

On the 3d of September hostilities commenced; the French were repulsed in different onsets; on the 9th two vessels being sunk with 500 men, the French were intimidated, and refused to proceed, until a party, encouraged by the promises, and urged by the threats of Schawembourg, disembarked and forced the entrenchments. At the same time two other columns landed at different points, and the corps rushing from the mountains, fell upon their rear. The small but heroic band, shut up in a narrow defile, and surrounded by a force ten times their number, sustained the assault with unparalleled courage.

"Then began," says an eye-witness of this desperate conflict, "the battle and the carnage. Our rustic heroes fire on every side, fight foot to foot, rush among the enemies' ranks, slay and are slain. These mountaineers were seen pressing French officers to death in their nervous arms; old men, women and children, roused by the noble example, and catching the enthusiasm of their sons, husbands, and fathers, appeared throwing themselves into the midst of the French battalions, arming themselves with clubs, pikes, pieces of muskets, nay the very limbs of the human body, strewing the ground with carcasses, and falling with the satisfaction of having fought to maintain their native land free from a

The French, exasperated at this incredible resistance, put to the sword not only their opponents on the field of battle, but involved all whom they met in indiscriminate slaughter, and the valley from

one end to the other became a prey to pillage, flames, and carnage.

Two hundred natives of Schweitz, hearing the cannonade, were ashamed of having deserted their brethren, and hastily arming themselves, forced the post which the French had established at Brunnen, and towards the end of the day approaching Stantz, saw the conflagration, which showed the fatal event of the action. They devoted themselves to revenge the fate of their countrymen, and after exterminating above 600 of their enemies, fell on the field of battle.

This was the last conflict of expiring liberty in Switzerland; had the united Swiss acted with equal spirit, the country would yet have been free.

The fall of Underwald, by an eye-witness, Mallet, vol. ii. p. 40.

Per invias rupes, fera per juga, Clivosque præruptos, sonantes Inter aquas, nemorumque noctem.

Issuing from the dark forest, we descended for a little way, and unanimously broke into an exclamation of surprise and delight, as we suddenly looked down upon a picturesque plain of an oval shape beautifully wooded, watered by several lively streams, enclosed within a circle of gentle hills, and terminated by a majestic amphitheatre of "cloud-capt Alps;" toward the extremity of this plain the abbey, a large quadrangular building of stone, is situated at the foot of the Engelberg, or Mountain of Angels, from which the whole district takes its name. On alighting from our horses, the abbot politely received and conducted us into a large saloon, where soon afterwards dinner was served with all the plenty of feudal times, and all the comforts of the present age. The company at table consisted of the abbot, five or six benedictines, ourselves, and our servants, who, according to the custom of the place, sat down to the same hospitable board with their masters. This intermixture of society, the politeness of the worthy abbot, and the facetious cheerfulness of one among the fathers, rendered the repast as agreeable as it was uncommon. After dinner we visited the library, which contains about ten thousand volumes; and, among many rare editions, above two hundred printed in the fifteenth century. I noticed a much larger collection of modern historical and miscellaneous works than are usually found within the walls of a monastery, which does honour to the taste of the abbot, and proves him a warm friend to polite literature.

The weather being fine and clear I strayed about the environs, admiring the scattered hamlets, the beautiful tufts of wood, and the lively streams which murmur through the plain: of these, one called the Melt-bach, which I observed issuing copiously from the ground, begins to flow on the first melting of the snow in the month of May, and ceases towards the end of September, and the Griesen-bach, that rises at the foot of Mount Blake, runs only from mid-day to the setting sun. Several other torrents, that pour down from the neighbouring glaciers, and numerous springs that burst from the ground near the abbey, help to supply the Aa, which rushes from the Suren Alps, and, swelled with these tributary waters, hastens to throw itself into the lake of Lucern. The amphitheatre of cloud-capt mountains is formed by the Melkleberg, the Arniberg, the Blakeberg, the Spitze-stock, the Suren Alps with their brown peaks boldly rising from the bosom of the snow, the Engelberg towering in naked majesty, and, the most elevated and most beautiful in the whole chain, Mount Titlis, supporting on its top an immense

About seven in the afternoon we sat down to supper; in the midst of the repast we were suddenly struck with an awful thunder-storm, which, though it could not be called the music of the spheres, or such as, according to the legends of the abbey, was performed on the top of the Engelberg, by a choir of angels, at the consecration of the convent; yet produced a most sublime effect, when re-echoed by the surrounding mountains.

The abbot, chosen by a majority of sixteen benedictines, who compose the chapter, is sovereign lord over the land of Engelberg, a tract of country about sixty miles in circumference, and under the protection of Lucern, Uri, Schweitz, and Underwalden. The small plain in which the abbey is situated is the only habitable part of this district, and contains fifteen hundred souls; the remaining portion, being entirely mountainous, affords in summer a retreat to numerous herds of cattle. The abbot, to whom we were indebted for so polite a reception, is Leodigar Saltzman, a native of Lucern, who, since his elevation to his present dignity, has been a kind and indulgent master: finding many of his subjects extremely poor and indolent, he has excited them to industry; and in order to assist them during the winter months, when agriculture is suspended, employs them in winding silk, which he imports from Italy. He possesses very considerable

power, which renders him nearly absolute: in all criminal cases he arrests and imprisons; appoints the person who examines; can order, if he thinks it necessary, the infliction of torture, and can pardon or mitigate the sentence given by the tribunal of the country, called landsgericht. In civil causes his influence is very considerable; he appoints, from twelve candidates selected by the people, the seven judges, who, in conjunction with the thalamman and stathalter, form the landsgericht, which decides in the first resort: he can also displace them if he pleases, and absolutely nominates all the judges of the geistlichen-gericht, or ecclesiastical court, which receives appeals from the decisions of the former tribunal. His power is restricted in the following instances. If he is engaged in a law-suit with an individual, the award of the country tribunal is final, and if with the whole community, the question is decided by the four cantons of Lucern, Uri, Schweitz, and Underwalden.

His revenues amount to about 5000l. and are derived partly from titles of certain estates in the free bailliages of Switzerland, and from a few feudal rights, but principally from the exportation of cheese. Beside those which are made on the pastures belonging to the abbey, he purchases others from the peasants of his little territory, and disposes of the whole on his own account. About eighteen hundred cows, including the cattle of the convent, are possessed by the natives of Engelberg, and annually supply milk for about 10,000 cheeses, each weighing from 25 to 50 pounds, and selling, on an average, for 15 florins, or 1l. 5s. per hundred weight: and it may be calculated that the abbot circulates annually to the value of 4000l. This revenue, however, cannot be considered as his own private property; for he pays the current expences of the

The

On the 1st of April 1798 the respectable abbot resigned his sovereignty, in a letter to Mengaud,

the French resident in Switzerland.

"Citizen Minister We fulfil a duty highly agreeable to us, in forwarding to you the enclosed act, in which we voluntarily re-establish the people of the valley of Engelberg in their sovereign rites. We flatter ourselves that you will acknowledge in this conduct the purity of our intentions, and our extreme eagerness to render ourselves worthy of the French republic. We hope, Citizen Minister, that you will make our sentiments known to the Directory of the Great Nation, and recommend us to the continuance of its esteem and kindness. Health and respect!

> (Signed) LEODEGARIUS Abbot, and MAURICE MULLER Prior."

Mengaud returned this insulting answer, which announced the dissolution of their community: "I have read with pleasure your letter of the 1st of April, in which you announce the re-establishment of the people of the valley of Engelberg in their sovereign rights. I commend this natural restitution of antiquated usurpations, eternally contrary to those imprescriptible rights of nature, to the enjoyment of which men are indiscriminately called. This acknowledgment on your part of a sacred and unalienable principle, is without doubt of great value; and under this point of view, citizen monks, you are commendable; but be still more so. Do not wait till philosophy expels you from the asylum of indolence and inutility. Quit the livery of superstition, return to society, and display virtues sufficient to bury in oblivion those years which have been consecrated to monas'ic nullity.".....Moniteur, 8th Floreal.

The respectable abbot of Engelberg died of chagrin, soon after he received the insulting letter of Mengaud. The unfeeling conduct of the French agent, and the virtues of the venerable abbot, are described in a recent publication; and the truth of the account must forcibly strike the reader, as the author cannot be suspected of partiality to the aristocracy and clergy of Switzerland.

"With infinite concern I read that part of the letter which speaks of the death of the abbot of Engelberg. It seems this venerable priest did not long survive the violent attack of the commissary Mengaud.

"The image of the venerable abbot for ever fills my imagination. His letter to the French commissary was so unlike the message of a sovereign prince, of a neutral and independent power, that it was framed to have flattered the vanity, and softened the violence, of the most intrepid revolutionist. Alas! he had been no enemy to the French revolution!....he loved mankind too well to condemn an experiment in its favour: to promote general nappiness was the sole purpose of his life, and, while the Several ineffectual expeditions have been made towards attaining the summit of Mount Titlis, the most elegated mountain in these parts, and perhaps scarcely inferior to the Schreckhorn and Jungfrauhorn; it was for a long time considered as inaccessible: but, as tradition reported, that in the year 1739 three men had ascended, Freygrabend, a native of Engelberg, and physician to the abbot, a few days after my departure from the convent, succeeded in a similar attempt. The following account of this expedition is extracted from a German letter, written by the physician himself to a friend at Lucern:

"Early in the morning on the 14th of September, the weather being fine and clear, I set out with eleven companions, among whom were Jerom Dopler and Conrad Stocher, two friars of the convent. About two in the morning, after ascending through Gerschne, and Unter and Ober-laub, we reached, at break of day, the summit of the Laubergrat. Here we enjoyed a fine view over the canton of Underwalden, the lake and canton of Lucern, the free bailliages, and the canton of Zug. Having taken some refreshment, and reposed ourselves a quarter of an hour, we put on our crampons, and pursued our route, eager, like the giants of old, to scale the steep sides of Mount Faulblatten. We continued about an hour along the piked ridge of this mountain, tottering by the side of tremendous precipices, and twice climbing an ascent almost perpendicular. We could not observe any trace of the smallest vegetation. Having gained the highest point of the Faulblatten, we arrived at a glacier, which being fortunately covered with fresh snow, rendered the ice less slippery than usual.

"Hitherto our course was attended with some danger, but from hence we ascended and reached with little difficulty the top of the Titlis, called Nollen. But here we were obliged to cross a deep chasm, and to mount the sides of the ice, which were as perpendicular as a wall, by forming steps for our feet with the iron spikes of our poles: below us was a valley of ice about sixteen miles in length, descending rapidly towards Oberhasli. It was now about ten in the morning, and the sun was extremely bright. Having walked a few paces, the prospect was on all sides open and unbounded. The sublime, yet dreary scene, though it surpasses all description, made an impression on my mind which I shall never forget.

"Here the painter and poet would find ample and endless employment, if the colours of the painter and the conceptions of the poet could resist the effects of the extreme cold. The first objects which caught our attention, were the Alps of the Vallais, Bern, and Savoy, with their glaciers and vallies of ice; a majestic and tremendous scene. Among numerous mountains which rose before us, Mont-Blanc, though at some distance, reared its head above the rest; near us towered the Schreckhorn, Wetterhorn, and Jungfrauhorn, but less elevated in appearance than the point on which we stood. Below us we observed a valley of ice about two miles in breadth, and of such immense length, that one extremity seemed to join Mont-Blanc, and the other to be closed

abbot of Engelberg existed, there was at least one sovereign prince who lived only for his people; who for them had corrected the frugality of nature; who had formed a paradise on the icy confines of the world; who had excluded the moral winter of the soul, and, while the tempest raged without, had opened a spring of happiness in every heart; * * * * *who had not only scattered blessings in profusion, but made his people participators of his power." * * * *who had not only scattered blessings in profusion of the good old abbot was not proof against such a rude compound of ignorance.

"The gentle spirit of the good old abbot was not proof against such a rude compound of ignorance and inhumanity. He appeared fitted for the enjoyment of a long and virtuous old age, but has sunk prematurely to the tomb! The remembrance of his virtues will be for ever embalmed in my heart; he sleeps secure from farther insult; but his convent becomes the prey of revolutionary inquisitors." ... Sketches of the State of Manners and Opinions in the French Republic at the Close of the Eighteenth Century.

of the

by the Titlis. To the cast, the Rothstock, the Plangen, and the mountains of Uri, neither so wild nor so clevated as those to the south; and towards the north-west, the eye reposed itself over the less dreary and more cultivated parts of Switzerland, as far as the borders of Alsace and Suabia. Immediately below us we noticed the abbey, and heard the sound of several mortars, which the abbot ordered to be fired as a signal that we were also seen: by means of a small telescope I observed the fire and smoke, and five minutes elapsed before the sound reached us, not in a straight direction, but recehod between the surrounding rocks. We had proposed to kindle a fire, and to let off some hand-grenades, but the cold prevented us from striking fire. Not being able to support its extremity more than three quarters of an hour, although the sun shone very bright, and we kept ourselves in continual motion, we placed a black flag on the highest point.

"We were as fortunate in descending as in mounting. We came to the Unter-Titlis at half past eleven; to the Laubergrat at one, where we again took some refreshment, and having let off our grenades, reached the abbey at five in the afternoon. We felt no permanent inconvenience from this expedition; our faces were only swelled, and our skins peeled, from the reflection of the sun, and for some hours after my return to Engelberg, I lost my sight and my hearing, both which however I soon recovered. Undoubtedly the Titlis is the highest mountain in Switzerland, excepting Mont-Blane, to

which it is not much inferior."

It is to be regretted, that this expedition was only a mere effort of curiosity, and that the ingenious physician carried with him neither thermometer nor barometer. His assertion that the Titlis is higher than any mountain in Switzerland, will, for this reason, and without farther proofs, admit of much doubt; its elevation, though very considerable, must be greatly inferior to that of Mont-Blanc, as will appear by considering that the expedition from the plain of Engelberg to the top of Titlis was performed in eight hours; whereas Dr. Paccard and James Balma employed fifteen in attaining the summit of Mont-Blanc; and the place from which they took their departure is probably much higher above the level of the sea than the valley of Engelberg.

August 25. Travellers, in going from Engelberg to Altdorf, usually return to Stantz or Buochs, embark on the lake of Lucern, and proceed the rest of the way by water; but as I had already visited those places, I preferred following the route across the mountains. The morning being obscure and rainy, we were detained till nine o'clock, when the weather clearing up I set out, in company with Messrs. Balthazar and Meyer, of Lucern. Passing through the plain of Engelberg, we admired on our left a fine waterfall, which precipitates itself from Mount Engel, and in about a league arrived at a cottage belonging to the abbey, where we found two peasants employed in making cheese, and regaled ourselves with some excellent cream. From this point we mounted gently by the side of the Aa, leaving on the right the high Suren Alps, whose pointed tops occasionally burst forth, amid the clouds and vapours; about a mile from the cottage we quitted the abbot's horses, walked up a gradual ascent, passed a superb cataract of the Aa, and reached a chapel noted in these parts for a small bell, which, according to tradition, was the gift of a French traveller. Near this chapel we observed a hut, which is in the canton of Uri, from whence the ascent was steeper, but not difficult; we crossed many drifts of snow, and were incommoded by a keen wind and frequent showers of sleet, hail, and rain. At length, in about four hours after our departure from the abbey, we reached a cross planted on the highest point; from this elevation we should

liave enjoyed a most superb view, greatly admired by travellers, on one side towards Uri and the chain of the St. Gothard, and on the other towards Engelberg, and the lake of Lucern, had not the weather totally obscured the prospect. From this point

the Titlis is much extolled for its beautiful and majestic appearance.

From hence we descended the Enkeberg into a most barren region, amid a harvest of pointed rocks, and over numerous drifts of snow, and fallen fragments of stone, intermixed with small patches of russet herbage, which contributed to increase the dreariness of the scene. Our descent continued above an hour and an half, along a bare slippery rock of slate, or in the bed of torrents, or over large masses of ice and snow, when we observed several huts scattered in a small plain. From their first appearance we concluded that we should presently reach them, but the precipices were so steep, the paths so rugged, and the distance so much greater than we at first imagined, that it employed us above an hour and an half.

The little valley, in which these huts are situated, is called Wald-nacht Alp, contains a small quantity of underwood, and feeds a hundred and thirty-three cows, beside a few sheep, goats, and hogs. The persants employed in tending the cattle and making cheese, usually arrive on the 20th of June, and remain about a hundred days. The owner of the hut in which we dried our clothes; makes every day during that period

two cheeses of twenty-five pounds each, from the milk of eighteen cows.

Having taken some refreshment, and recovered our fatigue, we continued along the valley through some groves of poplars and firs, and at its furthest extremity came to a single cottage seated on an eminence, the first house on this side which is habitable in winter. A little further we had a prospect of the town and environs of Altdorf; the fertile valle of Schackeren, which, though a very steep ascent, yet from this elevation seemed a level plain; the lake of Uri, which looked like a small rivulet; and the distant mountains reaching beyond the St. Gothard. The descent, through rich fields and pastures, was extremely steep and tedious, as the grass was rendered slippery by the rain, and we did not arrive at Altdorf till seven in the evening, wet and exceedingly fatigued, but much pleased with our expedition. This passage from Engelberg to Altdorf is estimated at seven leagues. A chasseur may perform it in four hours; a traveller accustomed to mountains, in six; and a person unused to such fatigue, will require eight or ten hours.

LETTER XXVII.

Valley of Schoellenen...Devil's Bridge...Valley of Urserea...Valley and mountain of St. Gothard...Sources of the Tesino and Reuss.

St. Gothard, Aug. 9.

SWITZERLAND is a most delightful country, and merits the particular observation of the traveller, as well for the diversity of the governments, as for the wonderful beauties of nature; but the impositions of the inn-keepers, and the difficulty of procuring horses,* are inevitable taxes for the enjoyment of these its delights. These little in-

*I would recommend to all travellers who traverse the canton of Uri in order to visit the Alps, either to hire horses at Lucern, or to be peak them against their arrival at Altdorf. If we fortunately had not taken the latter precaution, we should have found no less difficulty in procuring horses in 1785 than in 1776; notwithstanding all the good offices of our landlord at the Black Lion, who, knowing that I was the author of Letters on Switzerland, was extremely anxious to wipe away certain aspersions which, in the beginning of this letter, seem to glance at his native town. The two Mr. Cliffords, whom we met at Engelberg, and who to our great satisfaction, accompanied us in our tour as far as Geneva, were obliged to pursue their journey on foot, not being able to procure more than one horse, which was appropriated to their baggage.

conveniences, however, should be borne with patience and good he want; nor will I trouble you with any splenetic complaints of those unpleasant circumstances which

must occur to all travellers.

Quitting Altdorf, we passed at first through a fertile plain of pasture, in which the inhabitants, were employed in mowing the second crop of hay, and in about nine miles began ascending. The road winds continually along the steep sides of the mountains, and the Reuss sometimes appeared several hundred yards below us; here rushing a considerable way through a forest of pines, there falling in cascades, and losing itself in the valley. We crossed it several times, over bridges of a single arch, and beheld it tumbling under our feet, in channels which it had forced through the solid rock; innumerable torrents roaring down the sides of the mountains, which were sometimes bare, sometimes finely wooded, with here and there some fantastic trees clothing the sides of the precipice, and half obscuring the river. The darkness and solitude of the forests, the occasional liveliness and variety of the verdure, immense fragments of rock blended with enormous masses of ice; crags of an astonishing height piled upon one another, and shutting in the vale; such are the sublime and magnificent scenes with which this romantic country abounds.

Near Wasen is the valley of Meyen; the torrent that dashes through it, and falls into the Reuss, forms a series of grand cataracts, which the traveller may enjoy by venturing to the edge of the precipice, and supporting himself against an impending pine that

overlooks the gulf.

We set out this morning early from Wasen, a small village where we passed the night; and continued advancing for some way up a rugged ascent, through the same wild and beautiful tract of country which I have just attempted to describe. We could scarcely walk a hundred yards without crossing several torrents, and rolled with violence from the tops of the mountains. This being one of the great passes into Italy, we met many pack-horses laden with merchandise; and as the road in particular parts is very narrow, it required some dexterity in the horses to pass one another without jostling. These roads, impending over precipices, cannot fail of inspiring terror to travellers, who are unaccustomed to them; more particularly as the mules and horses do not keep in the middle of the tract, but continue crossing from the side of the mountain towards the edge of an abyss, then turn aslant abruptly; thus forming, if I may so express my-

self, a constant zig-zag.

Thus far the country appeared to be tolerably well peopled; we passed through several villages situated towards the bottom and less narrow part of the valley; the sides of the mountains were occasionally strewed with cottages, covered with forests, or enriched with pastures. Still continuing to ascend, the scenery beyond Wasen suddenly changing, became more wild and desert; there were no traces of trees, except here and there a stubbed pine; the rocks were bare, craggy, and impending; not the least sign of any habitation, and scarcely a blade of grass to be seen. We then came to a bridge thrown across a deep chasm over the Reuss, which formed a considerable cataract down the shagged sides of the mountain, and over immense fragments of rock which it has undermined in its course. This bridge is called Teufels-bruck, or the Devil's Bridge. As we stood upon the bridge contemplating the fall and listening to the roar of the cataract, we were covered with a spray, which the river threw up to a considerable height. These are sublime scenes of horror, of which those who have not been spectators can form no perfect idea: they defy the representations of painting or poetry.*

^{*} Many travellers have been disappointed on the first view of the Devil's bridge. It ought therefore to be remarked, that the bridge itself, though of difficult execution, is a triffing object, and not so stupen VOL. V.

Not far from this desolate landscape the road led us into the Urner-loch, a subterraneous passage cut through a rock of granite,* which opened at the opposite entrance into the screne and cultivated valley of Urseren: the objects that presented themselves were a village backed by a high mountain, and a wood of pines; peasants at work in the fields, cattle feeding in the meadows, and the river, which was lately all foam and agitation, now flowed silently and smoothly; while the sun, which had been hidden from us in the deep abyss, shone in its full splendour. In general, there is a regular gradation from extreme wildness to high cultivation; but here the transition was abrupt, and the change instantaneous; it was like the lifting up of a curtain, and had all the effect of enchantment.

In this valley are four villages, Urseren, Hopital, Realp, and Zundorf; forming a small republic under the protection of Uri. The territory of this little commonwealth is about nine miles in length and two in breadth, and contains thirteen hundred souls. The people elect, in their general assembly, their Talamman or chief, as also some other magistrates; and there is a permanent council of fifteen members, who assemble in each of the different districts. The inhabitants enjoy great privileges, but are not absolutely independent: for, in civil causes, an appeal lies from their courts of justice to Altdorf, and in criminal proceedings, two deputies from the government of Uri are present at the trial, and deliver to the judges of the valley the opinion of the Council of Altdorf.

Notwithstanding the considerable elevation of this valley, and the coldness of the air even at this season of the year, it produces excellent pasture. The only wood therein is the small plantation of pines above the village of Urseren, which is preserved with uncommon care and reverence, and a small quantity of underwood and stubbed willows, that feather the banks of the Reuss. In the adjacent country there are several mines of crystal, of which a considerable quantity is exported. The language of the natives is a kind of provincial German, but almost every person speaks Italian.

dous as many others in Switzerland; and that it is the wild and majestic scenery that astonishes and exalts the beholder. This bridge was destroyed by the French in 1799, and the torrent was passed by Marshal Suwarof and the Russians, when he made his famous retreat.

Perhaps the reader will not be displeased to contemplate Suwarof's picture of this sublime scenery, in his dispatch to the emperor of Russia, dated Feldkirch, Oct. 3. O. S.

"Our army left the frontiers of Italy regretted by all the inhabitants, but with the glory of having liberated that country, and traversed a chain of dreadful mountains. Here St. Gothard, the colossus of mountains, surrounded by clouds impregnated with thunder, presents itself to our view; there the Vogelberg, striving, as it were, to eclipse the former in terrific grandeur! All dangers, all obstacles are surmounted; and, amidst the combat of elements, the enemy cannot withstand the brave army which suddenly appears on this new theatre; every where they are driven back. Your imperial majesty's troops penetrated the dark mountain cavern of Urseren, and made themselves masters of the bridge which joins two mountains, and justly bears the name of the Devil's bridge. Though the enemy destroyed it, the progress of the victorious troops was not impeded; boards were tied together with the officers scarfs, and along that bridge they threw themselves from the highest precipices into tremendous abysses, fell in with the enemy, and defeated them wherever they could reach them. It now remained for our troops to climb Mount Winter, the summit of which is covered with everlasting snow, and whose naked rocks, surpass every other in steepness. Almost buried in mud, they were obliged to ascend through cataracts rolling down with impetuosity, hurling with irresistible force huge fragments of rock, and masses of snow and clay, by which numbers of men and horses were impelled down the gaping caverns, where some found their graves, and others escaped with the greatest difficulty. It is beyond the powers of language to paint this awful spectacle of nature in all its horrors."

* This passage was hollowed in 1707, by Peter Moretini, a native of Val-Maggia, at the expense of the inhabitants in the valley of Urseren. It is nine feet in breadth, ten in height, and two hundred and twenty in length.

The valley of Urseren is a small plain surrounded by high mountains, covered with pasture terminating in barren rocks, in many parts capped with snow. Near the middle of this beautiful plain we turned to the left, and entered the valley of St. Gothard, filled with the ruins of broken mountains; the Reuss, a most rapid and vehement torrent, bursting through it; on each side immense shattered blocks of granite, of a beautiful grayish colour (and of which the summits of these Alps are composed) confusedly piled together.

The valley of St. Gothard, though not so wild as that of Schoellenen, is yet exceedingly dreary. It does not contain a single shed, or produce a single tree; and the sides of the mountains are barely sprinkled with short herbage. The extremity is closed by the still ruder and naked rocks of the Feudo, supporting in its hollow vast masses of snow, while the superb glacier of the Locendro towers above the adjacent heights. It is about two leagues from Urseren to this place; but the road, considering the ruggedness of the rocks and the steepness of the ascent is not incommodious; it is from nine to twelve feet broad, and almost as well paved as the streets of London.

We are now lodged at a house inhabited by two Italian friars from the convent of Capuchins at Milan, who receive all strangers that pass through these inhospitable regions. One of the friars is absent, so that I am in possession of his bed-chamber: it is a snug little room, where a man may sleep very well without being an anchorite, and which, after the fatigues of our journey, I enjoy with a satisfaction much too sensible to envy the luxury of a palace. Our host has just supplied us with a dinner, consisting of delicious trout, with which the neighbouring lake of Locendro abounds, eggs and milk,

together with excellent butter and cheese; both made in this dreary spot.

Upon our arrival we were rejoiced to find a good fire; the weather being so exceedingly cold, that I, who was only clad in a thin camlet coat, entered the house half frozen. It is singular to find, at the distance of only a day's journey, such a difference in the climate: the air is absolutely in a freezing state; and I just now passed by a boy at work, who was blowing his fingers to warm them. If the cold is so piercing in the midst of summer, how intolerable must it prove in December? The snow begins to fall the latter end of September; and the lakes about this spot are frozen during eight months in the year.

I am just returned from visiting the sources of the Tesino and the Reuss, which rise within a short distance of each other. The Tesino has three principal sources in the chain of the St. Gothard. The first is a spring near the foot of the Prosa, entirely covered with frozen snow, or, when that is melted, with fallen fragments of rock, through which it trickles in numerous currents, that unite and help to form a small lake; from this piece of water it communicates with two other lakes, and issues in a more consider-

able torrent.

The lake of La Sella, in another part of the eastern chain, supplies the second source; the third is furnished by the snows of Mount Feudo. These three sources uniting with another branch, that flows from the Furca through the valley of Bedreto, form one great torrent, which takes its course towards the south, enters the lake of Locarno, and, traver-

sing part of the Milanese, falls into the Po. .

The source of the Reuss is the lake of Locondro, an oblong piece of water about three miles in circumference, stretching between the mountains of Petina and Locendro, and almost entirely supplied by the immense glaciers which crown the summit of the Locendro. The stream issuing from this lake rushes down the valley of St. Gothard, and, joining in the vale of Urseren the two branches which come from the Furca on one

side, and from the Grison mountains on the other, flows towards the north into the lake

of Lucern, and from thence throws itself into the Aar.

Within a day's journey is the source of the Rhine in the Grisons, and about the distance of three leagues, that of the Rhone in the Furca, which mountain we shall pass tomorrow. We are still surrounded by high rugged rocks, and inaccessible glaciers, so that our view is much confined; though I walked above a league towards Italy, in hopes of enjoying an extensive prospect over that delightful country, yet I could observe

nothing but rocks, precipices, and torrents.

I am at this instant near * seven thousand feet perpendicular above the level of the sea: no inconsiderable height, most certainly. Nevertheless, if I give credit to those who assert, that this mountain is the loftiest point in Europe, I should raise myself in idea above twice as high; but I have reason to think, that this opinion is founded upon false calculations. Mikeli, who measured the principal mountains of Switzerland, but who is very inaccurate in his calculations, considers the St. Gothard as the highest; and he estimates its elevations above the sea at 17,600 feet. But, so far from being of that height, it is by no means the highest ground of Switzerland; and there is probably not one mountain either in Europe, Asia, or Africa of that altitude. According to general Pfiffer, the summit of the St. Gothard rises above the sea 9,075 feet; an elevation considerably less than that of Ætna and Teneriff, and still more inferior to several mountains in the great chain of Alps, to which we are bending our course.

August 1785.

On my entrance into the little plain in which the friar's house is situated, although the air was exceedingly keen, I did not experience that piercing cold which I felt in 1776; but the day was fine, and the sun shone unclouded. When we arrived at the house the friar was saying mass to an audience of about twenty persons, many of whom come from the neighbouring Alps, where they are tending cattle, to divine service on Sundays and festivals. At the conclusion of mass, the friar, whose name is Francis, immediately recollected, and received me with great satisfaction. He is well known to all travellers that pass this way, having already inhabited this dreary spot above twenty years. Since my last expedition, he has considerably enlarged his house, and rendered it extremely commodious. It contains at present, besides several sitting-rooms, kitchens, and an apartment for the family, nine small bue neat bed-chambers appropriated to travellers. The expence of this addition has already amounted to 300l. part of which he collected in various districts of Switzerland; an equal sum is required to discharge the present debts, and to make the further necessary improvements, which he hopes to procure by another collection.

Friar Francis obligingly accompanied me about the environs, and favoured me with the following particulars, in addition to my former account: The chain of mountains which immediately surrounds this place takes the general appellation of St. Gothard, and its particular parts are called by different names; of which the principal are the Salla, Prosa, and Surecha, to the east; the Feudo, the Petina, and the Locendro, to the west; to the north, the Ursino; and to the south, the ridge of naked and piked rocks of the Val-Maggia. Of these the Feudo is the most elevated: its highest point rises more than 2000 feet above the plain in which stands the friar's house, and requires

^{*}According to M. de Saussure, the spot upon which the house of the Capuchin friars is built, is 1,061 French toises above the sea.

three hours to reach it. There are six pastures on the neighbouring heights, on which are fed two hundred cows, a hundred and fifty goats, and thirty horses.

On examining at mid-day Reaumur's thermometer, placed in the shade in a northern aspect, I was much surprised to find that the mercury stood at & above freezing point, or 46 of Fahrenheit, although the northern wind was exceedingly keen, and, if I had judged from my own feelings, I should have concluded that the air was in a freezing state.

About four years ago the elector of Bavaria sent to the friar several barometers, thermometers, and other meteorological instruments, which enabled him to note the variations of the atmosphere, and to form a series of observations. In the most extreme cold he ever experienced in these parts, the mercury in Reaumur's thermon.eter fell to 19 degrees below freezing point, or-10 of Fahrenheit.

In 1784. Greatest heat on the 13th of September, it stood at 13, or 61½ of Fahrenheit. Greatest cold at—17, or $8\frac{1}{2}$ of Fahrenheit.

M. de Luc's barometer never rose higher than Or fell lower than

It appeared from observations made in 1784, that the average state of the thermometer and barometer was as follows:

LETTER XXVIII.

Passage and Glacier of the Furca Source of the Rhone.

Munster in the Vallais, August 11, 1776. I ARRIVED here late yesterday evening, and so fatigued that I was incapable of writing, but I am this morning refreshed with a comfortable sleep, and in spirits to continue my journal. I took leave of our host at St. Gothard, and walked alone, for about two leagues, down the valley. I frequently quit my party, and either go on before, or loiter behind, that I may enjoy uninterrupted, and with a sort of melancholy pleasure, these sublime exhibitions of nature in her most awful and tremendous forms. I entered the valley of Urseren at Hopital, and was again struck with the strong contrast between that cultivated vale and the desolate country I had just quitted. At the same time I enjoyed a most sublime view of the high chain that encloses the vale of Urseren, and particularly noticed the towering rocks which stand in the country of the Grisons, one of them supporting on its rugged top a glacier, from which the Rhine takes its rise. We passed through the small village of Zundorf, and stopped at Realp, to procure some refreshment, and bait our horses. From thence we soon reached the extremity of the valley of Urseren; where we began ascending a path so narrow, steep, and rugged, that I suspected we had missed our way, as it seemed almost impracticable for horses; upon their arrival however I mounted, being fatigued with my walk from St. Gothard to Realp. It was a single path, up a steep mountain, where a horse, with some dexterity, could just put one leg before the other: this path sometimes lay upon the edge of a precipice, very craggy and stony; where, if my steed had happened to stumble, we must both inevitably have perished. But as I knew he was no more inclined than myself to roll down the precipice, I flung the bridle upon his made, and entrusted myself to his direction. Nor had I any reason to repent of my confidence; for, in the bad and dangerous parts, he never once tripped; where it was smoother and safer, indeed, he knew he had a licence to be more careless.

We came at length to a torrent, through which we drove our horses with some diffionly, and crossed it by means of a plank; a little farther we arrived at another, deeper and more violent, over which there was no bridge, nor the least appearance of any track on the other side; it was a considerable distance from any habitation, and our guide unacquainted with the road. After some observation we discovered that the mountain had lately fallen down, and overwhelmed the path, leaving only a very faint narrow track on the side of the precipice, along which my companions scrambled upon their hands and knees. While I was crossing the torrent on horseback, I heard a scream, and, turning round, saw one of our servants seized with a panic on the very edge of the precipice, and vehemently exclaiming, that he could neither get forwards or backwards. Nevertheless, with some assistance, he passed over, declaring, at the same time, that he would take care never to put himself again in a similar situation. We now regained a kind of path, but so extremely steep that we prudently dismounted, and suffered the horses to make their own way. With much difficulty, and, after crossing several large drifts of ice and snow, the torrents at the same time rumbling under our feet, we reached, by a very steep ascent, the summit of the Furca. A number of rugged and forked rocks piled one above another have occasioned, it is said, this chain to be called the Furca. The country immediately around was as dreary and desolate as the valley of Schoellenen; all vegetation seemed to have ceased; Lower down, the mountain's were covered with herbage and sweet-scented flowers; near us, but higher on the left, between the Blaueberg and the Lugnetz, lay a large body of ice, from which issued a torrent,* probably one of the first sources of the Rhone. In a word, the majestic objects that presented themselves to our view, formed a most astonishing and sublime scene.

From hence we descended broken rocks and craggy precipices for a considerable way. By this time I was so much fatigued, that I was glad to sit down and take some refreshment, consisting of bread, cheese, and hard eggs, the only provision we could procure at Realp. We were seated by a stream of clear water ripling down the side of a mountain so exceedingly steep, that our humble repast would have rolled away if it had not been supported. In full view before us was the glacier of the Furca; an immense valley of ice, extending at least three miles in length and near a mile in breadth, between the Gletcherberg and the Satzberg, rocks more shagged, if possible, than any of the neighbouring mountains: it stretches from their feet, fills up the intervening chasm, and reaches almost to their summits. The rays of the sun caused it to glisten like crystal, while the blue tints reflected on the surface appeared inexpressibly beautiful. The ice seemed to break in several parts, as we heard some loud and deep cracks; the torrent

[•] I was informed by a friar of Realp, who travels much in these parts, that this torrent, which is turpid in summer, is in winter as transparent as the clearest spring; and that when the countd, con of the snow prevents it from flowing under the glacier of the Furca, it then forms a lake, runs over the ice, and rushes to the Vallais with the waters it receives in its course.

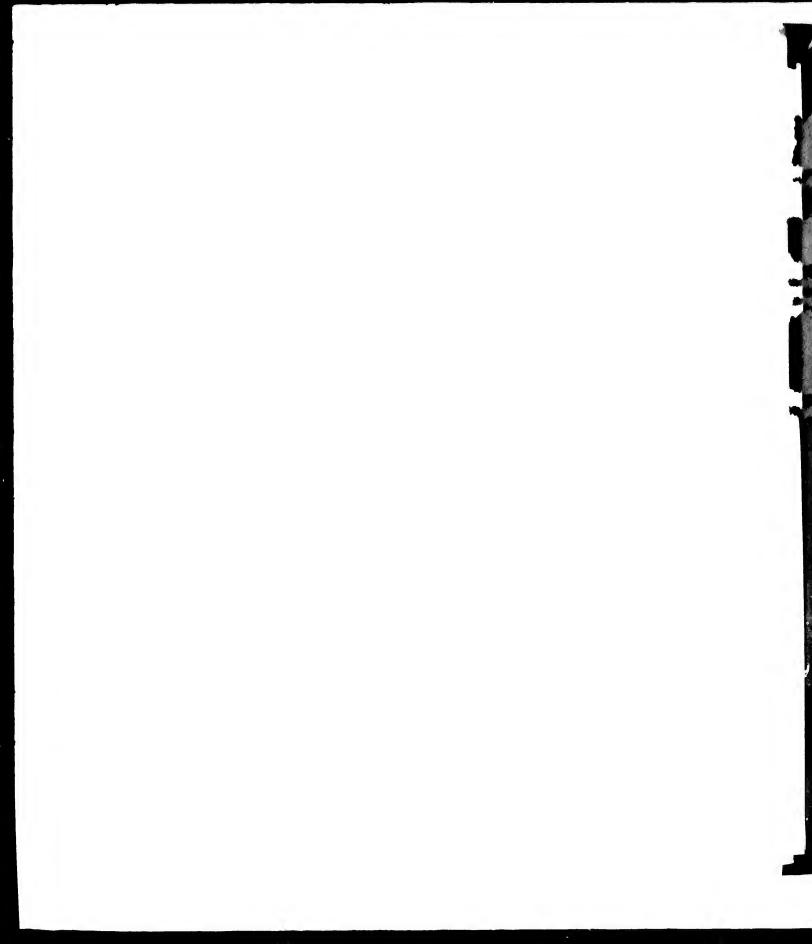

Sothard to dexterity, edge of a imble, we than myted myself in the bad er, indeed,

of the Rhone at the same time roaring beneath. That river is chiefly formed by this glacier: the small torrent, which bursts from the body of ice between the Blaueberg and the Lugnetz, being joined by several streams, loses itself under the vast arch of ice that forms the bottom of the glacier, issues considerably augmented, and is the great and principal source from whence the Rhone takes its rise. The range of mountains on which we were setting was overspread with underwood and herbage, and some cattle were feeding along the heights: a fine contrast to the sterility of the opposite chain, which appeared for some extent nothing but bare rock, except where it was covered with

ice and frozen snow.

Having finished our banquet, and reposed ourselves for a short time, in contemplation of the scene, we descended to the bottom of the glacier, where we admired the Rhone breaking forth with violence from the bed of ice, near the huge fragments of a fallen We now followed the course of that river, and proceeded down a mountain so steep, that several parts of the road winding along its sides were frequently parallel to each other. The scenery of the valley, which we now entered, was of the same nature as that of Schoellenen; the Rhone foaming with amazing rapidity, and falling in a continual cataract at the foot of irregular and immeasurable Alps. We travelled through this vailey above two leagues, perpetually ascending or descending the rugged sides of rocks; one moment close to the river, and the next some hundred yards above it. At first, the rocks were either bare, or studded with a few straggling pines, but as we advanced, became more and more clothed with wood and verdure; still, however, we observed no traces of any habitation, and we had now measured at least fifteen miles from the valley of Urseren, without seeing a single dwelling. I was here so struck with the beauty of the forests and the luxuriance of the pasture, that I could not avoid expressing my astonishment, on observing no appearance of any habitation in these delightful spots. I had scarcely made the remark, when four or five cottages, situated on the other side of the Rhone upon a beautiful declivity, announced our approach to the Vallais. Not long afterwards we unexpectedly came to an opening, which commanded an extensive view of that fertile vale, containing several scattered villages. In this very spot, a peasant of taste has built his cottage. Here we quitted the rugged track, and descended into the Vallais.

We had proposed passing the night at Oberwald, after the fatigues of the day, but upon hiquiry, found no refreshment. The master of a little hovel, which was called an inn, pointed to a large cheese, and told us that was all his provision: it was his bread, his fish, and his meat. As there was no better accommodation at Obergestlen, we continued our route to Munster, where we did not arrive till late; here we found an excellent inn for this country, which afforded good bread, and even some meat; but, what was far more comfortable to me, a quiet room and a clean bed. I am &c.

LETTER XXIX.

Mount Grimsel.... Source of the Aar.... Of the Chamois.

Spital upon the Grimsel, August 11-THE Vallaisans are remarkably attached to their liberty. On quitting Munster this morning we joined company with a peasant, with whom we had a long conversation. He demanded our opinion of the country; and, pointing to the mountains, exclaimed, "Behold our walls and bulwarks; Constantinople is not so strongly fortified." This upper part of the Vallais, I should imagine, is not much frequented by travellers, if we may judge from the curiosity of the people, who all came out to gaze upon us; and, on discovering that we were Englishmen, they observed us with greater attention. But what surprised us was, that the peasant above-mentioned inquired concerning the state

of our war with the Americans.

After returning about a league through the same fertile and well-cultivated country which we traversed yesterday, we left the plain, and ascended the Grimsel; one of those Alps which separate the Vallais from the canton of Bern. We employed four hours in climbing a steep and craggy road to the summit, and should have considered the attempt as scarcely practicable, had we not been encouraged by the experience of yesterday. We crossed the several shades of vegetation: in the valley, and the lower parts of the mountain, corn and rich meadows: then forests of larch and pine; next short grass, together with several species of herbs, that afford exquisite pasture to the cattle; to these succeeded the various tribes of mosses and lichens; then bare rock and snow. It would be curious to construct, or at least to imagine, a scale of vegetation, according to the iden of a French writer; who asserts, that excessive cold and excessive heat are equally pernicious. The tops of these mountains are barren, and produce no plants; and at certain heights nothing but mosses and lichens will vegetate: the same occurs in climates where the heat is intolerable; as no other vegetable productions are observed in the burning sands of Africa. The lichens and mosses then, which support the cold better than other plants, would form the first degree of a scale adjusted to determine how far vegetation accords with the temperature of the atmosphere. The same families of plants, as they bear also the heat much better than any other, would occupy the last degree in the scale. Thus, according to this fanciful scale, the two extremes touch each other surprisingly.

From the top of the Grimsel we descended about two miles, and arrived at a small plain or hollow in the midst of the mountains; containing one solitary hovel, from which I am now writing to you. Notwithstanding its wretched appearance, we found in this desert spot all the accommodations we could wish for, except beds, and these are the less necessary, after our sound sleep last night. Not to mention excellent cheese, butter, and milk (our ordinary fare) we obtained some good wine, a small portion of kid, and a boiled marmot,* which we have just devoured; although at another time we should have revolted at the very idea. The landlord is stationed in this forlorn region by the canton of Bern, and resides in it about nine months; he usually arrives here on the first of March, and retires in the beginning of December. When he quits the place, he leaves a certain quantity of cheese, hard bread, salted provision, and fuel, in case any unfortunate wanderer should happen to come this way in winter; and we observed long poles fixed on both sides of the track at small distances from each other, in order to point out the path to travellers, who may chance to pass this mountain after the snow has begun to fall. The road is seldom open for horses before the first of June. Near the house, upon the top of a small rock, our host has contrived a kind of little garden, by bringing some earth from the neighbouring pastures: this small piece of ground supplies him tolerably well with turnips and cabbages; although, on account of the height of the circumjacent mountains, it does not long enjoy the warmth of

the sun.

Numerous herds of goats are kept, during the summer months, upon these mountains: they are let out every morning to feed, and return every evening before sun-set, to be milked and housed. It was a pleasing sight to observe them marching homeward

^{*} See an account of the marmot, in letter lxx.

mounun-set, neward

mth of

in the same herd, and following each other down the broken precipices, and along the rugged sides of the rocks.

This hovel, besides the store-houses for cheese, contains only a small kitchen, a bedchamber appropriated to the family, and a room, in which we are now sitting. We occupy nearly one side: the other is taken up by our servants, the landlord and his wife and half a dozen honest labourers: the latter are partaking of their homely supper, with all the relish of well-earned hunger, and are enjoying a short respite from their

toil, with that noisy mirth which characterises this class of people.

The sources of the Aar are in these mountains. Near our hovel are three lakes that supply that river, which rolls down in an impetuous torrent from the neighbouring glaciers. While dinner was preparing, we walked by the side of the Aar, searching for crystals, which are very common in these parts: we found pieces of divers colours, white, black, yellow, and green. These mountains certainly abound also in rich veins of gold, and other metals; a considerable quantity of gold-dust being found in the bed of the Aar,* and in the various torrents. I can conceive nothing more fatal to the interests of Switzerland nor more repugnant to the liberties of the people, than to have these mines of gold or silver traced and opened. A sudden overflow of riches would effectually change and corrupt their manners: it is an incontestable truth, that the real power of a country, not ambitious of conquest, is derived less from the wealth than from the industry of its subjects: the happiness of a people, as well as of an individual, consisting in contentment.

What a chaos of mountains are here heaped upon one another! a dreary, desolate but

sublime appearance: it looks like the ruins and wreck of a world.

On the Grimsel, August 29, 1786.

You will recollect that, in 1776,† I described the passage of the Furca as extremely difficult and attended with some danger. But that was my first essay over the less frequented Alps. How different are our sensations at different intervals! To-day, on measuring the same ground, though I did not find the road as smooth as a bowling-green, I yet never once dismounted, but rode with my letters on Switzerland in my hand occasionally making notes and observations: it must, however, be confessed, that in many parts, where a faint path along the crags and impending precipices was scarcely obvious, my situation was not very favourable for accurate composition.

From the top of the Furca, instead of immediately descending and pursuing the same road which I followed in 1776, we sent our horses forwards, and ascended the Galleberg to the upper part of the Glacier of the Furca: from thence we looked down upon the Valais and the Rhone flowing through it, as upon a small field watered by a rill; above and around, and as far as the eye could reach, we observed numberless pointed Alps, and particularly that stupendous chain called the Aar-Gletchers, which comprises, among many others, the Finster-aar-horn, the Wetter-horn, the Jung-frau-horn, and the

Schreck horn.

The upper part of this glacier of the Furca is far more beautiful than the lower extremity; the snow is of a more virgin white; the pyramids of ice more bold, and the blue tints more lively and animated. Having enjoyed, in different directions, this icy scene, we descended near the edge of the glacier, and refreshed ourselves with some water from two transparent springs called Aughstweitcht-brunnen, that burst from the

^{*} It has been suggested to me, that no gold-dust is found in the Aar, until it has received the Reichenbach.

VOL. V.

sides of the rock, at a small distance from each other. We then went down a very steep descent, till we joined the track which I pursued in 1776. I recollected with a pleasing satisfaction, the torrent near which we took on that occasion our humble repast, and came to the Rhone about half a mile below the spot where it bursts in two streams, from the bottom of the glucier. In order to have a nearer view, we crossed the two streams, which, though scarcely three feet in depth, rushed with such violence, as almost to overturn the guide who conveyed me on his shoulders. Having admired the arch of ice, and paid our obeisance to the majestic habitation of the River-God, we walked at the foot of the Statzberg, and noticed several lively springs issuing from the ground, which the inhabitants call cold-waters, and a little further three warm sources.* These sources, uniting with several cold springs, fall within a few paces of their rise, into the great torrent that flows from the glacier, and are usually considered as the true sources of the Rhone. That honour is appropriated to these little rills, because, being of an equal temperature in all seasons of the year, they do not owe their origin, like the cold waters, to the melted snow and ice, and are as abundant in winter as in summer. It appears, however, extremely inconsistent to dignify these little streams with the exclusive title of the sources of the Rhone: for that river undoubtedly owes its origin and greatness to the perpetual and inexhaustible supplies from the surrounding glaciers.

We had now employed above nine hours in this expedition, and should have continued much longer amid these majestic scenes, had not the declining sun reminded us of approaching night. Being still at a considerable distance from any habitation, we continued our route, and began ascending the Grimsel, near the warm sources. The track, though extremely steep, and almost perpendicular, was not dangerous, because the rocks were thickly covered with small shrubs, herbage, and mosses.

After an hour and a quarter's tedious assent, we attained the summit of the Grimsel, and descending a rugged ridge of granite rocks, looked down upon a lake, from which

⁹ I am indebted to Saussure for correcting a triffing error in a former edition of this work, in which I observed that the mercury in Reaumur's therm, meter stood at 10 above freezing point, or 55 of Fahrenheit; but that ingenious naturalist, on plunging the thermometer into one of these sources found the mercury stand at 14½ or 64. 7. of Fahrenheit.

The experiments which Saussure made in analysing the waters, shall be inserted in his own words i "La hauteur de cette source est, d'apres mes observations du barometre, de 900 toises au-dessus de la Mediterrannee. Or, il est si extraordinarie de trouver une source chaude a une tell elevation, et de la trouver au milieu des glaces, qu'il etoit interessant de rechercher sa nature, et de voir si cette recherche ne donneroit point d'indication sur la cause de sa chaleur.

"Dans ce dessein, j'y portai, en 1783, quelques reactifs, avec de petits verres, que je lavai dans l'eau meme de la source, et j'en fis l'epreuve sur les lieux. La solution de soude ne la trouble en aucune maniere, non plus que l'acide du sucre, phenomene bien rare, et qui prouve que ces eaux ne contiennent aucun sel a base terreuse. Mais la solution de terre pesante dans l'acide marin, ou le muriate de baryte, la trouble un peu; ce qui indique la presence de l'acide vitriolique; et comme d'un autre cote, cette eau ne change nullement les couleurs vegetales, et qu'ainsi l'acide ne paroissoit point etre libre, il est vra isemblable qu'il y est combine avec un alkali, et qu'ainsi c'est du sel de glauber ou de sulfate de soude que ces eaux contiennent. Ensin la dissolution d'argent dans l'acide nitreux, la trouble sur le champ, et apres une demi heure de repos, la liqueur se separe en deux parties; celle de dessus, qui forme les \(\frac{3}{4} \) du verre, est grise et opaque, tandis que celle du fond paroit d'un rouge transparent. Il suit de la que ces eaux contiennent du soufre, mais plutot sous la forme de vapeur, que dissous par une terre, puisque l'acide nitreux libre n'y occasionne ni precipite ni changement de couleur.

"En la favourant avec attention, j'y reconnus un gout legerement sulfureux, et mon domestique, qui n'etoit point prevenu, le reconnut egalement. Il est donc vraisemblable, que cette eau, vraiment thermale, doit, comme les autres, sa chaleur a quelqu'amas de pyrites qui se rechauffent en se decomposant lentement dans le scin des montagnes. Les tremblements de terre, si frequents dans le canton d'Uri, sur les frontieres duquel ces sources sontsituees, rendent plus probable encore l'existence de ce foyer.

Saussure, Voyages dans les Alpes, tom. iii. p. 483, 484.

A little further we passed several small rills and dark lakes which supply the Aar; in less than an hour entered the road which leads to the Vallais, and reached the place of our destination, the same hovel on the Grimsel, where I passed the night on my former expedition. We arrived there about eight in the evening, after a journey which employed us more than twelve hours. I was much struck with the view of the lake near the Inn: it is of a dark appearance, and its name is as melancholy as its aspect: it is called the "Lake of the Dead," because the dead bodies of those who perish in traversing these unhospitable regions, are usually thrown into it.*

No situation can exceed the solitary horror of the scenery on the top of the Grimsel. Its appearance resembled the inside of a mine, and seemed as if the bowels of the earth had been violently rent asunder; reminding me of that sublime description in the Æneis, when the inside of Cacus's cave is instantaneously laid open by the arm of Hercules.

At specus, et Caci detecta apparuit ingens Regia, et umbrosæ penitus patuere cavernæ. Non secus ac si qua penitus vi terra dehiscens Infernas reseret sedes, et regna recludat Pallida, Diis invisa; superq; immane barathrum Ceruatur, trepidentque immisso lumine manes.;

On entering the hovel I immediately recognized the same landlord, who was stationed here in 1776, to whom, at that time, I never expected to owe a second reception in so forlorn a spot. While supper was preparing, a peasant and our guide, forgetful of his great fatigue, suddenly started up at the sound of their favourite air, the Renz des vaches, played upon a rebec by a shepherd, and danced several allemandes, perfectly in time, and not without grace; a picturesque group of spectators looking on and applauding.

August 30. This morning we made a short excursion to the source of the Aar, which takes its rise in neighbouring glaciers. In less than half an hour we entered a small plain, skirted by high mountains, and entirely closed by a rugged chain of Alps, over which tower the Finster-Aar and Lauter-Aar-horns, and at whose feet stretches a glacier so entirely covered with earth and stones, as to bear, at a small distance, the appearance of a sand-hill. From this glacier issues a "torrent roaring loud" of troubled waters, which is the source of the Lower Aar, and joins, in a few hundred paces, another stream called the Upper Aar, that falls from the Zinkeberg; the union of these torrents forms the Aar, which rushes with great impetuosity over enormous fragments of rock. At present it runs in a narrow channel; but at the first melting of the snow in spring, overflows the whole space between the mountains, and becomes a temporary lake.

* Saussure, vol. iv. p. 462. † Dryden's Virgil, Book viii.

The court of Cacus stands reveal'd to sight;
The cavern glares with new-admitted light,
So pent, the vapours with a rumbling sound
Heave from below, and rend the hollow ground.
A sounding flaw succeeds; and from on high
The gods with hate behold the nether-sky;
The ghosts repine at violated night,
And curse the invading sun; and sicken at the sight.

Our guide is a chasseur, who frequently ranges over this vast chain of Alps in pursuit of the chamois, an animal remarkable for its activity in scouring the craggy rocks, and leaping over the precipices. He informed me that this glacier is the extremity of a valley of ice about twelve miles in length, and from one to four in breadth: it then divides into two branches; one extends towards the Schreckhorn, and the other towards the Vallais. He expatiated with great enthusiasm on the profession of a chasseur, though extremely laborious, and at times dangerous. He usually kills from fifteen to sixteen chamois in a year: with the flesh, which is very delicate, he helps to support his family, and disposes of each skin for a guinea. He uses a rifle-barrelled gun, and generally shoots them at the distance of three or four hundred yards.

The chamois are very timorous, and consequently watchful animals. They usually go out in herds of twenty or thirty; while they are feeding, one of them posted on an adjacent height stands centinel, and is relieved at short intervals by another. The centinel looks around with great solicitude, and on the least suspicion of danger alarms the herd by a shrill cry; instantly the whole troop decamp, one following the other.

The chamois feed on various kinds of herbage, and particularly on the Lichen Rangiferinus, or rein-deer lichen, which is found in such great quantities, as in many parts to cover the summits and sides of the mountains. In order to procure their favourite food in winter, they, like the rein-deer, clear away the snow with their fore-feet, frequently thawing it with their breath, for the purpose of loosening it more easily. But when, either from the depth or hardness of the snow, they cannot penetrate to the lichens, they browse on the saplings of pine and fir. In summer their bodies are of a yellowish brown, and whitish under the throat; the hair is short and smooth; in winter their coat lengthens and grows dark, so as to resemble that of a bear. Sometimes, but very rarely, they have been found speckled, or of variegated colours, and lately a chamois entirely white was shot upon the Engelberg. It was in all other respects similar to a common chameis, and it is uncertain whether it owed its colour to age or accident.

Linnæss has classed the chamois in the goat genus, under the name of rupicapra, or mountain-goat; his acquaintance with the antelopes having been too slender to enable him to form a genus of antelopes, which Pallas first constructed, and where he has judiciously placed this animal. The example of Pallas has been followed by Pennant and succeeding zoologists. I am, &c.

LETTER XXX.

Valley of the Aar ... Land of Hasli ... Meyringen.

August 1776.

I FOUND the cold upon the Grimsel more piercing than upon the St. Gothard, and last night it even deprived me of sleep. But then circumstances were very different in the two lodgings; for on the St. Gothard I had a comfortable bed, whereas last night I lay in the hay-loft, without any covering: I declare, my blood has scarcely recovered its circulation. Take notice, this is the twelfth of August.

Having quitted our wretched abode on the Grimsel, we passed along the valley of the Aar, through a chain of wild, rugged, and uninhabitable Alps.

The road along this valley, though much narrower than that from Altdorf to the St. Gothard, is formed in the same manner along the steep acclivities and declivities, sometimes laid on arches, and sometimes carried over bridges thrown across tremendous precipices. It is paved with flat pieces of granite, so smooth and slippery, that the horses

would have perpanally stumbled, had they not been rough-shod. In some places this road ran along the bare and rugged ridges; in others, down steps, either cut in the rock, or formed by large stones, so that for several paces it resembled a stair-case. The whole surface of the valley was thickly strewed with vast fragments of rock; while those which still hung on the sides of the mountains seemed threatening to overwhelm us; the river, during the whole way, thundering along in a continual fall. This valley exhibits the same kind of scenes to which we have been long accustomed; except that the Aar rushes with more impetuous rage even than the Rhone or the Reuss, and is frequently so swelled with torrents as to ravage all the adjacent country: we saw many traces of these terrible devastations. We crossed it in several places, over stone bridges of a single arch, one of which equalled, in the length of its span and dreariness of the landscape, the Devil's Bridge in the valley of Schoellenen. About three leagues from Spital we had a glimpse, through the trees, of the Aar falling from a considerable height. In order to gain a nearer view, we climbed along the sides of a steep roan, rell covered with moss: I leaned against a tree that impended over the precipice, and saw the river rushing from the rock, and spreading into a kind of semicircular expansion in its descent. It fell with fury into a deep and narrow gulf, and then lost itself in the midst of the forest. The body of water was very considerable, and its perpendicular fall at least one hundred and fifty feet. The scenery was also solemnly majestic; the gray rocks on each side rising perpendicularly, and totally bare, except their tops, which were fringed

This picturesque scene appeared to realize a favourite image of classic antiquity: as I viewed the Aar pouring its flood of waters from a crevice of the rock, I figured to myself

the Nile or the Tyber bursting at once from the urn of a River God.

In our way to Meyringen, we traversed large forests of beech and pines, the Aar roaring along the valley, and the road, which was usually craggy and rugged, incessantly ascending and descending. We now passed through several small villages, which afforded a pleasing sight, after the desolate country we had lately quitted, and entered a beautiful little valley of a most lively verdure, and delightfully planted. All was calmness and repose; neither rapid river nor roaring torrent to interrupt the unusual stillness and tranquillity of the scene. This short interval of silence rendered us more sensibly affected with the turbulence of the Aar, and the loud clamour of the cataracts.

From this silent and sequestered spot, we descended to a larger valley on the banks of the Aar. Perhaps no other part of Switzerland would yield more delight and occupation to the landscape-painter than this picture que valley, from the agreeable and everchanging colour of the rocks which bound it, their summits finely broken into irregular and fantastic forms, and from the variety and size of the fragments dispersed near the banks of the river. Each fragment, each cottage, each shed, each shrub, is a picture; the effect being considerably heightened by the transparency of the air, and the grandeur

of the back-ground.

I have now visited the sources of three great rivers in Switzerland, and traced their impetuous progress through a tract of country, in which nature has exhibited the grandest and most august of her works. But it is impossible adequately to describe these majestic and astonishing scenes! In description they must all appear nearly the same; yet, in fact, every river, cataract, rock, mountain, precipice, are respectively distinguished by an infinite diversity of modifications, and by all the possible forms of beauty, magnificence, sublimity, or horror. But these discriminating variations, though too visibly marked to escape even the least observing eye, elude representation and defy the strongest powers of the pen and pencil. In a word, you must not judge of this romantic

country from the faint sketches I have attempted to delineate; they can no more convey an idea of these wonderful scenes, than if I were to aim at describing the pictures of Claude and Salvator, by informing you that they are composed of paint and canvass.

Meyringen, a large and neat village, is the capital burgh of Hasiland, a district in the canton of Bern, which enjoys considerable privileges. The people are governed by their own magistrates, and only take oaths of fidelity to the sovereign council. All the authority, which the bailiffs in the other parts of this canton enjoy, is possessed in a great measure by the Landamman, who resides at Meyringen. He is always a native of Hasiland, and is appointed by the sovereign council of Bern, at the recommendation of the bailiff of Interlaken. Most of the other magistrates are elected by the people, who assemble as occasion requires, and are convoked by the Landamman.

The inhabitants are a fine race of people: the men in general remarkably strong and well made; the women tall and handsome. The women have an elegant manner of wearing their hair, which is commonly of a beautiful brown: it is parted on the top of the forehead, from thence brought round and joined to the locks behind, which either hang down their back in long tresses, are braided with ribband, or woven round the head in a simple plait.

Meyringen is situated near the Aar, in a romantic vale, surrounded by meadows of most luxuriant verdure, and sprinkled with cottages, which are occasionally separated by huge intervening stones and deep channels, the vestiges of storms and floods. Close to the village, the torrent Alp-bach falls from Mount Housli, in two perpendicular cascades, but with so much violence, and in so large a body of water, as to cause frequent inundations: indeed the burgh itself has been in danger of destruction by its repeated ravages; against which, however, it is now protected by a wall of considerable height and solidity. Near this torrent another fall of water, the Dorf-bach, glides gently down the bare rock; further on, the Millebach glistened as it descended, through a hanging grove of pines, that feather the sides of the mountain.

As I stood on a platform of rock, about fifty feet above the bottom of the Alp-bach, I looked over the delightful vale of Hasli, observed Mount Sheidec rising from the banks of the Aar, and sinking in one part, us if on purpose to discover three tremendous peaks towering in regular gradation: the one a naked conical rock; the second tapering and sprinkled with snow; and the third, which is the highest point of the Wetterhorn, of a pyramidal form, mantled with glistening ice.

The following is the ordinary price of provisions throughout the mountainous parts of Switzerland.

By this list you will perceive, that bread is much dearer in proportion than the other articles, and the reason is obvious; for these mountainous parts abound in pasture, but produce little corn. The peasants, inhabiting the mountainous districts of Switzerland, live chiefly upon milk and potatoes. I had to-day a long conversation with one of our guides; he lives upon the mountains of Uri; and, as the winter lasts near eight months, each family lays in sufficient provision for the whole time. His own family consists of seven persons, and is provided with the following stores: seven cheeses, each weighing twenty-five pounds; a hundred and eight pounds of hard bread; twenty-five baskets of potatoes, each weighing about forty pounds; seven goats, and three cows, one of which is killed. The cows and horses are fed with hay, and the goats with the boughs of fir, which, in a scarcity of fodder, are given also to the other cattle. During this dreary season, the family are employed in making linen and cloth: for this purpose a small part of the ground belonging to each cottage is generally sown with flax, which has lately been much cultivated, and with increasing success, in the mountainous districts.

The houses, like those of Appenzel and Glarus, are generally of wood; and it was a natural observation of one of our servants, in passing through a continued chain of rocks, that as there was no deficiency of stone, it seemed extraordinary to employ wood alone for the purposes of building. But it may be remarked, that these wooden houses are sooner constructed, and easily repaired; and being formed in a compact manner, with small rooms, and low ceilings, are sufficiently warm even for so cold a climate. The chief objection arises from the danger of fire; which, however, is in some measure obviated by the method of building their cottages detached from each other. But this observation does not hold with respect to some of their largest burghs, which are exposed to the ravages of this dreadful calamity. I am, &c.

LETTER XXXI.

Fall of the Reichenbach....Passage of the Sheidec....Valley and Glaciers of Grindelwald.

Grindelwald, August 13.

WE left Meyringen this morning, crossed the Aar, and ascended the Sheidec through a beautiful forest of beech, poplars, mountain-ash, and pines. About two miles from Meyringen we dismounted at a small village, and passed along some fields, in order to view the fall of the Reichenbach, which is deservedly celebrated for its variety and beauty: it has its source at the foot of the Wetterhorn, and rolls in numerous cataracts down the steep sides of Mount Sheidec, until it joins the Aar mear Meyringen.

The fall may be divided into three principal parts.

The first, which alone is usually visited by travellers, precipitates itself from an overhanging rock, is reduced into spray and foam, and in that state falls in a perpendicular column, from an elevation of at least two hundred feet, into a natural basin, and is soon lost in the abyss beneath. The rock itself is concave, arched, totally bare, excepting its summit, which is feathered with shrubs, and being of black marble, forms a striking contrast with the pure whiteness or the descending foam. Part of the spray rebounds on the rock, and glides gently into the basin in many a silvery current.

The second catalact begins from the overflowing of the basin, and is most advantageously seen from a large tree hanging on the side of the precipice; the torrent forms a second perpendicular column, which is half obscured as it dashes through a chasm of projecting rocks. The best point of view for seeing the third catalact is in a meadow at the bottom of the second. From that situation the whole Reichenbach seems one

immense water-fall; the bottom of the first, and the top of the second cataract, being concealed by the intervening hills. From thence it rolls nearly in a horizontal direction; is divided into two streams by a rocky island beautifully sprinkled with trees, and impetuously descends in two unequal bodies. It then dashes over broken crags of black marble, through groves of beech, mountain-ash, and pines, and rich grounds interspersed with hamlets.

On viewing the various parts of this stupendous fall, I was as much interested and affected as Aristæus is represented by Virgil, when his mother Cyrene points out to him the sources of the principal rivers bursting at once from the earth.

From hence ascending by the side of the Reichenbach, we crossed that torrent over a bridge, and having traversed several plains, or rather undulating vallies, beautifully sprinkled with ash, poplar, and other large trees, continued our route at the foot of some enormous mountains, which are called by the general name of Wetterhorn,† or Stormy Peak. This enormous group, which forms the Wetterhorn, is peculiarly striking, from the naked majesty and grandeur of its rugged peaks, and from its insulated situation, and because, in passing from Meyringen to Grindelwald, it presents itself the first of this stupendous chain.‡

With wond'ring eyes he views the secret store Of lakes, that pent in hollow caverns roar; He hears the crackling sound of coral woods, And sees the secret source of subterraneous floods; And where, distinguished in their sev'ral cells, The fount of Phasis and of Lycus dwells; Where swift Enipeus in his bed appears, And Tiber his majestic forehead rears; Where Anio flows, and Hypanis profound Breaks thro' th' opposing rocks with raging sound; Where Po first issues from his dark abodes, And, awful in his cradle, rules the floods.

Dryden's Virgil, Georg. book iv.

† The several peaks of this mountain have different appellations, and are not ascertained without much difficulty, the peasants usually mistaking and confounding them: One is called the Wetter-horn, another the Nager-horn, a third the Engel-horn, and the highest point takes the denomination of Jungfrau-horn, or Virgin-horn, for the same reason as the mountain of that name in the valley of Lauter-bruennen, because its summit is inaccessible. Hence several travellers have mistaken this peak for the real Jungfrau-horn. I have mentioned these circumstances, in order to prevent the confusion of names puzzling future travellers as they once puzzled me. The word horn in German, which bears the same signification as in the English tongue, is applied to the highest peaks, as in French aiguille, or needle.

‡ To those who go from Grindelwald to Meyringen, the Wetter-horn is the last of this chain. Hence the traveller will not perhaps be so much affected with its majesty and grandeur, as if he first observed it in ascending from Meyringen. I mention this circumstance, because all descriptions are comparative

ract, being putal direct trees, and gs of black nterspersed

sted and afout to him

rent over a beautifully ot of some or Stormy king, from I situation, first of this

thout much thorn, anon of Jungof Lauteris peak for enfusion of h bears the aiguille, or

n. Hence observed it mparative Having ascended about three hours from the time of our quitting Meyringen, we refreshed ourselves and our horses in a delightful vale strewed with hamlets; a sloping hill, adorned with variegated verdure and wood, on one side; on the other, the Rosenlavi and Schwartz-wald glaciers stretching between impending rocks; and before us the highest point of the Wetterhorn lifting its pyramidal top capped with eternal snow. As we were taking our repast, we were suddenly started by a noise, like the sound of thunder, occasio d by a large body of snow falling from the top of the mountain, which, in its precipitate descent, had the appearance of a torrent of water reduced almost into spray. These avalanches (as they are called) are sometimes attended with the most fatal consequences; for when they consist of enormous masses, they destroy every thing in their course, and not unfrequently overwhelm even a whole village. The best preservative against their effects being the forests, with which the Alps abound, there is scarcely a village, if situated at the foot of a mountain, that is not sheltered by trees, which the inhabitants preserve with uncommon reverence. Thus, what constitutes one of the principal beauties in the country, affords also security to the people.

We continued our course at the foot of the Wetterhorn, which in this part is so extremely perpendicular and tapering as to appear like half of an immense pyramid. Here we conceived it impossible that any scenes could be more rude and majestic than those before us; but on reaching the top of the Scheidec, we burst upon a view so far exceeding them in wildness and horror, that we unanimously exclaimed, "There is the Schreckhorn, or Peak of Terror." The descent from hence to Grindelwald is gentle but tedious. That village, consisting of numerous cottages, dispersed over the plain and upon the rising hills, exhibits an agreeable and picturesque scene, heightened at the same time by a view of the vallies of ice, which stretch along the steep sides of the moun-

tains in a regular curve, and are beautifully skirted with wood.

The two vallies of ice, which extend into the plain of Grindelwald, are called the Superior and Inferior Glaciers. The former lies between the Wetterhorn and the Mettenberg: the latter between the Mettenberg and the Eger-horn. The Mettenberg is the base of the Schreckhorn; and the Eger-horn, or Pointed Peak, borders on the valley of Grindelwald, and slopes gradually from barren rocks and snow to fertility and cultivation.*

August the 14th.

DARE I confess to you that I am somewhat disappointed, and that a nearer view of the glacier has not sufficiently compensated for the fatigue and trouble of the expedition? But I have promised to write from my own feelings, and not to send an account taken

from exaggerated descriptions.

We sallied forth this morning full of impatience, and arrived at the bottom of the Inferior Glacier, forming a majestic arch of ice, from which issued a loud torrent of snow-water. This glacier is composed of numerous pyramids, which are more elevated towards the plain; being from about forty to fifty feet high, and gradually shortening, until they terminate in a broad surface broken into deep and wide chasms. We mounted a very difficult path at the edge of the frozen region, occasionally passing over the steep and craggy parts of the rock almost perpendicular, along the very sides of the precipice, the danger of which makes me shudder even now. This glacier is several miles in length, and is supposed by many travellers to join the glacier of the Aar, which I vi-

vol. v. 5

[•] For a further account of this chain of Alps, which are contiguous to the vallies of Grindelwald and Lauterbruennen, see Letter on the chain of Alps observed from Bern.

sited in my expedition to the top of the Grimsel. But the reverend Mr. Wyttenbach of Bern, who has frequently examined its direction from the adjacent heights, assured me that those two glaciers are separated from each other by a chain of mountains.

After employing above two hours in ascending, we were prevented from continuing our progress by rugged rocks, and a rising hill of ice; our guide assuring us at the same time that it was impossible to proceed. Of this we were by no means convinced; but not having any conductor who could lead the way, and not daring to explore these unknown regions alone, we descended with heavy hearts, much disappointed that what we had seen, though certainly a very curious and sublime sight, did not equal our expectations: it added to our chagrin, on being afterwards informed, that though we could scarcely have proceeded further in the direction which we took, yet that if we had followed another path we might have penetrated to the Superior Glacier, and reached the base of the Schreckhorn. In that part between the mountains, now occupied by the Inferior Glacier, there was formerly a road which communicated with the Vallais, but at present impassable; and a spot was pointed out to us, now covered with ice, where once stood a small chapel.

Not far from this glacier of Grindelwald, pines, willows, ash, and oaks, grow and come to perfection; and near the borders of the ice I gathered strawberries and wild cherries, and observed hazel nuts, barberries, and mulberry-trees. The valley of Grindelwald is extremely fertile; it produces barley, rye, hay, hemp, and fruit-trees in great abundance, and feeds above two thousand large cattle. I am, &c.

LETTER XXXII.

Valley and Glaciers of Lauterbruennen Fall of the Staubbach.

A TOLERABLE road leads from Grindelwald to this place, and we met a cart, which to us is become a remarkable object, not having seen any thing moving upon wheels since we quitted Lucern. The country is pleasingly diversified with hanging woods, immense rocks, deep precipices, and violent torrents. But I suppose you are by this time as much accustomed to rocks, precipices, and torrents, as the readers of Fingal to blue mists and hollow winds.*

The valley of Lauterbruennen is embosomed in the midst of the Alps. The western boundary, from which the Stubbach fells, would, in any other country, be called an enormous mountain: it here appears only a trifling hill in comparison with the opposite chain, of which the highest point is the beautiful Jungfrau-horn, that stretches in a semicircular direction, and, towering above the adjacent peaks, rises to a stupendous height.

We are now lodged at the house of the clergyman of Lauterbruennen; a little village, or rather collection of cottages, sprinkled, like those of Grindelwald, about the valley and accessible parts of the hills. Near the house is the celebrated fall of the Staubbach, from which I am just returned. This torrent rolls perpendicularly from so considerable a height, and resolves itself into fine spray; the greater part falls clear of the overhanging mountain during its whole descent; but the remainder dashes about

^{*} A nearer and more interesting, but more difficult passage, conducts over the Sheidec from Grindelwaldto Lauterbruennen. In my second tour, I proposed traversing this passage and had actually set off for that purpose; but a violent shower obliging me to change my resolution, I continued my journey along the same road as before.

It may be proper to apprise the traveller, that there are two Sheidees, the one separating the vallies of Grindelwald and Meyringen, the other those of Grindelwald Lauterbruennen.

half way against a projection of the rock, and flies off with great violence. The clergy-man measured a short time ago its perpendicular height, and found it nine hundred and thirty feet. The sun shining in an opposite direction, a miniature rainbow was reflected towards the bottom of the fall; while I stood at some distance, it assumed a semicircular figure; as I approached, the extremities gradually coincided, and formed a complete circle of the most brilliant colours. In order to have a still finer view, I ventured nearer and nearer, the circle at the same time becoming smaller and smaller; and as I stood quite under the fall, it suddenly disappeared. When I looked up to the torrent, it resembled a cloud of dust, and from this circumstance it takes its name: Staubbach signifying, in the German language, a spring of dust. I paid for my curiosity, by being extremely wet; but then I had the satisfaction, at the same time, of seeing a rainbow in miniature: no uncommon phenomenon, however, as it may be observed in any cascade upon which the rays of the sun fall in a certain direction. In the present instance, however, it was some consolation to me that the object happened to be peculiarly striking.

The next morning we rode to the extremity of the vale, in which there are some noble points of view, and ascended to the glaciers, stretching from the feet of the Breithorn and Gross-horn. In this delightful valley many streams* of the clearest water gush from the earth like small rivers, and numberless torrents precipitate themselves from the mountains. I noticed two in particular, which fall from a greater height than even the Staubbach; but as their descent is not so direct, they are less extraordinary.

After mounting above three hours we reached a small hut, which in summer is inhabited by herdsmen, who make excellent cheese, and tend numerous herds of cows, goats, and swine. Here we feasted upon cold chamois, which our host had provided for us, and concluded our repast with a desert of delicious cream. From thence we ascended still further, with considerable difficulty arrived at the borders of the glaciers, and were entirely surrounded by rugged and almost impassable rocks. We wished to proceed; but our host assuring us that we had only time to return before night, we sat down close to the ice, and contemplated with rapture and astonishment part of the great central chain of the Alps; rocks towering above rocks, and mountains rising above mountains, not more distinguished for their stupendous height, than for the endless variety and rudeness of their forms. One of the peaks, which is called the Gross-horn, is of a pyramidal shape, and capped with frozen snow; another, the Breit-horn, is conical, and seems crowned with an enormous mass of transparent ice, from which the reflection of the sun beams was inexpressibly beautiful. But the most elevated and most majestic of the whole group is the Jung-frau-horn, or Virgin's horn, which receives the name of virgin, because its summit is inaccessible.

The hollows between the mountains are filled with large vallies of ice, broken into a great variety of shapes; and several torrents bursting from the snow, and uniting in their course, from the Weiss-Lutchine, a river which rolls rapidly through the valley of Lauterbruennen, joins the Schwartz-Lutchine, which flows from Grindelwald, and swells the Aar. Many of the mountains are covered to a great height with verdure, on which the eye reposes with delight amid the horrors of such wintry scenes. We observed also, at considerable elevations, small villages, the access to which must be almost

as difficult as to the glaciers to which we ascended.

^{*} From which circumstance it receives its name, Lauterbruennen, in German, signifying many springs.

withstanding the magnificence and variety of this scenery, and the uncommon nomenon of ice and snow in the midst of summer, bordering on forests and cultivative; I must again repeat, that the ideas which we had previously conceived from exaggerated accounts concerning the boundless extent and magnificent appearance of the glaciers, were not sufficiently answered. It is remarkable, that every object in Switzerland has more than gratified our expectations except the glaciers, which must be considered as forming one of the most interesting phenomena in the whole country. This disappointment seems to have been occasioned by the turgid descriptions which we had heard and read of the glaciers of Grindelwald and Lauterbruennen: and we were led to suppose, that the glacier of the Furca was much inferior in magnitude to those of Grindelwald and Lauterbruennen; whereas, in fact, it was in all respects equal, if not superior.

September 1, 1785.

In 1785 I was considerably more delighted and astonished with the vallies of Grindelwald and Lauterbruennen than in 1776; because my imagination was not in this, as in the former instance, exalted by exaggerated descriptions, and led to expect more than could be reached even by nature herself, however prodigal in these her sublimest works. But the vallies of ice still appear inconsiderable objects when viewed at some distance, and compared with the surrounding mountains, whose summits and sides are clothed with vast tracts of ice and snow. On a nearer approach they become more interesting, particularly when broken into abrupt ridges and immense chasms; and when their aggregate mass and numerous branches are observed from the surrounding heights. Still, however, the traveller may be disappointed, whose imagination has been previously filled with turgid descriptions, or who applies to the vallies of ice that sublimity and magnificence, which are principally due to the Alps above and around them.

LETTER XXXIII.

Lakes of Thun and Brientz Passage of Mount Gemni Baths of Leuk.

THE nearest route from Lauterbruennen to the Baths of Leuk leads across the mountains to Kandersteig. It is called le chemin vert, or the green way, because the rocks are for the most part covered with herbage. It is only practicable to footpassengers; and I was informed by a Swiss gentleman who passed it, that though steep and difficult, it is not dangerous. Its distance may be three leagues, and to a person not wholly accustomed to alpine passages, would require about five or six hours. A chasseur would perform it in less than half the time. In my second expedition in 1785 I had proposed crossing this way, but was obliged to decline it, as I could not procure a guide who was acquainted with the road.

I pursued therefore the usual route, which runs from the entrance of the valley of Lauterbruennen, through a fertile plain, between the lakes of Thun and Brientz. About two leagues from Lauterbruennen I came to the Aar, near its exit from the lake of Brientz, and followed its course until it entered that of Thun. This lake is about four leagues long and one broad; and, if we may judge from the steepness of the mountains with which it is bounded, must be very deep; the borders are richly varie-

^{*}We perhaps were less struck with the glaciers of Grindelwald and Lauterbruennen, because we had previously viewed similar scenes in our passage through the most sublime regions of Switzerland; whereas these are the first grand objects in the route usually taken by travellers through Berne, and consequently make a greater impression.

gated, and present several fine points of view, greatly heightened by many rugged rocks rising boldly from the margin of the water. We coasted this lake, through a delightful country, to the small village of Leisingen; then ascended to Æschi, and looked down upon the lakes of Thun and Brientz. In all the maps of Switzerland which have fallen under my observation, these two lakes are represented as they extended almost in a straight line; whereas they are situated nearly at right angles to each other. You may judge of their true position by the annexed engraving, communicated by the Rev. Mr. Wyttenbach of Bern.

Having descended from Æschi, we soon entered the rich valley of Frutigen, parallel to that of Lauterbruennen, and enjoyed for a considerable way a prospect of the glaciers we visited the day before. This valley ends at the small town of Frutigen; from thence commences that of Kander, watered by a river of the same name, and bounded by Mount Kander. In all these vallies the rudeness and height of the mountains which almost enclose them, contrasted with the beauty and fruitfulness of the plains, always fertilized by some lively torrent, form a thousand picturesque scenes, ever changing, and impossible to be described: they are still further embellished by the number of ruined castles

perched upon points seemingly inaccessible.

From the village of Kandersteg, delicate travellers who do not choose to mount a rugged ascent, either on foot or on horseback, are carried in an arm-chair supported by means of poles upon men's shoulders. We proceeded however, on horseback, having before rode up steeper and more difficult paths. After ascending about an hour and a half we arrived at the summit of the Kander, where a wooden cross marks the entrance into the Vallais; then traversed a waving plain of pasture, in which we observed a few huts and several herds of cattle, and at length reached a single house on the Gemmi, where we procured some refreshment: here we saw nothing but immense rocks piled upon one another, with no appearance of vegetation, and the weather was exceedingly cold. Passing over a large drift of snow, we came to a lake called the Dauben See, about a league in circumference, supplied by a considerable torrent from a neighbouring glacier. This lake has no visible outlet, but doubtless finds a subterraneous passage into the Vallais.

The chain of mountains which here separates the canton of Bern from the Vallais, is called the Gemmi; from the point of which, over-looking and almost over-hanging the Vallais, we had at once a most extensive prospect over that fertile country, and the rugged Alps of Savoy. The mountain which we descended is in many places almost perpendicular, and yet a horse-road has been hewed in the hard rock down this formidable descent. It was begun in 1736, and finished in 1741, at the joint expence of the Vallais and the canton of Bern: an astonishing work! which proves that nothing is impracticable to human industry. More than a league has been blown up with gun-powder, and a way formed which seems dangerous to those who are unused to mountainous countries, or whose heads are apt to turn giddy. It is about nine feet broad, and quite hangs over the precipice; in some parts, for a considerable space, it is a hollow way, open only at one side, the rock above projecting over it, of the same breadth. The effect is peculiarly singular: for, as the road winds continually, the scene also continually changes; so that one moment we commanded an extensive view, and the next were enclosed with barren rock.

The descent from the top to the plain is about two leagues; when you arrive at the bottom, and look up, you cannot observe the smallest traces of a road: so that a stranger would hardly believe it possible, that a passage has been formed down the rock, until convinced by his own experience. About thirty years ago, the troops of Bern descended

this road for the purpose of assisting the canton of Uri against the inhabitants of the valley of Levino, who had revolted; and, what is almost incredible, they descended with heavy artillery.

This place is famous for hot medicinal springs, and is much frequented by invalids during this season of the year: the patients either bathe or drink the waters. As far as I can judge from the accounts which I have received concerning their warmth, their analysis, the method of using them, and their efficacy in curing the gout, rheumatism, obstructions, and cutaneous disorders, they seem nearly to resemble those of Bath. There are several springs of different warmth and of different qualities: according to the most accurate experiments made by the Rev. Mr. Wyttenbach, the mercury in Fahrenneit's thermometer, when plunged into the principal source, stood at 115°; and at 120° in the spring which flows near the bridge over the Dala.

The accommodations for the company are very inconvenient; each person having for his own use a small apartment not more than a few feet square, in which there is just room for a bed, a table, and two chairs. The public dining-room is upon a larger scale, as is also an apartment where the company occasionally assemble. Formerly the accommodations were tolerably good; but unfortunately, in 1719, an avalanche from a neighbouring glaciar overwhelmed the greater part of the houses and the baths, and destroyed a considerable number of inhabitants.

The company, consisting of persons from different quarters of Switzerland, are exceedingly affable and obliging, insomuch that several of them have invited us to their respective houses; and this invitation was made with that openness and unaffected frankness so peculiarly characteristic of the Swiss. We dined this morning at eleven; the bell for supper is now ringing, and it is scarce seven. These are primitive hours, but we have travelling appetites; and, provided we meet with refreshment, the hour and place are of little consequence.

You are now probably drinking tea in your withdrawing room at Bath, from whence you are enjoying that beautiful prospect I have so often admired. The situation of this spot is more romancic than that of Bath, and the waters perhaps not less efficacious; vet this village contains only a few miserable houses, while Bath is one of the finest towns in Europe. I had a conversation to-day upon this topic, with a very ingenious and well-informed gentleman of the Vallais. I observed to him, that, considering the great credit and efficacy of these waters, I could not forbear wondering, that the chiefs of the republic had not considered the improvement of the accommodations an object worthy of their attention; for if they were rendered more convenient for the reception of invalids, it would undoubtedly be the means of drawing a great number of strangers, and consequently must be highly beneficial to the country. He assured me, it had more than once been in contemplation; that some persons of great credit and authority opposed all improvements, upon a principle similar to the policy of Lycurgus; conceiving that an influx of strangers would only serve to introduce luxury among the inhabitants, and insensibly destroy that simplicity of manners, for which the Vallaisans are so remarkably distinguished.

How far the ignorance of the people contributes to their true felicity; or how far simplicity of manners may be corrupted by national improvement? are questions which have been much agitated, and will never be decided so long as it shall be held just reasoning to argue from the abuse against the use. But it will readily be allowed, that superstition is ever the companion of ignorance; and that a people who are both ignorant and superstitious, must necessarily be benefitted by an intercourse with nations more improved and enlightened than themselves.

Where the mountain inclines towards a slope, a footpath has been cut; but in those parts where the rock is perpendicular, ladders are placed, and the peasants ascend and descend with heavy burdens upon their shoulders. We counted seven of these ladders. I mention this circumstance, not as being an object so remarkable, perhaps, as is represented by some travellers, but as it will convey to you an idea of the extreme ruggedness and singularity of the country. I am, &c.

LETTER XXXIV.

Republic of the Vallais.... Cardinal Schinner.... Town of Sion.... Martigny.... St. Maurice.

Sion, August 19

SION being nearly the point where the German language terminates, and the French begins, the natives in this part of the Vallais consequently speak both tongues.

We set out this morning at five, and came down a very steep valley to Leuk, a small town built upon an eminence near the Rhone, which is here very rapid; and, if we may judge by the breadth of the channel, often overflows its banks. We crossed at this place, and continued for some way through a forest of firs, till we again passed the river to Siders; from thence we consted its banks to Sion, the capital of the Vallais.

Another road leading from the baths of Leuk to Siders, which I traversed in 1785, though more steep and incommodious, is far more interesting to the traveller who delights in picturesque views. It is called the galleries, is cut along the sides of an abrupt and rugged rock in a zig-zag direction, and bounded by a wooden raiiing, which overhangs a dreadful abyss, so deep and obscure, that the river Dala, which rolls impetuously through it, is neither seen nor heard. The opposite chain of mountains is clothed with dark forests, enlivened with pastures, and interspersed with occasional villages, which are situated one above the other to a considerable height, and seem scarcely accessible but to foot passengers.

This tract of country, called the Vallais, stretches from east to west about a hundred miles, and contains one hundred thousand inhabitants, who all profess the Roman Catholic religion. It is divided into Upper and Lower Vallais: the former reaches from the Furca to the Morge, below Sion; and the latter, from that river to St. Gingou,

situated upon the lake of Geneva.

The upper Vallais is sovereign of the Lower Vallais, and comprises seven independent dixains, or commonwealths; namely, Sion, Goms, Brieg, Visp, Leuk, Raren, and Siders; of these Sion is aristocratical, and the others democratical. They are called dixains, because the Upper Vallais being divided into seven, and the Lower into three

districts, each division is a dixain, or tenth of the whole.

The bishop of Sion was formerly absolute sovereign over the greater part of the Vallais; but his authority is at present limited to a few particulars. He has the sole power of pardoning criminals, and signs the warrants for execution; the money is coined in his name, and with the arms of the republic. In his acts he styles himself bishop of Sion, prince of the German empire, and count and præfect of the Vallais; in days of high ceremony he dines in public, and is waited upon by the first noble of the Vallais, who is hereditary treasurer. He nominates also the bailliffs or governors of the two bailliages of Martigny and Arden, and possesses considerable influence from his patronage of church preferment. Upon the vacancy in the see, the canons of the chapter of Sion

present from their own body four candidates, one of whom is appointed bishop by the

Landsrath, or general diet.

The seven dixains form, conjointly with the bishop, the republic of the Vallais, and all affairs are transacted in the dict, called Landsrath, which meets twice every year at Sion. This assembly consists of nine voices; the bishop; the Lands-hauptmann, who is chosen or confirmed by the diet every two years; and the seven communities. The bishop presides, the Lands-hauptmann collects the votes, and all resolutions are decided by the majority. Each dixain, although it has but one vote, sends as many deputies as it pleases; they generally consist of four; a judge, a banneret, a captain, and a lieutenant. The judge and the lieutenant are appointed every two years; the two others hold their offices for life.

In all civil causes of a certain importance, an appeal lies from the inferior courts of justice to the diet in the last resort. Thus, by the institution of this supreme council, the communities in this country are firmly united, and form in conjunction one body politic, or republic, for the general affairs of the nation. In other cases, each of the

commonwealths is governed by its own particular laws and customs.

Both the Upper and Lower Vallais were formerly dependent upon the bishop of Sion; but the inhabitants of the two districts united in order to limit his power; and, having succeeded, quarrelled for superiority. A bloody war ensued, which terminated in 1475, by the total defeat of the Lower Vallaisans. Since that period, they have continued subject to the Upper Vallais, with the enjoyment, however, of some considerable privileges.

The republic of the Vallais is an ally of the thirteen cantons, and has formed a par-

ticular league with the seven Catholic cantons, for the defence of their religion.

The bishops of Sion had formerly a considerable influence over the political affairs of Switzerland; and Matthew Schinner, the cardinal bishop, is famous in history for great abilities, daring spirit of intrigue, and restless ambition. He was born at Milbach, in the dixain of Goms; and in 1500 was raised to this see. In consequence of his representations and influence, the Swiss troops gave a singular instance of infidelity to their public engagements, by breaking a subsidiary treaty which they had recently contracted with Francis the First, soon after his first invasion of the Milanese. The Swiss historians, however, record with triumph the patriotic conduct of two officers, who, remonstrating against this breach of faith, drew off eight thousand troops, and, returning to Switzerland, in some measure retrieved the honour of the nation. The remainder of the army, instigated by the eloquence of the cardinal, engaged Francis the First near Marignano, in one of the most furious battles fought during the bloody wars of Italy. Night alone put a stop to the engagement, without separating the combatants; both armies were blended upon the field of battle; and Francis slept upon the carriage of a cannon at no great distance from a battalion of the enemy. At day-breathe Swiss renewed the charge with their usual courage, and were received with equal bravery. At length the intrepidity of the king, and the desperate valour of the French, rose superior to the repeated attacks of the Swiss, who retreated to Milan, leaving Francis in possession of the field of battle: an advantage, however, which he gained by the loss of his bravest troops.

The Cardinal, actuated by the most inveterate enmity to the French, occasioned also, by his intrigues, the loss of the Milanese to Francis. Lautrec, in the year 1521, commanded a body of twelve thousand Swiss, who formed the principal strength of his army. On the other side, the Cardinal obtained, by his influence over his countrymen, a secret levy of the like number, to join the enemies of France: thus, for the first time, the Swiss were seen combating under opposite banners, and ready to commit hostilities

oned also, 21, comth of his intrymen, first time, iostilities against each other. Upon this occasion the cantons dispatched messengers, with peremptory orders for the Swiss in both armies to return to their country. The Cardinal bribed the messengers to conceal these orders from the Swiss in the army of the confederates, and to deliver them only to those who were in the French service. They obeyed accordingly; and this desertion weakening the army of Lautree, Milan and the principal towns surrendered to the confederates. Soon after this additional instance of his intrigues and influence, the Cardinal ended his turbulent life in the conclave, which assembled on the death of Leo the Tenth, for the election of a new pope.

The inhabitants of this part of the Vallais are very much subject to goiters, or large excrescences in the neck, which often increase to a most enormous size; but, what is more extraordinary, idiocy no less abounds. I saw many instances of both, as I passed through Sion; some idiots were basking in the sun with their tongues out, and their heads hanging down, exhibiting an affecting spectacle of intellectual imbecility. The causes which produce a frequency of these phenomena greatly excite my curiosity; but

I shall defer my remarks until I shall have obtained farther information.

The weather in this enclosed vale is so exceedingly sultry, that although the evening is far advanced, I am quite oppressed. This languid heat is probably one of the causes which occasion the inconceivable indolence of the inhabitants: much, however, must at the same time be attributed to the richness of the soil, which precludes the necessity of labour by almost spontaneously producing the fruits of the earth. In fact, the people assist nature very little: we passed several vineyards in which the vines were suffered to trail upon the ground; whereas, if the branches were properly supported, the owner would be well rewarded by the superior quantity and quality of the produce.

The uncleanliness of the common people is disgusting beyond expression. I have just been holding a conversation upon this subject with my landlord; though himself a notorious example, he severely censured the dirtiness of his countrymen, and seemed to assign it as one cause of goiters. This assertion induced me to examine the person of my host with somewhat more attention; and I was rather disappointed to find, that he proved an exception to his own remark. Let me not, however, be understood as insinuating that the inhabitants in general are either goitrous, idiots, indolent, or dirty; like that traveller who asserted, that all the women of a certain town were crooked, redhaired, and pitted with the small-pox, because his landlady happened to be so. Indeed, I look upon national reflections in general to proceed from the most illiberal turn of mind, and have always been cautious not to judge of the physical or moral character of any people from a partial and superficial view. But the prevalency, in the present instance, of goiters and idiocy, and the general dirtiness and indolence of the common people are too notorious to escape the observation of the most careless traveller.

Sion is situated near the Rhone, at the foot of three insulated rocks, that rise immediately from the plain. The highest, called Tourbillon, supports the ruins of the old episcopal palace, still containing two or three untenanted apartments, in one of which are the portraits of the several bishops. On the second rock, denominated Valeria, are observed the remains of the old cathedral, and a few houses belonging to the canons. On Mayoria, the third rock, stands the episcopal palace, an ancient edifice of stone, built in 1547. On seeing the apartments I was greatly struck with their plainness, and could not avoid reflecting with pleasure on the simplicity of manners which must necessarily prevail in this country; when the rooms inhabited by the sovereign, instead of bespeaking the magnificence of a court, are scarcely superior to the dwelling of a peasant. Two apartments principally engaged my attention. The first is that in which the diet assembles; at the upper end are two armed chairs for the bishop and the lands-

. v.

hauptmann, and on each side a row of smaller seats for the deputies of the seven dixains. The other apartment is the hall, in which the bishop holds his court, like the feudal lords of ancient times; at the further extremity is a raised seat, called a throne, surrounded by a wooden balustrade, and, as an incitement to wisdom and impartiality, the figures of Justice, and Solomon's Judgment are coarsely painted upon the walls.**

Sion is an ancient town, and was formerly the capital of the Seduni, who inhabited this part of the country in the time of Julius Cæsar. A few remaining inscriptions still prove its antiquity; and, among others so obliterated that I was not able to decypher them, I observed one which was more legible: it is in honour of the emperor Augustus, during his eleventh consulship. in this inscription the town is called Civitas Sedunorum.

At Sion we parted with our horses and guides, who had accompanied us from Altdorf: and procured a piece of luxury, to which we had been for some time unaccustomed, I mean a coach. But, notwithstanding the concentrated heat of the climate, and the great sultriness of the air, I prefer riding or walking, as by what means I enjoy a more unobstructed view of the country: indeed the scenes are so beautiful, and so perpetually changing, that the attention is incessantly engaged by a variety of new objects.

On entering the Lower Vallais, I perceived as much uncleanliness, but a greater appearance of industry; and I am informed that the natives are not altogether so indolent as the inhabitants of Sion and its environs.

This imputation of indolence will not hold good with respect to all the inhabitants of the upper Vallais; for in the eastern part of that district, which we entered after having crossed the Furca, the soil, though far inferior, was much better cultivated, and the people seemed more industrious. Some physical reasons may be assigned for this difference; for there the weather is not so sultry, the water is not unwholesome, the air re-

* Soon after the capture of Bern, the attempts to introduce the new constitution created great dissatisfaction among the natives of the Upper Vallais. But the Bishop of Sion, who was then in the power of the French, was under the necessity of affecting great pleasure at the overthrow of his sovereignty. The Moniteur has preserved his letter on this occasion to the French Resident Mangourit, and the answer.

"Citizen Resident, I have learnt with extreme satisfaction, that the plan of a constitution for the republic of the Vallais, guarantees, under your auspices to my diocese the preservation of the catholic, apostolic, and Roman religion, in all its purity. I want words to testify the most lively gratitude; and I doubt not but our religion will be a restraint on my flock, and inspire it with an implacable hatred of licentiousness and anarchy.

"Take, I beseech you, Citizen, under your powerful protection the church of Sion and all the clergy, of whom the greater part, particularly our chapter, in seconding my intentions, and executing my orders, have distinguished themselves by a conduct calculated to inspire the people with confidence in their worthy representatives, and to re-animate the love of their country.

(Signed) "ANTONY, Bishop of Sion."

ANSWER OF MANGOURIT.

- "Athanasius closed the doors of his church against the crimes of Theodosius; you have opened yours to civic virtues, by facilitating the acceptance of the constitution of the Vallais.
- "At your voice the canons of Sion repaired to the seven upper dixains, to prevent the people from being misled by malevolence.
- "Glory be to your humanity!
- "Schinner, one of your predecessors, occasioned the effusion of much blood; you, Citizen Bishop, you love to spare bloodshed.
- "An article of the constitution guarantees to your flock the maintenance of their religious opinions.

 "Your wise conduct secures to you for ever the homage of the friends of liberty, of wisdom, and of peace." Moniteur, 15th Germinal.

We stopped at the village of Martigny, which, according to antiquaries, was the ancient Octodurum. It is said, that near this place may be traced the site of Sergius Galba's camp, one of Julius Cæsar's lieutenants, who was sent to subdue the Veragri, the Nantuates, and the Seduni; the ancient inhabitants of these districts. It seems evident indeed from Cæsar's description, in the third book of his Commentaries, that Octodurum could not be far from the present situation of Martigny, which stands in a small plain, encircled by high mountains, and divided by the Dranse, that falls into the Rhone. I cannot, however, ascertain from my own observation, whether any traces of a Roman encampment still remain, nor could I gain the least information from the inhabitants; so that the conjecture concerning the situation of Octodurum rests only upon the faith

of antiquaries, and on the general position of the country.

Martigny is a place much frequented by travellers: it leads to the valley of Chamouny, to St. Maurice, and the lake of Geneva, and is the passage of the merchandise which is conveyed over the Great St. Bernard into Italy. Near Martigny we passed under the majestic ruins of La Bathia, an old episcopal castle, crowning the summit of a craggy rock, and impending over the impetuous Dranse. The road from hence to St. Maurice runs under a chain of rocks, the Rhone flowing at a small distance through the middle of a fertile vale. Having crossed the Trient, a turbid torrent which issues from a narrow and obscure glen, remarkable for its rugged and romantic scenery, we arrived at the Pisse-Vache, a cataract much noticed by travellers. The characteristic beauty of this fall is, that it seems to burst from a cleft in the middle of the rock, through hanging shrubs, and forms a perpendicular column about two hundred feet in height. The body of water being very ample, and the elevation not so considerable as to reduce it entirely into spray, render the effect very striking. I enjoyed also the additional pleasure of seeing the sun rise opposite to this water-fall. The regular expansion of the rays enlivening the different parts of the column of water; and the gradual descent of the rainbow formed by the spray, were inexpressibly beautiful. These torrents are my delight; but perhaps they recur too often in my letters to continue to be yours. Formerly travellers passed close to the Pisse-Vache; but a few years ago part of the rock falling down totally obstructed the road, which now runs through the middle of the valley.

At the extremity of the Lower Vallais, the two chains of mountains that bound this country approach towards the Rhone, which nearly fills the interval between. In this spot is situated the town of St. Maurice, built almost totally upon the rock at the foot of some steep mountains, and at a small distance from the river. The ancient appellation was Agaunum: that of St. Maurice is derived from an abbey, erected in the beginning of the sixth century, by Sigismond king of Burgundy, in honour of a saint, who is supposed to have suffered martyrdom in this place; he was the leader of the famous Theban legion, said to have been massacred by order of the emperor Maximin, for not renouncing Christianity. This history has given rise to much controversy: while some authors have treated it as a mere forgery, others have contended for its authenticity with as much zeal as if the truth of Christianity depended upon the decision. Without cutering into the merits of the question, I cannot but remark, that the cause of Christianity has suffered more from weak and imprudent defenders, than from the sharpest attacks of its most inveterate adversaries. Indeed, the question concerning the number and sufferings of the martyrs has occasioned much idle disputation: should we reduce the popular accounts of both within the bounds of probability, there will still remain sufficient evidence of the wonderful constancy and calm resolution of those primitive victims; and whether a hundred thousand, or only fifty, suffered, Christianity will equally stand upon the same immovable foundation. Nor is the inquiry more material concerning the motives that actuated its powerful and cruel adversaries. It matters not whether Decius ordered the Christians to be massacred, because they had been favoured by his predecessor Philip, or from his attachment to the Pagan rites; whether Maximin persecuted them from interested motives; Dioclesian as introducing innovations in his government; or whether Constantine protected them from conviction or policy. For the truth of Christianity is in no respect affected either by the imprudence of its early professors (if with any they were justly chargeable) or the political reasons that influenced the conduct of those emperors.

A few Roman inscriptions, chiefly sepulchral, and two defaced columns, are the only uncontroverted remains of the antiquity of St. Maurice. It is principally distinguished as being the chief entrance from the canton of Bern into the Vallais. This entrance is formed by a narrow pass, so strongly fortified by nature, that a handful of men might defend it against a considerable army. The stone bridge over the Rhone is much admired for its bold projection: it is of a single arch, and the span is a hundred and thirty feet. Half of this bridge belongs to the Vallais, and the remainder to the canton of Bern.* I am, &c.

LETTER XXXV.

Of the Vallais ... Goiters and Idiots.

I AM now writing from the village of Trient, on my way to Mont Blanc and the Alps of Savoy. From the mountain of the Furca, its eastern boundary, two vast ranges of Alps enclose the Vallais: the southern chain separates it from the Milanese, Piedmont, and part of Savoy; the northern, from the canton of Bern. These two chains in their various windings, form several small vallies, watered by numerous torrents that rush into the Rhone, as it traverses the whole district from the Furca to St. Maurice. A country thus entirely enclosed within high Alps, and consisting of plains, elevated vallies, and lofty mountains, must exhibit a great variety of situations, climates and productions. Accordingly, the Vallais presents to the curious traveller a quick succession of prospects, as beautiful as diversified. Vineyards, rich pastures covered with cattle, corn, flax, fruit-trees, and forests, occasionally bordered by naked rocks crowned with everlasting snow.

The productions of the Vallais vary according to the great diversity of climates by which this country is distinguished. It supplies more than sufficient wine and corn for interior consumption, and exports a considerable quantity of both; the soil in the midland and lower districts being exceedingly rich and fertile. In the plain, where the heat is collected and confined between the mountains, the harvest is usually finished in

^{*} At an early period of the French revolution, the disaffected party of the Lower Vallais appealed to France to emancipate their country from their subjection to the Upper Vallais, but the French not having matured their scheme of fraternization, their petition was rejected.

In February 1798, however, the people of the Lower Vallais were enfranchised, and admitted to an equality of rights by the Upper Vallais; but after the conquest of Bern, and the revolution of the greater part of Switzerland, the inhabitants of the Upper Vallais rejected the new constitution, took up arms, and defended themselves with great spirit. After several bloody defeats, and the capture of the castle of Sion, which was stormed by the French, the natives submitted, and both districts were moulded into one department called the Vallais, of which the capital is Sion.

greatook up of the s were July; whereas, in the more clevated parts, barley is the only grain that can be cultivated with any success, and the crop is seldom cut before November. About Sion, the fig, the melon, and all the other fruits of Italy, come to perfection: in consequence of this singular variety of climates, I tasted in the same day, strawberries, cherries, plums, pears, and grapes; each the natural growth of the country.

There are no manufactures of any consequence; and indeed the general ignorance of the people is no less remarkable than their indolence; so that they may be considered in regard to knowledge and improvements, as some centuries behind the Swiss, who are an enlightened nation. The peasants seldom endeavour to ameliorate those lands where the soil is originally bad, or to draw the most advantage from those which are uncommonly fertile; having few wants, and being satisfied with the spontaneous gifts of nature, they enjoy her blessings without much considering in what manner to improve them.

Before I take leave of the Vallais, I shall communicate the result of my inquiries concerning the causes which contribute to render goitrous persons and idiots common in these parts; premising, at the same time, that I must stand greatly in need of your candour, when I venture to treat a subject so extremely complicated, and on which so many

different opinions have been advanced by naturalists and physicians.

The notion that snow water occasions goiters, is totally void of foundation; for on that supposition, why are they common in the midland and lower parts, and extremely rare in the higher regions of Switzerland? particularly what reason can be assigned, why the natives of those places that lie most contiguous to the glaciers, and who drink no other water than what descends immediately from those immense reservoirs of ice and snow, are not subject to this malady? Why are the inhabitants of those countries in which there is no snow, afflicted with it? For these guttural tumours are to be found in the environs of Naples, in the island of Sumatra, and at Patna and Purnea, in the East Indies, where snow is unknown.

But, instead of repeating the various opinions on this subject, I shall at present con-

fine myself to the result of my own observations and inquiries.

The springs of this district are impregnated with a calcareous matter called in Switzerland tuf,* nearly similar to the incrustations of Matlock in Derbyshire, so completely dissolved as not to affect the transparency of the water. Will it be deemed improbable, that the impalpable particles of this substance should thus introduce themselves, by means of the blood, into the glands of the throat, and produce giters?† I ground this opinion on the following observations and facts:

* The Porus of the older authors.

The Tophus glareoso, argillaceus Polymorphus, of Linnæus, 186. 1.

The Tophus Pelymorphus of Wallerius, Syst. vol. ii. p. 394.

The Tophi of Kirwan, p. 25, called Duckstein by the Germans.
† Dr. Baillie, physician to St. George's hospital, has lately given a beautiful plate illustrative of the diseased appearances of the Thyroid Gland, which is the seat of the Bronchocele, or Goiter. "When a section is made," he says, "of the thyroid gland affected with this disease, it is found to contain a number of cells filled with a transparent viscid fluid. This fluid become solid, like jelly, when the gland has been preserved for some time in spirits." He notices too, that a few of the cells of one gland, which he divided, were filled with a gritty, hard, whitish matter.

It appears also that the structure of the thyroid gland is favourable to the deposition and detention of stony particles carried into it by the blood; for it is supplied by four arteries, uncommonly large in proportion to the size of the gland, and has no excretory duct, through which any substance once deposited can pass. Hence a very inconsiderable deposition of tuf might be sufficient to produce by irritation such an abundant secretion of viscid fluid as to distend the cells, and by this enlargement of the gland, gradually to occasion goiters. Baillie's Morbid Anatomy, p. 311. Second Fasciculus, plate I.

To speak in general: during my travels through Europe, I never failed to observe that tuf, or this calcareous deposition, abounds in all those districts wherein goiters are common. I noticed goitrous persons and much tuf in Derbyshire, in various parts of the Vallais, in the Valleline, at Lucern, Friburgh, and Bern, near Aigle and Bex, in several places of the Pays de Vaud, near Dresden, in the vallies of Savoy and Piedmont, near Turin and Milan.

To descend to particular instances. The inhabitants of Friburgh, Bern, and Lucern, are much subject to guttural excrescences. With respect to Friburgh, I observed that one of the principal springs which supplies the town with water, issues from a neighbouring stone-quarry, and has formed large depositions of tuf on the rock from which it bubbles. The pipes also which convey water to the public fountains at Bern, are charged with the same calcareous sediment; and a gentleman, on whose veracity I can depend, assured me, that he is subject to a small swelling in the throat, which usually increases in winter, when he is chiefly resident at Bern, and diminishes in summer on his removal to other places, where the waters are not loaded with tuf.

I was, moreover, informed by general Pfiffer, that at Lucern all the waters, excepting one spring, are impregnated with tuf, and that the natives who dwell near that spring, are much less subject to goiters than the other inhabitants; that the same difference is observed among the members of the same family, between those who drink no water but what is drawn from that spring, and the others who do not use that precaution. The general showed me also the tin vessel, in which water was every morning boiled for his use, and which was so speedily and thickly incrustated as to render it necessary to have it cleansed twice a-week. The water which yields this deposition is as transparent as crystal.*

I also visited many places contiguous to those districts wherein goiters and tuf are frequent, and having precisely the same situation and climate, yet I observed no goiters among the inhabitants, nor any appearance of tuf.

But the strongest proof in favour of this opinion is derived from positive fact. A surgeon whom I met at the baths of Leuk, informed me, that he had not unfrequently extracted concretions of tuf stone from several goiters; and that from one in particular which suppurated, he had taken several flat pieces, each about half an inch long; the same substance, he added, is found in the stomachs of cows, and in the goitrous tumours to which even the dogs of the country are subject. He likewise assured me, that in the course of an extensive practice, he had diminished and cured the goiters of many young persons by emollient liquors and external applications; that his principal method to prevent them in future consisted in removing the patients from the places where the springs are impregnated with tuf, and, if that could not be contrived, by forbidding the use of water which was not purified. He confirmed the report that infants are occasionally born with guttural swellings, particularly those whose parents are goitrous, and remarked that one of his own children had at its birth a goiter as large as an egg; neither he nor his wife, who were both foreigners, the were afflicted with that malady. He had dissipated it by external remedies; and since that period, had inva-

^{*} Although it appears that wherever there are goiters there is tuf-stone; yet the reverse is by no means true, that wherever the waters deposit tuf, there are always goiters: for perhaps the natives do not drink of the springs which are loaded with tuf, or that substance is not sufficiently dissolved in the waters; absolute solution being, perhaps, necessary to produce these swellings.

[†] In the former instance, goiters may, though perhaps erroneously, be esteemed hereditary; but in the latter, where the parents are both foreigners and not goitrous, can scarcely be derived from any other cause than the aliment of the mother.

riably prohibited his family from tasting the spring waters, unless they were distilled, or mixed with wine or vinegar; by which means he preserved them from those tumours that were extremely common among the natives of the town which he inhabited.

Although it is by no means my intention to trouble you with the various opinions which have been advanced on this subject; yet it would be unjust to withhold that of M. de Saussure, whose accurate researches and profound investigation on philosophical subjects deserve to be weighed with the greatest attention. That able naturalist, in a recent publication,* attributes the production of goiters not to the waters, but principally to the concentrated heat of the climate, and stagnation of the air. He informs us, that in all his travels through the Alpine countries, he never observed goiters in any places which are clevated more than 500 or 600 toises† above the level of the sea: he noticed them in those vallies where the heat is concentrated, and the air stagnates, and that they usually cease wherever the valley terminates, and the country expands into a large plain. With great descrence, however, to his opinion, may I be permitted to observe, that the conclusion does not absolutely follow from these premises? For it may be remarked, that in places elevated more than 500 or 600 toises above the level of the sea, the springs are too near their sources to have dissolved a sufficient quantity of calcareous matter, or so minutely as may be requisite for the regeneration of goiters; that when the valley expands into a plain, the waters may deposit their sediment by mixing with the rivers and lakes, or by filtrating through the earth and gravel. But although the two causes mentioned by Saussure do not solely produce, they may assist in producing guttural excrescences, by relaxing the fibres, and disposing the glands of the throat to admit more easily the introduction of the impalpable particles in the water. For it is observable, that women and children, whose frames are more relaxed than those of men, are more liable to be afflicted with these swellings; that the natives of those districts most remarkable for the size and number of goiters, are extremely wan and livid, much subject to intermitting fevers, and other disorders judged to proceed from relaxation. Although the concentrated heat, and stagnation of the air, may be allowed to have considerable influence on the human body, yet they do not seem sufficient for the effect in question, without the intervention of some other cause: this cause seems to be the water, should the facts already stated prove consonant to truth and experience.

It may be necessary, however, to obviate an objection, that goiters must rather originate from climate and situation; because foreigners established in the country are never afflicted with those tumours, while their children are no less subject to them than the natives. But is it uncontrovertible, that no foreigner has ever been afflicted with this malady? the question, I should presume, can scarcely be replied to in the affirmative. And all that can be established, with any degree of certainty is, that foreigners are less subject to these swellings than their children or the natives. In this respect the answer is evident. Persons who usually settle in foreign countries are adults; and adults are doubtless much less liable than children to an endemial malady, whose operation is gradual, and which requires much time before its effects are visible. It is remarked, that among the natives themselves those persons who have escaped this disorder during their infancy, are seldom attacked by it to any considerable degree at a more advanced age.

In reasoning upon this, as well as on similar subjects, where a cause is sought for capable of producing a certain effect, it is necessary to establish a primary and general cause, which always and necessarily exists, wherever that effect is produced, and to exclude those circumstances which do not always and necessarily exist, wherever that effect is produced.

^{*}See voyages dans les Alpes, ch. 48. vol. ii. p. 480.

Thus, in the present instance: if snow-water occasions goiters, wherever there are goiters there must be snow-water, which is contrary to fact and experience. If the concentrated heat of the climate, and stagnation of the air, are necessary to the formation of goitiers, those excrescences could never be formed where these causes are wanting, which is not confirmed by fact and experience. If waters impregnated with tuf, or with certain calcarcous substances, produce goiters; wherever there are goiters, the natives must drink waters so impregnated, and this seems agreeable to fact and experience.**

The same causes which generate goiters, probably operate in the case of idiots; for wherever goiters prevail to a considerable degree, idiots invariably abound: such is the nice and inexplicable connection between our bodies and our minds, that the one ever sympathises with the other; and it is by no means an ill-grounded conjecture, that the same causes which affect the body should also affect the mind, or, in other words, that the waters which create obstructions and goiters should also occasion mental imbecility.

Although these idiots are frequently the children of goitrous parents, and have usually those swellings themselves, yet they are sometimes the offspring even of healthy parents, whose other children are properly organised, and are themselves free from guttural excrescences. I observed several children, scarcely ten years of age, with very large goiters. These tumours, when they increase to a considerable magnitude, check respiration, and render those who are afflicted with them exceedingly indolent and languid. Some persons have, in opposition to the opinion which I have ventured to advance, supposed that the small glandular swellings, which are common in many other parts, and realized excrescences, are more particularly observed in the Vallais, in the valley of Aost, and in some other places, do not proceed from the same cause, and are not the same disorder. But sufficient reasons have not been assigned for this opinion. During my expedition through the Vallais and other parts of Switzerland, I noticed some of all proportions, from the size of a walnut to almost the bigness of a peck loaf. As the same gradation may be also observed in the species of idiots; by a similar mode of argument, those who possess some faint dawnings of reason might be discriminated from others, who are totally deaf and dumb, and give no proof of existence but the mere animal sensations. Whereas it is probable that in both instances the greater or lesser derangement of the body or mind does not indicate a different complaint, but only different degrees of the

It is to be presumed, that a people accustomed to these excrescences will not be shocked at their deformity; but I do not find, as some writers assert, that they consider them as beauties. To judge from the accounts of many travellers, it might be supposed that the natives, without exception, were either idiots or goitrous; whereas, in fact, the Vallaisans in general are a robust race; and all that with truth can be affirmed is, that goitrous persons and idiots are more abundant in some districts of the Vallais than perhaps in any other part of the globe.‡

^{*}The learned Mr. Whitaker, in his interesting account of the passage of Hannibal over the Alps, vol. i. p. 194, agrees with me in imputing the goiters to the waters, but to the waters impregnated with metallic particles, and he supports his opinion by the authority of Simler; but surely if so, the metallic particles would have been constantly found in the waters, and occasionally in the glandular swellings, which is not the fact.

[†] It has been suggested to me, by a very intelligent physician, that perhaps the impalpable particles of stone may penetrate by means of the blood into the glands of the brain, and form concretions which may affect that organ. It is a well known fact, that earthy matter is frequently found in the pituitary gland.

[‡] I cannot withhold from the reader a curious passage on goitrous persons and idiots, from an integesting work published since my letters, which tends to confirm my remarks on this subject.

e are goiters concentrated of goitiers, which is not certain calmust drink

m an inte-:t. It has been asserted also that the people very much respect these idiots, and even consider them as blessings from heaven; which is strongly contradicted by others. Upon my questioning some gentlemen of this country, at the baths of Leuk, they treated the notion as absurd and false; but whether they delivered their real sentiments, or were unwilling to confirm what might lower their countrymen in the opinion of a stranger, will admit perhaps of some doubt. For having since that time frequently inquired among the lower ranks, I am convinced that the common people esteem them blessings. They call them "souls of God, without sin:" and many parents prefer these idiot-children to those whose understandings are perfect; because, as they are incapable of intentional criminality, they consider them as certain of happiness in a future state. Nor is this opinion entirely without its good effect, as it disposes the parents to pay greater attention to such helpless beings. These idiots are suffered to marry, as well among them selves as with others. I am, &c.

Interrogatus autem a rege Toko cur plura pharetræ spicula detraxisset, cum fortunam arcus semel duntaxat experimento prosequi debuisset. "Ut in te," inquit, "primi errorem reliquorum acumine vindicarem, ne mea forte innocentia pænam tui impunitatem experiretur violentia. Quo tam libero dicto et sibi fortitudinis titulum deberi docuit, et regis imperium pæna dignum ostendit." Lib. x. p. 286, edit. Leipsic, 1771.

"Goiters and idiots are very common in that part of Turtary which borders upon the Chinese Wall-Both sexes are subject to these swellings, but females more than males; the latter removing oftener

from the spots where the causes exist, whatever they may be that occasion them.

"These prenatural tumours did not appear to be attended with any other symptoms affecting the general health or corporal functions of those in whom they were observed. But the minds of many of them were much weakened, and perhaps of all in a less degree. Some were reduced to a state of absolute idiocy. The spectacle of such objects, which fails not to convey a serious and even melancholy impression to persons who view them for the first time, produces no such effect upon those among whom they are bred. The objects themselves are, in their general habits, cheerful, and lead a mere animal life, as contradistinguished from that in which any thought or reflection is concerned. As they act alone from instinct, or the mere impulse of the senses, so their actions, however injurious they may happen to prove to others, are free from intentional malice, and occasion no resentment. Their persons are considered in some degree as sacred; and they are maintained by their families with peculiar care." Account of the Embassy to China, vol. ii. p. 202.

LETTER XXXVI.

Passage of the Tete Noire Col de Balme Mont Blanc Its great Elevation.

Geneva, August 28.

QUITTING Trient, we traversed some narrow vallies, through forests of pine and fir, by the side of a small but impetuous torrent, which takes its rise from the neighbouring glacier. The road, which is very rugged, is carried over the steep crags of a mountain called La Tete Noire. A little way from Trient we entered the dutchy of Faucigny, subject* to the king of Sardinia, and arrived at the vale of Chamoun, the great

mountains and glaciers of Savoy rising majestically before us.

Another way leads from Trient to Chamouny over the Col de Balme. I passed it on a mule the 7th of September 1785; it is exceedingly steep, but not dangerous, as represented by many travellers; for I did not even find it necessary to dismount; and the path, which is in no part bare rock, runs through a thick wood clothing the sides of the mountain. We set off from Trient on this expedition about half past four, with the expectation of seeing the sun rise on the summit of Mont Blanc, but were disappointed; for we did not reach the Col de Balme in less than two hours, and day had already begun to break. We enjoyed, however, from the summit an extensive prospect, which many travellers consider as equal to the most sublime prospects in Switzerland: on one side it commands the Vallais, the Alps of St. Bernard, and the distant mountains of the cantons of Underwalden and Bern; the other comprehends Mont Blanc and the circumjacent heights. I observed the Point de Mousson; the Mortine, supporting on its top the glacier of Buet, on which De Luc made his celebrated experiments to ascertain the state of the atmosphere; the Point de la Tour; Les Aguilles d'Argentiere; the Aiguille de Midi, a piked rock starting out of a large mass of snow; and, lastly, Mont Blanc itself. The highest point of this gigantic mountain is in the shape of a compressed hemisphere, and is called from its form La Bosse du Dromedaire; from that point it gradually sinks, presents a kind of concave surface of snow, in the midst of which is a small pyramid of ice; then rises into a second hemisphere, called by some Little Mont Blanc, but with more propriety by others, Le Dome du Milieu, or the Middle Dome; thence it descends into another concave surface terminating in a point, indiscriminately styled by the natives Aiguille de Goute, Point de Goute, and Dome de Goute, and which I shall name the Dome of Goute; from that dome it ends abruptly, and loses itself amid the mountains that bound the vale of Chamouny.

Mont Blane is particularly distinguished from other mountains by a mantle of snow, which clothes its summit and sides, almost without the intervention of the least rock to break the glare of the white appearance, from whence its name is derived. This circumstance frequently deceives the eye unaccustomed to such objects, and in many situations renders it less lofty in appearance than it is in reality. Although the summit was more than seven thousand feet above the spot where I stood, yet it did not impress me with that astonishment which might be expected from its superior height and magnitude above the circumjacent mountains. I was indeed more struck with the first view of the Schreckhorn from the top of the Sheidec, than of Mont Blane from the Col de Balme.

^{*} Now subject to France.

The summit of Mont Blanc being of a roundish form, and covered with snow, unite-beauty with grandeur; whereas the Schreckhorn being piked, naked, and its shagged sides only streaked with snow, its grand characteristics are ruggedness and horror; and hence it derives the name of Schreckhorn, or the Peak of Terror.* But Mont Blanc soon re-assumed its real importance, seemed to increase in size and height, and solely attracted our attention, until we entered the vale of Chamouny.

You who are totally unacquainted with Alpine scenes, may perhaps conceive a faint idea of the elevation of this gigantic mountain, on being informed that the mantle of snow, which appears to cover its top and sides, exceeds an altitude of four thousand feet perpendicular, and nine thousand feet in a horizontal direction from the Dome of Goute to the summit; and that the height of the snow and ice, estimated from the source of the Arveron, at the bottom of the glacier of Montanvert, to the summit of Mont Blane, cannot be less than twelve thousand perpendicular feet, or near three times as high as Snowdon in North Wales.

Five glaciers extend into this vale of Chamouny, and are separated from each other by forests, corn-fields, and meadows; so that large tracts of ice are blended with cultivation, and perpetually succeed each other in the most singular and striking vicissitude. These glaciers, which lie chiefly in the hollows of the mountains, and are some leagues in length, unite at the foot of Mont Blanc, the highest mountain in Europe, and probably of the ancient world.

According to the calculations of De Luc (by whose improvement of the barometer elevations are taken with a degree of facility and accuracy before unattainable) the height of this mountain above the level of the sea is 23913 French toises, or 15,304 English feet; † or, according to Sir George Schuckborough, of 15,662 feet.

De Luc having found the altitude of the Buet, from thence took geometrically the elevation of Mont Blanc. The labours of this celebrated naturalist, and his rules for computing heights by the barometer, are to be found in his very valuable treatise, "Sur les Modifications de l'Atmosphere." These rules are explained, and his tables reduced to English measure, by Dr. Maskelyne, Astronomer Royal; and still more fully by the Rev. Dr. Horsley.‡

The accuracy of these barometrical measurements was verified by Sir George Schuck-borough, in a number of ingenious experiments to ascertain the elevation of several mountains of Savoy, a short time before I arrived at Geneva. He followed De Luc's method; computed the heights of several mountains, reciprocally, by barometrical and geometrical observations, and perceived that they almost exactly coincided. Having found the elevation of the Mole above the lake of Geneva, he took from thence the geometrical altitude of Mont Blanc. During the course of these experiments, he was enabled to correct some trifling errors in De Luc's calculations, to improve his discoveries, and to facilitate the means of taking elevations, by simplifying the tables and rules.

The traveller will recollect that I am here describing Mont Blanc, as observed from the Col de Balme, 1 the vale of Chamouny. Those who have seen it from the valley of Aost assure me, that it is not on that side covered with a mantle of snow, but exceeds even the Schreckhorn in ruggedness and horror.

† In reducing the French toise, which is equal to six French feet, to English measure, I have considered the proportion of the English to the French foot as 15 to 16. Its real proportion, according to the accurate calculation of Sir George Schuckborough, is 15 to 16 and a small fraction; but the error in my calculation being not one toise in a thousand, in order to prevent confusion, I have omitted the fraction.

‡ Now bishop of Rochester. Both these treatises are published in the Philosophical Transactions for the year 1774.

ind which

I am convinced, from the situation of Mont Blane, and its superior altitude above the surrounding mountains, that it exceeds the loftiest point in Switzerland, which is, next to Mont Blane, the most elevated ground in Europe. That it is higher than any part of Asia and Africa, is an assertion which can only be proved by comparing the judicious calculations of modern travellers with the exaggerated accounts of former writers; and by showing that there is probably no mountain in those two quarters of the globe, whose altitude surpasses 15,000 feet.

Perhaps in no instance has the imagination of man been more given to amplification, than in ascertaining the heights of the globe. Gruner, in his description of the Swiss glaciers, has mentioned the elevation of some remarkable mountains, agreeably to the calculations of several famous geographers and travellers, both ancient and modern.

								Toises.	Eng. Feet.	
According to Strabo, the	3,411	21,830								
According to Riccioli		-	•	-	-	•		58,216	372,382	
According to Father Kircher, who took the elevations of mountains by the										
uncertain method of n	neasui	ing	their shado	ws,			•			
Ætna is -		•	-		-	-	-	4,000	25,600	
The peak of Teneriff			-	-	-		•	10,000	64,000	
Mount Athos		-	-	•			-	20,000	128,000	
Larissa in Egypt		•	-	-	-	-	•	28,000	179,200	

But these calculations are evidently so extravagant, that their exaggeration must strike the most common observer. If we consult more modern and rational accounts, it appears that the peak of Teneriff and Ætna have been frequently supposed the highest points of the globe. Teneriff is estimated by some natural philosophers to be 3,000 toises, or 19,200 feet above the level of the sea; but, according to Feuille, this elevation is reduced to 2,070 toises, or 13,248 feet; whereas Ætna, by the accurate computations of Saussure, rises only* 1672 toises, or 10,700\frac{1}{2} feet above the sea. Hence it appears, that there are no mountains, except those in America (the elevation whereof, according to Condamine, surpasses 3000 toises, or 19,200 feet) which are equal to the altitude of Mont Blanc.

In order, however, to determine with absolute certainty that Mont Blanc is the highest point of the old world, it would be necessary to estimate, by the same mode of mensuration, Mont Blanc, the Schreckhorn, the peak of Teneriff, the mountains of the Moon m Africa, the Taurus, and the Cancasus.

* According to Sir George Schuckborough, 1,672 toises, or 10,954 feet; who says, "I have ventured to compute the height of this celebrated mountain from my own tables, though from an observation of M. De Saussure in 1773, which that gentleman obligingly communicated to me. It will serve to show that this volcano is by no means the highest mountain of the old world; and that Vesuvius, placed upon Mount Ætna, would not be equal to the height of Mont Blanc, which I take to be the most elevated point of Europe, Asia, and Africa."

I am happy to find my conjectures corroborated by that ingenious and accurate observer.

Height of Etna, according to Sir George - - 10,954 Feet.

Of Vesuvius, according to Saussure - - 3,900

Trembley's pes, vol. ii.

The chain of the Caucasus has long been deemed the highest mountains of Asia; and some philosophers, upon considering the great superiority of the eastern rivers over the European, both in depth and breadth, have drawn a presumptive argument, that the Asiatic mountains are much more lofty than those of Europe. But conjectures are now banished from natural philosophy; and, until it shall be proved from undoubted calculations, that the highest part of the Caucasus rises more than 15,000 feet above the level of the sea, Mont Blane may be fairly considered as more elevated.

LETTER XXXVII.

Glucier of Bosson.....Montanvert....Expedition across the Valley of Ice.

AUGUST 23d, we mounted by the side of the glacier of Bosson, to les Murailles de Glace, so called from their resemblance to walls: they form large ranges of ice of prodigious thickness and solidity, rising abruptly, and parallel to each other.* Some of these ranges appeared about a hundred feet high; but, if we may believe our guides, they are four hundred feet above their real base. Near them were pyramids and cones of ice of all forms and sizes, shooting to a very considerable height, in the most beautiful and fantastic shapes. From this glacier, which we crossed without much difficulty,

we enjoyed a fine view of the vale of Chamouny.

The 24th. We had proposed sallying forth this morning very early, in order to visit the valley of ice in the glacier of Montanvert, and to penetrate as far as the time would admit; but the weather proving cloudy, and likely to rain, we deferred our departure till nine. Having procured three guides, we ascended on horseback about three miles; we were then obliged to dismount, and scrambled up a steep and rugged path, called "the road of the crystal-hunters." From the summit of the Montanvert we descended to the edge of the glacier, and made a refreshing meal upon some cold provision which we brought with us. A large block of granite, called "La pierre des Anglois," served for a table; and near us was a hovel,† where those who make expeditions towards Mont Blanc frequently pass the night. The scene around us was magnificent and sublime; numberless rocks rising boldly above the clouds, some of whose tops were bare, others covered with snow; many of these peaks, gradually diminishing towards their summits, end in sharp points, and are called Needles. Between these rocks the valley of ice stretches several leagues in length, and is nearly a mile broad, extending on one side towards Mont Blanc, and on the other, towards the plain of Chamouny.

The names of the principal needles are, Aiguilles de Midi, de Dru, de Bouchard, de Moine, de Tacul, de Charmeaux; the five glaciers, that stretch towards the plain of Chamouny, and unite at the foot of Mont Blanc, are called Tacona, Bossons, Montan-

vert, Argentiere, and Tour.

Having sufficiently refreshed ourselves, we prepared for our adventures across the ice. We had each of us a long pole spiked with iron; and, in order to secure us from slipping, the guides fastened to our shoes crampons, or small bars of iron, provided with four spikes. The difficulty in crossing these vallies of ice arises from the immense chasms, which our guides assured us in some places are not less than five hundred feet in depth. I can no otherwise convey to you an image of this body of ice, broken into irregular ridges and deep chasms, than by comparing it to waves instantaneously frozen in the midst of a violent storm.

*In 1785, these murailles de glace no longer existed.

[†] Since my first expedition, Mr Blair, an English gentleman, has built a more commodious wood en hut, which, from him, is called Blair's Cabin.

We began our walk with great slowness and deliberation; but gradually gaining courage and confidence, we soon found that we could safely pass along those places, where the ascent and descent were not very considerable, much faster even than when walking at the rate of our common pace: in other parts we leaped over the clefts, and slid down the steeper declivities. In one place we were obliged to tread with peculiar caution. After walking some paces sideways along a narrow ridge of ice, scarcely three inches broad, we stept across a chasm into a little hollow, which the guides formed for our feet, and ascended by means of small holes made with the spikes of our poles. This account appears terrible; but we had not the least apprehension of danger, as the guides were exceedingly careful, and took excellent precautions. One of our servants had the courage to follow us without crampons, or nails in his shoes, which was certainly danger-

ous, on account of the slipperiness of the leather when wetted.

We had now almost reached the opposite side, when we were obliged to make a circuit of above a quarter of a mile, in order to get round a broad chasm. This will give you some idea of the difficulty attending excursions over some of these glaciers: our guides informed us, that when they hunt chamois and marmots, these unavoidable circuits generally carry them six or seven miles, when the direct distance is scarcely two. A storm threatening every moment, we were obliged to hasten off the glacier; for rain renders the ice exceedingly slippery, and in case of a fog, which generally accompanies a storm in these upper regions, our situation would have been extremely dangerous. Indeed we had no time to lose; for we had scarcely quitted the ice before the tempest began, and soon became very violent, attended with frequent flashes of lightning, and loud peals of thunder, which being re-echoed within the hollows of the mountains, added greatly to the awful sublimity of the scene.

We crawled for a considerable way upon our hands and feet along a steep and bare rock, and down one of the most difficult and rugged precipices I ever descended in Switzerland; the thunder at the same time roaring over us, and the rain pouring down like torrents. After much difficulty, but without the least accident, we gained the valley of Chamouny, and returned to the inn, as wet as if we had been plunged into water, but

perfectly gratified with our expedition.

In my second excursion to the valley of Chamouny in 1785, instead of crossing the glacier, I ascended, in company with three Englishmen and a Swiss gentleman, from Blair's cabin, about an hour and a half, over the bare and rugged rocks, to a summit under the Aiguille de Charmox, near the spot from which a Genevan unfortunately fell and was dashed to pieces. On this summit, at the very edge of the fearful precipice which overlooks the vale of Chamouny, stood a collection of stones, about three feet high, called by the natives le bon homme. We immediately raised this heap to the height of six feet, and piled up another of the same elevation, which we styled, in the language of the country, le monument de quatre Anglois, in memory of the four* Englishmen who amused themselves in forming it.

I employed an hour in ascending part of the Montanvert on horseback, the same time in walking up to Blair's cabin, an hour and a half to the monument de quatre Anglois, half an hour in descending to Blair's cabin, and three quarters of an hour in passing

from thence to Chamouny.

^{*} Mr. Whitbread, the two Mr. Cliffords, and myself. We were accompanied and assisted by M. Exchaquet, a Swiss gentleman, remarkable for his numerous expeditions into these Alps.

I made this expedition in company with M. Exchaquet, a Swiss gentleman, native of Aubonne, and director-general of the mines of Savoy. His repeated expeditions into these regions have enabled him to execute a model in relief of the valley of Chamouny, Mont Blane, the circumjacent Alps, and glaciers.* In order to render this model still more valuable to the naturalist, he collects specimens of the different stones which compose the mountains represented on the plan. He is now employed by the government of Bern in constructing a model of the district of Aigle.

M. Exchaquet has discovered a more commodious route than that hitherto followed, to ascend the Buet and Mount Breven, which are described by M. Van Berchem, secretary to the Society of Sciences at Lausanne, in his letter† to Mr. Wyttenbach of Bern, relating an expedition to the mines of Faucigny, and the glaciers which extend at the foot of Mont Blanc. In these letters the reader will find, beside much accurate and picturesque description, an account of several fossil and vegetable productions of the higher Alps.

LETTER XXXVIII.

Excursion towards the Summit of the Couvercle.

IN my subsequent expedition to the valley of Chamouny, I proposed pushing my course still further towards the glacier of Talefre, but particularly to the Couverele, of which I had read a very curious description in Saussure's work. But having bruised my foot in ascending the Montanvert, I was prevented from executing my purpose. You will, however, have no reason to regret my disappointment, on receiving the following account of that expedition, extracted from notes communicated by a friend.

We quitted the Priory at six in the morning, accompanied by Michael Paccard and Marie Coutet, two guides of Chamouny, traversed the plain, and ascended the Montanvert through a wood of pines. We had fine views of the glacier which gives rise to the Arveron, and of the vale of Chamouny, chequered in a most singular manner with alternate rows of arable and pasture land. After continuing about an hour, we quitted our mules, proceeded on foot, and in an hour and a half reached Blair's Hut, on the

top of the Montanvert, where we rested for a few minutes.

We then descended to the glacier, coasted it by the path of the crystal hunters, and in about half an hour came to some difficult passes called Les Ponts, or the Bridges, which run over a perpendicular rock, at the edge of a frightful precipiee. These passages, though still difficult, were extremely dangerous, until, by order of Saussure, the rock was in some parts blown access with gunpowder, and small holes formed for the hands and feet. The first bridge was about forty paces in length, and the two others somewhat less difficult, of about ten paces each. In a quarter of an hour we arrived at a fountain, which drops from the roof and sides of a natural grotto, the inside whereof is overgrown with large tufts of the ranunculus glacialis. Having walked about eight miles since our departure from Chamouny, we sat down in this sequestered grotto and made our first repast.

From hence we crossed some snow, the remains of the last winter's avalanche, and immediately got upon the Moraine, the term given to the stones and earth which the glaciers disgorge on each side, after having received them from the impending moun-

^{*} This plan has been finished, and a coloured print of it published. † Excursion dans les Mines de Haut Faucigny, &c. Lausanne, 1787.

tains: they are very treacherous and difficult to walk upon. The ice upon which these stones rest is harder than that of the rest of the glacier; and the earth is laid in such regular and equable heaps as to give the appearance of art. As we looked from hence over the valley of ice, the passage seemed impracticable; so numerous and broad were the chasms which intersected it in every direction, many bearing a tremendous appearance, and of an astonishing depth; but we soon found that it only required courage and activity. Instead of crampons we had large nails in our shoes, which more effectually answered our purpose, and our spiked sticks were on this occasion particularly serviceable. Having descended upon the glacier, we found the ice softened by a warm wind, which rendered it less slippery than usual. We continued along it about a quarter of an hour, then regained and walked along the Moraine near half an hour. We now embarked upon the great valley of ice called Glacier des Bois, I own not without emotion to see ourselves upon this extraordinary descrt, broken into frightful chasms, through the maze of which we were to pass. It was curious to observe the numerous little rills produced by the collection of drops occasioned by the thawing of the ice on the upper part of the glacier: these little rills hollow out some channels, and torrent-like precipitate themselves into the chasms with a violent noise; increasing the body of waters formed by the melting of the interior surface, and finding an outlet under the immense arch of ice in the valley of Chamouny, from which the Arveron rushes. This ice-water was agreeable to the palate, and extremely refreshing from its coolness.

The field of ice, which at first sight seemed impervious to all but the chamois and marmot, and scarcely practicable even for the daring footsteps of man, is traversed by flocks of sheep, driven to the scanty pasturage which the opposite rocks afford. The shepherds leave them in these desolate spots, and visit them at different intervals. We observed their track over the ice, and saw a flock returning; one shepherd preceded as a guide, and another followed the herd: we had the good fortune to preserve a sheep which

had strayed from the flock.

As we were continuing our course, we were surprised by a loud noise; and, looking round, perceived a large fragment of rock which had detached itself from one of the highest needles: it bounded from precipice to precipice with great rapidity, and, before it reached the bottom, was reduced almost entirely into dust. Having proceeded about an hour, we were astonished with a view far more magnificent than imagination can conceive: hitherto the glaciers had scarcely answered my expectations, but now far surpassed them. Nature clad herself in all her terrors. Before us was a valley of ice twenty miles in extent, bounded by a circular glacier of pure unbroken snow, called Tacu, which leads directly to the foot of Mont Blanc, and is surrounded by large conical rocks, terminating in sharp points like the turrets of an ancient fortification; to the right rose a range of magnificent peaks, their intervals filled with glaciers; and far above the rest, the majestic summit of Mont Blanc, his highest point obscured with clouds. He appeared of such immense magnitude, that at his presence the circumjacent mountains, however gigantic, seemed to shrink before him, and "hide their diminished heads."* In half an hour we arrived at the Moraine, which forms a boundary of the valley, crossed it, and proceeded upon a body of ice about three quarters of a mile broad. Here the ice was more even and free from chasms than in the great valley. We then passed a second Moraine, and beyond that another mass of ice to a third Moraine: de-

raine : de-

scending from thence we came upon the last ridge of ice, considerably broader than the two former and full of large chasms: it is separated from the rock only by a very narrow Moraine. These Moraines contain great quantities of crystal.

Here we turned a little to the right, and ascended the valley of ice, the scene every moment increasing in magnificence and horror. In a short time we arrived at the foot of the Couvercle, having walked about six miles on the ice. We now found it difficult to quit the ice, and the first part of the descent was really perilous. One step was truly dreadful: a bulging rock entirely smooth, and presenting a precipice of very considerable depth, which was terminated by an immense chasm in the ice, seemed to forbid our progress; a small hollow, however, in the middle served for one foot, and from thence we bounded over to the firm ground. One guide went first, and held out his hand on the opposite side, whilst the other helped and directed us where to place our feet. We continued ascending a path which now seemed without danger, though very narrow and steep, and carried along the ridge of precipices. The scenery around was indeed so sublime as to banish all ideas of fatigue and apprehension. Half an hour more brought us to the side of a fountain, where we sat down to our dinner. We had now

The clouds beginning to gather, warned us to hasten to the top of the Couvercle. From that station we had the view of three stupendous vallies of ice, the glacier of Talefre to the left, in front that of l'Echaut, and the Tacu to the right; all uniting in one great valley of ice called the Glacier des Bois, which stretched under our feet, and was surrounded and ornamented by the rugged needles. The dead silence which reigned in this place was only interrupted by the bounding of distant chamois, and the cries of

employed five hours and a half from Chamouny, and notwithstanding all difficulties and

necessary halts, had walked fifteen miles, but none of us complained of fatigue.

alarm which the marmots gave to their tribes at our approach.

Having refreshed ourselves, we proceeded to the top of the Couvercle, a most extraordinary rock of granite, having the appearance of a large irregular multilateral building placed on a mountain; the ascent was laborious, but perfectly secure. Towards its foot we found a bottle containing the names of two Englishmen who had reached that place about a fortnight before, and probably flattered themselves that no stranger would go beyond them. We wrote our names on the reverse of the paper, and carried the bottle with us to the summit of the Couvercle. Three quarters of an hour brought us to the point, and we reached a rock overhanging a precipice which my eyes dared not measure. In this situation we were surprised with a thunder storm, which added great horror and magnificence to the scene. We took shelter under an impending rock, and listened to the roaring of the storm with a mixed sensation of fear and pleasure. On reflecting in this place that we were to measure back the same ground, and to undergo a repetition of the same difficulties, we were not exempted from alarm; but recollecting that it is the duty of man to encounter some dangers, in order to behold such glorious scenes, we from that moment banished all apprehensions.

Our view from the top of the Couverele comprehended the same sublime scenes we had enjoyed from its base, but considerably heightened and enlarged; the stupendous extent of ice appeared like a rugged expanse of frozen sea, bounded by the most gigantic rocks, and terminated by Mont Blanc, the Atlas of the globe. Although we were thus entirely enclosed between ice and slow, and barren crags where all vegetation might be supposed to cease; yet our eyes reposed on a triangular rock, clothed with grass and alpine plants, and starting up like a fertile island in the midst of a desolate ocean. It is known by the name of the Garden, and exhibits a curious contrast to the

surrounding dreariness.

During our expeditions into the Alps, we had frequently found occasion to remark the peculiarly deep shade of the blue colour* in the "pure Empyreal;"† and to-day we were more particularly affected with this circumstance. It conveyed a most sublime idea of the infinity of space: the higher we ascended the more beautiful it seemed; and we were informed by a person accustomed to alpine scenes, that, on considerable elevations, he had frequently observed the stars at noon-day.

Our descent from these icy regions was no less fortunate than our ascent; we reached the Priory at seven in the afternoon, without the least accident, and wrapt in astonishment on the recollection of scenes which surpass the imagination, as much as they defy

description. I am, &c.

LETTER XXXIX.

Various attempts to reach the Summit of Mont Blanc....Successful Expedition of James Bulma and Dr. Paceard....Of Saussure....His physical Observations.

VARIOUS attempts having been made to reach the summit of Mont Blanc, as well by the guides of Chamouny, as by Messrs. de Saussure and Bourrit; a chronological account of the principal expeditions which have at length terminated successfully, will

not, perhaps, be uninteresting.

The first was made by M. Couteran and three guides of Chamouny, Michael Paccard, Victor Tissay, and Marie Coutet. On the 13th of July 1776, they set off from the Priory, about cleven in the evening; passed between the glaciers of Bosson and Tacona; and, after employing above fourteen hours in mounting rugged and dangerous ascents, in crossing several vallies of ice, and large plains of snow, found themselves on the top next to Mont Blanc. At first sight it appeared scarcely a league distant; but they soon discovered that the clearness of the air, the extraordinary whiteness of the snow, and its great height, made it seem nearer than it was in reality; and they perceived with regret, that it would require at least four hours more to reach the summit, even supposing it practicable. But as the day was far advanced, and the vapours towards the summit of Mont Blanc began to gather into clouds, they were obliged to relinquish their enterprise. As they were returning in great haste, one of the party slipped in attempting to leap over a chasm of ice. He held in his hand a long pole spiked with iron, which he had struck into the ice; and upon this he hung dreadfully suspended for a few moments until he was released by his companions. The danger he had just escaped made such an impression upon him that he fainted, and continued for some time in that situation: he was at length brought to himself, and, though considerably bruised, sufficiently recovered to continue his journey. They arrived at Chamouny about eight in the evening, after a journey of two-and-twenty hours: as some sort of recompence for so much fatigue they enjoyed the satisfaction, at least, of having approached nearer to Mont Blanc than any former adventurers.

According to Sir George Schuckborough, the summit which they attained is more than 13,000 feet above the Mediterranean. These persons, however, did not take the necessary precautions for so perilous an enterprise; for the expedition was not only extremely hazardous, but also far too fatiguing and difficult to be accomplished within

^{*} The depth of this blue colour is owing to the extreme purity and transparency of the air. Saussure made some curious experiments to ascertain the exact shade of blue which forms the colour of the heavens in this elevated spot. By means of slips of paper stained with different tints of blue, from the palest to the darkest, he formed a scale of 51 shades, and found that the 39th was the colour of the heavens. Vol. iv. p. 158.

Saussure our of the blue, from colour of twenty-four hours. The failure of this expedition seemed for some time to repress all future attempts, until the indefatigable Bourrit infused a new spirit into the inhabitants of Chamouny. After reiterated though unsuccessful attempts, on the 11th of September 1784, Bourrit, accompanied by six guides, departed from Bionasay, and was scaling, as he expresses himself, the rampart of Mont Blanc, when he suddenly found himself so extremely affected by the intense cold, that he was unable to proceed.

Marie Coutet and Francis Guidet, two of the guides who attended him in this expedition, preceded their company, and ascended to the Dome of Goute, which is about 9400 feet in a horizontal direction from the summit. Marie Coutet informed me, that they passed the Middle Dome, and walked along the ridge between that dome and the summit at far as some high rocks, which appear from the vale of Chamouny like small points rising out of the snow, but night approaching obliged them to return.

On the 4th of September 1785 Marie Coutet and James Balma reached a place under a rock at considerable elevation, where they passed the night. Setting off before sunrise, they found themselves about seven on the Dome of Goute, and were proceeding towards the summit with a fair prospect of success, when a violent storm of hail ac-

companied with a strong wind compelled them to return.

On the 13th of September Messrs. de Saussure and Bourrit, attended by twelve guides well provided with barometers, thermometers, and other instruments, for the purpose of making the necessary observations, departed from Bionasay, and arrived at a hut, which they had ordered to be constructed at Pierre Ronde 7808 feet above the level of the sea. Here they passed the night, and early the next morning reached the Dome of Goute without the least accident, and without much difficulty; where they were stopped by a fresh fall of snow, into which they sunk so deep that all farther progress was impracticable. Saussure informs us, that the mercury in the barometer sunk eighteen inches and a half, and that he reached an elevation of 1290 toises, or 8256 English feet.

At length, in July 1786, six guides of Chamouny having failed in another attempt, James Balma, one of the party, being overtaken by darkness, as he was rambling upon the ice, missed his way, and passed the night in a spot above the Dome of Goute, elevated more than 12,000 feet above the level of the sea. His youth, and the strength of his constitution, having preserved him from the effects of the nocturnal cold in so severe an atmosphere, at the approach of morn he reconnoitred the situation, and observed a part which appeared more easy of access than any hitherto attempted. On his arrival at Chamouny he was seized with a very severe indisposition, the effect of extreme fatigue, and of the intense cold. Being attended by Dr. Paccard, a physician of the place, James Balma communicated his observations; and, in gratitude for his attendance,

offered to conduct him to the summit of Mont Blanc.

On the 7th of August these two daring adventurers sallied from Chamouny upon this memorable expedition, and reached before dark the mountain La Cote, which overhangs the upper part of the glacier of Bosson. Here they continued during the night; and at three in the morning pursued their route over the ice, ascended the Dome of Goute, passed under the Middle Dome, and at the last pyramid of rock turned to the east, and continued along the ridge, which is seen from Geneva, and lies on the left of the summit. Here they first began to experience such intense cold, and such extreme fatigue, that Dr. Paccard was almost induced to relinquish the enterprise; being, however, encouraged by James Balma, more accustomed to such dangerous expeditions, he followed his companion. The wind was so violent and piercing, that in order to avoid its blowing in their faces, they were obliged to walk sideways for a considerable time. About

5 H 2

six in the afternoon, they at length attained the summit of Mont Blanc, and stood triumphantly on a spot of ground, which no one had reached before, and at the elevation of 15,662 feet above the sea, which is undoubtedly the highest point in the ancient world. They remained on the summit no more than half an hour, the cold being so intense, that the provision was frozen in their pockets, the ink congealed in their inkhorns, and the mercury in Fahrenheit's thermometer sunk to 18½ degrees. Doctor Paccard had just time to observe the state of the barometer, which he has not communicated to the public.

They employed fifteen hours in ascending; and though they again reached the mountain of La Cote in five hours, found great difficulty in descending, their sight being debilitated by the reflection from the snow. They arrived at La Cote about midnight, after twenty-four hours unremitted fatigue. Having reposed themselves two hours, they again sallied forth, and returned to Chamouny at eight in the morning. Their faces were exceriated, and their lips exceedingly swelled; Dr. Paccard was almost blind, and his eyes continued to be affected for a considerable time.

We cannot expect any accurate experiments from these two persons, to whom the glory of first ascending the summit of Mont Blane is undoubtedly due. But they prepared the way for the observations and discoveries of future naturalists, and particularly of Saussure, whose indefatigable zeal did not permit him to rest, until he had reached the top of Mont Blane, and made those experiments which cannot fail greatly to elucidate the theory of the atmosphere.

That able naturalist set out on this successful expedition, from the valley of Chamouny on the 13th of August 1787. He was accompanied by eighteen guides, who carried a tent, matrasses, all necessary accommodations, and instruments of experimental philosophy. They passed the first night on the top of the mountain of La Cote, in a hut previously constructed for that purpose. At four o'clock in the following afternoon they reached an elevation of 9312 feet above the Priory, or 12,762 above the level of the sea. Here they encamped, and formed an excavation in the congealed snow, which they covered with a tent. In this icy habitation, instead of suffering from the cold, Saussure felt such a suffocating heat, from the closeness of the tent, and the number of persons crowded in a small compass, that he was frequently obliged to go into the open air in order to breathe.

The next morning the whole company departed at seven, and found the ascent in some places so steep, that the guides were obliged to hew out steps with a hatchet. At eleven they reached the summit of Mont Blanc. Here they continued four hours and a half, during which time Saussure enjoyed, with rapture and astonishment, a view the most extensive as well as the most rugged and sublime in nature; and made those observations which render this expedition no longer a matter of mere curiosity. You will, perhaps, not be displeased with the following particulars selected from a complete and ample detail of those observations communicated to the public by Saussure in the fourth volume of his Vovages dans les Alpes.*

He did not find the cold so extremely piercing as Dr. Paccard and James Balma. By comparing his experiments on Mont Blanc with those made at the same time by M. Senebier at Geneva, he was enabled to give the following observations. Reamur's thermometer stood in the shade at 2,3 below freezing point, or 27 of Fahrenheit; at Geneva,

^{*} A translation of this account, by the Rev. Mr. Martyn, professor of botany in the university of Cambridge, printed by Kearsley, forms an Appendix to his Sketch of a Tour through Switzerland; which I would recommend to the traveller.

at 22, 6, or 82 of Fahrenheit, which gives a difference of near 25 degrees of Reaumur, or 45 of Fahrenheit, between the state of the atmosphere at both places. De Lue's barometer fell to 16.0\frac{122}{124}, and as it stood at Geneva at 27.2\frac{1244}{124}, it gives a difference of 11. 2, without regarding the fraction. On estimating the height of Mont Blane from barometrical experiments, he found it almost exactly correspond with that given by sir George Shuckborough, or 15,662 English feet above the level of the sea, which reflects

high honour on the accuracy of the English observer.

By experiments with the hygrometer, the air on the top of Mont Blane contained six times less humidity than that of Geneva; and to that extreme dryness of the atmosphere he imputes the burning thirst which he and his companions experienced. It requires half an hour to boil water on the top of Mont Blane, fifteen or sixteen minutes are sufficient at Geneva, and fourteen or fifteen by the sea-side. By experiments on the electrometer, the balls diverged only three lines; the electricity was positive. On the summit he noticed two butterflies on the wing; observed, at the elevation of 11,392 feet above the sea, the Silene Acaulis, or moss campion, in flower; and still higher, on the most elevated rocks, the Lichen Sulphureus and Lichen Rupestris of Hoffman. The summits of Mont Blane, he adds, and the adjacent mountains, are composed of granite; and next to Mont Blane, the Schreckhorn and Monnt Rosa* in Piedmont, appeared the most elevated points.

Saussure, as well as many of his party, found themselves extremely affected by the rarefaction of the air; and at two began returning. They descended a little lower than the place in which they passed the preceding night, arrived the next morning at the valley of Chamouny without the least accident, and as they had taken the precaution to

wear veils of crape, their faces were not excoriated, nor their sight debilitated.

On the eighth of August, a few days after Saussure's expedition, Mr. Beaufoy, an English gentleman, succeeded in a similar attempt, though it was attended with greater difficulty, arising from the enlargement of the chasms in the ice. An account of this expedition was read before the Royal Society on the 13th of December 1787, and will probably be communicated to the public.

• Saussure afterwards measured the height of Mont Rosa, and found its elevation above the sea-2430 toises, which is only 50 French toises or 320 feet lower than Mont Blanc. Voyages dans les Alpes, tom. iv. p. 349.

† Some persons have attributed the difficulty of respiration to fatigue, and not the rarefaction of the air; but Saussure has fully disproved this opinion. The whole passage is so curious, that I will in-

sert the original words:

"Mais de tous nos organes, celui qui est le plus affecte par la rarete de l'air c'est celui de la respiration. On suit que pour entretenir la vie, sur tout celle des animaux a sang chaud, il faut qu'une quantite determinee d'air traverse leurs peumons dans un tems donne. Si done l'air qu'ils respirent est le double plus rare, il faudra que leurs inspirations soient le double plus frequentes, afin que la rarete soit compensee par le volume. C'est cette acceleration forcee de la respiration qui est la cause de la fatigue et des angoisses que l'on eprouve a ces grandes hauteurs. Car en meme tems que la respiration s'accelere, la circulation s'accelere aussi. Je m'en suis souvent appercu sur de hautes cimes, mais je voulois en faire une epreuve exacte sur le Mont Blanc; et pour que l'acceleration du mouvement du voyage ne put pas se confondre avec celle de la rarete de l'air, je ne fis mon epreuve qu'apres que nous fumes restes tranquilles, ou a peu pres tranquilles pendant 4 heurs sur la cime de la montagne. Alors le pouls de Pierre Balmat se trouva battre 68 pulsations par minute; celui de Tetu, mon domestique, 112, et le mien 100. A Chamouni, egalement apres le repos, les memes, dans le meme ordre, battirent 49. 60. 72. Nous etions donc tous la dans un etat de fievre qui explique, et la soif qui nous tourmentoit, et notre aversion pour le vin, pour les liqueurs fortes, et meme pour tout espece d'aliment. Il n'y avoit que l'eau fraiche qui fit du bien et du plaisir." Tom: iv. p. 207.

LETTER XL.

Conjectures on the Formation and State of the Glaciers.

NO subject in natural history is more curious than the origin of these glaciers, extending into fields of corn and pasture, and lying, without being melted, in a situation where the sun is sufficiently powerful to bring vegetation to maturity: for it is almost literally true, that with one hand I could touch ice, and the other ripe corn. As in my first expedition to the Alps my stay was exceedingly short, I declined entering upon a subject too important to be superficially treated, and only threw together a few hasty remarks, which occurred to me on the spot. But I find that these remarks, however lasty and superficial, served to excite your curiosity, and have induced you to inquire, "Which is the most rational system concerning the formation of the glaciers? Are they in a state of augmentation or diminution; or do they remain within the same limits?"

Although in subsequent journeys to the Alps I made this subject a particular object of research, and although I attentively perused the principal systems concerning the formation of glaciers, yet I do not, without great diffidence, presume to reply to your very

difficult questions.

The theory of Gruner, confirmed and amended by that able naturalist Saussure, appears the most simple and rational; and I do not know how I can better satisfy your curiosity, than by forming an extract from his much esteemed work,* interspersing it with a few additional remarks drawn from my own particular observations.

If a person could be conveyed to such an elevation as to embrace at one view the Alps of Switzerland, Savoy, and Dauphine, he would behold a vast chaos of mountains, intersected by numerous vallies, and composed of many parallel chains, the highest occupying the centre, and the others gradually diminishing in proportion to their distance.

The most elevated, or centage chain, would appear bristled with pointed rocks, and covered, even in summer, with ice and snow, in all parts not perpendicular. On each side of this chain he would discover deep vallies clothed with verdure, peopled with numerous villages, and watered by many rivers. In considering these objects with greater attention, he would remark, that the central chain is composed of elevated peaks and diverging ridges, whose summits are overspread with snow; that the declivities of the peaks and ridges, excepting those parts that are extremely steep, are covered with snow and ice, and that the intermediate depths and spaces between are filled with immense fields of ice, terminating in those cultivated vallies which border the great chain.

The branches most contiguous to the central chain would present the same phenomena, only in a lesser degree. At greater distances no ice would be observed, and scarcely any snow, but upon some of the most elevated summits; and the mountains diminishing in height and ruggedness, would appear covered with herbage, and gradually sink into

hills and plains.

In this general survey, the glaciers may be divided into two sorts; the first occupying the deep vallies situated in the bosom of the Alps, and termed by the natives Vallees de Glace, but which I shall distinguish by the name of Lower Glaciers; the second, which clothe the summits and the sides of the mountains, I shall call Upper Glaciers.

1. The Lower Glaciers are by far the most considerable in extent and depth. Some stretch several leagues; that of des Bois in particular is more than fifteen miles long, and above three in its greatest breadth.

The Lower Glaciers do not, as is generally imagined, communicate with each other; and but few of them are parallel to the central chain: they mostly stretch in a transverse direction, are bordered at the higher extremity by inaccessible rocks, and on the other extend into the cultivated vallies. The thickness of the ice varies in different parts. Saussure found its general depth in the glacier des Bois from eighty to a hundred feet; but questions not the information of those who assert, that in some places

its thickness exceeds even six hundred feet.

These immense fields of ice usually rest on an inclined plane; being pushed forwards by the pressure of their own weight, and but weakly supported by the rugged rocks beneath, are intersected by large transverse chasms, and present the appearance of walls, pyramids, and other fantastic shapes, observed at all heights and in all situations, wherever the declivity exceeds thirty or forty degrees. But in those parts, where the plane on which they rest is horizontal, or gently inclined, the surface of the ice is nearly uniform; the chasms are but few and narrow, and the traveller crosses on foot, without much difficulty.

The surface of the ice is not so slippery as that of frozen ponds or rivers: it is rough and granulated, and only dangerous to the passenger in steep descents. It is not transparent, is extremely porous and full of small bubbles, which seldom exceed the size of a pea, and consequently is not so compact as common ice; its perfect resemblance to the congelation of snow impregnated with water, in opacity, roughness, and in the number and smallness of the air-bubbles, led Saussure to conceive the following simple

and natural theory concerning the formation of the Glaciers.

An immense quantity of snow continually accumulates in the elevated vallies enclosed within the Alps, as well from that which falls from the clouds during nine months in the year, as from the masses incessantly rolling from the steep sides of the circumjacent mountains. Part of this snow, not dissolved during summer, impregnated with rain and snow-water, is frozen during winter, and forms that opaque and porous ice of which the Lower Glaciers are composed.

2. The Upper Glaciers may be subdivided into those which cover the summits, and

those which extend along the sides of the Alps.

Those which cover the summits owe their origin to the snow that falls at all seasons of the year, and which remains nearly in its original state, being congealed into a hard substance, and not converted into ice. For although, according to the opinion of some philosophers, the summit of Mont Blanc, and of other elevated mountains, is, from the glistening of the surface, covered with pure ice, yet both theory and experience prove it to be snow. For in so elevated and cold a region, a sufficient quantity of snow cannot be melted to impregnate with water the whole mass, which remains undissolved. Experience also justifies this reasoning. Saussure found the top of Mont Blanc only encrusted with ice, which, though of a firm consistence, was yet penetrable with a stick; and on the declivities of the summit he discovered, beneath the surface, a soft snow without cohesion.

The substance which clothes the sides of the Alps is neither pure snow like that of the summits, nor ice which forms the Lower Glaciers, but an assemblage of both. It contains less snow than the summits, because the summer heat has more power to dissolve it, and because the liquefied snow descending from above, the mass absorbs a larger quantity of water. It contains more snow than the Lower Glaciers, because the dissolution of the snow is comparatively less. Hence the ice is even more porous, opaque, less compact than that of the Lower Glaciers, and of so doubtful a texture as

in a situation is almost li-As in my

phenomeind scarcely liminishing y sink into

est occupyves Vallees the second, Glaciers. th. Some s long, and renders it, in many parts, difficult to decide, whether it may be called icc or frozen snow.

In a word, there is a regular gradation from the snow on the summits to the ice of the Lower Glaciers, formed by the intermediate mixture which becomes more compact and less porous in proportion as it approaches the Lower Glaciers, until it unites and assimilates with them. And it is evident, that the greater or lesser degree of density is derived from the greater or lesser quantity of water, with which the mass is impregnated.

In regard to your second question, "whether the glaciers are in a state of increase or diminution," though I declined on a former occasion entering minutely upon a subject, which required accurate research and experimental investigation, yet I ventured to make one remark, which seemed to prove the occasional increase and diminution of the glaciers, contrary to the opinion of some philosophers, who assert, that they remain al-

ways the same, and of others, that they are continually increasing.

The borders of the glacier of Montanvert are mostly skirted with trees: towards its base a vast arch of ice rises near a hundred feet in height, under which the Arveron rushes in a large body of water. As we approached the ice we passed through a wood of firs: those trees which stand at a little distance from the arch are about eighty feet high, and undoubtedly of a very great age. Between these and the glacier, the trees are of a later growth, as is evident from their texture and inferior size. Others, still smaller have been overturned and enveloped by the ice: there seems to be a kind of regular gradation in the age of these trees, from the largest which are standing to the smallest that lie prostrate.

These facts justly lead to the following conclusions: the glacier once extended as far as the row of tall firs; upon its gradual dissolution, a number of trees shot up in the very spots which it formerly occupied; since that period, the ice has again advanced, and has overturned the trees of later growth, before they had attained any considerable height. Large stones of granite are usually found at a small distance from the extremities of the glacier: they have certainly fallen from the mountains upon the ice, have been carried on in its progress, and left on the plain upon the dissolution or sinking of the ice which supported them. These stones, which the inhabitants call Moraine, from a kind of border towards the foot of the valley of ice, have been pushed forward by the advance of the glacier, and extend even to the place occupied by the larger pines.

As several writers upon Switzerland have, in contradiction to these facts, endeavoured to prove, that the snow and ice are continually accumulating in the Alps, I shall

add a few remarks, that may tend to confirm the contrary opinion.

In 1785 the Inferior Glacier of Grindelwald was diminished at least four hundred yards since 1776; in the valley of Chamouny, the Murailles de Glace, which I described as forming the border of the Glacier of Bosson, no longer existed, and young trees had shot up in the parts which were then covered by the glacier of Montanvert.

The advocates for the increase of the glaciers, admit these facts, yet deny that any judgment can be formed concerning the state of the more elevated regions, from what passes in the vallies, where the sun has power to bring the fruits of the earth to maturity. It appears, they assert, both from theory and fact, that more snow falls, and more ice is annually formed in the Alps than can be annually dissolved. To judge from theory; they argue, that the cold occasioned by the mass of ice already formed ought to augment it still further; and in regard to experience, it is evident, that within the memory of the present generation, many mountains have been covered, many pastures and habitations invaded, and many passages irrecoverably obstructed by the ice.

r hundred nich I desand young ottovert. It that any from what is to matufalls, and udge from med ought within the y pastures But in considering the arguments drawn from theory, we may observe that the causes which tend to the diminution of the ice, are no less powerful than the augmentation of the cold, which is supposed to occasion its indefinite increase. These causes are principally, 1, rain and sleet in the less elevated regions; 2, evaporation; 3, descent of the snow and ice, both precipitous and gradual; 4, heat of the atmosphere; 5, mean temperature of the earth.

1. The rain and sleet, which fall during summer upon the Lower Glaciers, not only thaw the ice, but increase the rills that collect on the surface, excavate channels, descend

into the clefts, and assist in forming or enlarging the chasms.

Evaporation is a still more powerful cause; as it acts at all heights, and in all seasons.
 The descent of the snow and ice, as it is distinguished by precipitous and gradual.

3. The descent of the snow and ice, as it is distinguished by precipitous and gradual. The avalanches, or precipitous fallings of congealed snow, are detached either by their own weight, softened from their hold by the heat of the sun, the warm air which blows from the south, or overthrown by the violent hurricanes extremely common in the upper Alps. When these masses are precipitated into a milder region, though they may sometimes resist the influence of heat, and form vallies of ice, yet they are usually dissolved. These avalanches are most common in the Upper Glaciers: whereas the gradual descent of the ice is chiefly confined to the Lower Glaciers, and greatly contributes to lessen the aggregate mass.

All the Lower Glaciers, or vallies of ice, rest on an inclined plane, are arched, and undermined by the torrents, which are constantly flowing, as well from the Upper Glaciers, as from their own interior surface. The natural tendency of a heavy body in such a position is to descend, and the progressive motion is accelerated in proportion to its weight, and the greater inclination of its base. This progressive motion, which acts, though imperceptibly, yet gradually and uniformly, carries the ice into those cultivated plains and vallies, where the sun ripens the fruits of the field; and where a period is

put to its farther increase.

If you require a proof of this imperceptible descent, the answer is obvious. It is to be collected from the facts which I have already enumerated, namely from the trees which are occasionally overturned by the ice in its progress, and by the moraine of stones at the bottom of the Lower Glaciers. These stones being similar to the mountains of the upper Alps, and essentially different from the rocks below, must have been conveyed

by the ice in its descent from the Upper Glaciers.

4. The heat of the atmosphere, or the effect of the sun's rays on the outward surface of the glaciers, is too evident to require any proof, even to those who have never been in the Alps. Another cause of a thaw, occasioned by the heat of the atmosphere, which will not be suspected by those who have not visited these icy regions, is derived from the warm winds which blow by night as well as by day in the Upper no less than in the Lower Glaciers. These warm winds are, during summer, so common in these parts, that I never crossed a glacier without feeling, in some particular positions, a warmth similar to the air of a hot bath.

5. But as these two last causes only operate in summer, and the solar rays do not produce sufficient effect in the highest parts, we must have recourse to the mean temperature of the earth, which seems to be the greatest and most powerful agent in preventing an indefinite augmentation of ice and snow. This mean temperature, termed by some philosophers the internal * heat of the earth, is always above the freezing point,

^{*} Some Philosophers impute this constant thaw, which takes place in the lower surface of the glaciers, to an internal source of heat in the earth; but that opinion has been very ably refuted by several movol. V. 5 I

as is evident from the heat of the springs which issue from the bowels of the earth. In winter, therefore, or in those high regions of the globe where the cold is usually below the freezing point, any spot of ground covered with only a thin coat of snow, may be so far cooled, to a certain depth, by the influence of the external air, as not to be capable of dissolving any part of the superincumbent snow. But when the mass of snow is of such a thickness as to protect the surface of the ground from the effects of the atmospherical cold, the mean temperature, which is always above the freezing point, will be sufficient to melt the contiguous stratum of snow, and to occasion a constant thaw, which supplies those currents of water that flow, at all seasons, from the Upper and Lower Glaciers.

In regard to the argument derived from experience, it is sufficient to observe, that while I admit the facts which prove the progress of the ice, it by no means seems to follow that its mass is perpetually increasing. For the advocates of this opinion, while they scrupulously enumerate the places which have been invaded by the ice, do not take any notice of those parts, no less numerous, from which the ice has receded.

During my second expedition into the Alps, I also made this point of controversy a particular object of my research; and on inquiring from the chasseurs and other persons who frequent the mountains, the greater part were of opinion that the collection of ice and snow, even in the elevated regions, was by no means in a continual state of augmentation; but that while it gained in some places, it diminished in others, and that upon an average, the aggregate quantity was nearly the same.

LETTER XLI.

Account of the Bouquetin, or Mountain-Goat.

I OBSERVED, at Michael Paccard's, a guide of Chamouny, a head and horns of the male bouquetin, or mountain-goat, and stuffed specimens of a female and a young one.

As this animal is extremely rare, and inhabits the highest and almost inaccessible mountains, the descriptions of it have been inaccurate and confused. But a new light has been lately thrown on the subject by Dr. Girtanner of St. Gallen, and by M. Van Berchem, secretary to the Society of Sciences at Lausanne; and although these two naturalists differ in some instances, yet their joint labours have assisted in ascertaining the nature and economy of this curious animal. The following account of the bouquetin is drawn principally from their observations in Rozier's Journal, and from additional information obligingly communicated by M. Van Berchem.

The elder naturalists speak of the bouquetin as of an animal well known, and in their time by no means uncommon on the high Alps of Switzerland, especially in the canton of Glarus and in the country of the Grisons. On the town hall of Garus, there is still a pair of horns of an extraordinary length, belonging to an animal of this species, formerly killed in the canton. These horns are probably the same which Ray saw in the last century, when the natives informed him, that the breed was there extinct.

That this animal was found among the Grisons, appears from a letter in the possession of M. de Salis Scervis, dated the fourteenth of October 1574, in which the Arch-

dern naturalists; the mean temperature of the ground being found sufficient to account for all the phenomena (local circumstances excepted) which have been usually assigned to an internal heat of the earth.

e phe-

duke Ferdinand of Austria requires from his bailiff of Castels, in the Pretiguu, two bouquetins; adding, that he had received several from his predecessors. About forty years after the date of this letter the animal became rure; for a decree in the year 1612 prohibits the chace of the bouquetin under a fine of fifty crowns, and that of the chamois from New Year's Day to St. John, under the penalty of ten crowns. Sprecher in his Pallas Rhetica, published in 1617, relates that the chace of the bouquetin was not uncommon in his time, in the vallies of Pregallia, Vais, and Upper Engadina. Another law of 1633, confirmed in the following year, inflicts corporal punishment on those who kill a bouquetin. But these severities could not preserve the breed; and probably this was the epoch of their destruction, when the fear of their being extinct prompted government to forbid the chace.* It is certain, that within the memory of the present generation, no bouquetins have been found in a wild state in the country of the Grisons.

These animals now inhabit that chain which stretches from Dauphine through Savoy to the confines of Italy, and principally on the Alps bordering on Mont Blane, which is the most elevated part. They haunt the valley of Cormayor to the south of Mont Blane, the heights between Mont Blane and the frontiers of the Vallais, and the mountains bordering Val Savarenche; but are found more abundantly in the mountains of the valley of Cogne, and almost always frequent places which have a southern aspect.

The several names by which the bouquetin is known in different languages, are, in Greek, by Homer and Ælian, At ergo; † Latin, Ibex; Italian, Capra Selvatica. German and Swiss, Steinboch, or Rock-goat, the female, Etagne, or Ybschen and Ybschgeiss, perhaps from the Latin Ibex; Flemish, Wildgheit; French, Bouquetin, anciently Bouc-estain, the German name reversed. Belon named it Hircus ferus; Brisson Hircus Ibex; Linnæus, Capra Ibex; Pennant, the Ibex; Dr. Girtanner, Capra Alpina. I have adopted the name of bouquetin, because it is the provincial appellation of the animal in the Alps.

The systematic naturalists agree in taking the specific character of the bouquetin from the beard, and the horns, which they describe as knobbed along the upper or anterior

surface, and reclining towards the back.

The male bouquetin, though larger, much resembles the tame goat. The head is small in proportion to the body, with the muzzie thick, compressed, and a little arched; the eyes are large, round, and have much fire and brilliancy. The horns large when of a full size weighing sometimes 16 or 18 pounds, flatted before and rounded behind, with one or two longitudinal and many transverse ridges, which degenerate towards the tip into knobs; the colour dusky brown. The beard long, tawny, or dusky; the legs slender, with the hoofs short, hollow on the inside, and on the outside terminated by a salient border, like those of the chamois. The body short, thick, and strong. The tail short, maked undermeath, the rest covered with long hairs, white at the base and sides, black above and at the end; space under the tail in some rawny, in others white.

"Parcitur hie Capricorne tamen tibi, Panos amice, Arma quod exornes, et pulchra insignia gentia, Hine longum hine vitam vivens, ingentia jactas Cornua, perpue plicas ragosa, repundaque in armos, Formosusque nigris villis in montibus erras."

Franciscus Niger, in his description of the Grisons, quoted by Conrad Gesner, says, that they spare
 this animal in hunting, because it is the armorial bearing of the country.

[†] Most naturalises affirm that Homer calls this animal As again, whereas he styles it As 222 as or the wild-gout, adding the epithet space or wanton. Hind as v. 105.

The coat long, but not pendant, ash-coloured, mixed with some hoary hairs: a black list runs along the back, and there is a black spot above and below the knees. The colour, however, like that of all other animals, varies according to its age and local circumstances.

The female has been little noticed among naturalists. She is one-third less than the male, and not so corpulent; her colour less tawny; her horns small, and not above eight inches long; she has two teats, like the tame she-goat, and never any beard, unless, perhaps, in an advanced age. The young ones are of a dirty gray colour, and the list along the back is scarcely discernible. The female shews much attachment to her young, and even defends it against eagles, wolves, and other enemies; she takes refuge in some cavern, and presenting her head at the entrance of the hole, thus opposes the enemy.

From a stuffed specimen of the male bouquetin in Parkinson's, late sir Ashton Lever's Museum, I have given some of the principal dimensions, as they are not to be found in any author that has fallen under my observation, except in Buffon's Histoire Naturelle; and those were taken by Daubenton from a young subject.

			Feet	. Inches

The horns being so remarkable a part of this animal, I shall add the measurement. not only of those belonging to Mr. Parkinson, but of four others, which are deposited in the British Museum. Those in the second and third columns certainly belong to the bouquetin of the Alps; their colour is a dusky brown; the first of these is very flat before, the second not so flat; neither the longitudinal or transverse ridges are strongly marked; these are evidently the horns of a very old animal. The horns in the fourth column belong also to the bouquetin, but probably from some other country. Their colour is black; they are much flatter on the sides, and narrower before than the others. the longitudinal ridge is very strongly marked, and the transverse ridges stronger and more numerous. I cannot observe more than one * longitudinal ridge in any of the horns which I have examined, the exterior part of the front being universally rounded off, and the transverse ridges running very little into the sides. The horns in the fifth column being unquestionably to the Ægagrus of Pallas, which is not improbably a variety of the bouquetin. Two fine pairs of these horns were given to the Museum by the late duke of Northumberland. They have no anterior flat face, but a sharp ridge, with a few knobs in front, about nine in number, and very distant from each other; they are streaked transversely, more evidently towards the end; their extremities are

^{*} Most naturalists affirm, that the horns are marked with two longitudinal ridges; all those that have fallen under my observation have only one interior longitudinal ridge, and a faint mark on the exterior edge, which is probably taken for the second longitudinal ridge.

It is a common notion of the hunters, adopted by many naturalists, that the age of a bouquetin may be estimated by the number of transverse ridges or knobs in the horns. M. Van Berchem, however assures me, from his own observations, that this is a vulgar error, and that the age can only be ascertained by the number and form of the teeth, as in sheep and goats. The bouquetin increases in bulk to the age of four years; according, therefore, to the system of Buffon, that the age is about seven times the growth, it lives about twenty-eight or thirty years.

In a state of tranquillity the bouquetin commonly carries the head low; but in running holds it high, and even bends it a little forward. He mounts a perpendicular rock of fifteen feet at three bounds of five feet each, and does not appear to find any footing on the rock, but touches it merely to be repelled, like an elastic substance striking against a hard body; he is not supposed to take more than three successive leaps in this manner. If he is between two rocks near each other, and wants to reach the top, he leaps from one side of one rock to the other alternately, till he has attained the summit. He also traverses the glaciers with rapidity, but only when pursued, for otherwise he avoids them.

The bouquetins feed, during the night, in the highest woods; but the sun no sooner gilds the summits, than they quit the woody region, and mount, feeding in their progress, till they have reached the most considerable heights. They betake themselves to the sides of the mountains which face the east or south, and lie down in the highest places and hottest exposures; but when the sun has finished more than three quarters of its course, they again begin to feed, and to descend towards the woods, whither they retire when it is likely to snow, and where they always pass the winter. The bouquetins assemble in flocks, consisting at most of ten, twelve, or fifteen, but usually in smaller numbers. The males of six years old and upwards haunt more elevated places than the females and younger bouquetins, and as they advance in age are less fond of society: they become gradually hardened against the effects of extreme cold, and frequently live entirely alone.

In summer they feed principally on the genipi and other aromatic plants which grow in the high Alps; in winter they cat the lichens, and browse on bushes and the tender shoots of trees. They prefer those spots where the dwarf birch and alpine willows.

grow, and where rhododendron, thalictrum, and saxifrages abound. The bouquetins having their fore legs somewhat shorter than the hind legs, naturally ascend with greater facility than they descend; for this reason nothing but the severest weather can force them into the lower regions, and even in winter, if there are a few fine days, they leave the

woods and mount higher.

Winter is the season of love with them, and principally the month of January. The females are with young five months, and consequently produce in the last week of June, or the first of July. At the time of parturition they separate from the males, retire to the side of some rill, and generally bring forth only one, though some naturalists affirm that they occasionally produce two. The common cry of the bouquetin is a short sharp whistle, not unlike that of the chamois, but of less continuance: sometimes it makes a

snort, and voung bleats.

The seal or hunting the bouquetin is towards the end of summer, and in autumn, during the months of August and September, when they are usually in good condition. None but mountaineers engage in the chace; for it requires not only a head that can look down from the greatest heights without terror, and sure-footedness in the most difficult and dangerous passes, but also much strength and vigour, to support hunger, cold, and fatigue. The most determined hunters of bouquetins inhabit the mountains of the Lower Vallais, particularly the natives of Scrvan, a village in a wild and picturesque situation, between Valorsine and Martigny; and the bouquetins being extinct in their mountains, they hunt in those of the valley of Aost, with the permission of the inhabitants.

Two or three hunters usually associate in this perilous occupation; thay are armed with rifle-guns, and furnished with small bags of provisions; they pass the night among rocks at considerable heights, erect a miserable hut of turf, where they lie without fire or covering, and on waking not unfrequently find the entrance blocked up with snow three or four feet in depth. Sometimes being overtaken by darkness amid crags and precipices, they are obliged to pass the whole night standing, embraced in order to support each other, and to prevent themselves from sleeping. As the bouquetins ascend into the higher regions early in the morning, it is necessary to gain the heights before them, otherwise they scent the hunter, and betake themselves to flight: it would then be in vain to follow them; for when once they escape, they never stop till they think themselves entirely out of danger, and will even sometimes run ten or twelve leagues.

When a bouquetin is shot, the hunters let it cool upon the spot, and then embowel it, putting the blood into one of the entrails, which is esteemed by the peasants a sovereign remedy in pleurisies and some other disorders. A large bouquetin thus embowelled

will weigh 180 or 200 pounds; a female from 70 to 80.

Some naturalists affirm, that the diminution of the race of bouquetins in the Alps is owing to his size, the monstrous length and weight of the horns, which impede him in his course; because he is driven into places where he can scarcely procure sufficient nourishment during great part of the year, where his sight becomes debilitated, and is frequently lost by the strong reflection of the sun from the ice and snow. They consider this animal rather as a native of the subalpine regions, which are covered during summer with the finest herbage, and where the bouquetins and chamois probably pastured in tranquillity, when only the lower vallies and plains were inhabited.

According to the opinion of others, the bouquetin is endued with strength proportionate to his size; though inferior to the chamois in liveliness and agility, yet he is by no means deficient in activity; his horns, though large and weighty, yet from their reclined position do not seem an impediment, but rather render him an essential service

him in inflicient and is ey conduring ly pas-

ropore is by their ervice when he happens to fall, or purposely throws himself down precipices to avoid his pursuers. His natural food is rather lichens than herbs; he is particularly fond of the young shoots of trees and shrubs; and in all the places where he inhabits, is found in the coldest and rudest mountains, and on the steepest rocks. From these circumstances it is not improbable that his present situation and manner of life is an effect of nature rather than of necessity; and to account for the present scarcity of the bouquetin, we need only consider the number of its enemies, in men, beasts, and birds of prey.

Even should the bouquetin be no longer found in his native Alps, still the race could not be considered as extinct, but as having migrated into a milder climate, and, with a state of domestication and more succulent food, acquired softer manners, a form less rude, smaller and smoother horns. For it is not improbable that the bouquetin of the Alps, the hircus ferus or bouc-estain of Belon, the Siberian ibex, and ægagrus, both accurately described by Pallas,* and the tame goat in all its different forms, are only varieties of the same species. They are found to couple freely with each other, are asserted to produce an offspring which is fertile, and all have a beard, which seems to be the characteristic of this genus. The circumstance in which they differ, such as the size, coat, and shape of the horns, cannot be esteemed specific distinctions, and may be accounted for from a change of climate, situation, and food.

The greatest difference undoubtedly consists in the horns; none perhaps, except the bouquetin, having a longitudinal ridge, and some being even without the transverse ridges. But this variation is less perceptible, in comparing the bouquetin with the Siberian ibex, the ibex with the ægagrus, and the ægagrus with the tame goat; for the horns of the Alpine bouquetin are not so much weightier, longer, and larger, than those

of the ibex and ægagrus, as to form a certain specific distinction.

But even should this difference be still greater, it can never be admitted as forming a specific distinction; for the horns not only vary in individuals of the same species, but in the same individuals at different ages; and if we attempt to arrange animals solely by their horns, the discriminations will be as endless as uncertain. But should the Alpine bouquetin and the other species of the goat genus be excepted from this general assertion, we have only to add, that the horns of the female bouquetin are like those of the tame goat, and that M. Van Berchem possesses the horns of a young one, produced from the union of the bouquetin and she-goat, that are exactly similar to the horns of the ægagrus, which, according to Pallas, resemble those of the tame goat. Climate and nutriment have a great effect upon the horns of animals; it is no wonder, therefore, if a long servitude, an inactive life, a change from the manifesting plants and pure air of the mountains to a gross nutriment and moister atmosphicity shiplid diminish the horns, alter their shape, subdue the longitudinal ridge, and convert the knobs into wrinkles.

*Perhaps also the capra caucasica, described by Pullas, from the important fluidenstaedt, and which he represents as differing from the ægagrus, will have been contained by some naturalists. See Act. Petr. for 1779,

[†] The horns of the bouquetin sometimes weigh sixteen or eighteen pounds, are three feet in length, and have twenty-four transverse ridges. A similar horn of a silverian like weighed, according to Pallas, eight Russian pounds, which is one-tenth less than an implied pound, and had sixteen or eighteen transverse ridges. The horns of another full-grown Siberian hex measured 2 feet 5 inches and 5 lines along the curvature, and 1 foot 2 inches and 9 lines along the retilinear direction. The horns of an ægagrus measured 2 feet 2 inches and 9 lines along the curvature, and 1 foot 4 inches in a linear direction. The horns of a full-grown Caucasan goat were 2 feet 4 inches along the curvature, and 1 foot 6 inches in the linear direction. The longitudinal ridge or ridges remain then as the only specific difference between the horns of the Alpine bouquetin and those of the other species. See the measurements in Pallas Spic. Zool. and in his Description of the Capra Caucasica, in Act. Petr. for 1779.

Buffon extends the goat genus still further, and comprehends under it even the chamois; conjecturing that the bouquetin is the male in the original race of goats, and the chamois the female. But there does not seem the least foundation for this notion; the chamois being an animal totally distinct from the goat, never coupling with them, and judiciously classed by Pallas and Pennant in the genus of antelopes. The conjecture of Buffon, however, that the bouquetin is the original source of the tame goat seems well-founded, and has been adopted by most succeeding naturalists. And, as according to the just observations of Pallas, the ægagrus approaches nearer than the bouquetin to the tame goat in its form and horns, the ægagrus may be the link which connects the bouquetin and the tame goat. May not the agagrus be considered as a race produced from the bouquetin and she goat, or the goat and female bouquetin? Pallas also conjectures that the tame goat may have been propagated from the ægagrus and Siberian ibex, which is allowed by most naturalists to be the same as the bouquetin; and Pennant remarks, with no less sagacity, that the tame goats may be derived from both, as we are assured that the ibex and she goat will produce a similar offspring. It is likewise probable that the bouquetin is the origin of all the goat genus, because it is the largest, strongest, and dwells in the most inhospitable regions. For, according to the observations of the great zoologist,* those animals who are natives of the coldest mountains must, on descending into the warm plains, be liable to greater changes than those who are formed for milder climates; and this circumstance seems sufficient to account for the great variety observable in the goat genus.

Some naturalists pretend that the bouquetin cannot be the original stock from whence the goats have been produced, because, as he inhabits the loftiest summits covered with eternal snow, and feeds only on plants peculiar to high regions, he cannot be domesticated in a variety of climates; but this opinion is contradicted by fact and experience, Stumpf, the historian of Switzerland, informs us, that the Vallaisans near Sion bred tame bouquetins with their goats; and Belon relates, that the Cretans tamed the young bouc-estains by suckling them with goats. Pallas also frequently observed the Siberian ibex among the tame goats, and mentions one in particular at Orenburg, which was leader of a flock, and father of a numerous offspring more resembling the females than himself; it was very different from the tame he goats, and scarcely inferior in size to a bouquetin two years old; in colour and strength he resembled the wild animal, had thick horns, knobbed, not kneeled above, and a long rough coat, but no where pendent, except in the beard; the black list on the back was almost obliterated. Lastly, M. Van, Berchem saw several tame bouquetins at Aigle; they were gentle and familiar, and, without being remarkably lively, were active and graceful in all their motions; they bred with different she-goats, and the young ones seemed to form a new race.

Should these observations be well founded, the goat genus, or race of the bouquetin, is found in a wild state along the chain of mountains that traverses the temperate parts both of Europe and Asia; on the Alps, Pyrenees, and Carpathian mountains; on the Taurus and Caucasus; on the mountains of Siberia and Tartary; in Kamtchatka; on the islands of the Archipelago; in Hedsjæas in Arabia; in India; perhaps in Egypt

and Lybia.

LETTER XLII.

Journey to Geneva... Pays de Vaud... Lausanne... Felix the Fifth... Vevay... Tomb and character of General Ludlow... Clarens... Meillerie.

QUITTING the delightful vale of Chamouny and its magnificent scenery, we continued our route towards Geneva. As we proceeded the height of the mountains gradually diminished, and the vallies through which we passed were agreeably diversified in their forms and productions. We followed the course of the sonorous and violent Arve; near Salenche passed on our right hand a small but picturesque lake, skirted with wood, and from hence descended into the plain, which continues almost perfectly level to Geneva. Salenche lies at the bottom of a broad valley, which here contracts to a narrow pass. According to tradition, this little plain was once a lake; and indeed its form, and the quality of the soil, seem to justify tradition: great part is laid waste by the unruly Arve, which frequently overflows its banks, and the rest is mostly covered with froit-trees.

Not far from Magland we stopped to admire a beautiful fall of water, called the cascade of Arpenas, which rushes, like the stubbach, from an impending rock. When I saw it there was a considerable wind, which drove the torrent at least an hundred yards out of the perpendicular direction, into almost imperceptible spray: I then beheld it trickling down the sides of the mountains in a thousand little streams, which united at a ridge, and from thence formed three cascades; the body of water was much more considerable* than that of the Stubbach; and the fall appeared to me altogether as high. Between Magland and Cluse we took a guide to conduct us to the cave of la Balme. The ascent, though not long, was so steep that we were nearly an hour in reaching it; we then scrambled along a precipice, from which we mounted a ladder, and by the aid of the branches of a nut-tree growing from the rock, pulled ourselves into a natural cavern more than a quarter of a mile in length, and forming various branches that led into lofty vaults and spacious openings, the sight of which did not answer the trouble required to enter it.

We passed the night at Cluse, which is situated by the side of the Arve, and the next morning came down the banks of that river to Bonneville, the capital of Faucigny: it stands also upon the Arve, at the bottom of a chain of rocks, which from this place diminish into hills. All this part of Faucigny, as also a small strip of Chablais through which we passed, is a rich plain, producing wine and corn in great plenty, but neither populous nor well cultivated. By the little village of Chene we entered the territory of Geneva, and were much pleased with the sudden change from the poverty of the Savoyards to the neatness and ease of the Genevans; we admired the populousness of the country, the richness of cultivation, and the number of country-seats scattered about the

fields.

As I propose re-visiting Geneva, in my way to the south of France, I will defer my

account of that interesting town until my return.

We went from Geneva to Crassi, a small village in the Pays de Vaud, where we passed a day with an English gentleman, who has taken a house for the summer in that delightful spot. In our way we passed through Versoi, a little village in the French territories,

VOL. V.

^{*} It may be necessary to apprise the traveller, that in dry summers this cascade is sometimes almost destitute of water, lest, seeing it under that circumstance, he should conceive the description in the text to be too much exaggerated.

upon the lake of Geneva, which bears the name of Choiseul's Folly. Geneva having fallen under the displeasure of France, that minister availing himself of the troubles in 1768, laid a plan to build a new town, and monopolise the whole trade of the lake. Accordingly he fixed upon Versoi as the most proper situation, formed a pier, made a harbour, constructed a frigate, marked out the streets, sent a considerable quantity of stone to build houses, and stationed a garrison in temporary huts, But when the harbour was nearly finished, and he had expended about 125,000l. the scheme was relinquished.

The road from Geneva to Lausanne runs through the Pays de Vaud, a region of which historians and travellers speak with rapture; particularly of that part which borders upon the lake of Geneva. It is almost the whole way a gradual ascent from the edge of the lake, richly laid out in vineyards, corn fields, and luxuriant meadows, and chequered with continued hamlets, villages, and towns; the shores are generally of the

cleanest gravel, and the water of the finest transparency.

We passed through Nyon, delightfully scated upon the edge of the lake. It was formerly called Colonia Equestris Noiodunum; and, as a proof of its antiquity, Roman inscriptions and other ancient remains have been frequently discovered in the outskirts of the town. In this part the lake forms a beautiful curve, happily alluded to by Lucan, where he mentions the army of Julius Cæsar striking their tents, which were posted on the borders:

Descruero cavo tentoria fixa Lemano.*

All the possessions in this country formerly belonging to the duke of Savoy were conquered by the canton of Bern in 1536, and in the same year the reformation was introduced. From that period all the Pays de Vaud, excepting the common bailliages of Grenson, Orbe, and a small portion of it which was ceded to Friburgh, has been sub-

ject to Bern, and makes part of that canton.

Morges, situated at the extremity of a beautiful bay, is the neatest town in these parts. The environs are extremely pleasant; the banks of the lake form an amphitheatre gently rising to the Jura, and Mont Blane presents itself through an immense opening in the opposite chain of rocks, which seemed to have been formed by nature in order to exhibit a sublime perspective of that beautiful mountain. Near the town is the lime-tree twenty-four feet three inches in circumference, with branches of magnificent extent; it has a companion about three feet less in girth. Mr. Pennant informs me, that "this tree is a native of Switzerland, and of many other parts of the continent; that it was imported into England before the year 1652; one being described by Dr. William Turner as growing in a park near Colchester; that one thirty-six feet in circumference grew near the great church at Bern; it was planted about the year 1410; and the hollow trunk, still putting forth leaves, remained in the year 1702.† The Germans, in old times, planted the lime before their churches and in the market-places, on account of its grateful shade. This tree is now neglected; yet the Romans esteemed it so highly as to say that it was employed for a thousand purposes; tiliæ ad mille usus petendæ. Å

^{* &}quot;They strike their tents and quit the hollow bend "Of Leman's lake."

[†] A large lime is to be seen on the heights above Villars, a seat belonging to M. Graffenreid of Bern, near Morat; its girth measures at least thirty-six feet in circumference, and its height is not less than ninety feet; it is very ancient, as it was lopped in 1550, for the sake of the bark. The traveller who visits this tree will be no less gratified with an extensive prospect, commanding the lakes of Morat, Neuchatel, and Bienne, and that stupendous chain of snowy Alps, which is represented on the engraving inserted in this volume.

sweet juice exudes from the leaves and bark, from which the Poles extract a honey called by them Liepiz.* Bees are also fond of the flowers; and Virgil, in his beautiful description of the industrious Corycian, places the lime and the pine in the neighbourhood of his hives."

Lausanne contains about seven thousand inhabitants; it is built upon an ascent so steep, that in some places the horses cannot, without great difficulty, draw up a carriage, and foot-passengers ascend to the upper part of the town by steps. But these inconveniences are amply compensated by the sublimest views in nature, commanding the lake of Geneva, the Pays de Vaud, and the rugged coast of Chablais.†

The same year in which part of the Pays de Vaud was conquered from the house of Savoy, the bishop of Lausanne retired from the town, and the inhabitants put themselves under the protection and sovereignty of the canton of Bern, which confirmed and augmented their privileges. At present Lausanne is governed by its own magistrates, has its own courts of justice, and, what is very singular, the burghers who possess houses in the principal street enjoy the right of pronouncing sentence in criminal causes. The criminal is tried by the civil power: if he is found, and acknowledges himself guilty, one of the magistrates pleads in defence of the prisoner, and another against him; the court of justice give their opinion upon the point of law, and the majority of the burghers possessing houses in the principal street determine the penalty. If the punishment is capital, there is, according to the letter of the law, no pardon, unless obtained

Mella favis; illi tilia, atque uberrima pinus.

the lirst and second editions of this work, the letter on the Pays de Vaud contained this passage: "The whole Pays de Vaud is much less peopled than it was during the last century. This depopulation is owing to the increase of luxury, which prevents the gentry from entering into matrimonial engagements so generally as they were heretofore accustomed, and induces numbers of them continually to emigrate in order to engage in foreign services. For although the government of Bern is certainly very mild, and never lays on any additional taxes, nor ever encroaches upon the privileges of their subjects, yet as the gentry are totally excluded from any share in the administration of public affairs, and commerce is reckoned degrading, they have no other resource but foreign services. For this reason many of them are malcontents, and would gladly exchange the mild republican form under which they now live for a monarchical mode of government."

The omission of this passage in the enlarged edition occasioned a censure from some Swiss tourist, as if I had expunged this passage in compliance with the representations of some aristocrat of Bern. I deem it, therefore, necessary to state my reasons for this omission.

In my first cursory tour through the Pays de Vand, I principally frequented the nobility and gentry, from whom I heard repeated complaints of the oppressions under which they grouned, and particularly of their exclusion from all share in the government. But in my subsequent tours I had an opportunity to examine the condition of the peasants, and to learn their sentiments on the nature of the government; and I found that, excepting in the large towns and among the gentry and opulent citizens, the great majority of the natives were fully satisfied with their condition, and deprecated all innovation. For this reason I omitted the passage in the later editions, because the happiness of a country cannot be estimated from the situation of the gentry, and a few opulent citizens alone, but from the general welfare of the collective body of the people. Even in the late revolution of Switzerland, which took its rise in the Pays de Vand, where the grievances were exaggerated by some factious leaders, and fomented by the agents of France, the number of the disaffected was exceedingly small; and had the government of Bern opposed the irruption of the French by arms, and not deprecated it by negotiation, the great majority of the natives would have flocked to their standard. A small minority, assisted by France, overcame the majority; and those who first introduced the French were soon more dissatisfied with their proceedings, than those by whom they were most carnestly opposed. When the tree of liberty was planted at Yverdum, even the adherents of France exclaimed, "it is the tree of slavery, and not the tree of liberty."

The Pays de Vaud was separated from the canton of Bern, and formed into an independent republic under the protection of France in January 1798. In the new division of Switzerland it forms the carton or department of Leman, of which Lausanne is the capital.

within twenty-four hours from the sovereign council of Bern; although it generally happens that eight days are granted for that purpose. When the criminal is seized within the jurisdiction of the town, the fact is tried, and the burghers pronounce sentence in the town-hall; in this case there is no appeal. But when he is taken within the district of the bailiff, they assemble in his house, and an appeal lies from their determination to Bern. I have been more particular in my inquiries concerning the mode of this criminal process, from the resemblance it bears, in some respects, to our trial by jury.

Here is an academy for the students of this country; professors in every science are appointed by government, and there is a tolerable library for the use of the public.

I have several times had the good fortune to meet Tissot,* the celebrated physician of this place; well known in the literary world for his excellent writings upon medical subjects. His conversation is uncommonly interesting; as besides his skill in his profession he is well versed in every branch of polite literature. His private character is no less respectable than his public, and he is as much esteemed for his great humanity as for his superior knowledge.

The church of Lausanne, formerly the cathedral, is a magnificent Gothic building, standing on the most elevated part of the town. It contains, among many other sepulchres, the tomb of Amadeus the Eighth, duke of Savoy, styled the Solomon of his age, but more known by the name of the anti-pope Felix the Fifth, who exhibited a singular instance in the annals of Europe, of a personage twice abdicating the pomp of sovereignty,

and twice retiring to a private station.

Having passed his early youth and opening manhood in the pursuits of ambition, he enlarged his dominions by the acquisition of the Genevois and Piedmont, and obtained an increase of rank by the erection of Savoy into a dutchy. Yet in the midst of his success and propitious fortune, the sudden death of a beloved wife, and a narrow escape from assassination, inspired him with a disgust of the world; he resigned his dominions to his eldest son, and, accompanied with a few lords of his court, retired to a palace at La Ripaille, on the borders of the lake of Geneva. In this palace, which he called an hermitage, he enjoyed, with an apparent indifference to the affairs of the world, a calm and tranquillity that seemed incompatible with his former aspiring ambition, until he was suddenly called forth to public notice in a more exalted station.

The council of Basle having deposed Eugenius the Fourth, induced, according to some authors, by the reputation which Amadeus had acquired for sanctity, influenced, according to others, by his largesses and intrigues, raised the hermit of La Ripaille to the papal throne. This event took place in 1439: the new pontiff quitting his favourite retreat, accepted the proffered dignity either with a real or affected reluctance, and assum-

ed the name of Felix the Fifth.

The æra of his disputed pontificate was marked with turbulence and anarchy. In erder to avoid the storms which agitated Europe, and to favour the indolence of his temper, he frequently retreated to his beloved hermitage, and directed the affairs of the church from that sequestered corner. Conscious, at length, that his acceptance of the papacy served to widen instead of healing the schism of the church; finding that he was opposed by the most powerful princes of Europe; that, on the death of his rival Eugenius, the cardinals of Rome had chosen another pope, and being ill supported by the remains of the council of Basle, he terminated the schism by resigning the papal tiara in favour of Nicholas the Fifth. In this transaction he proved his talents for ne-

^{*} Tissot is dead since this was written.

gotiation by obtaining the following conditions: that he should enjoy the next rank to the pope, be appointed viear of the Roman see, and that all the acts passed in his pontificate should be valid. On his resignation he fixed his residence at La Ripaille, and died in 1451.

Felix the Fifth shared the fate of many equivocal characters. By some he is represented as a saint, by others, as covering the most ambitious designs under the mask of sanctity; by the former, his residence at La Ripaille is described as the retreat of religious austerity; by the latter, as the seat of luxury. In this, as in similar cases, both parties exceeded the truth. On reviewing the principal events of his life, we may conclude, that a palace built by a prince, in which he was accompanied by many lords of his court, where he instituted an order of knighthood, and resided with the pomp and dignity of a sovereign pontiff, could be no common hermitage; and that he assumed the name, rather than passed the life of a hermit; while the power and rank which he secured to himself on his resignation of the papacy, sufficiently demonstrate, that he never intended to renounce the world. On the contrary, should we admit, that his life at La Ripaille was not embittered by penance and mortifications; yet as no contemporary authors, even those who were by no means partial to his character, have stigmatised his retirement, we ought not hastily to conclude that it was the retreat of a mere voluptuary. But in whatever light his moral qualities may be considered, no one can withhold from him the character of an able politician.

It is not my intention to enter into a general or particular description of the Roman antiquities discovered in Switzerland; if you are curious in such researches, I must refer you to Bochart, Miller, Spon, and other antiquaries, who have minutely treated that subject. I cannot, however, avoid mentioning two lately-discovered Roman monuments, which are placed in the garden of M. Levade, near the church at Lausanne.

The first is an altar of white marble with red veins, and was found in 1782 by some workmen in digging the foundations of a house in the town of Vevay; it is broken in a horizontal direction, and what remains is a foot and a half long and a foot high. The inscription, though not entire, proves it to be an altar erected by the twentieth legion to the god Silvanus:

DEO SILVANO ESPER URSUL. FICIO LEG. XX.

The second monument is a Roman mile-stone, discovered in a vineyard near Panda, a few paces from the high road, with this inscription:

Imp.
Cæs T. Æ. Avg.
Antonino
Pio 'PM Trib.
Cos. III. P. P.
Avent. M. P. T.
NXXVIII.

This inscription removed a doubt long entertained by the Swiss antiquaries. Bochart, among others, expresses his surprise, that no inscription bearing the name Antoninus Pius, who was so great a benefactor to the ancient Helvetians, had been found in Swit

ding, epuls age, gular gnty,

zerland. But this mile-stone, which was put up in the third consulship of that Emperor, is probably the prelude to the discovery of other monuments creeted in his honour.

The road from Lausanne to Vevay runs along the sides of the mountains between continued ranges of Vineyards. The industry of the Swiss is nowhere more observable than in these parts: the mountains in many places, though naturally consisting of a bare steep rock, are thickly covered with vines; the mould has been brought from other grounds, in order to create a soil, and is supported by rows of stones ranged in straight lines like walls. But this mode of culture, however advantageous and even necessary to the natives, occasions a disagreeable uniformity in the face of the country. The vines also do not form a pleasing and picturesque appearance, like those of the Valteline,* which are carried in beautiful festoons from tree to tree. The plants are low, and fastened to poles about four feet in height; and the walls which enclose them and border the road, frequently interrupt the view.

This district between Lausanne and Vevay is called La Vaux, and contains the two pleasant little towns of Lutty and Cully, with the villages of St. Saphorin† and Corsier: it is entirely hilly, rising abruptly from the lake; above the vineyards are rich mea-

dows and a continued forest.

Vevay, the ancient Vibiseum, and the principal town of the bailliage, is clean and well built, stands in a small plain at the foot of the mountain on the margin of the water, and is one of the few places in the canton of Bern which carry on any trade. The borders of this part of the lake are much more contrasted, wild, and picturesque, than those about Geneva: the mountains of the Vallais and Savoy boldly project into the water, and form a semicircular chain enclosing the lake, except where they are divided

by the Rhone a few leagues from Vevay.

Vevay is distinguished as the residence of Edmund Ludlow, the famous parliamentary general, who, in those times of misrule and confusion, uniformly acted with consistency and dignity. True to his republican principles, he no less violently opposed the daring usurpation of Cromwell, than the arbitrary measures of Charles the First, and could never be prevailed upon, either by threats or promises, to desert the cause, which he considered as that of justice and liberty. Being excepted, as one of the king's judges, from the act of indemnity passed at the restoration of Charles the Second, he wandered without any fixed place of residence, until he found an asylum from the attempts of his enemies at Vevay, under the protection of Bern.

At the important period of the revolution he returned to England, anxious to serve his country under our great deliverer; and William the Third, whose mind rose superior to the narrow prejudices of party, was no less desirous to employ a general of

XXXVII

This inscription ascertains two circumstances frequently called in question: namely, that the banks of the lake of Geneva, which border this part of Switzerland were comprised within a Roman province, even so early as the time of Claudius; and also that Aventicum was the chief town of this part of Helvetia: for the mile-stones always referred to the capital of the province in which they were placed and the distance from St. Saphorin to Avenches is nearly 37,000.

[†] In the church of St. Saphoria is an ancient Roman mile-stone, found near that village:

such approved experience and fidelity. But the king being addressed by the house of commons to issue a proclamation for apprehending Ludlow, he was compelled to quit England at this critical period, and again settled at Vevay. We may collect from his general character and conduct, that, had he been permitted to serve his country, he would have successively employed his great military talents against the asserters of bigotry and despotism, with the same zeal which he displayed in opposing an arbitrary government; he would have supported the new administration, when the enormous prerogatives of the crown, against which he had unsheathed his sword, were abolished by law, and the freedom of the subject was established on the basis of equal liberty under the authority of a limited monarch.

He died in 1693, in the sixty-fourth year of his age, and was interred in the church of Vevay. His monument is a plain grave-stone of black marble, containing a Latin inscription, which is printed in Addison's Travels. The house which he formerly inhabited stands near the gate leading to the Vallais, and the uncouth motto inscribed over

the door is still preserved out of respect to his memory:

Omne solum forti patria est, quia patris.

The memoirs of Ludlow are written in a simple and perspicuous style, with the knowledge of a man annually engaged in the scenes which he describes, and with the spirit of a general zealous in the cause which he had espoused and defended. Perhaps his animated detail of the trial and execution of the regicides is not surpassed by any

narrative in ancient or modern history.

Nature can scarcely form a position more delightful than that of the castle of Chatil lard or Clarens; it stands not far from Vevay, above the village, on an eminence, whose gentle declivity slopes gradually towards the lake, commanding a view of that majestic body of water, its fertile borders, and the bold rocks and Alps of Savoy. The adjacent scenery consists of vineyards, fields of corn and pasture, and rich groves of oak, ash, and Spanish chesnut trees. Although the situation and environs harmonize with the animated scenery in the Eloise of Rousseau; yet the eastle by no means accords with his description. The traveller sees an oblong building with ancient towers and a penthouse roof; in the inside a large hall like a prison, and the whole bears rather the antiquated appearance of a feudal mansion inhabited by some turbulent baron, than the residence of the elegant and impassioned Julia.

Opposite to Clarens, on the other shore of the lake, are the dark gloomy rocks of Meillerie. The village lies in the recess of a small bay, at the foot of impending mountains, in some parts gently sloping, and clothed to the water's edge with dark forests; in others naked and perpendicular, bringing to recollection the fancied rocks of Lencate.*

These are the scenes of the Nouvelle Eloise. Having obtained that novel at a circulating library in Lausanne, I continued, during these expeditions, to examine the position of the country, and compare it with the descriptions of Rousseau. Small objects may be magnified: but no pencil, however animated, can defineate the wonderful and sublime works of nature; even the warm colouring of Rousseau has not equalled the beauty of the scenery. I read with attention the principal parts of that singular performance, and dwelt more particularly upon that letter, in which St. Preus volutes his

expedition to Meillerie; wherein love and despair are worked up almost to madness. Open that performance, read that letter, and consider that part of it, where St. Preux points out the number of towns and villages, the continued fertility and high cultivation of the Pays de Vaud, and contrasts it with the gloomy coasts of Chablais, exhibiting only a few towns lying on the edge of the water; you will then see the happy effects of liberty under a mild and equitable government, like that of Bern. I am, &c.

LETTER XLIII.

Castle of Schillon ... Villeneuve Aigle ... Salt-works of Bex and Aigle.

TRAVELLERS not unusually make an agreeable excursion from Vevay to the Salt

works of Bex and Aigle.

The road continues along a plain, with hills on one side, and the lake on the other. Haller's judicious distinction of the elevated part of this country may from this spot be well exemplified. The rocky Alps are seen with their pyramidal tops shooting into the heavens, and incrusted with ice and snow. Snow likewise, at various intervals, covers the steep slopes beneath the aspiring peaks; rich pasturage succeeds, and the lower parts are clothed with forests of firs. The mountains, such as the Jura, and those rising towards Denis and Gruyeres, are fertile in grass, well wooded, their tops even, extensive, and arable; and though with little appearance of rock on the surface, yet internally filled with a hard yellowish stone fit for building, but impatient of the chissel. The collines, or little hills, are frequent at the foot of the mountains, and separated by little vallies watered by brooks.

As I advanced, the mountains approached the lake; their nature changed, their height increased, and their craggy tops and wooded sides convinced me, that I was approaching the genuine Alps. Above the woods soared, in a most picturesque manner, a lofty pyramidal crag called Le Dent de Jamant; the woods were firs mixed with oak;

the road lay close to the water's edge.

The eastle of Chillon, or rather the eastellated house, is a large pile with round and square towers, standing on a rock in the lake, and connected with the land by a draw-bridge. The vaults are very fine; the arched roofs, and the pillars which support it, are in a neat Gothic style. This eastle,* in 1536, was wrested from Charles III, of Savoy, by the canton of Bern, assisted by the Genevans, who furnished a frigate (their naval force) to besiege it by water. In a deep dungeon, below the level of the lake, the conquerors found Bonivard, prior of St. Victor, the intrepid antagonist of the duke of Savoy, and the great asserter of Genevan independence. He had been imprisoned by the Savoyards during six years, and, by constant walking in his short limits, had worn a hollow in the rock. This eastle was for a short time the residence of a bailiff from Bern, until a more convenient house was purchased in Vevay.

About half a league further is Villeneuve, a small town at the extremity of the lake. This magnificent piece of water stretches from Geneva to Villeneuve, in length fifty-four miles; it is in the shape of a crescent; Switzerland forms the hollow, Savoy the convex part; the greatest breadth is from St. Sulpice to Grande Rive, where it is twelve miles wide. Savoy affords a rude and awful boundary of aspiring Alps, craggy and covered with the ice of ages. The country from Geneva to the environs of Lausanne, slopes for a considerable way to the margin of the lake, and is enriched with all

^{*} The castle of Chillon was seized by the insurgents in January 1798, and this act of rebellion, not being punished, was followed by the separation of the Pays de Vaud from the canton of Bern.

madness.

f the lake, ngth fifty Savoy the where it is ps, craggy hs of Laud with all ebellion, not been.

the varieties which nature can bestow; the long ridge of the Jura, fertile in pasturage, and varied with woods, backs this beautiful tract. Near Lausanne the banks rise very considerably, and form a most charming terrace; a few miles beyond is a rapid descent. Near Vevay begins a plain, which is continued far beyond the end of the lake, but contracting, by the approach of the mountains, towards the lake. The colour of the water is extremely beautiful, clear, and at a distance seems of a most lovely blue.

Near Geneva the coast abounds in small pebbles covered with a brown incrustation, from thence as far as Lausanne the shores are sandy; between that town and Chillon appear ledges of rocks, hard and calcareous; and the extremity of the lake is a marsh formed by the collected mud of the Rhone. The depth is various: De Luc asserts, that on sounding it he had found the greatest depth to be a hundred and sixty fathoms: like all inland lakes enclosed within high mountains, it is subject to sudden storms.

I am uncertain whether any birds frequent the lake, which are not common to the rest of Switzerland. The tippet grebes* appear in December, and retire in February: being obliged to breed in other places, because the lake is almost totally destitute of reeds and rushes, in which they form their floating nest. The skins are an elegant article of luxury, and sell for about twelve or fourteen shillings each.

From Villeneuve the road runs through a beautiful valley, four miles in width, consisting of the richest meadow and corn land, very populous and finely wooded, bounded on each side by the Alps, with tops broken into vast crags of various forms. I passed near La Roche, where a director of the salt-works is stationed by the government of Bern; a place rendered memorable by the residence of Haller, who filled that office from 1758 to 1766, and prepared in this delightful retreat many of his numerous pub-

lications, particularly his immortal work on physiology.

I left at a little distance Yvorne, ruined, in 1584, by the lapse of a mountain occasioned by an earthquake, crossed the torrent of La Grande Eau, and halted at Aigle. a good town, seated beneath some small round hills prettily covered with firs. This country was conquered from the Savoyards by Bern in 1475, and was made a distinct government consisting of four Mandemens; the governor resides at Aigle. This town was formerly governed by the family of Torrens; but in 1553 the last count formally resigned his pretensions at Bern. This government of Aigle reaches to the Pays de Vaud, and, when under the dominion of the house of Savov, was comprised within that district; at present it is classed under the German division, although the language of the natives is French. Further on the valley is greatly contracted, and so fitted with trees as to appear a great forest. The laburnum abounds in a wild state; the wood is beautifully veined, of great strength, and much used for wedges and musical instruments; the variety with short spikes of flowers has elegant veins, and is called the ebony of the Alps. Pliny says its wood is the hardest next to the ebony. The cornelian cherry is common in the hedges, and the fruit is frequently preserved with sugar. The Machaleb cherry, or Prunus Machaleb, is found in these parts; the wood is red, of fine seent, and in request for handles of knives; it is known among cutters by the name of Bois de St. Lucie; a pleasant scented water is distilled from the leaves, and the seeds are used to give a fragrancy to soap. Between Aigle and Bex is a most picturesque view of the castle of St. Tryphon, on the summit of an insulated rock in the middle of the plain; it is quite surrounded with wood, and realises Milton's description of an ancient castle,

"Bosomed high in tufted trees."

^{*} Pennant's Brit. Zool. vol. ii. No. 222.

I am informed it is built of marble, and probably of a beautifel black species in the vicinity. St. Tryphon was a Phrygian, who is said to have suffered martyrdom at Nice

in 251, at the time of the persecution under the emperor Decius.

Bex is a small town at the foot of the mountains, five miles from the salt-works at Bevieux; in this district I observed the larch in great plenty. Painters, from the time of Pliny to that of Raphael, trusted their works to this wood, which the Roman naturalist styles immortale lignum; it is reckoned excellent for all works which are to lie under water; and the borderers on the lake of Geneva prefer it for building their vessels. In these parts I saw most beautiful woods of chesnut; Haller says they extend some leagues, and informs us that they are found in other parts of Switzerland, and even in desert places in some of the transalpine districts; accident must have brought them thither, as, according to Pliny, these trees were first introduced into Europe from Sardis.

Upon our arrival at the salt-springs, I put on a workman's jacket, and went into the mountain about 3000 feet almost horizontally. The gallery is six feet high, and four broad, and as nicely hollowed as if cut with a chissel: it is hewn in a black rock, veined in some places with white gypsum. The salt is procured from springs, which are found within a solid rock, perforated at a great expence; the richest source yields twenty-eight pounds of salt per cent, and the poorest but half a pound. Near these springs are several warm sources which contain a mixture of salt, but are so strongly impregnated with sulphur as to flame when a lighted candle is put into the pipe through which they flow. No solid salt, excepting a few small cubes, has been yet discovered; but the mountain is replete with its particles. Rocks of white gypsum or alabaster, mixed with bluish clay, are common near the springs, in the same manner as may be observed in the pits of Northwich, in Cheshire.

After travelling in this subterraneous passage near three quarters of a mile, I observed a great wheel of thirty-five feet diameter, which raises the brine from the depth of about seventy feet. From this place is a shaft three hundred feet high, which is cut through the mountain to the surface, for the purpose of introducing fresh air. I noticed two reservoirs hollowed in the solid rock for holding the brine; one was a hundred and sixty feet square, and nine in depth. Since my first expedition to these pits in 1776, the workmen had pierced the rock twenty-five feet deeper, and cut a gallery a hundred feet in length; they had also begun to form a third reservoir to contain 5500 cubic feet which was nearly half finished. The brine deposited in these reservoirs is conveyed, by means of two thousand pipes, about a league to Bevieux, where the salt is extracted.

The brine pits near Aigle contain only from two to one-half per cent, and yield annually about a third as much as those of Bevieux, or about 500 quintals. The salt is much whiter and heavier than that of Bevieux, and consequently bears a higher

price.

These, which are the only salt-works in Switzerland, scarcely yield a net yearly profit of more than 3000l, and furnish only one-twelfth of the annual consumption of the canton. The remainder is procured chiefly from France, which by treaty provides the Swiss states with this commodity at a moderate price; indeed so high is the tax upon salt in that kingdom, that even the French salt is sold two-thirds cheaper in Switzerland, than in many parts of France.* The ordinary price of common salt throughout the canton is three halfpence per pound.

^{*} At Paris, where it is the dearest, a pound of salt is sold for about 13 sols, or sixpence of our money: in some other parts of France, for instance in France Comte, a pound costs only 4 or 5 sols;

LETTER XLIV.

Valley and Lake of Jour....Orbe.... St. Bartheleni... Yverdin.

verdun, Sept. 7

The chain of mountains called the Jura, begins in the Canton of Zurie, extends along the Rhine into the canton and bishopric of Basle stretches into the canton of So leure and the principality of Neuchatel, branches out towards the Pays de Vaud, separates that country from Franche Comte and Burgundy, and continues beyond the frontiers of the Genevois as far as the Rhone. In various parts of the Pays de Vaud, this chain forms many elevated vallies much visited by travellers, amongst which, not the least remarkable, is the valley of the lake of Joux, upon the top of that part of the Jura called Mont Joux, in the bailliage of Roman Motier. It contains several neat and well-peopled villages, is beautifully chequered with wood, arable and pasture ground, and watered by the two picturesque lakes of Joux and Brenet.

Near the small village of Abbaye, a rivulet gushes from the bottom rock, and loses itself in the larger lake. From the small lake descends a stream, which is lost in a hollow gulf called L'Entonnier, or the Funnel, a name common to several others in this place; in this gulf several mills are turned by the force of the current. About two miles further, on the other side of the mountain, the river Orbe bursts forth, and is

probably produced by the stream here ingulfing.

This little vale is very populous, containing about three thousand inhabitants, who are remarkably industrious. Some make watches; but the greater part are employed in polishing crystals, granites, and mareasites. In the small village of Pont, where we lodged, most of the inhabitants bear the surname of Rochat; a name which also runs through the village of Charboniere, with the exception of only two or three families, and is prevalent likewise in that of Abbaye: the whole number of these Rochats amounts to about a thousand; they are supposed to be descendants of the same family, and their ancestors came originally from France. These parts are much infested with bears and wolves.

In descending from this delightful spot, through a variety of hill, valley, wood, and lawn; we had a most extensive prospect, comprehending great part of the Pays de Vaud, the lake of Geneva with its mountainous boundary, and that of Neuchatel. These two lakes appear, from that high point of view, to be nearly upon the same le-

vel,* with no considerable swell of the country intervening.

We passed through a beautiful and picturesque country from Roman Motier to Orbe; which, according to antiquaries, was the most ancient town, and once the most powerful, of all Helvetia; it was called Urba, and was the capital of the Pagus Urbigenus; no remains, however, exist at present of its ancient splendour. Some antique fortifications, an old castle, and a round tower, are works probably of later and more turbulent times; erected, perhaps, when this country was divided into a number of feudal sovereignties. I am greatly pleased with the romantic situation of the town, the boldness of the single-arched bridge projecting over the Orbe, the wild scenery on the banks of that river, the frequent cataracts, and the picturesque views in the environs.

but it is furnished to the Swiss at the rate of 2½ sols. The reader will recollect that this account was written in 1776.

^{*} According to M. de Luc, the lake of Neuchatel is 159 French feet above that of Geneva.

M. Venel, an eminent surgeon of this town, has formed, under the protection of the government of Bern, an establishment which well deserves the attention of the humane and curious traveller. It is an infirmary for the reception of those objects who are born with distorted limbs, or owe that misfortune to accident. The children are lodged and boarded in the house under the care of his assistant, who charges himself with all the detail of house keeping, and of instructing those, whose age renders it requisite that their education should not be neglected. M. Venel's skill in improving and simplifying the machines necessary for his purpose, has been sufficiently attested by various cures.

Though he chiefly confines his attempts to infants and children, yet he has performed several cures on adults. His most efficacious remedy is a machine which he has invented to embrace the patient's limbs when in bed, and which is contrived to act without disturbing their rest. Ingenious as his method is, yet he acknowledges, that much of his success depends on mild treatment and continual inspection. I was convinced indeed of the mildness of his treatment, by observing several of these children, from four to ten years of age crawling about the ground and diverting themselves with great cheerfulness, although based up in their machinery. It may not perhaps be unworthy of remark, that M. Venel, on the admission of a miserable object, takes in plaister of Paris the figure of the distorted limbs, in order to demonstrate the progress of the cure. Such an establishment redounds highly to the honour of M. Venel, and the government who protects it, and is worthy of imitation in all countries.

Orbe, which is governed by its own magistrates, is comprised within the bailliage of Echalens, belonging to Bern and Friburgh: these two cantons alternately send a bailiff, who resides at Echalens, and remains in office during five years. When Bern appoints the bailiff, an appeal lies from his decisions to the sovereign council of Friburgh; as it does to the government of Bern, when he is nominated by Friburgh. By these means a great check is laid upon the exactions of the bailiff, and I am informed, that justice is no where more equally administered than in these common bailliages of the

Perhaps one of the most beautiful and finest positions in Switzerland is the castle of St. Barthelemi, the seat of count d'Afiry, colonel of the Swiss guards; and now inhabited by his son, count Louis d'Afiry, to whom I was indebted for a most kind and friendly reception. This ancient family-seat stands on an eminence in the bailliage of Echalens, about three miles from Orbe, near the high road from Lausanne to Yverdun. The sides of the eminence are feathered with wood, and below are rich fields and meadows of the finest verdure, watered by two lively torrents which unite and form the Falun. Upon the high road, the count has reared an obelisk, on which he has inscribed, in the true spirit of toleration, "praise God, all ye nations," in the English, Latin, French, and German languages.

The eastle commands a prospect of a most fertile and well-wooded country, gently broken into hill and dale: on one side appears a distant view of the Jura and the hills of Burgundy and Franche Comte; on the other, the horison is bounded by the rugged Alps in the canton of Bern and in the Vallais, by Mount Velain, the highest point of St. Bernard, and Mont Blanc, whose superior elevation above the surrounding heights is such, that its summit reflects the rays of the rising sun several minutes sooner, and retains those of the setting sun several minutes later than any of the circumjacean mountains.

From St. Barthelemi we descended into the plain, which stretches to the lake of Yverdun, and was formerly covered as far as Entreroches (three leagues from its pre-

the huets who lren are himself t requiing and

lake of its pre-

sent position) and probably further, by that lake; it is now, for a considerable part, a great swamp. Within a quarter of a mile of the town, are warm baths which are strongly sulphureous, and much frequented during the summer months.

Yverdun is large, niry and well-built with stone, like the towns in the Pays de Vaud: it stands near the lake, in a small island formed by the two branches of the river Thiele. Between the town and the lake a pleasant lawn extends to the water, planted with avenues of lime trees. Yverdun carries on scarcely any trade, and its principal support arises from the passage of the merchandise between Piedmont and Germany. This town is celebrated for its printing-press, established in the beginning of the present century; but entirely neglected until, some years ago, it was renewed by Felice, a Neapolitan of learning and abilities.

The lake of Yverdun, or of Neuchatel, stretches from south to north about twenty miles in length, and in some places about five in breadth; its shores near Yverdun are

covered with country houses.

It is extraordinary, that the dull and tasteless uniformity of the French gardens should have been adopted by the Swiss, whose country abounds with noble and picturesque situations, and where nature wantons in the most faxuriant variety. I have frequently observed, in the midst of the most romantic scenes, a majestic forest sliced into regular alleys, and at the very borders of the fine lakes, artificial pools of water edged with sunburnt parterres.

Should any person in this instance accuse me of national prejudice, let me exclaim with

Voltaire, who certainly cannot be convicted of partiality to the English:

Jardins plantes en symmetrie,
Arbres nains tires au cordeau,
Celui qui vous mit au niveau
En vain s'applaudit, se recrie;
En voyant ce petit morceau,
Jardins il faut que je vous fuie,
Trop d'art me revolte et m'emuie;
J'aime mieux ces vastes forets,
La nature libre e' hardie
Irreguliere deos ses trais
S'accorde avec ma fantasie.

I am, &c.

LETTER XLV.

Gransou....Neuchatel....M. Pury's Benefaction.

WE skirted the west side of the lake of Neuchatel through Granson, the principal town of a bailliage of that name, belonging to Bern and Friburgh, and remarkable for the battle in which Charles the bold, duke of Burgundy, was defeated by the Swiss in 1467. We entered the principality of the Neuchatel about six miles from that town, and passed through St. Aubin, Boudri, Colombier, lying pleasantly upon the borders of the water. The road runs along the side of the Jura, through a country that resembled, in some measure, the district of La Vaux, between Lausanne and Vevay: the sides of the Jura are almost the whole way covered with vines, supported in many parts by low stone walls. The borders are more uniform than those of the lake of Geneva, and do not rise into such high, irregular and grotesque Alps as the coast of Chablais. Towards Granson and St. Aubin, the country is more diversified with meadows and corn-fields; nearer to Neuchatel, the summits of the mountains are clothed with forest, and the midland and lower parts entirely planted with vines.

Between the lake and the Jura many streams burst from the rock, and after turning several mills, fall into the lake at a little distance from their source. The largest is that of La Serriere, near a small village of the same name, which we crossed in our way to Colombier, where we dined with a family whose acquaintance we had formed at the baths of Leuk. We passed a very agreeable day with these amiable persons; by whom we were received with that frankness and unaffected case which characterises true politeness.

After dinner some musicians of the country performed the Renz des vaches, that famous air which was forbidden to be played among the Swiss troops in the French service; as it awakened in the soldiers such a longing recollection of their native country that it oftened produced a settled melancholy, and occasioned frequent desertion. The French call this species of patriotic regret, la maladic du pays. There is nothing peculiarly striking in the tune; but, as it is composed of the most simple notes, the powerful effect of its malady upon the Swiss, in a foreign land, is less surprising. Nothing indeed revives so lively a remembrance of former scenes, as a piece of favourite music which we were accustomed to hear amid our earliest and dearest connections; upon such an occasion, a long train of associated ideas rise in the mind, and melt it into tenderness. To use the language of poetry,

There is in souls a sympathy with sounds.

Wherever I have heard A kindred melody, the scene recurs, And with it all its pleasure and its pains.*

It is observable, that those who inhabit mountainous countries are most subject to this maladie du pays, because their habits of life are essentially different from the customs and manners of other parts. Accordingly, the Scotch Highlanders, and the Biscayans, as well as the Swiss, when absent from their homes, are peculiarly apt to be affected with every circumstance that recalls it to their minds.

The town of Neuchatel is small, and contains about 3000 souls. It lies partly upon the little plain between the lake and the Jura, and partly upon the declivity of that mountain; in consequence of which situation, some of the streets are very steep. At the commencement of the present century, commerce was almost wholly unknown in this town, as the ridiculous pride of its being deemed degrading generally prevailed among the inhabitants: this senseless prejudice, is now, however, nearly extinguished. The chief article of exportation is wine, produced from the neighbouring vineyards, and much esteemed; manufactures also of printed linens and cottons have been established with success, and within these few years, several merchants have raised large fortunes.

October 3, 1786. The mildness of the government, and the general well being of the inhabitants, are visibly demonstrated from the increase of population, and the prodigious influx of settlers. The number of souls in the principality of Neuchatel and Vallengin being, in 1752, only 28,017 subjects, and 4318 aliens, amounted in 1784 to 31,576 subjects, and 9704 aliens, which gives an increase of near a fourth part within the space of thirty-two years. The facility of acquiring the burghership of Neuchatel has also prevented any decrease of inhabitants. Thus the magistrates, between the years 1760 and 1770,

· Cowper's Task, book vi.

3, 1786. tants, are ix of setbeing, in subjects, of thirtyerevented and 1770, admitted forty-one burghers; from 1770 to 1780, forty-six: from 1780 to 1785, fifty-one; in all, a hundred and thirty-eight. Many of these settlers had children before they purchased the burghership; thirty-eight were foreigners, either German, French, or Swiss.

Several public works and buildings have been lately erected at Neuchatel, at an expence far exceeding the revenues, or even wants of this little state. Amongst others I shall mention a superb causeway leading towards the valley of St. Imier, and a townhouse, built of such solid materials, as if intended to survive to the most distant posterity.

and rival the duration of the much-famed Roman capitol.*

The person to whom the burghers of Neuchatel principally owe the embellishment of their town is M. David Pury, late banker of the court at Lisbon. He was a citizen of Neuchatel, and was born in 1709: his father was mayor of Liegneres, afterwards colonel and justice of peace in South Carolina, and founder of Purisburgh. Having received his education in his native town, he quitted it, as some say, in great poverty, and repaired to Geneva, where he passed his apprenticeship, but in what house, or in what trade, the person who obligingly furnished me with these ancedotes did not mention. From Geneva he went to London, and acted as one of the clerks to an eminent jeweller, where he acquired great skill in estimating the value of diamonds. After a long residence in England, he established himself in Lisbon, and carried on an extensive commerce, particularly in brazil-wood and precious stones. Being appointed court banker he rapidly increased his fortune. This generous man, however, did not, with a parsimony usual in persons who have enriched themselves by commerce, consign his money to his coffers, or sparingly distribute his largesses; on the contrary, while living, he remitted large sums of money to his native town, and being unmarried, and having only distant relations, left his country his heir. The following is a list of the sums which he gave away, either in charitable donations, or for the improvement of Neuchatel.

From the year 1771 to 1786, 100l. annually for the poor of Neuchatel, and the same sum for those of Vallengin, which, for fifteen years, amounts to 3000l. Different sums at various periods, and for divers uses, to January 1785, amounting to 15,900l. To this must be added the purchase of near 7000 tickets in the lottery towards raising a fund for building and endowing an hospital, which tickets he also presented to the said hospital. He died on the 31st of May 1785; and the remains of his fortune, bequeathed to his country, after the payment of a few legacies, did not fall short of 160,000l. which, together with the contributions in his life-time, render his benefactions equal to

almost 200,000l.

His grateful country obtained from the king of Prussia the title of baron in his favour; a title which, through his singular modesty, he neither bore nor used in the signature of his letters. The citizens of Neuchatel have placed the portrait of this generous benefactor in one of the apartments in which government assembles, and have ordered a marble bust to be executed for the new town-house.

LETTER XLVI.

Expedition to Locle and Chaux de Fond.

Neuchatel, September 11.

I AM charmed with an expedition to the summit of the Jura, and will give you a short account of it, while the impression remains warm upon my mind.

The principality of Neuchatel and Vallengin stretches from the lake to the limits of Franche Comte, containing in length, from north to south, about twelve leagues, and about six in its greatest breadth. The district of Neuchatel occupies all the plain, together with the lower parts of the mountains; while Vallengin is totally enclosed within the Jura. Parallel chains of the Jura run from east to west, and form, in the most elevated parts, several valleys. The lower grounds of this chain are arable lands and vineyards: the higher consist of large tracts of forest, which in many parts have been cleared, and converted into considerable pastures, intermixed with some fields of barley and oats. But the singular genius and industry of the numerous inhabitants, particularly demand the attention of every curious traveller.

We passed through Vallengin, the capital of the district; a small open burgh, with a modern eastle built on some ancient ruins; and then crossed the Val de Ruz, containing above twenty villages, situated at the foot of the mountains which border the valley: the inhabitants in general are employed in agriculture, some few excepted, who follow occasionally the mechanical arts. We arrived about mid-day at La Chaux de Fond, a large handsome village lying in a broad valley which reaches to Franche Comte: from thence we proceeded to Locle, through a continued range of pleasing cottages, which skirt both sides of the road, and are scattered likewise over the country.

La Chaux de Fond and Locle, together with the districts belonging to them, may contain about six thousand inhabitants, distinguished for their genius, industry, and skill in the mechanical arts. They carry on an extensive traffic in lace, stockings, cutlery, and other articles of their own manufacture; but particularly excel in watch-making, and every branch of clock work. All sorts of workmen necessary for the completion of that business, such as painters, enamellers, engravers, and gilders, are found in those villages, where, upon an average, about forty thousand watches are yearly made. The genius and industry, indeed, observable upon these mountains, exhibit a scene uncommonly pleasing; as every individual is sure, not only of obtaining a comfortable maintenance, but also of soon placing his children in a way of procuring their own livelihood; the people marry very early.

Not many years ago the greater part of these valleys was almost one continued forest; but the wonder-working powers of industry have happily changed the scene into flourishing villages and fertile pastures. The increase of population will appear from the following fact: formerly the produce of the country was more than sufficient for the consumption of the inhabitants; at present, although considerably more cultivated, it scarcely furnishes an eighth part of the provisions necessary for interior consumption; the remainder is drawn from Franche Comte. And no wonder; for beside the natural effect of their frequent and early marriages, every stranger, who brings a certificate of his good behaviour, is at liberty to settle, and follow any trade without the least restriction. Here no apprenticeship is necessary, nothing is contraband, and industry exerts herself untaxed.

Beside those particular arts I have already mentioned, several inhabitants of Lock and La Chaux de Fond are well skilled in other branches of mechanical science, and have invented useful mathematical and astronomical instruments. Among those who have eminently distinguished themselves in this way, is the famous Jaquet Droz, who is now at Paris, and whose son exhibited in England several automatical figures of a very singular and surprising construction: one played upon the harpsichord, another drew landscapes, and, what is still more extraordinary, a third copied any word presented to it, or wrote down whatever was dictated by any of the company. These are certainly wonderful inventions, and seem to exalt the powers of mechanism; but still they are mere toys, and an unworthy waste of great genius: it is Swift making riddles. How much more laudably, and with equal success, might the same talents and application have been exerted in improving, or adding to, those instruments and apparatus which are necessary to the astronomer and natural philosopher!

The origin of watch-making in these parts, as related by M. Osterwald, the historio grapher of these mountains, is extremely curious; the truth of his account was confirmed to me by several artists both of Loele and La Chaux de Fond. In 1679 one of the inhabitants brought from London a watch, which being out of order, he entrusted it to Daniel John Richard, of La Sagne. Richard, after examining the mechanism with great attention, determined to attempt making a watch from the model before him : but being destitute of every other resource than the powers of his own native genius, he employed a whole year in inventing and finishing the instruments previously necessary; and in six months from that period (by the sole force of his own penetrating and persevering talents) produced a complete watch. But his industry did not stop here: besides applying himself successfully to the invention of several new instruments useful for the perfection of his work, he took a journey to Geneva, where he gained considerable information in the art. He continued for some time the only watch-maker in these parts; but business increasing, he instructed several associates, by whose assistance he was enabled to supply from his singular shop all the demands of the neighbouring country. Towards the beginning of the present century he removed to Lock, where he died in 1741, leaving five sons, who followed their father's occupation. The knowledge and practice of the art gradually spread itself, is now become almost the universal occupation of the inhabitants, and may be deemed the principal cause of the population observable in these mountains.

The inventive genius of this mechanical people discovers itself upon all occasions, where it can be applied to the purposes of their convenience and accommodation. To give an instance: the rocks in most parts of the Alps being exceedingly hard and solid, the waters usually make their way along their sides, and rush down in perpetual torrents; but the strata which compose the Jura being less firm and compact, the rains and melted snow penetrating into the crevices, from subterraneous channels, and issue in rivulets at the bottom of the mountains. The peasants, availing themselves of this peculiarity, have, in the midst of these subterraneous channels, with much labour, erected mills which are turned by the descending torrents. They have constructed wheels in places where it seemed scarcely practicable, inventing new modes of scaffolding, and a great variety of other ingenious contrivances in order to facilitate their work.

The natives are exceedingly courteous to strangers who visit their country. They are in general well informed in several branches of knowledge, and, as they usually employ their leisure hours in reading, many of the villages contain circulating libraries. The houses are plaistered and white-washed; though small, are commodious and well

d forest; nto flourom the t for the vated, it mption ; the naa certifi. the least industry

built, and turnished with a degree of neatness, and even elegance, peculiarly striking in

these sequestered mountains.

The rock which forms the base of the Jura, is mostly composed of calcareous stone; and perhaps there is no spot in Europe where such large quantities of petrified shells and marine plants are found in so small a space. Near Locle I observed a ridge of hills, that seemed to consist entirely of pierres arborisces, or stones bearing the impression

Such perfect case and plenty reigns throughout these mountains, that I scarcely saw one object of poverty; the natural effects of industry under a mild and equitable government. It is of these vallies, and of their inhabitants, that Rousseau gives so en-

chanting a description in his letter to D'Alembert.

In returning we had a most sublime prospect of the lakes of Neuchatel, Bicune, and Morat, with the high and rugged chain of Alps stretching from the cantons of Bern and Friburgh, as far as the Vallais, and the mountains of Chablais. I am, &c.

LETTER XLVII.

Government of Neuchatel.

AFTER the extinction of the kingdom of Arles or Burgundy, Neuchatel was governed by a succession of petty sovereigns. The direct line failing, the country was possessed by a collateral branch, the counts of Friburgh, in opposition to the counts of Chalons, who claimed it as liege lords. On the extinction of the male line it was transferred to the family of Hochberg, and the heiress of this house conveyed it in marriage to Louis d'Orleans, duke of Longueville (1504.) His last descendant, Mary d'Orleans, dutchess of Nemours, dying in 1707 without issue, numerous claimants appeared; but the right of Frederic the First, king of Prussia, as heir to the house of Chalons, was acknowledged by the states of the country, and it now forms part of the Prussian dominions.

Neuchatel is also an ally of the Helvetic Confederacy, by means of treatics of com-

burghership with Soleure, Bern, Friburgh, and Lucern.

The constitution of Neuchatel is a limited monarchy. The machine of this government is indeed actuated by such nice springs, and its motions are so exceedingly complicated, that a stranger cannot readily distinguish, with any degree of accuracy, the prerogatives of the sovereign, and the franchises of the people; particularly as some even of their most important privileges depend upon mutual acquiescence and immemorial custom, and not upon written laws. I shall endeavour, however, to trace the principal features of this government, the result of my best inquiries during my continuance at Neuchatel.

Upon his accession Frederic the First signed and ratified certain general articles, which in a great measure established the prerogatives of the prince and the liberties of the subject. Beside these general articles, others were added at the pacification of 1768, which terminated the dispute between the sovereign and subject. By this pacification, the king not only renewed his assent to the general articles, but also explained them, wherever their tenor had been mistaken; expressly confirming also several other privileges in favour of the people, which had hitherto been equivocal, or not duly observed.

The most important of these general articles are:

1. The sovereign promises to maintain the reformed religion as by law established; and to tolerate no other sect, except within the districts of Landeron and Cressier, where

stablished; sier, where

the Catholic religion is dominant. 2. No person but a native of the country is capable of holding any civil or military charge, excepting that of governor, who may be a fo reigner; and the same incapacity is extended even to natives, who are in the service of a foreign prince. 3. All the subjects have a right to enter into the service of a foreign power, provided that power is not in actual war against the prince, as sovereign of Neuchatel; and if the sovereign should be engaged in hostilities which do not concern Neucliatel, that state may continue neuter, except the Helvetic body should be involved in the contest. 4. Justice shall be equitably administered; and for this purpose, the three states of Neuchatel and Vallengin shall be annually assembled. 5. The magis trates and officers of justice, instead of holding their employments during pleasure, shall enjoy them during their good behaviour. By the late pacification it was further agreed. that the prince is not himself the judge of their good behaviour; and they cannot be de prived of their places, unless they are fully convicted of malversation in office, by certain judges at Neuchatel appointed for that purpose. 6. The sovereign shall take the accustomed oath upon his accession, and promise to maintain all the rights, liberties, franchises, and customs, written or unwritten.

It is remarkable, that one of the most essential rights of the subject depends upon immemorial usage; for that "the sovereign shall be considered as resident only at Neuchatel," is in the number of their unwritten immunities. Now this privilege, in conjunction with the third article, forms the basis of their civil liberty. By the former, the prince when absent can only address his subjects through his governor and council of state, and no subject can be tried out of the country, or otherwise than by judges appointed by the constitution: by the latter, should the king of Prussia be at war with all Europe, the people of Neuchatel and Vallengin are by no means obliged to arm in his defence; but individuals may even serve against him, so long as the powers whom they serve are not engaged in the hostilities against their country.†

Beside these general articles, that comprehend the privileges of the people at large, there are others which the sovereign is equally bound to maintain, relating to the town of Neuchatel, and the district of Vallengin in particular.

The prince confers nobility, nominates to principal offices of state, both civil and military, and appoints the chatclains and mayors, who preside in the courts of justice. His revenues, which scarcely amount to 5,000l. a-year, arise from certain demesnes, from a small land-tax, from the tithes of wine and corn, and from the tenth of the value on the sale of immoveables. With regard to commerce, no subject pays any duties either of importation or exportation, except for foreign wines imported into the town of Neuchatel.

^{*} The last clause of this article is not so clearly worded as it might have been; from a delicacy, I suppose, of not expressly stipulating, that the state of Neuchatel and Vallengin may oppose their sovereign by arms, in case the Swiss should be engaged in war against him. It is evident, however, that they consider their connection with the Helvetic body as of superior obligation to that with their prince, as sovereign of Neuchatel and Vallengin.

The remarkable clause in question is as follows:

Et qu'en outre et conformement a des articles expres et formels des franchises tant de la bourgeoisie de Neufebatel que de celle de Vallengin, cet Etat ne puisse être engage dans aucune guerre, ni les sujets d'icclui obliges d'y marcher, que ce ne soit pour la propre guerre du Prince, c'est a dire, pour la defence de l'Etat, et pour la guerres que le Prince pourroit avoir en tant que souverain de Neufebatel et non autrement: en sorte que s'il avoit guerre pour raison de quelque autre Etat, terres et seigneuries, l'Etat de Neufebatel ne soit point oblige d'y entrer; mais en ce cas devra demurer dans la neutralitie, a moins que tout le corps Helvetique en general n'y prit part et interet.

[†] When Henry, duke of Longueville, and sovereign of Neuchatel, was, in 1650, sent to the castle of Vincennes, Felix de Mareval, captain of the Swiss guards, kept guard in his turn, though he was citizen of Neuchatel, at the door of the prison in which his sovereign was confined.

During the absence of the prince, he is represented by a governor of his own appointing, who enjoys considerable honours, but is extremely limited in his authority. He convokes the three estates, presides in that assembly, and has the easting vote when the suffrages are equal; he enjoys the power in criminal cases of pardoning, or of mitigating the sentence. In the governor's absence his place is supplied by the senior

counsellor of state.

The three estates of Neuchatel form the superior tribunal, and receive appeals from the inferior courts of justice. They are composed of twelve judges, divided into three estates: the first consists of the four senior counsellors of state, who are noble; the second of the four chatclains of Landeron, Bondry, Val de Travers, and Thielle;* and in ease of absence, their place is supplied by the respective mayors in the principality of Neuchatel, according to a regulated order; the third is composed of four counsellors of the town of Neuchatel. The judges in the first and second division hold their places for life; those in the third are appointed annually. This body ordinarily assembles every year in the month of May; but is convoked extraordinarily upon particular occasions; the town of Neuchatel is always the place of meeting.

The three estates are not the representatives of the people, or do they possess the legislative authority. They are, properly speaking, the supreme court of judicature, which receives all appeals, and decides finally all causes, even those relating to the sovereignty of the country; a power which they exercised in the year 1707, upon the ex-

tinction of the direct line in the person of the dutchess of Nemours.

It may be here not unworthy of remark, that the three estates decided the famous cause of the succession in 1707, as a process between the several claimants of the sovereignty. But if (in failure of claimants) a new sovereign was to be chosen, or a new form of government established, the question would no longer be considered as amenable to a court of judicature, but would be referred to the people assembled by means

of their representatives.

The council of state is invested with the ordinary administration of government, superintends the general police, and is entrusted with the execution of the laws. The members nominated by the sovereign are not limited in number. The prince exercises his authority by means of this council, in which he is always considered as personally presiding: the power of the president is only to convoke the assembly, to propose the subject of their consideration, to collect the votes, and to decide when the voices are equal. The ordinances of the council are previously communicated to the ministraux of Neuchatel, who are to certify that they contain nothing contrary to law.

The town of Neuchatel enjoys very considerable privileges: it has the care of the police within its own district, and is governed by its own magistracy, consisting of a Great and Little Council. I will not trouble you with a detail of the several departments; but I cannot omit mentioning the ministraux, because the members of that body form the third estate on every act of legislation. The ministraux are a kind of committee from the council of the town, entrusted with the administration of the police. They consist of the two presidents of that council, four master-burghers drawn from the Little Council, and the banneret, or guardian of the people's liberties. The president and master-burghers are changed every two years; the banneret is chosen by the general assembly of the citizens, and continues in office during six years.

[•] The principality of Neuchatel is divided into a certain number of districts, some of which are denominated chatelleines, and others mayoradies. The chiefs of the former are called chatelains, and of the latter mayors: in every other respect their office and power is the same.

which are chatelains, The legislative authority is so complicated, that it would be no easy task to determine precisely where it absolutely resides. Perhaps an account of the persons concerned, and of the forms observed, in enacting and promulgating laws, may assist in clearing the difficulty.

As soon as the causes are decided by the three estates assembled in the month of May, the four judges who form the third estate retire, and are supplied by the four ministraux. The attorney-general then desires the members of the three estates to take into consideration whether it is necessary to frame any new laws? When a new ordinance is proposed, a decleration is drawn up and delivered to the council of state for their deliberation, whether it is contrary to the prerogatives of the prince, or to the rights of the subject? From thence it is communicated to the council of the town, in order to be examined, whether it infringes the privileges of the citizens. If adopted by the council of state and the council of the town, it is proposed to the prince for his approbation or rejection: in the former case, it is again publicly read before the three estates, and the governor or president declares the approbation of the sovereign. It is then promulgated, or, as the expression is, passed into a law by the three estates.

Since the accession of the house of Brandenburgh, the people of Vallengin are always consulted upon the framing of a new law. For this purpose the three master-burghers of Vallengin examine, whether it contains any thing inconsistent with the franchises of that district? in which case they have the power of remonstrating to the governor in

council.

From this detail it should seem, that the legislative authority resides conjunctively in the prince, the council of state, and the town; that the people of Vallengin have a kind

of negative voice, and that the three estates propose and promulgate the laws.

Every year, at the conclusion of the assembly of the three estates of Neuchatel, those of Vallengin, as constituting the supreme court of judicature for that country, meet at Vallengin, and decide finally all appeals from the inferior courts of justice. The first of these three estates is formed by the same four noble and senior counsellors, who sit in the first of the three estates of Neuchatel; the second by four mayors of the county of Vallengin; and the third by four members of the court of justice of Vallengin, nominated by the mayor of Vallengin. The governor, or, in his absence, the senior counsellor presides, as in those of Neuchatel. The three estates of Vallengin have no interference in any act of legislation: the laws which have been framed or amended at Neuchatel being simply remitted to them by the solicitor-general, and publicly read.

The people of Vallengin assemble every three years in an open plain, to elect their three master-burghers, who are respectively chosen from the inhabitants of the burgh of Vallengin, of the Val de Ruz, and of the mountains. The function of these master-burghers is to watch over the general interests of the people; they are also in some cases deputed to Neuchatel by the people, whenever they are summoned by the governor and council of state, in relation to any affair which particularly concerns their country.

The principality of Neuchatel and Vallengin is divided into a certain number of districts, each of which has its criminal court of justice. The great circumspection observed in the judicial proceedings may sometimes favour the escape of the criminal; but the few instances of atrocious crimes prove that his humane caution is no encourage ment to transgressors, and is a strong presumption of the general good morals which prevail among the people. In a word, personal liberty is almost as tenderly and as securely protected by the laws of this country, as by those of our own invaluable constitution.

When the criminal is arrested, he is immediately brought to trial; after which the sentence is read to him in prison. The next morning he again appears before his judges, assembled in the open air; the former proceedings on the trial are read, and the judges once more deliver their opinion. In capital sentences, the governor is instantly acquainted with the circumstances of the crime, and if he does not remit or soften the punishment, the sentence is immediately executed. I am concerned to add, that torture

(though seldom used) is not absolutely abolished.

Such are the general outlines of this remarkable constitution, by which the liberties of the people are as well, and perhaps better, secured than in the democratical cantons; for although the most despotic prince in Germany is sovereign, his power is exceedingly limited. Among the striking circumstances which characterise this government, must be mentioned the very liberal encouragement given to strangers who settle in the country. They enjoy every possible privilege of trade and commerce, and in no state are fewer essential distinctions made between strangers and natives. I have already observed to you the good effects of this enlarged policy on the population of Neuchatel and Vallengin; whereas a narrower and more contracted principle in some of the neighbouring Swiss cantons, has occasioned, and continued to occasion, a very manifest decrease of inhabitants.*

LETTER XLVIII.

Route from Pontarlier to Neuchatel....Valley of Travers....Anecdotes of Rousseau....

Isle of St. Peter in the Lake of Bienne.

Neuchatel, October 1785.

I NOW write to you a second time from Neuchatel, at the interval of nine years since the date of my former letters; on the preceding occasion I went from Granson to Neu-

chatel; to-day I came from Pontarlier, a small town in Burgundy.

From Pontarlier I ascended gently by the side of the Dou, here a small rivulet bubbling in the vale, quitted that stream and passed under a bold rock, on which stands the eastle of Joux forming a picturesque landscape; it has a garrison of invalids, and commands the narrow valley leading into Burgundy. Near it the road is divided into two branches; one leads directly to Joigne, and the other to Neuchatel. In about two hours we observed a stone, which separates France from the county of Neuchatel. Soon afterwards we mounted an eminence, looked down upon the beautiful valley of Travers, and descended to a narrow pass, which is guarded by a chain fastened to the rock, bearing the date of 1772. History, however, makes mention of a similar chain at a much earlier period, particularly in 1476, when Charles the Bold, having ineffectually attempted to force the pass, marched with his army to Joigne, and besieged Granson, where he was defeated.

Having descended to St. Sulpice, I visited the source of the Reus, which issues at the root of a rock in five copious springs, that form a large body of water, and turn several mills. I was accompanied to this picturesque spot by an inhabitant of Fleurier, a neighbouring village. Speaking of the increase of industry in these parts, he informed me that thirty years ago Fleurier contained only three watch-makers, whereas at present above a hundred were settled in that place. He added, that notwithstanding the constant influx of strangers, hands were still wanting for the numerous trades which are

carried on with great success in these parts.

^{*}Of all the states of Switzerland, Neuchatel has hitherto alone escaped the revolutionary vortex, a happy circumstance, which it owes to the neutrality of its sovereign the king of Prussia.

ry vortex,

I continued along the high road leading to Neuchatel, through the beautiful and romantic valley of Travers, watered by the Reus, abounding in the most fertile pastures, bordered by hills gently rising from the banks of the river, and beautifully sprinkled with wood. I passed through many neat villages, particularly Bouveresse, Couvet, Travers, and Noirague, where I quitted the valley, and entered the narrow pass of Clusette. From hence the road traverses an abrupt and woody country along the sides of precipices, the Reus rolling beneath in a deep channel. At the small village of Brot, a pleasing view of the lake of Neuchatel and the adjacent country opened gradually, as I descended and joined the road leading from Granson to Neuchatel.

I did not quit the valley of Travers without paying a visit to Moitier Travers, rendered memorable by the residence of Rousseau, who being driven first from Geneva, and afterwards from Yverdun by the government of Bern, found a refuge from civil and theological persecution in this secluded valley, under the protection of lord Keith, governor of Neuchatel. The dwelling-house of this singular man is a small wooden building at the further extremity of the village, near the road which leads to Fleurier, and is now occupied by Mr. Martinet, mayor of the valley, a sensible old gentleman, who lived

in habits of great intimacy with the philosopher of Geneva.

The room chiefly occupied by Rousseau is a small bed-chamber, which out of respect to his memory, is left in the same state as when he lived there. In a corner near the window is a kind of recess formed by two book-cases, and a simple deal plank reaching from one book-case to the other, on which he was accustomed to write. Rousseau admitted company into this room; but suffered no one to enter the recess, from a suspicion that they would overlook his papers. He used also to frequent a small open gallery in the front of the house, enclosed at the extremities with planks, in which were peep-holes for the purpose of reconnoitering those persons who came to visit him, that he might give his orders whether they should be admitted or refused. Here we walked and read.

During his residence at Moitier, from 1762 to 1765, by frequently sauntering into the fields and on the neighbouring mountains, he acquired a taste for the study of botany, which he never intermitted, and always styled his peculiar delight. During this period of his life, he issued from this seeluded corner his Lettre a PArcheveque de Paris, his Lettres Ecrites de la Montagne, and some other works; in which he displays those wonderful powers of invention and description, that fascinating yet declamatory eloquence, that glow and animation of style, that fondness for paradoxes, that reverence for the scriptures, and yet those perverse doubts of their authenticity, those liberal yet levelling principles of government, that keenness of irony, and that motley mixture of sophistry and argument, which chequer and characterise all his writings.

Rousseau, on his arrival at Moitier, appeared in a common dress, but soon afterwards assumed an Armenian habit; either, as he himself alleged, because that mode of clothing was adapted to the disorder with which he was afflicted; or from that affectation of singularity which seems to have marked his character in every period of his life. Through lord Keith's intercession, the king of Prussia offered Rousseau a pension of 100l. per annum, which he declined from his aversion to the least shadow of dependence; preferring to copy music for his livelihood, rather than accept an obligation even from so great a sovereign; and he used to boast that he could daily carn a guinea

by that occupation.

Rousseau took his repast usually alone; though he would sometimes, but very rarely, accept an invitation from M. Martinet to dinner or supper, particularly when lord Keith passed a week at Moitier Travers for the purpose of visiting him. On these occasions he was remarkably agreeable and lively; being naturally of a social disposition, he con

versed with great spirit and animation, and yet with as much correctness as if dictating

for the press.

Rousseau seems to have trusted entirely to his own judgment; being so impatient of contradiction, that he would never listen to the admonitions of his friends, and seldom asked advice with an intention of adopting it. Having finished his celebrated letter to the archbishop of Paris, he read it to M. Martinet, and demanded his advice relative to the publication. The mayor, though struck with the fire and spirit of the raillery, yet could not avoid representing to him that his letter, however forcibly written, would never make a convert of the archbishop; that he would only be entangled in endless controversies, and draw upon himself much obloquy and ill-will: "Your advice," returned Rousseau calmly, "is a little too late; it is already published:" and immediately presented to him a printed copy of the letter which he had just read to him in manuscript.

He derived from nature an extreme sensibility which bordered upon weakness; he seems to have want done proof of a great mind, that of receiving an obligation, and to have possessed such pride and soreness of temper as rendered it impossible to serve him; for he frequently construct a benefit into an injury. His extreme sensibility was irritated and augmented by a troublesome and painful disorder, which preyed upon his constitution, and at times rendered him unfit for society. To this complaint, in conjunction with that merciless persecution which he repeatedly endured should be attributed in a great measure the recluseness of his life, and that suspicious mistrust which

occasionally bordered upon madness.

Rousscau had now continued three years at Moitier, greatly delighted with his situation, when an unexpected event induced him to quit a retreat, in which he wished to pass the remainder of his days. This event has been variously related. According to some authors, the populace, incited by the minister of the parish, in consequence of the scepticism displayed in his Lettres Ecrites de la Montagne, assembled in crouds, broke the windows of his house, forced open the door, and entering his bed-chamber, treated him with such violence, that he escaped with difficulty, and, not to become a martyr to his opinions, quitted the country. According to others, neither the minister nor the natives were exasperated against him; but his housekeeper, the same person whom he afterwards married, disgusted with the inhabitants, broke the windows, and persuading her master that he was in danger of being assassinated, induced him to quit Moitier the next morning: as a proof of this assertion, they affirm that one of the stones found in the apartment was too large to have passed through the broken panes of glass.

The truth, however, seems to be, that his pride and suspicious temper rendered him obnoxious to many of the inhabitants; the scepticism and infidelity in his Lettres Ecrites de la Montagne raised a party against him; some of the people occasionally insulted him; the minister of the parish summoned him before the consistory; he declined appearing; the council of state of Neuchatel proposed condemning the above-mentioned publication, and even applied to the king of Prussia for that purpose. Frederic, in an answer which does honour to his head and his heart, while he permitted them to use any precautions which might tend to prevent the diffusion of sceptical opinions, yet wisely forbade all persecution, and ensured to Rousseau a secure retreat at Moitier under his immediate protection. Before this answer was returned, some of the populace, intoxicated with liquor, threw stones against Rousseau's windows with such violence as to penetrate into the kitchen, and to tear off the plaister from the walls; but none of these stones did, or could enter his bed-chamber, as that apartment was situated on the other side of the house. This violence, however, exaggerated by the real or pretended terrors

red him **Ecrites** insulted ined apentioned ic, in an use any t wisely nder his , intoxias to pcof these the other d terrors of his housekeeper, was sufficient to alarm Rousseau: on the next morning he retired

from Moitier, and took refuge in the island of St. Peter.

The island of St. Peter, sometimes called the island of La Motte, and sometimes Rousseau's island, lies towards the southern extremity of the lake of Bienne. To this delightful spot I made an agreeable excursion on the 4th of October 1786, in company with the Rev. M. de Meuron, of Neuchatel, and three English gentlemen. We quitted Neuchatel in the morning; passed through St. Blaise and the district of Landeron, and embarked at Neuville, a small town, which, like Bienne, acknowledges the bishop of Basle for its liege lord, but possesses such rights and immunities as render it an independent republic; it contains about twelve hundred inhabitants. The fine weather, and the clearness of the air, enabled us to enjoy the mild beauties of the view as we sailed to the island. To the south-west we discerned Neuville and its ancient easile, and to the south-east admired the Julimont, an insulated hill adorned with woods of oak, the summit of which is frequently visited by travellers for the beauty of the prospect; and its name has been derived by fanciful antiquaries from Julius Cæsar. At the extremity of a rocky and woody promontory, which stretches from the foot of the Julimout into the lake, stands the eastle of Cerlier, and beyond, at some distance, the fertile plains watered by the Thiele.

We landed on the south side of St. Peter's island, and walked through an agreeable meadow skirted with vineyards to a large farm-house, which was formerly a convent,* and is now inhabited by the steward of the general hospital at Bern, to which the island

belongs.

The island is about two miles in circumference, and righly wooded with various shrubs and trees, particularly with large oaks, beech, and Spanish chesnuts. Its surface is gently undulating; the southern shore, covered with herbage, forms a gradual slope to the lake; the remaining borders are steep and rocky: in a few places their summits are thinly fringed with shrubs; in others, their perpendicular sides are clothed to the water's edge with hanging woods. The views from the different parts of the island are beautiful and diversified; that to the north is the most extensive and pleasing. It commands the lake of Bienne, which is of an oval form; its cultivated borders spotted with villages and castles, with the towns of Nidua and Bienne standing on the farther extremity. Agreeable walks are carried through the woods, and terminate at a circular pavilion placed in the centre of the island. During vintage particularly, and on Sunday, which is the usual day of festivity, the island is filled with parties who take refreshments at the farm-house, stray about the woods, or dance in the circular building, and animate these romantic but solitary scenes.

Rousscau occupied an apartment in the farm-house, the only dwelling in the island. He lived with the steward and his family, who are the present inhabitants. The woman informed me, that he paid for his board and lodging forty shillings a month; that he usually rose at six, dined with the family at twelve, and after a slight supper retired to rest at nine. She added, he was extremely cheerful and agreeable; conversed with the family with the greatest ease and complacency, and conformed to their hours and manner of living; he amused himself entirely in wandering about the woods, and searching for plants, which he used to explain to them with singular satisfaction. Rousseau mentions his residence in this delightful island with the highest terms of

rapture, and with his usual proneness to exaggeration.

^{*} It was secularized at the reformation

"I was permitted to remain only two months in this delightful island; but I could have passed there two years, two centuries, all eternity, without suffering a moment's emui, although my whole society consisted of the steward and family, good but plain people. I esteem these two months the most happy period of my life; and so happy, that I could have passed my whole existence without even a momentary wish for another situation.

If we examine in what this extreme happiness consisted, he himself informs us, that his principal occupation was in doing nothing. He did not even unpack his books, and could scarcely prevail on himself to read, much less to answer any letter. He assisted the steward and his servants at work in the vineyards and fields; sauntered about the woods, and attached himself entirely to botany. He proposed to write a Flora Petrinsularis, or a description of the plants in the island; adding on this head, that as a German had published a book on the kernel of a lemon, in the same manner he would compose a treatise on each species of grass, moss, and lichen, and would not leave the most minute particle of vegetation undescribed. He made occasional excursions on the lake, sometimes coasting the shady banks of the island, at other times suffering the bark to float without direction: then, to use his own expressions, " he would lie down in the boat, look up to the heavens, and continue in that posture for several hours, enjoying a thousand unconnected and confused, but delicious reveries." He frequently rowed to a small sandy island, which he describes as a most beautiful spot. It was one of his great amusements to stock it with rabbits; and as he was conveying, with great pomp, the steward's family to be present at the foundation of this little colony, he describes himself as equally elated with the pilot of the Argonautic expedition.

From these simple avocations and every day occurrences, which Rousseau relates with that enthusiasm and those sentiments peculiar to himself, he draws the following reflections: "I have remarked, during the vicissitudes of a long life, that the most delightful enjoyments and most rapturous pleasures are not, upon recollection, those with which I am most affected. Such fleeting moments of passion and delirium, however, rapturous, are, from their very nature, but thinly scattered in the path of life. They are too rare and rapid to constitute a fixed state; and the happiness which my heart regrets is not composed of fugitive instants, but consists in a simple and permanent state, without rapture, the duration of which increases the charm, till it finds supreme felicity."

This state he describes himself as possessing during his short continuance in the island of Bienne; a longer residence would probably have dissolved the charm, which was raised by his own sanguine imagination. That restlessness of temper, which is usually the attendant of great genius, and was his inseparable companion, would have probably returned, and embittered the delightful calm described with such rapture and eestacy. But he had not time to become disgusted with his situation; for the same intolerant spirit which had hitherto pursued him, followed him even to this sequestered island: he had scarcely passed two months before he received an order from the government of Bern to depart from their territories. Rousseau was so shocked at this unexpected command, that he petitioned to be imprisoned for life, only requesting the use of a few books, and occasional permission to walk in the open air. Soon after this extraordinary request, which shows the extreme agitation of his mind, he reluctantly quitted the island. It does not fall within the compass of a letter to dwell upon this singular man through the subsequent events of his life, or even accompany him to England, where, notwithstanding the most distinguished reception, the same perverseness of disposition, and the

LETTER XLIX.

Environs of Morat ... Mount Vuilly.

IN our way to Morat and Avenche we crossed the river Thiele, which issues from the take of Neuchard, discharges itself into that of Bienne, and separates the principality of Neuchard from the canton of Bern.

Morat is a bailliage belonging to Bern and Friburgh: the reformation was introduced in 1530, by the majority of voices, in presence of deputies from Bern and Friburgh. The free spirit of the Swiss governments is in no instance more remarkably apparent, than by the mode which they observed in embracing or rejecting the reformation: in many other towns beside Morat, the question was put to the vote, and the minority generally submitted, with perfect acquiescence to the decision of the greater number.

Morat stands pleasantly upon the edge of a small lake, about six miles long, and two broad: in the midst of a well cultivated country. The lakes of Morat and Neuchatel are parallel to each other, and separated only by a ridge of hills; the former is the most elevated; for it discharges itself by means of the river Broye, into the lake of Neuchatel. According to De Luc, it is fifteen French feet above the level of that of Neuchatel. Both these lakes, as well as that of Bienne, formerly extended much farther than their present limits; and, from the position of the country, appear to have been once united.

Mr. Pennant informs me, "that the vast fish called the silurus glanus, or the saluting which frequents the lakes of Morat and Neuchatel, has not been caught here in the memory of man. It is well described, and finely engraven, in Dr. Bloch's History of Fishes, vol. i. 194. tab. 54. In the time of Gesner two were taken, one of which was eight feet long; but some have been so large as to weigh six hundred pounds. It is an cel-shaped fish, very smooth, round, and thick, with a great head. The mouth is furnished with four short and two long whiskers. It is very inactive and slow in its motions, and loves the deep and muddy parts of the lakes. They are found in many of the great fresh waters of Europe, and abundantly in the Volga."

On my subsequent expeditions into these parts, I examined with greater attention the environs of Morat, during several days, which I passed most agreeably at Coujouvax, a seat belonging to the count of Diesbach, and at Grens with M. de Garville, a French gentleman, who, attached to the beauties of this delightful country, has built a villa in a pleasing situation near the banks of the lake of Morat, where he comes every year from Paris to pass the summer. By these families I was received without any other introduction than as being the author of Letters on Switzerland, and with that frankness and cordiality so flattering to a stranger. I found the environs of Morat, though not so wild and romantic as many other parts of Switzerland, yet extremely desirable for a constant residence.

I made several excursions across the lake to an insulated ridge between the lakes of Neuchatel and Morat, and enjoyed many delightful points of view. Of these various prospects the most remarkable is from the summit of Mount Vuilly, where I seated myself on the edge of an abrupt precipice. I tooked down upon the lakes of Bienne, Morat, and Neuchatel; observed the Broye entering the lake of Morat, issuing from thence, and winding through a marshy plain into the lake of Neuchatel; the Thiele

5 N O

flowing from the lake of Neuchatel, and hastening to fall into the lake of Bienne; the fertile and variegated countries encircling those bodies of water, and the grounds rising in regular gradations from plains to Alps. But what renders this charming spot more particularly striking is, that it is perhaps the only central point from which the eye can at once comprehend the vast amphitheatre formed on one side by the Jura, stretching from the environs of Geneva as far as Basle, and on the other by that stupendous chain of snowy Alps, which extends from the frontiers of Italy to the confines of Germany, and is lost at each extremity in the immense horizon.

Impressed with this sublime view, I cast my eyes downwards over that dead and extensive morass through which the Broye serpentines: and exclaimed in the language of

poetry, which knows how to animate the dullest objects:

Quittons les bois et les montagnes
Je vois couler la Broye * a travers les roscaux.
Son onde partagee en differens canaux.
S'egare avec plaisir dans de vertes campagnes.
Et forme dans la plaine un labyrinthe d'eaux.
Riviere tranquille et cherie

Que j'aime a suivre tes detours! Ton cau silencieuse en son paisable cours. Presente a mon esprit l'image de la vie; Elle semble immobile, et s'ecoule toujours.

LETTER L.

Battle of Morat.... War between the Swiss and Charles the Bold, duke of Burgundy....Its consequences.

MORAT is celebrated for the obstinate siege sustained against Charles the Bold, duke of Burgundy, which was followed by the battle of Morat, fought on the 22d of June 1476. In this famous engagement the duke was routed, and his whole army almost destroyed, by the confederate troops of Switzerland. Not far from the town, and joining to the high road, a monument of this victory still remains: it is a square building, filled with the bones of the Burgundian soldiers who were slain at the siege and in the battle.† To judge from the quantity of these bones, the number of the

* From a poem entitled "La Vue d'Anet." I have followed the example of M. Sinner, in his Voy. Hist. et Pol. de la Suisse, who substitutes the Broye for the Thiele, to which the lines in the

original are applied

In February 1798 the Bernese troops, under the command of general d'Erlach, assembled in the field around this ossuary, to defend their country against the invasion of the French. General Brune recommended d'Erlach to surrender Morat. "My ancestors," replied d'Erlach, "never surrendered; were I base enough to entertain such a thought, this monument of their valour," pointing to the ossuary, "would deter me" Happy might it have been for Switzerland, had the government of Bern been actuated with the same spirit as their general.

On the 3d of March the French troops demolished this ossuary, and the Directory thought the de-

molition of sufficient importance to be communicated to the Council of Five Hundred:

"On the same day in the evening, the Bernese evacuated Morat, a town famous for the battle gained over the Burgundians in 1476, and for the manner in which the bones of the vanquished were preserved. A trophy so insulating to the French nation could not fail to be destroyed; and, what is very remarkable, it was destroyed by the battalions of the Cote d'or, on the very day which was the anniversary of the battle of Morat. A tree of liberty was immediately planted in the place of this monument, which the oligarchies pointed out beforehand, as destined to become a second time the fomb of the French." Message from the Executive Directory to the Council of Five Hundred, March 13. But this coincidence of circumstances was fabricated for the event, as the battle of Morat was not on the 3d of March, but on the 23d of June.

According also to the French accounts, the colours taken from the duke of Burgundy, at the pattles of Morat and Vancy, were found in the arsenal of Soleure, and sent to Paris. Moniteur, 16th

rgundy, at the Moniteur, 16th slaughtered must have been considerable. Among several inscriptions in the Latin and German languages relative to that memorable victory, I transcribed one on account eT its conciseness:

Deo Opt: Max:
Caroli Inclyti et Fortissimi
Burgundiæ Ducis Exercitus
Muratum obsidens ab Helvetiis
Cæsus hoc sui Monumentum reliquit.
Ann: 1476.

This war, which Charles the Bold carried on against the Swiss with a temerity peculiar to himself, forms a remarkable æra in the history of this country, and was attended with some extraordinary circumstances. From the time of the famous revolution in 1306, which gave rise to the Helvetic confederacy, to the end of the following century, the Swiss republies deprived the house of Austria of all its territories situated in Switzerland, and continued in possession notwithstanding the various attempts of the different dukes to recover their lost domains. But of all the princes of that house Sigismond the simple, archduke of Austria, of the branch of Tyrol, was more particularly engaged in hostilities with the Swiss cantons, and their allies; for his hereditary dominions in Suabia and Alsace bordering upon Switzerland, induced him to enter more frequently into these disputes, than the other branch, which was in possession of the Imperial throne.

In the course of these hostilities, Sigismond was compelled to cede a considerable part of his territories to the Swiss republics; particularly the rich country of Thurgau to the seven cantons, which at that period composed the Helvetic league.* Inflamed by these repeated losses, and the humiliating conditions of peace he was constrained to accept in 1468, he endeavoured to engage some of the neighbouring powers in a confederacy against the Swiss cantons. Having first ineffectually applied to Louis the Eleventh, king of France, he at length addressed himself to Charles the Bold, duke of Burgundy.

Charles having succeeded to the possession of Frauche Comte, Burgundy, Artois, and Flanders, together with the greater part of the United Provinces, possessed as ample revenues, and as extensive territories as the most potent sovereign of his time. Magnificent, impetuous, and enterprising, he neglected no opportunity of aggrandizing his power, and set no bounds to the projects of his restless ambition. He formed the plan of erecting Burgundy into a monarchy, and already in imagination appropriated to himself Lorraine and part of Switzerland, which he proposed to annex by conquest to his hereditary dominions.

A prince of such a character being naturally disposed to undertake any war that might advance his ambitious schemes, received with eagerness the propositions of Sigismond, flattered that credulous prince with the hopes of receiving in marriage his daughter Mary, heiress of his extensive dominions, and prevailed upon him, by the loan of eighty thousand florins, to surrender, Sundgau, Alsace, Brisgau, and the four forest-towns; promising to restore them upon the repayment of that sum. By this alliance Sigismond acquired a sum of money to assist him in his preparations against the Swiss, protected, as he thought, his hereditary dominions from their enterprises, and secured a powerful ally against the ancient enemies of his family. The reverse, however, happened; for, by a strange fatality, this league, which was intended to cement the union of the two

^{*} Bern obtained the co-regency of Thurgau at the peace of Aran. 1713

princes, served only to divide them; and occasioned the first perpetual alliance between

the Swiss cantons and a prince of the house of Austria.

Charles, upon the conclusion of this treaty, informed the cantons, that he had taken Sigismond under his protection, and would defend him to the numost of his power. Meanwhile, the bailiffs, whom he placed over his newly-acquired territories in Alsace, oppressed the people, laid embargoes upon the commerce of Mulhausen and withheld the rents of the estates belonging to the Swiss in Sundgau and Alsace.

These grievances being laid before Charles in an embassy which Bern dispatched to his court, in the name of the confederate cantons, the duke received it with haughtiness; and, after compelling the deputies to kneel while they delivered their remonstrance, dismissed them without an answer. This disdainful treatment was ill brooked by a free people, unaccustomed to crouch before the insolence of power; and their just indignation was still more inflamed by the artful policy of Louis the Eleventh, who, jealous of the duke of Burgundy's power, entered into a defensive alliance with the Swiss repub-

lies, in order to counteract his designs.

But Louis still further strengthened the Swiss, by effecting a reconciliation between them and Sigismond, who had no sooner surrendered to Charles, Sundgau, Alsace, and the other dominions, than he became sensible of his error. The duke of Burgundy not only oppressed his new subjects, but seemed determined, even should the eighty thousand florins be repaid, to keep possession of these conditional territories, and did not appear inclined to fulfil the promise of bestowing his daughter upon the archduke. Induced by these considerations, Sigismond accepted the mediation of Louis, threw himself under the protection of the Swiss, and concluded the famous treaty which was confirmed at Lucern in 1474, called the hereditary union; an appellation appropriated to the treaties between the Swiss and the house of Austria. Sigismond renounced all right to the provinces which the Swiss had conquered from the house of Austria; the two contracting parties formed a defensive alliance, and engaged to guarantee each other's territories. Thus the Swiss, after depriving Sigismond of all his possessions in their country, engaged to support his title to those very provinces, which he had mortgaged in order to strengthen his arms against them, and Sigismond accepted a guarantee from the most inveterate enemies of his family.

This treaty, which entirely changed the policy of the Swiss republics, was solely effected by the artful intrigues of Louis the Eleventh: the jealousy of that designing monarch turned into another channel the vast preparations of the duke of Burgundy; preparations which might have been attended with more success had they been directed

against France.

Charles, too late perceiving the imprudence of his conduct towards the Swiss republies, in vain exerted all his efforts to engage them in a neutrality. They rejected his proposals with firmness, prepared with their usual vigour for a war, which now appeared inevitable, and even advanced the eighty thousand florins to Sigismond, who demanded the restitution of his lands, which the duke of Burgundy evaded under various pretexts. The duke having concluded a separate peace with Louis, turned his whole force against the Swiss, entered their country with an army of sixty thousand men, and, laying siege to Granson, carried it by assault. But his success ended there: for at the subsequent battles of Granson and Morat, he was totally defeated, and his attempts upon Switzerland entirely frustrated.* Nevertheless, his restless and ambitious spirit still

^{*} Charles entered Switzerland confident of subduing that country. The effect which this unexpected and humiliating disappointment had upon his spirit and constitution, is related by P. de Comines, with

s unexpected lomines, with unsubdued, impelled him to attack the duke of Lorraine. But that prince, having engaged a body of eight thousand Swiss, obtained a complete victory near Nancy; Charles was slain in the engagement,* and his death terminated this bloody war; in which the Swiss gave distinguishing proofs of invincible valour, and spread the fame of their military virtues throughout all Europe, but obtained no solid advantage.† In fact, the principal and almost sole benefit accrued to Louis the Eleventh; as, by the death of Charles, he was not only released from a dangerous and enterprising rival, but also annexed the rich provinces of Burgundy and Artois to the crown of France.

But although the immediate advantages which the Swiss derived from the death of Charles were unimportant; yet the consequences operated considerably on their future politics. Mary of Burgundy, the only surviving child and heiress of Charles, married the archduke Maximilian, eldest son of the emperor Frederic the Third, and afterwards emperor himself. By this marriage the house of Austria acquired possession of the Netherlands, and having frequent disputes with France, the alliance of the Swiss was strenuously courted by both parties. Thus this country, being secured from all invasions, acceded, as occasion offered, to the two rival powers, and assisted each party as the intrigues, or rather as the subsidies of the one or the other prevailed.

These intrigues gave rise to different alliances, contracted with the house of Austrin, the kings of France, the pope, the dukes of Savoy and Milan. Not to enter more minutely into their history, I shall only observe in general, that hitherto the Swiss acted with great disinterestedness in all their treaties, and never took the field but with a view to secure their liberties, or to drive their enemies from Switzerland. But about the period of the Burgundian war, the subsidies which they obtained from Louis the Eleventh, taught them the disgraceful arts of mercenary polities; as the rich plunder which they gained from the duke of Burgundy gave, in some measure, the first taint to their original simplicity of manners; till, at length, Swiss venality has become a proverbial expression.

his usual minuteness, in his Memoirs addressed to Angelo Cattho, archbishop of Vienne in Dauphine His account is curious, and will give some idea of the violent and impetuous character of Charles:

"His concern and distraction for his first defeat at Granson was so great and made such deep impression on his spirits, that it threw him into a violent and dangerous fit of sickness; for whereas before his choler and matural heat was so great that he drank no wine, only in the morning he took a little titsane, sweetened with conserve of roses, to refresh himself; this sudden melancholy had so altered his constitution, he was now forced to drink the strongest wine that could be got, without any water. And, in order to draw the blood from his heart, some burning tow was put into the cupping-glasses, and applied to his side. But this, my lord of Vienne, you know better than I; for your lordship attended or him during the whole course of his illness, and spared no pains that might contribute to his recovery; and it was by your persuasion that the duke was prevailed upon to cut his beard, which was of a predigious length. In my opinion his understanding was never so perfect, nor his senses so seedate and composed after this fit of sickness as before."

Uvedale's Trans. Vol. 1, p. 423.

*The death of Charles at the battle of Nancy was attended with some very extraordinary circumstances; for the particulars of which see the curious account extracted from Philip de Comines, and the Chronique Scandaleuse of John de Troyes, in Wraxal's interesting Memoirs of the king's of France of the house of Valois.

† "And what," says Comines, "was the occasion of this war? It was begun on account of a waggen of sheep-skins, which the lord of Romont took from a Swiss, who was passing through his territories. If God had not abandoned the duke, it is not probable, that he would have put himself into so much danger for so trilling a circumstance; considering the offers that were made to him; against what sort of people he was engaged; and from whence neither profit nor glory could accrue to him. For the Swiss were not in such repute as they are in at present, and nothing could be poorer; insomuch that one of their ambassadors, as he was endeavouring to prevent the duke from engaging in that war, remonstrated, that he could gain nothing by attacking them; for their country was so barren, that the spurs of his troops and the bits of their horses were worth more than could be furnished by all the Swiss territories, in case they were conquered."

LETTER LL

Antiquities of Avenche.

FEW ancient towns have occasioned more controversy among antiquaries, or given ise to such a variety of conjectures concerning their origin and importance, as Avenche, the principal burgh of a bailliage in the Pays de Vaud. Some contend that it was the capital of all Helvetia, because Tacitus calls it Aventicum gentis caput: while others have endeavoured to prove, that by this expression the historian intended only to denote the apital town of its particular district. Agreeable to some accounts, the city was built, and a Roman colony founded by Vespasian; but with more probability, according to others, it was only repaired and beautified by Vespasian, after it had been laid waste, and dimost ruined, by Vitellius.

Without entering into dry and uninteresting discussions, it was formerly a very considerable town, and under the dominion of the Romans, as appears not only from several mile-stones, found in many parts of the Pays de Vaud, most of which are numbered from Aventicum, as the principal place of reference; but more particularly from the present rains. I shall slightly mention a few of these ruins, merely to shew you, that

the inhabitants do not boast of their antiquity without sufficient evidence.

We traced the site of the ancient walls, which appear to have enclosed a space near five miles in circumference. The present town occupies but a very inconsiderable part of this ground; the remainder is covered with corn-fields and meadows. One of the ancient towers still exists; it is a semicircular building, with the convex side towards the town

We next examined a coarse mosaic pavement, discovered some years ago in ploughing a field, and now in a sad state of dilapidation, enclosed by a barn, which is let to some peasants; the ignorant occupiers employ it as a drying-house for tobacco, and suffer strangers to take away specimens. Even the government of Bern was so insensible of its value, that they permitted the count de Caylus to remove a pannel, containing the

figures of two Bacchanalians.

This mesaic was the floor of an ancient bath, and is about sixty feet in length and forty in breadth; the general form is perfect; and, although several parts are broken and lost, yet from the present remains the configuration of the whole may be easily traced. It consists of three compartments: those at each extremity are regularly divided into fifteen octagons, eight small squares, and sixteen small triangles. Five of these octagons in each compartment represented human figures in various attitudes, but chiefly Bacchanals; the remaining octagons were composed of three different patterns. The vacant parts between the octagons are filled with the small squares; and towards the outward border with the small triangles. The middle compartment is divided into oblong pannels, in the largest of which is an octagon bath of white marble, of about six feet in diameter, and a foot and a half deep; the sides are ornamented with dolphins. Of these three compartments, one is almost perfect, the others much defaced. Each of the pannels is encircled with several borders prettily diversified; and a general border encloses the whole.

Schmidt, in his Recueil d'Antiquites de la Suisse, ingeniously conjectures from a glory which surrounds the head of Baechus in this mosaic, that it was wrought during some part of the intervening age between Vespasian and Marcus Aurelius; because that mark of divinity is not usual upon any monuments of Roman antiquity before that period. The same kind of glory, he adds, is observed upon the head of Trajan in an ancient paint.

ing at Rome, upon that of Antoninus Pius on a medal, and on the arch of Constantine. He strengthens this conjecture by further remarking, that the head-dress of a Baechanalian woman represented in this mosaic resembles the head-dress on the medals of the empress Plotina and Sabina.*

From thence we were conducted to the ruins of an ancient amplitheatre, within the walls of the bailiff's garden. The general form and size of this building are tolerably perfect, as also parts of the brick walls which enclosed it. The diameter of the arena was, as well as we could judge by pacing it, about eighty yards, which must be an uncertain estimate, as a former bailiff brought in a considerable quantity of earth, in order to plant fruit tress; conceiving, I suppose, that good fruit was of more value than to be able to determine the precise extent of an ancient amphitheatre. Under a tower partly built of Roman materials, is a cell from which the animals were probably let loose upon the arena. On the outside are still to be seen the remains of five dens; and the walls are adorned with several pieces of rude sculpture dilapidated.

Not far from these ruins stands a column of white marble, about fifty feet in height, composed of large masses, nicely joined together without cement; near it lies a considerable fragment of defaced sculpture, which seems to have once formed part of the portal belonging to a magnificent temple. At a small distance from this column, in the high road, we observed a cornice of white marble sculptured with urns and griffins; and as we walked through the town, we remarked several other masses of cornice, ornamented with sea-horses and urns, and some marble columns of beautiful proportions.

About a mile from Avenche, near the village of Coppet, on the other side of a little stream which separates the canton of Friburgh from that of Bern, are the remains of a small aqueduct, discovered about fifteen years ago, by the accidental fall of a sand-hill. The outside is formed of stones and mortar, and the inside of red Roman cement; the vault of the arch may be about two feet and a half high, and one and a half broad. This aqueduct has been traced to the east side of the town, and near the marble column. We were also informed that it extends to the tower of Gausa, between Vevay and Lausanne, and that, between Villarsel and Marnau, about four leagues from Coppet, an arch of nearly the same dimensions is excavated in the solid rock.

When I visited the ruins of Avenche in October 1786, I had much satisfaction in finding, that the bailiff, M. Techarner, paid great attention to these remains, and particularly to the mosaic. I could not avoid remarking to the bailiff, who politely favoured us with his company, that every lover of antiquity must regret, his predecessors had not shewn the same taste. Several excavations were lately made by lord Northampton, who has a house in the neighbourhood, and have been continued at the expence of Bern. A coarse mosaic pavement, a few fragments of walls rudely painted, and some trifling remains of ancient baths, are the only vestiges of antiquity hitherto discovered.

LETTER LII.

Town and Canton of Friburg Population Government ... Secret Chamber.

FRIBURG was built in 1779, by Berchtold the Fourth, duke of Zæringen, who endowed it with considerable privileges. Upon the extinction of the male line of the

^{*} The curious reader will find in the Recueil, cited in the text, a very accurate descripton and engraving of this mosaic.

house of Zeringen, in 1218,* Ulric of Kyburg obtained the sovereignty, in right of his wife Anne, sister of the last duke Berchtold the Fifth. It came by marriage into the possession or Eberhard count of Hapsburg-Lauffenburg; who sold it to his cousin Rodolph of Hapsburg, afterwards emperor. During this period a continual rivalship subsisting between Bern and Friburg, they were frequently engaged in hostilities: at length all differences were composed; and the two cities, in 1403, concluded a perpetual alliance.

Friburg continued under the dominion of the house of Austria, and was concerned in all the quarrels in which that family was engaged with the Swiss republies, until the middle of the fiftee th century; when, by a very singular revolution, it renounced all allegiance to the archduke Albert, and put itself under the protection of the duke of Savoy. From this area it occasionally assisted the cantons against the house of Austria; and in the war between the Swiss and Charles the Bold, its troops had a share in the victories of Granson and Morat. Soon after the battle of Morat, it became a free and independent republic; and, in 1481, was admitted a member of the Helvetic confederacy.

The situation of the town, though not one of the most beautiful, is certainly one of the most picturesque and wild in Switzerland. It stands partly in a small plain, partly on bold acclivities, on a ridge of rugged rocks, half encircled by the river Sane; and is so entirely concealed by the circumjacent hills, that the traveller scarcely catches the smallest glimpse, until he bursts upon a view of the whole town from the overhanging

eminence.

The fortifications, which consist of high stone walls and towers, enclose a circumference of about four miles; within which space the eye comprehends a singular mixture of houses, rocks, thickets, and meadows, varying instantly from wild to agreeable, from the bustle of a town to the solitude of the deepest retirement. The Sane flows in such a serpentine course, as to form, within the space of two miles, five angles between which the different parts of the currents are nearly parallel to each other.

On all sides the descent to the town is extremely steep, and in one place the streets even pass above the roofs of the houses. Many of the edifices are raised in regular gradation like the seats of an amphitheatre, many overhang the edge of so deep a precipice, that on looking down, a weak head would be apt to turn giddy: and an unfortunate lover, repulsed in his suit, might instantly terminate his pains, by taking a leap from the parlour window, without the trouble of a journey to Leucate, or to the rocks of Miellerie.

But the most extraordinary point of view is from the Pont-neuf. To the north-west, part of the town stands boldly on the sides and the piked back of an abrupt ridge; and from east to west a semicircle of high perpendicular rocks is seen, whose base is washed and undermined by the winding Sane, and whose tops and sides are thinly scattered with shrubs and underwood. On the highest point of the rocks and on the very edge of the precipice, appears, half langing in the air, the gate of the town called Bour-

^{*} The house of Zwringen was descended from the ancient counts of Alsace, by Berchtold count of Srisgan. His grandson, Berchtold the Second, built the castle of Zwringen, situated near a village of the same name, not far from the present town of Friburg, capital of the Brisgau. Upon the demise of Berchtold the Fifth, the last duke without male issue, his territories were divided between last collateral heirs, the dukes of Teck, and his two sisters Agnes and Anne. Agnes married Egeno, count of Urach, by which marriage he obtained possession of Friburg in the Brisgau; his posterity were called counts of Friburg. Anne married Uric, count of Kyburg; their daughter Hedwige was a Front Albert count of Hapsburg, and mother of the emperor Rodolph the First.

circumfeular mixagrecable, Sane flows angles be-

he streets in regular cep a prean unforing a leap the rocks

orth-west, idge; and is washed y scattered very edge lled Bour-

edd count of ear a village. Upon the ded between cried Egeno, his posterity Iedwige was guillon: a stranger standing on the bridge would compare it to Laputa, or the flying Island in Gulliver's Travels, and would not conceive it to be accessible but by means of a cord and pulleys. In the midst of the river I observed a large fragment of stone, which a few years ago fell from the rocky heights, was carried under one of the arches, and in conjunction with other fragments stopping the current, raised it more than tenfect above the usual level, threatening the lower part of the town with a sudden inhudation.

A traveller fond of wild and romantic scenery will not fail to visit the Moulin de la Motte, in the valley of Goteron: it is a miller's dwelling, hollowed in the midst of an impending rock, near it issues a small torrent, which, turning the mill, falls within a few paces into the Sane. This singular dwelling seems so far removed from "the busy hum of men," as to be rather situated in a remote solitude, than within the walls of a fortified town. Near it is an ascent of four hundred steps to the Places des Fontanes,

in the upper part of the town,

The valley of Goteron, on the north-west of the town near the bridge leading to Bern, takes its name from the Goteron, a small rivulet; it is extremely narrow, above two miles in length, and is bounded on each side by overhanging rocks of sand-stone. Vernet, the celebrated landscape painter, studied these rocks with great attention, and frequently declared that, excepting those of Tivoli, he never saw any whose varying tints had a more pleasing and harmonious effect. The valley contains several mills, an iron foundery, where the ore brought from Franche Comte is forged, and a manufacture of printed linen and cotton, lately established by some merchants of Neuchatel, under the protection and encouragement of government.

The houses of Friburg, constructed with a gray sand-stone, drawn from a neighbouring quarry, are neat and well built; but the whole town has a dull and inanimate

appearance.

Among the few worthy objects of particular notice are, the cathedral, an elegant Gothic edifice, erected in the latter end of the fourteenth century, and remarkable for the height and solidity of the tower; the town-house an ancient building, which formerly composed part of the palace belonging to the dukes of Zaringen, and also a lime tree, in the middle of the principal square. Tradition reports, that this tree was planted by one of the soldiers, on the 22d of June 1477, on his return from the battle of Morat: an emblem of Swiss liberty, which took deep root on the memorable defeat of Charles the Botd, and thus remaining firm against the conflicts of time, has continued to spread and flourish to the admiration and example of future ages.

The society of Friburg is extremely agreeable; the gentry are frank and hospitable, and blend French politeness with great simplicity of manners. Dinner is usually served at twelve; and supper seldom later than eight. I never experienced a more cordial re-

ception in any town of Switzerland.

The bishop of Lausanne, called here the bishop of Friburg, resides in this city. He is appointed by the Pope, usually at the recommendation of the French court; and his revenues including a small pension from France, and from the abbey of Hauterive, of which he was abbot, amount to about 400l. per ann. His diocese extends over the whole canton, and part of that of Solure; in all his acts and deeds he signs himself bishop and count of Lausanne, and prince of the German empire.

The present bishop, Bernhard of Lenzburg, is a man of letters, and an honour to his profession: he is employed in preparing for the public a biography of the illustrious and learned men born in the canton of Friburg, who have distinguished themselves.

either in the civil, military, or literary line.

This canton is entirely catholic. Its population in 1785 may be estimated from the following table:

The town contained									5,011

The sovereign power resides in the Great Council of Two Hundred; comprising the two Avoyers, the Chancellor, the Grand Santier, the Senate or little Council of Twen ty-four, the Sixty, from which body are chosen the bannerets and principal magistrates, and the remaining hundred and twelve members, who are simply denominated

Burghers.

The only persons eligible to this sovereign council, and capable of enjoying any share in the government, are the secret burghers, or a certain number of families divided into four bannieres, or tribes of the town; they are called secret burghers, to distinguish them from the other citizens, partly inhabiting the town, and partly the twenty-four parishes in the environs, who enjoy the right of appointing the avoyers, from certain candidates proposed by the Sixty, and of annually confirming them. Hence many authors have called this government aristo-democratical, but erroneously; for, as the power of the people is confined to the act of choosing and confirming the two avoyers, and as the supreme authority absolutely resides in the Council of Two Hundred, necessarily supplied by a limited number of patrician families, the government is, in the strictest sense, an aristocracy.

Instead of troubling you with an uninteresting detail of those points in which the government of Friburg resembles that of the other aristocratical cantons, I shall confine myself to those peculiar circumstances by which it is discriminated from them. This

difference may be principally said to consist in three articles.

1. The blind ballot, or mode by which several important offices are supplied, and particularly by which the members of the senate and the sixty are chosen, this mode of election was instituted in order to prevent venality, and is too singular not to be distinctly explained. The names of the candidates are placed privately in a box, containing as many partitions as there are persons who solicit the charge. Into each of these partitions, the electors throw in their suffrages as chance directs, without knowing to whom they may happen to give their votes; and the candidate who has the most of these casual ballots is elected.

2. The clause which excludes certain noble families from the office of banneret, and from the secret chamber. These families are sixteen in number; some were acknowledged noble, even as early as the foundation of the republic; others successively obtained titles of counts and barons from the foreign princes to whom they were attach-

ed, and in whose armies they served.

3. But the most remarkable circumstance which discriminates the constitution of Friburg from that of the other aristocratical cantons, is a committee distinguished by the name of the Secret Chamber, which, though not any public or responsible part of administration, is yet the concealed spring that puts the wheels of government in motion. As the prerogatives and operation of this secret chamber are in general little known, and still less understood, a concise account of its origin and constitution will not be uninteresting.

nneret, and re acknowssively obvere attach-

stitution of guished by ible part of ent in moeneral little constitution

The secret chamber, forming a part of the conneil of sixty, is composed of the four bannerets, and twenty-four members; the four bannerets are chosen by the council of two hundred from the four tribes, and remain in office four years; the twenty-four are nominated by a majority of their own body, and continue for life.

The secret chamber assembles ordinarily four times in the year, or oftener if occasion requires, and is convoked by a banneret. The two principal meetings are between the Sunday before St. John's day and the 24th of June, usually on the anniversary of the battle of Morat, for the purpose of appointing the vacant places in the council of two hundred; and on Tuesday in Whitsun-week, when they supply the vacancies in

their own body.

Its origin is thus traced in the records of the republic. From 1347 to 1387, the three bannerets nominated twenty persons from each of the three tribes into which it was then divided, and these sixty assembled on the Sunday before St. John's day, to establish the senate, and elect the treasurer; from hence is derived the origin of the sixty, and of the assembly which meets on the Sunday now called Secret Sunday. It consists of the whole council of two hundred, excepting the avoyers and senate, and is presided by the chancellor, the four bannerets, and the members of the secret chamber, who take the places of the senators. This assembly reviews, confirms, or censures, if necessary, the senators, the bannerets, and the sixty (the members of each tribe retiring, while their conduct is examined by the remainder) and fills up the vacant places in the senate, and the sixty, by blind ballot.

In 1387, the nomination of the sixty was transferred from the bannerets to the as sembly which met on the Secret Sunday, and that assembly was also empowered to appoint the senate, the treasurer, the sixty, and the remaining members of the two hun dred. By a charter of the same year, four coadjutors, drawn from the sixty, were given to each banneret, who were chosen in the same manner as the bannerets, separately by each tribe, and this may probably be considered as the origin of the secret chamber. A charter of the year 1392 confirms the Secret Sunday in the right of nomi nating the sixty, and confers on the bannerets that of choosing the prud-hommes, who accompanied them when they convoked the people on St. John's day, and probably also that of appointing their coadjutors. This nomination took place, as at present, on the Tuesday in Whitsun-week. The town being at that period only divided into three tribes, the coadjutors were limited to twelve; when a fourth tribe was added, then number was augmented to sixteen.

A charter dated 1404 confirms, in many instances, these arrangements; but doc. not grant to the Secret Sunday, the nomination of the two hundred; a right at that time enjoyed by the bannerets, who shared it with their coadjutors, the secrets: thus probably arose the power of appointing the members of the two hundred, since constantly

exercised by the bannerets and secrets.

The same charter orders the bannerets to assemble on Whit-Tuesday, in conjunction with the sixty of the preceding year, for the purpose of electing four members of the sixty from each tribe, who should accompany the bannerets when they convoked the assembly of burghers and inhabitants on St. John's day; and two additional members for convening the assembly of Secret Sunday. Here then are six persons from each tribe employed in these convocations, or in all twenty-four persons, the number of members who now form the secret chamber. The same charter also enjoins the bannerets and secrets to collect the votes in all elections and deliberations; an office which they continue to exercise to this day.

As early as the beginning of the fifteenth century, the bannerets and secrets assembled a Christmas and Easter, for the purpose of preparing such motions as were to be laid

before the council of two hundred, which adopted, modified, or rejected them.

As the bannerets probably continued to employ the same coadjutors in convoking the assemblies on St. John's day, and on Secret Sunday, the secret chamber, composed of these twenty-four coadjutors, at length became a permanent body, and enjoys the following prerogatives:

1. It convokes, in conjunction with the bannerets, the people on St. John's day, and the assembly which meets on Secret Sunday.

2. Prepares and draws up all the laws and ordinances, enjoys the sole power of proposing in the great council, and by means of the bannerets, of putting a negative on any motion, by simply affirm-

ing it to be contrary to the constitution.

3. Collects the votes in the election or confirmation of the avoyer, at the meeting of the people on St. John's day, and in the deliberations of the great council. 4. Fills up all the vacancies in that council. 5. Suspends, deposes, confirms, and censures its members. 6. Confirms, or suspends and deposes its own members; makes regulations for the interior administration of its own body; appoints the manner of electing its own members, and filling up the vacancies in the great council. 7. Fixes on the time for those elections, and the sum of money which each member is permitted to receive from those elected. 8. It can exclude all candidates from being chosen members of the senate, of the sixty, from the office of bailiffs, and other important charges, either by refusal to present, or by rejecting them as incapable. All these prerogatives, founded on authentic documents, or immemorial usage, were confirmed by the council of two hundred, in 1606, 1623, and particularly in 1716.

All affairs of government, and all debates in the national assemblies, are carried on in the German language; and as the French tongue is spoken in the greater part of the canton, and particularly by the gentry, many members of the great council do not an-

derstand the debates.

Such was the general form of government when I first visited Friburg in 1776; since that period it has undergone some very important alterations, the substance of which I shall communicate to you in the following letter.

LETTER LIII.

Origin and Suppression of the late Troubles in the Canton of Friburg Changes in the form of Government.

THE exclusive right of sharing in the administration of affairs, enjoyed by a certain number of families, in the aristocratical cantons, has, in conjunction with other concurrent circumstances, occasioned revolts in those of Zurie, Bern, and Lucern, which were quelled by the interposition of the other Helvetic powers, and prevented from again breaking out, by judicious regulations. Friburg having exhibited a recent example of the same kind, I endeavoured to trace the origin and progress of those intestine commotions, which have been followed by a considerable alteration in the form of government. Accordingly, I now lay before you the result of my inquiries, impartially drawn from repeated conversations with persons of both parties, from an attentive perusal of several publications written during the course of the troubles, and from some curious manuscripts, which I fortunately obtained.

In the latter end of April 1781, an insurrection suddenly broke out in the bailliage of Gruyeres, a district in the southern part of the canton, whose inhabitants are extremely jealous of their liberties, and zealously attached to all the customs of their ancestors.

ailliage of extremely ancestors.

Irritated by a few impolitic acts of government, by the petty vexations of the bathffs, by the scentarization of Val Sainte, a convent of Chartrenx, by the abolition of several fasts and festivals, and excited by the artifices of Chenaux and Castellaz, two designing leaders, they rose in open rebeliion.

Peter Nicholas Chenaux, the chief of the sedition, was a native of la Tour de Treme, in the bailliage of Grayeres: he was greatly embarrassed in his circumstances, and being arrested and imprisoned in 1771, for his disobedient and turbulent conduct, was highly exasperated against government. He was in the thirty-eighth year of his age, of a good figure and expressive countenance, and being a man of rude but popular eloquence, and of an overbearing spirit, obtained a considerable influence over the ardess inhabitants. His abettor, John Nicholas Andrew Castellaz, was a burgher of Friburg, and advocate of Gruyeres; versed in all the chicanery of the law, conversant in the history and ancient records of his country, and well acquainted with the privileges of the people, he was the first to expose the slightest oppressions of the bailiff, and to remark wherever government seemed to infringe their immunities, or issued edicts contrary to long-established usage. Having a loud voice, and vehement elecution, he was formed for popular assemblies, and principally directed Chenaux in all difficult emergencies; he drew up the principal remonstrances which, exaggerating every defect in the constitution, tended to render government odious, and to spread discontents among the people.

These two leaders, in conjunction with other accomplices, availed themselves of the public dissatisfaction, and engaging a considerable number of adherents, held, in the month of April 1781, regular meetings at Bulle. On the 24th, in particular, they insinuated before a large assembly, that government had formed a design of imposing additional taxes of a grievous nature, particularly on horned cattle and horses, and even of withholding the annual present of salt, which they shared with the burghers of Friburg. They represented that the secularization of Val Sainte, and the abolition of certain festivals, implied a settled determination to overturn the religion of their ancestors; that the governing party had many enemies; that the despotism of the secret chamber was held in universal abhorrence; that the nobles were discontented, on account of their exclusion from the principal charges of the commonwealth; and that the burghers and inhabitants of the twenty-four parishes were jealous of the exorbitant rights possessed by the secret burghers. They added, the time was arrived when the people might venture with impunity to petition for redress of grievances; a strong party in the capital was ready, on the first moment of their appearance, to join them; and multitudes would repair from all quarters to the standard of liberty.

Having, by these and similar insimuations, increased the number of their adherents, it was finally concluded that, on the 3d of May, they should secretly repair to the capital, and, assembling in the market-place, force the arsenal; that having provided themselves with arms, they should secure the garrison, constrain the Great Council to redress their grievances, and make those changes in the constitution, which could alone secure to the people a mild and just administration.

Notwithstanding the general ferment which prevailed among the people in the bailliage of Gruycres, and the number of persons concerned in this conspiracy, government received no notice of the plot before the 29th or 50th of April. On the first certain intelligence of the intended insurrection, the council of war, who immediately assembled on the occasion, dispatched some troops to arrest Chenaux; but having received information from one of his accomplices in the capital, he escaped to la Tour de Treme, and being joined by the most desperate of his adherents, determined to take arms without lelay. Having, by means of his emissaries, excited the spirit of rebellion among the people, who were informed that Chenaux had narrowly escaped an arrest for his patriotic attempts, he ventured to repair to Gruyeres, where Castellaz had already collected a considerable party. The advocate, having assembled a large body during the night, expatiated with much force and eloquence on the several grievances, and used various arguments in favour of an immediate revolt, similar to those which were urged on the 24th of April. He inflamed the populace to such a degree of frenzy, that they flew to arms at five in the morning, and, imprisoning the bailiff, erected the standard of rebellion. The alarm being given, Chenaux advanced to Posicux, which was fixed for the place of general rendezvous; from whence he addressed a letter to the magistrates of Friburg, disclaiming all design of violence, and requiring only that the petitions and remonstrances of the people should be taken into consideration.

On the next morning he conducted about sixty of his partisans to a height overlooking Friburg, with an intention of surprising the city; but finding the gates shut, the fortifications guarded, and not being joined, as he expected, by the inhabitants of the twenty-four parishes, he retired first to Posieux, and afterwards to Avry, where he expected a re-inforcement, which Castellaz and his emissaries were collecting in various

parts of the canton.

During these proceedings, the magistrates of Friburg were active in preparing for the security of the town. The council of war sat the whole night; a night of extreme terror and anxiety to many of the inhabitants. The account of the bailiff's arrest, of Chenaux's escape, and his arrival at Posicux, within two leagues of the capital, with a corps of rebels whose number rumour exaggerated, was no sooner divulged, than a general panic prevailed. The garrison scarcely consisted of more than fifty soldiers, and those chiefly invalids; the fortifications were weak and extensive; not more than two hundred burghers could be mustered to defend the ramparts, and the insurgents were supposed to possess a strong party even within the walls. If in this moment of disorder, aided by the darkness of the night, Chenaux had attacked the town, he might have carried it by assault. But the first emotions of terror had no sooner subsided, than the besieged assumed a spirit and vigour adequate to the alarming situation of affairs; they ran to arms; the nobles, burghers, and even strangers, crowded to the ramparts, and prepared for a vigorous defence; their confidence was raised by the arrival of some militia from Morat, who entered the gates at nine in the morning, and by the expectation of more effectual succours from the canton of Bern.

On the preceding evening a messenger was dispatched to Bern, requesting immediate assistance. He arrived soon after midnight: the avoyer d'Erlach, in the 85th year of his age, instantly summoned the sovereign council. "Gentlemen," exclaimed the venerable magistrate, "on other occasions you have a year to deliberate; you must now instantly act: Friburg is besieged by an army of rebels; let those who approve sending troops to her relief hold up their hands." The members unanimously assenting, twelve hundred troops were commanded to march without a moment's delay. Before the close of the evening major Rihimer entered Friburg at the head of two hundred soldiers, who passed unmolested through flying parties of the insurgents; at midnight a hundred and fifty dragoons arrived, and on the next morning eight hundred infantry completed

the re-inforcement.

The arrival of these troops inspired the magistrates of Friburg with perfect confidence and security, and saved the town from the most imminent danger. Nevertheless the emissaries of Chenaux and Castellaz, ranging about the country, sounded the church bells in the various parishes, exclaiming that their religion and liberties were threatened

confidence heless the he church threatened

with innucliate annihilation. The rebel forces were continually augmenting; they were joined by many inhabitants in the environs of the town, and the least success would have increased their number. Chenaux had several emissaries within the city, and be fore mid-day threatened Friburg at the head of above two thousand men, eight hundred of whom were provided with muskets, the remainder with only clubs, or the first weapons which chance presented. Having occupied the heights, he found his followers wayering and irresolute, and struck with a general panic on receiving the news, that a large boody of troops from Bern had reinforced the garrison. He posted his followers, however, in an advantageous situation; waiting with considerable anxiety till his forces should be increased, and an opportunity present itself of commencing hostilities, or ob-

taining a general amnesty for himself and his adherents.

In this situation of affairs, major Ribimer k.d a detachment of one hundred and eighty dragoons from one of the gates; while lieutenant Froideville, at the head of seventy men and twenty dragoons, sallied from another. The major, driving the besiegers from a height which commanded the town, continued his march with an intent of attacking them in front, and at the distance of about a cannon-shot reconnoitred eight hundred of the enemy drawn up in order of battle, but without artillery. The insur gents no sooner observed the cannon planted against them, and perceived that the commander was an officer of Bern, than they dispatched repeated messengers to assure him they were only collected to petition for a redress of grievances, and entreated him to spare the effusion of blood. Having received an answer, that he would undertake to intercede in their behalf, if they would instantly lay down their arms, and deliver up Chenaux; they agreed to the first point, but refused the second, The major continued to enforce his demand, and gained time, until lieutenant Froideville appeared unexpectedly in their rear. The two commanders repeating their promises, that their just remonstrances should not be neglected, the whole troop surrendered themselves prisoners. Four of the principal ringleaders being secured, the remainder, having delivered in their names and places of abode, were permitted to retire without molestation.

Chenaux, either finding it impossible to excite his followers to sustain the attack, or being deficient in personal courage, was among the first who betook himself to flight. Wandering from village to village, he was about midnight observed near Posicux by Henry Rossier, one of his principal accomplices. Rossier, willing to save his own life by betraying his leader, seized him by the collar, reproached him for seducing the people into rebellion, and for cowardice in forsaking them, and, with the assistance of Chavailet and Python, two other insurgents, wrested from him a double-barrelled pistol, and conducted him towards Friburg. Chenaux, suddenly disengaging himself, drew out a knife, wounded Rossier in several places, and endeavoured to escape towards Posieux; but Rossier snatching a musket from one of his followers, soon overtook him, and summoned him to surrender under pain of instant death. Chenaux, deriving cou rage from despair, attacked Rossier with inconsiderate fury, received the assailant's bayo-

net in his breast, and expired on the spot.

The death of the leader, the voluntary surrender of his principal associates, and the flight of Castellaz, put an end to this ill-concerted enterprise. Six hundred insurgents, the only remains of the rebels, were on the next morning observed hovering about the capital; but learning the fate of their leader, and the surrender of his followers, and being attacked by a corps of grenadiers, dispersed without resistance.

But although the insurrection was thus suppressed, and all parties concurred in chastising rebellion; yet the spirit of discontent had spread itself with too great violence and rapidity among all ranks of men, not to convince the rulers of the state, that the seeds

5 1

VOL. V.

of the royolt by deeper than appearances seemed to suggest. For it was obvious that the petty vexations of the bailills, the abolition of unnecessary fasts and festivals, and the seeming violation of a few trifling immunities, however exaggerated by the artifices of the most designing leaders, were not sufficient to excite the people of Gruyeres to the desperate extremity of taking arms against their lawful sovereigns, if government had not been extremely unpopular; if several grievances of an oppressive nature had not required to be redressed; several odious restrictions to be removed, and several defects in the constitution to be remedied. Influenced by these considerations, government, in a manifesto, issued on the 11th of May, after granting an amnesty, except to a few ring leaders, found it necessary to invite the subjects of all denominations to present remounstrances, to make representations, and to petition against grievances. About the same time the three cantons of Bern, Lucern, and Soleure, dispatched deputies to Friburg, offering their mediation towards composing the dissensions of the republic.

In consequence of this manifesto, many petitions and remonstrances were presented to the Great Conneil, either elaiming the reacted of obsolete rights, the removal of certain restrictions, or the abolition of various taxes; demanding redress of grievances, and an amendment of the constitution; or complaining of an infringement of popular franchises. As it would be needless to mention all the complaints and plans which were dietated by the spirit of party and the frenzy of innovation, I shall confine myself to three principal points of dispute, which occasioned the most violent altereations; and which would never have been compromised, had not the three mediating cantons effectually interfered: 1. The disqualification of the nobility from the office of hamteress and secrets; 2. The exorbitant prerogatives and influence of the secret chamber; and 3. The exclu-

sive privileges of the secret burghers.

1. With respect to the first point in agitation, it may be remarked, that the exclusion of the noble families from the charge of bannerets and of secrets appeared sufficiently reasonable, as long as the government was democratical, and the bannerets were, according to the ancient charters, chosen from the people, and of course when neither they, nor their coadjutors, the secrets, could be taken from the nobility. But when the government was changed from a democracy to an aristocracy, and the municipal administration no longer subsisted, particularly when the troubles excited by the bannerets, in 1553, obliged the council of two hundred to transfer from the people to themselves the right of appointing those magistrates; the disqualification of the nobility, which was founded on democratical jealousy, ought to have no longer subsisted. Their remonstrances were therefore just, and would have been still more reasonable, if the troubles

of the republic had not rendered them dangerous.

2. As to the second point in question: the extensive power and extraordinary influence of the secret chamber could not fail to create jealousies and discontents among all ranks of men. For, on considering the detail of their prerogatives, as laid down in the preceding letter, it must appear, that although the members of that committee enjoyed no positive authority in enacting or annulling laws; yet by being the depositaries of the constitution, and the ultimate framers of all decrees; by having the sole right of proposing, and a negative on all the resolutions of the Great Council, no motion could pass without their concurrence. It is also no less obvious, that the power of making regulations for the interior administration of their own affairs, mysteriously concealed from the knowledge of the Sovereign Council, might give rise to dangerous abuses; that the members of the chamber eventually enjoyed, by the power of excluding from all charges, that of nomination; that by appointing to the vacancies in their own body it was to be feared, what in effect happened, that an admission into the secret chamber would

be chiefly coni. Id to a few families; that, as they filled up all the elections in the council of two hundred, these elections would depend entirely upon a few persons who possessed the greatest credit, and that thus the government would gradually tend to a narrower oligarchy.

3. The third point in debate, namely, the exclusive privileges of the secret burghers, opened a larger and more dangerous field of contention. The demand of the other burghers that according to the ancient form of government, the right of admission into the great council, instead of being exclusively confined to the secret burghers, should be extended to them, seemed to militate against the fundamental laws of the republic, and to involve a total change in the very essence of the constitution.

The remaining part of the year was employed in agitating these points of dispute; which gave rise to many political and historical discussions, and accasioned several curious researches into the origin of the secret chamber, and the rise of the distinction between the secret and other burghers. For the purpose of ascertaining these queetons, the popular party demanded access to the archives; but met with delays and refusals on the part of government, which considered such an inquiry of dangerous tendency, and calculated to introduce factious innovations in the state.

Exasperated by repeated refusals, the populace began to shew signs of discontent, and to assemble in crowds at the place where Chenaux was put to death: they marched in solemn procession, bearing crosses and colours, and chaunting hymns and requiems in honour of this martyr (as they called him) to the religion and liberties of als country. These tumultuous meetings would probably have ended in another insurrection, if the bishop of Lausanne had not forbidden them, under pain of excommunication. Towards the conclusion of the year, deputies from Bern, Lucern, and Soleure, arrived at Friburg, for the purpose of composing the differences subsisting in the capital; and in order to conciliate the burghers, who were no less violent in favour of the nobles than in extending their own immunities, prevailed upon administration to repeal the disabling clause. With respect, however, to the other subjects of controversy, they conceived it dangerous to entrust the leaders of a heated populace with the records of government which might be attended with projects of endless innovation, and proposed that the great council should order a committee to draw up a declaration setting forth the privileges and franchises of the burghers, and that for the future this declaration should be considered as a fundamental code.

But although these essential points were obtained; yet so many subjects of altereation still remained, that for some time all further plans for composing the differences were fruitless. The deputies repaired to Morat, where they were employed, from the 25th of April 1782 to the 25th of July, in hearing appeals, revising and considering the arguments on both sides, and consulting on the best methods to conciliate the two parties.

The burghers however, dissatisfied with the chiefs of the aristocracy, formed a resolution to refuse taking the annual oath of allegiance to the great council; nor were they without great difficulty prevailed upon by the three deputies in person to perform the usual homage. Displeased nevertheless with the deputies themselves, and considering them as partial to administration, they delivered a memorial, in which, after representing their grievances, they threatened to appeal to the general diet of the thirteen cautons assembled at Frauenfield.

A measure of so alarming a nature, tending to produce a material change in the principles of the Helvetic union, was strongly reprobated by the members of that confederacy. For it was urged (and with great reason) that by introducing an innovation of such public notoriety, the disputes between the respective governments and their sub-

rous that ivals, and artifices of res to the ment had c had not al defects ament, in few ring at remonthe same

ery influmong all wn in the e enjoyed ies of the t of proould pass g regulafrom the that the from all n body it er would canton would be liable to become more numerous and daugerous, and that in the end each canton would fall under the guardianship of the remainder. On the other hand, what rendered the present crisis still more alarming was, that the court of France, consulted by several leading members in administration, tendered her good offices towards composing the dissensions. And although the three cautous reprobated, with consistent dignity, the intervention of any foreign power, and declared that Friburg, on accepting such a mediation, should be excluded from the Helvetic confederacy; yet it was apprehended, that on an increase of the troubles the French would find some pretext to interfere in the

affairs of Friburg, as they were actually engaged in those of Geneva.

Influenced by these considerations, the three mediating cautons, anxious to bring matters to a speedy conclusion, prevailed upon the ruling party to consent to several alterations in the constitution. At length, after various delays, disputes, and conferences, the deputies published on the 19th of June a manifesto, declaring, that on an impartial and diligent review of the various memorials and manifestos on both sides, the assertions of the burghers were groundless, and their demands unconstitutional; that the present form of government had subsisted above two hundred years, and that the supreme authority resided in the members of the great council. To this declaration they added, that the three cantons would defend and protect the existing form of government, and would never permit an appeal relating to the amendment or alteration of the constitution, to any other power than the supreme council of the republic; that tribunal being alone competent to such questions. At the same time they recommended to government a repeal of the disabling clause, which excluded the nobility from the office of banneret or secret; to admit some new families into the secret burghership; to hear and redress any remaining grievances, and to correct any defects in the constitution.

This declaration being accepted by government, was read on the 28th of July to the burghers assembled in their respective tribes; but several among them protesting formally against it, the three principal ringleaders of this opposition were banished, their

protests disregarded, and tranquillity restored.

Soon after this final pacification, the great council passed several acts for the redress of grievances, removed some burdens and usages which had been the object of general complaint, and amended the constitution in the following points: 1. A perfect equality is established between the secret burghers; the ancient nobles are no longer disqualified from holding the office of bannerets or secrets, but do not enjoy any precedence in consequence of their titles, which in all acts and deeds within the canton of Friburg are omitted. In return, all the secret burghers are, without distinction of persons, esteemed equally noble. 2. Sixteen new families have been admitted into the secret burghership, which addition nearly completes the number of a hundred families; and it is further enacted, that on the extinction of any three families, an equal number shall be elected without delay. 3. The vacancies in the sixty, instead of being indiscriminately supplied from the members of the two hundred at large, are now filled up according to seniority.

4. But the great and principal alteration in the form of government respects the new constitution of the secret chamber, which is changed in the following important points:

1. The members of that committee, instead of being nominated by a majority of voices in their own body, are now taken from the sixty, and chosen by blind ballot. The candidates are no longer under the necessity of being presented by a member of the secret chamber; but on addressing themselves to their banneret, the latter is obliged to deliver in their names to the secret chamber. As each vacancy is supplied from the particular tribe in which it happens, this alteration must reduce the candidates to three or four:

in order also to prevent cabal or corruption, if there shall be only one candidate, he is not necessarily elected; but it must be decided by lot, whether he shall be chosen or rejected, and if there should be a majority of ballots for the negative, he must wait till the subsequent year before he can have another chance of being appointed. Each mem ber on his election shall pay no more than 11, 10s, to each banneret and secret; and the money shall be delivered to the secretary, and by him be equally distributed. 2. Neither father and son, nor two brothers, nor more than two persons bearing the same name. shall be admitted at the same time into the secret chamber. 3. The members still retain the right of filling up all the vacancies in the council of two hundred, with the usual provisions, that the candidates shall be twenty years of age, and that the promotion shall take place every two years. It is further decreed, that on oath, under pain of deprivation, no more than 1200 crowns* shall be received for the nomination; and that the said sum, instead of being solely appropriated to the person who is to appoint, shall now be delivered to the secretary, to be by him equally distributed among the four bannerets. when either of them shall elect, or among the members of the secret chamber, belonging to the tribe in which there is a vacancy, when the turn devolves upon either of them.† It is moreover added, that if the person presented by the banneret, or a secret, shall be rejected by two-thirds of the chamber, another may be presented; but if the second is rejected. the right of presentation shall be transferred to the banneret, or secret, next in rank of the same tribe. It is also stipulated on oath, that all promises of exchanging presentations, or similar engagements, shall not be valid for the furture; those only excepted which are now absolutely subsisting, and which concern either a son of the contracting party, or a person whose name is specified. 4. The power of excluding persons from the principal charges of government is still reserved to them; but they are exhorted to use it with great precaution and care. 5. The interposition of a negative, exercised by a single banneret, is no longer sufficient to reject a motion in the Great Council. The opposition, in order to render it valid, must now be founded on a precise law, and unanimously approved by the four bannerets; but if one shall dissent, it is then referred to the council of two hundred, which shall decide, by a majority of two-thirds, whether the negative shall be confirmed or rejected. 6. The power of proposing, formerly vested only in the secret chamber, is now extended to the members of the senate and the sixty; and the mode of deliberating on such propositions and motions is attended with forms more or less complicated, as the object is more or less important. In all instances the laws are prepared and finally drawn up by the secret chamber. 7. The secrets shall take an oath before the bannerets as delegates of the Great Council, to obey all the ordinances of that assembly, and to observe the present articles, without retrenching or adding to them. And it is further ordered, that no alterations shall be made in the present constitution of the secret chamber, unless approved by three-fourths of their own body, and by two-thirds of the Great Council.‡

according to seniority, in his particular tribe.

[†] On considering the present disturbance, the number of the disaffected, and the exclusive privileges of the secret burghers, it was natural to suppose that the French would have found more adherents in this canton than in any other part of Switzerland; but the reverse was the truth. No innovation was made in the constitution before the surrender of the town; and the magistrates shewed less inclination than the people to resist the French. On the same night in which Soleure was invested, a column of the French army, under the command of general Pigion, marched towards Friburg, surprised the outposts, and summoned the magistrates, who were roused from sleep by this mexpected attack, to an immediate surrender, while the French adherents in the town seized the

LETTER LIV.

Cheese of Gruyeres.... Hermitage near Friburg.

THE canton of Friburg contains a small portion of arable land, but abounds in pastures; accordingly, its principal articles of exportation consist in horned cattle, cheese, butter, and hides.

The cheese, well known under the name of Gruyeres, which is exported in large quantities, is made on a chain of mountains about ten leagues in length and four in breadth, extending from the bailliage of Schwartzenburgh to the districts of Vevay and Aigle in the canton of Bern. All the cheese, though made in the same manner, is not of the same quality; a difference probably arising from the diversity of the soil; the same plants not growing at all heights, and the lower pastures, called gites, being not in such estimation for their goods as a those in the most elevated situations.

The whole district is divided in a scatter or lesser farms, which the proprietors let out in leases of three or six years, at a annual rate of 16s.* to 11. 10s. during five months for each cow, according to the nature or elevation of the ground: the lower pastures, though not of the best quality, are the dearest because being sooner freed from the snow, and later covered with it, they afford food to the cattle for a longer time.

Each farmer, having rented a mountain, hires from the different peasants in the canton from forty to sixty cows, from the 15th of May to the 8th of October, and pays at the rate of from 11. 6s. to 11. 13s. 6d. per head; each cow upon an average yields daily from twenty to twenty-four quarts of milk, and supplies two hundred pounds† of cheese during the five months. On the eighteenth of October the farmer restores the cows to the different proprietors. The eattle are then pastured in the meadows which have been twice mowed, until the 10 or 11th of November, when on account of the snow, they are usually removed to the stables, and fed during winter on having aftergrass.

As the mountains in the canton of Friburg afford pasture for at least 15,000 cows, it may be estimated that they annually supply about 30,000 hundred weight of cheese fit for exportation; beside 2,000 or 3,000 after their return from the mountains, exclusive of a thinner sort, which is made in various parts of the canton. The cheeses fit for exportation weigh from forty to sixty pounds each, and are sold from 11. 17s. to 21. per hundred weight. Beside the cows which are pastured during summer in the mountains, the canton contains about 12,000 belonging to the landholders, which supply their families with milk.

The buildings necessary for making cheese consist of a chalet or cottage, which contains a room with a furnace for boiling the milk, a cellar where the milk is preserved, and

arsenal. The magistrates inclined to capitulate, were deterred by the influx of 4000 persants who flocked into the town, recovered the arsenal, and with 1500 Bernese troops, prepared to defend it to the last extremity. A message being dispatched to general Pigion that the magistrates, overpowered by the people, could not order a capitulation, some shells were thrown into the town, several houses set on fire, a breach made at the walls, and the French prepared to storm the place. The troops of Bern, perceiving the untenable state of the fortifications, and the timidity of the magistrates, marched out with 30 cannon, and accompanied by the 4000 peasants, without being molested by the enemy. The town was instantly occupied by the French, and a provisional government elected by the districts of Friburg superseded the former magistracy. Planta, vol. in. p. 424.

sants who efend it to erpowered rad houses troops of , marched he enemy, e districts a stable for sixty or seventy cows; near it is a kind of dairy-room, kept in an equal degree of temperature, where the cheeses are every day turned and salted. The thickness of the vat, in which each cheese is pressed, is about four inches. The casks for exportation contain ten cheeses, excepting those destined for Italy, which hold only three, in order to be conveyed by mules across the Great St. Bernard. The cheeses well packed up bear the tran port into the most distant countries; they ought to be kept in a damp place, and frequently washed with white wine, to preserve them from insects. When the cows return from the mountains, a species of cream cheese is made in autumn, and even in winter; it is much esteemed, and is dearer than that of Gruyeres. The greater part of the salt used on these occasions is drawn from Franche Comte; a small quantity from Lorraine and Bavaria, but its quality is much inferior. The consumption of the whole canton, for all purposes, is at least 20,000 hundred weight, of which 15,000 is drawn from Franche Comte.

A great number of mares, foals, and horned cattle, are annually raised in the canton: the oxen of three or four years old are sold in the canton of Bern, in the country of Neuchatel, and in Franche Comte. Upon an average it may be estimated that the can-

ton of Friburg annually supplies pasture for 37,000 cows and oxen.

In our route from Friburg to Bern, we made a small circuit to the village of Neuneck, to an hermitage, that lies about a league from Friburg; and which has been highly extolled by travellers on account of its singularity. It is formed in the solid rock, and was the work of two men; as such, it is an astonishing performance, but, in any other respect, is scarcely worth visiting. In the last century a hermit scooped out a hollow in this rock, just sufficient to lie at full length: but his successor desiring a more commodious mansion, hewed, in the heart of the mountain, a chapel, several apartments, and stair-cases. The length of the whole is above four hundred feet; one room is ninety feet long, and twenty broad; the steeple of the chapel, if it may be so called, is eighty feet high, and the chimney of the kitchen ninety.

The hermit who perforated this habitation, was near thirty years engaged in the work. What a waste of time and industry! But such is the folly of sequestered superstition, that, for want of better occupations, it frequently has recourse to laborious trifles. The situation of the hermitage is extremely be autiful: the rock hangs over the river Sane, which meandering between two chains of hills covered with wood, fills all the valley be-

neath. The present hermit is a German; and with him lives an old soldier.

From this hermitage to Neuneck (where the canton of Bern commences) the country is rich and finely wooded; on our right we had a distant view of rugged rocks, the snowy Alps rising above them and closing the prospect. The sun was now declining: the various tints of the evening, the purple gleam upon the naked rocks, and the rays of the setting-sun upon the glaciers, which seemed to glow almost into transparency, cast such a beautiful radiance over this magnificent scene, as even the luminous pencil of Apelles himself, who is said to have painted "quæ pingi non possunt, fulgura & fulgetra," would in vain have attempted to imitate. I am, &c.

LETTER LV.

Town and Canton of Bern.

Bern, September 16.

I WAS much struck, on entering into Bern, with its singular neatness and beauty. The principal streets are broad and long, not straight, but gently curved; the houses

[&]quot;"Things which cannot be painted, thunder and lightning." Vid. Plie. H. N. lib. 35. c. 10.

are mostly uniform, built of a grayish stone upon arcades. Through the middle of the streets runs a fively stream of the clearest water, in a stone channel, while several fountains are not less ornamental to the place than beneficial to the inhabitants. The river Aar almost surrounds the town, winding its course over a rocky bed much below the level of the streets, and for a considerable way forming by its steep and craggy banks a kind of natural rampart. The cathedral, a noble pile of Gothic architecture, stands upon a platform raised from the bed of the river, and commands a most extensive view. The adjacent country is richly cultivated, and agreeably diversified with hills, lawns, wood, and water; the river flows rapidly below, and an abrupt chain of rugged and snow-capt Alps bounds the distant horizon. Such an assembly of wild and beautiful objects would, in any place, present a most striking prospect; but the effect is greatly

heightened, when seen from the midst of a large town.

According to the native historians, Bern was built by Berchtold the Fifth, duke of Zeringen, and was, from its foundation, an imperial city. Upon his death in 1218, the emperor Frederic the Second conferred upon the inhabitants considerable privileges, and compiled a code, which forms the basis of their present civil law. The liberty which this city enjoyed attracted many persons from the adjacent country, who found a sure asylum from the oppression of the nobles. Although Bern from its foundation was engaged in perpetual wars with its neighbours, and for some time with the house of Austria; yet it continued to aggrandise itself by degrees, and considerably enlarged its territory. In the year 1353 Bern acceded to the Helvetic confederacy; and possessed such power, even at that early period, as to obtain the second rank among the Swiss cantons. Since the acquisition of the Pays de Vaud, the domains of this canton form nearly the third part of Switzerland, and about the fourth of the actual population; it contains about \$70,000 souls, exclusive of 11,000 in the capital. At the introduction of the reformation in 1528, government acquired a large increase of revenue by secularizing the ecclesiastical possessions. At the same period the whole canton followed the example of the capital; and the reformed religion was permanently established.

The canton is divided into two great divisions, the Pays de Vaud and the German district. The Pays de Vaud having been conquered from the house of Savoy, and the German district from the states of the empire; justice is administered, and taxes regulated in each by peculiar laws and customs. Each of these divisions has its treasurer and chamber of appeal resident in the capital; the chamber of appeal belonging to the Pays de Vaud judges in the last resort, but the inhabitants of the German district may appeal

to the sovereign council.

The society is extremely agreeable, and foreigners are received with great case and politeness. The men do not meet in separate societies, and the women are the life and ornament of their daily assemblies, which begin about four or five in the afternoon, and continue till eight, when the parties usually retire to their respective houses. Dancing is a frequent amusement at Bern; there is a public ball every fortnight, and in winter scarcely an evening passes without one. These diversions commence at so early an hour as five in the afternoon, on account of a standing order of government, which prohibits their continuance after eleven. English country dances are usually introduced, but the walse (which is a species of allemande) the favourite dance of the natives, is most common; the parties arrange themselves in distinct couples, and follow each other in a circular direction, the gentleman turning his partner with great velocity. The life and spirit of their dances strike an Englishman with astonishment, and can scarcely be conceived by those who have never seen them. The gaicty of the parties is still more enlivened during the summer months, when the natives resort to a garden near the town, and

ldle of the eral foun-The river below the y banks a ire, stands sive view. ills, lawns, ugged and beautiful is greatly

at ease and the life and rnoon, and

Dancing d in winter arly an hour ch prohibits ed, but the most comier in a cirhe life and ely be cone enlivened town, and

dance under an open pavilion amid seenes of rural festivity. The foreigner who pre fers the constant intercourse of company to a more tranquil society, will choose the resi dence of Bern rather than that of any other town in Switzerland.

There is but little trade in the capital; some few manufactures indeed (chiefly ci linen and silk) have been established, but are carried on by those only who have to prospect of being admitted into the sovereign council. For those families who enjoy any influence in public affairs would hold themselves degraded by engaging in commerce; and as offices of state, except baillinges, are in general not very profitable, nor indeed numerous, many enter, as their sole resource, into foreign armies. One general advantage, however, is derived from this anti-commercial spirit; the members of government not being interested in laying restrictions on trade, do not, as at Zuric and Basle. confine the exclusive right of establishing manufactures to the burghers of the capital; but wisely extend that permission to all their subjects without distinction. From this circumstance, in conjunction with the mildness and wisdom of government, arises that comfortable state, and even affluence, which peculiarly distinguishes the peasantry in the whole canton of Bern: to the natural result of these wise regulations may be reasonably imputed the attachment to government particularly observable in the German district.*

It is remarkable that the peasants, who have acquired opulence either by manufactures or agriculture, seldom quit their situation; they continue in the same habits which they contracted in the earlier period of life, and, however wealthy, never give their

daughters in marriage but to persons of their own description.

The public buildings are constructed in a noble simplicity of style, and announce the riches and grandeur of the republic. The arsenal contains arms for sixty thousand men, and a considerable quantity of cannon, which are cast in the town. The granary, an excellent institution, similar to that of Zurie, always contains a large provision of corn, supplied in consequence of particular treaties by France and Holland.

· No subjects ever displayed more attachment to their government than the peasants of this cantou; and many instances occur in the history of Bern, when they flocked in crowds to the capital, to offer their assistance in suppressing all attempts to make innovations in the constitution. This unvaried attachment to the former government is a sufficient culogy of its mildness and equity, and affords a decisive answer to all the reproaches of tyrannical oligarchy, urged by a few disaffected persons, and exaggerated by the French.

The address of the fifty delegates chosen by the people to assist the supreme council in amending the constitution, bears the most honourable testimony to the wisdom and integrity of government:

"It was to satisfy your views, that, as soon as we had taken our places in the assembly of the government, alterations were proposed to us which appeared useful to the general good of the country, and suitable to circumstances. We have supported these propositions with firminess as you entrusted to us the care of co-operating as we shall judge necessary for the safety of the country.

"If it be true, that our constitution was not exempt from abuses, which human weakness renders almost inseparable from governments, how many have already disappeared through the wisdom and pru dence of the administration? Did we not possess, in the fullest extent, the security of persons and property, the two most precious advantages of civil society? Can the administration be accused of a single deviation from justice? Can the members of our government be reproached with the least in clination that could look like corruption? Could the treasures of the state be administered with stric ter responsibility, with greater economy? And if the fertility of a parched and rocky soil, if the prosperity of a loyal nation, that has preserved the ancient purity of its manners, be most certain proofs of the goodness of its government, is it not yourselves who render this glorious testimony to the supreme power? Woe be to you, if ever you can forget it!"

The heroic intrepidity of the peasants, who voluntarily sacrificed their lives in defence of the con stitution, notwithstanding the irresolution of the government, plainly proves that these sentiments

were indelibly impressed on the hearts of the people.

vol. v.

The progress of the fatal revolution in the canton of Bern, and dissolution of the reoveranceal errelated in the introductory account of the conquest of Switzerhand

The charatable institutions are numerous, liberal, and well directed. The hospitals are in general large, clean, and airy; and, in the alms house for the reception of fifty poor citizens, is a enrious establishment similar to one which I noticed at Basle. Distressed travellers are treated with a meal and a lodging, if at night, and receive sixpence on their departure; if sick or wounded, they are maintained till their recovery.

The house of correction which, when the benevolent Mr. Howard visited Bern, was in so deplorable a state, is now extremely well regulated, and reflects great honour on M. Manuel, member of the great council, to whose care and attention this salutary change is chiefly owing. Formerly all delinquents, without distinction, were confined together, but are now separated; two houses are established, one called the house of correction for greater crimes, and the other the house of labour for misdemeanors. The prisoners are also discriminated by the appellations of brown and blue from the colour of their clothes, with which they are supplied gratis during the term of their confinement; the brown colour is appropriated to the house of correction, the blue to the house of labour. The men and women are lodged in separate apartments. Both are constantly employed, sometimes in cleaning the streets, and other servile occupations; at other times they are taught to read and write, and instructed in various trades, which may assist them in gaining a maintenance at the expiration of the time for which they were sentenced to hard labour. By these means the expence of the establishment is nearly supported, and an honest livelihood assured to those who would otherwise prove useless or pernicious members of society.

There are four tables, at which the respective seats are a mark of distinction appropriated to good behaviour, and a larger or lesser share of provision is distributed to each in proportion to their industry. After earning their food, the prisoners in the house of labour receive ten per cent, those in the house of correction eight per cent, for their extra work.

Public justice is wisely and impartially administered; and the torture, which had for some time fallen into disuse, is now formally abolished by a public act of government. This humane and just act forms a distinguished æra in the history of Swiss jurisprudence; as the example of so powerful and wise a government cannot fail of having a general influence; and it is to be hoped, will be the prelude to the abolition of torture throughout Switzerland.

The solemnity used in passing capital sentence on a criminal deserves to be mentioned and imitated. The trial being finished, the prisoner is informed of his condemnation by the grand sautier, or lieutenant of the police, and attended by two elergymen, who prepare him for death. On the day appointed for execution, a large scaffold, covered with a black canopy, is constructed in the middle of the principal street. The avoyer, with a sceptre in his hand, is scated on an elevated kind of throne between two senators, and attended by the chancellor and lieutenant of the police, holding an iron stick, called the rod of blood, all habited in their official robes. The criminal being brought to the foot of the scaffold without chains, the chancellor reads aloud the sentence of condemnation, at the conclusion of which the avoyer bids the executioner approach, who instantly binds the arms of the culprit, and leads him to the place of execution.

The public library is a small but well chosen collection, containing 20,000 volumes, a cabinet of Swiss coins and medals, and many curious manuscripts, of which M. Sianer, a man of great erudition, has published a judicious catalogue. He has not only set forth their titles, and ascertained their age, but has also given a general and succinct account of their respective subjects, and from many has published extracts equally curious and interesting. Among these MSS, are some of the thirteenth century, consisting of se-

hospitals of fifty e. Dissixpence

ern, was onour on salutary confined house of meanors, from the of their blue to a. Both occupas trades, or which ishment se prove

olumes, Sinner, set forth account ous and g of several songs and romanees of the Troubadours, written in that and the preceding ages which merit the attention of those who are conversant in that species of ancient poetry.

Learning is neither so universally encouraged, nor so successfully cultivated here as at Zuric; the academical studies are principally directed to those branches of knowledge more essentially necessary for entering into the church. The society for promotion of agriculture is almost the only establishment directly tending to promote the arts and sciences, but meets with little countenance from government.

October, 1786

I FEEL a very sensible satisfaction on adding, that this enlightened government no ionger merits the reproach of not sufficiently encouraging literature; it is now awakened from its former lethargy, and begins to perceive that it is the interest of every wise state to esteem and protect the sciences. The magistrates have lately purchased and appropriated a large mansion for the public library, increased the collection of books, and procured

from England an extensive apparatus for experimental philosophy.

Among other undertakings, a new map of the canton is now preparing under their auspices, by the professor of experimental philosophy, a great desideratum in the geography of Switzerland, as the Alps of the canton are incorrectly delineated in all the maps which have fallen under my observation. I am also happy to add, that the Rev. M. Wyttenbach has lately instituted a literary society for the promotion of physics and natural history in general, and that of Switzerland in particular. In January 1788, this society consisted of ten members resident at Bern, of whom several possess, and others are forming collections agreeable to the plan of the institution. The members have established regular correspondence in various parts of Europe, and readily answer the inquiries of foreign naturalists, relating to the natural history of this country. An institution founded on such liberal and extensive principles, and having one object principally in view, cannot fail to render the most essential service to science. I am, &c.

LETTER LVI.

Government of Bern.

WERE I to attempt entering into a minute disquisition concerning the government of Bern, my letter would not only exceed its proper limits, but would hardly be contained within the extent of an ordinary pamphlet. I am persuaded, therefore, you will readily excuse me from putting your patience to so tedious a trial; but you will probably think me very inconsistent indeed, if after having already descended into less interesting details, I should pass over in silence a government, the wisdom of whose administration is so justly admired. Let me endeavour then to sketch the general outlines of this constitution.

The sovereign power resides in the great council of two hundred; which, when complete, consists of two hundred and ninety-nine members, chosen from the citizens; from whom they are considered as deriving their power, and as acting by deputation. The authority with which they are invested is, in some respects, the most uncontrolled of any among the aristocratical sizes of Switzerland. The government of Lucern is indeed called the most aristocratical of all the cantons; and it may be so perhaps with respect to the small number of families, to which the administration of affairs is entrusted; but no war can be declared, no peace concluded, no alliance made, no taxes imposed,

5 Q 3

without the consent of the burghers in a general assembly. At Friburgh and Soleme the burghers are likewise convened upon particular occasions; whereas the great council of Bern (since 1682, when it was declared the sovereign) is restrained by no constitutional check of this kind; as a general assembly of the citizens is never convened on any occasion.

The executive powers of government are delegated by this sovereign council to the senate, chosen by themselves from their own body; the former assembles ordinarily three times a week, and extraordinarily upon particular occasions; the senate every day,

Sundays excepted.

The senate, comprising the two avoyers, or chiefs of the republics, is composed of twenty-seven members; and from this select body are drawn the principal magistrates. On a vacancy in the senate, twenty-six balls, three of which are golden, are put into a box, and drawn by the several members; those who draw the three golden balls nominate three electors out of their body. In the same manner seven members are chosen from the great conneil, who also nominate seven electors out of their own body. These ten electors fix upon a certain number of candidates, not exceeding ten nor less than six; and those among these candidates who have the fewest votes in the sovereign council retire till their number is reduced to four; then four balls, two golden and two silver, are drawn by the four remaining candidates; the two who draw the former are put in nomination, and he who has the greatest number of suffrages in the sovereign council is chosen. But, to be eligible, the candidate must have been a member of the great council ten years, and must be married or a widower.*

The great council is generally filled up every ten years; as within that period there is usually a deficiency of eighty members to complete the whole number of two hundred and ninety-nine. A new election can only be proposed on a vacancy of eighty; and cannot be deferred when there is a deficiency of a hundred. The time of the election being determined by vote, each avoyer nominates two of the new members; each scizenier, and each member of the senate, one; two or three officers of state enjoy the same privilege. A few persons claim, by virtue of their offices, a right of being elected, and are generally admitted. These several nominations and pretensions commonly amount in the whole to about fifty; the remaining vacancies are supplied by the suffrages of the senate and

the seizeniers.†

Mr. Planta justly observes, that, although I have justly described this mode of balloting with suf-

ficient accuracy, yet I have not pointed out the true objects, which he thus describes:

"The reason of this repeated alternation by lot and ballot cannot but be obvious to those who will bestow some thought upon the subject. Its greatest excellence perhaps consisted in making the chance of lots apply chiefly to the electors, and not to those who might pretend to the succession; by which means the dangerons effects of cabal were in a great measure obviated; and yet a fair prospect of success was given to the meritorious, while those wholly unqualified could entertain little hope of being preferred. The selected candidates drew lots only in one stage of the proceeding, and this when their number, being reduced to only four, an even chance was given to those few to whom eminent qualifications had secured the marked approbation of their fellow-citizens; and when fortune proved unfavourable in one instance, repeated opportunities would occur in which, unless she proved singularly unpropitious, the desired object would ultimately be obtained. This mode will admit of much meditation, and may perhaps afford some hints for imitation. It has here been explained somewhat at large, as no similar institution occurs in any republic, either ancient or modern." Planta's History of the Helvetic Confederacy, vol. ii. p. 261.

† This measure of deferring the election till the number of vacancies amounted to eighty, though not dangerous in times of tranquillity, was extremely impolitic in a period of innovation. It greatly contributed to disorganise the government, at the commencement of the late revolution, as the admission of so many new members, who were mostly infected with French principles, proved the source of that fluctuation which distinguished the councils of this government, and precipitated us downfall.

downfall.

The seizeniers are sixteen members of the great council, drawn yearly from the albayes or tribes; two from each of the four great tribes, and one from each of the remaining eight; the candidates are generally taken from those who have exercised the office of bailiffs; and are elected by lot. Every year during three days at Easter, all other employments in the state are suspended, except those of the bannerets and the scizeniers, who are invested with an anthority similar to that of the Roman censors. In case of maladministration, they may remove any member from the great council, or senate; but it is a power which they never exercise; and should they think proper to exert it, the sentence must be contirmed by the council.

The principal magistrates are, two avoyers, two treasurers, and four bannerets; each chosen by a majority of voices in the sovereign council, and yearly confirmed in their respective offices. The avoyers hold their post for life; the treasurers, six years; and the bannerets, four. At Easter the avoyer in office delivers up his authority, in full council, to his colleague. The reigning avoyer sits on an elevated seat, under a canopy, and the scal of the republic lies upon the table before him. He never delivers his opinion except it is demanded; he enjoys no vote unless the numbers are equal, and in that case he has the casting voice. The ex-avoyer is the first senator in rank, and president of the secret council.

The two treasurers, one for the German district, and the other for the Pays de Vaud, form, in conjunction with the four bannerets, an economical chamber, or council of finance;† which passes the accounts of the bailiffs, and receives the revenues from those who are accountable to government. The four bannerets, together with the ex-avoyer, the senior treasurer, and two members of the senate, compose a committee or secret council, in which all state affairs, requiring secrecy, are discussed.

• I say generally, because it is not absolutely fixed, that all the seizeniers must have been bailiffs, for if it happens, that in one tribe there are two persons one of whom has been a bailiff, and the other is a member of the great council, they draw lots for the charge. And should a member of the great council be the only one of his tribe, he becomes seizenier of course, provided he is eligible. In order to be seizenier, the candidate must be married, or a widower, and have neither his father or brother in the senate.

† The finances were regulated with the strictest economy, and yet the expenditure was answerable to the dignity of the republic.

The salaries of the principal magistrates were extremely moderate:

| Reigning avoyer | - | 4001 | Senators each | - | 1501 | Bannerets | - | 2301

The revenues were derived principally from the public demesnes, which were appropriated at the time of the Reformation, the tithes sequestered at the same period, and assigned to the maintenance of the elergy, public seminaries, and charitable institutions; quit-rents, and monopoly of salt, and gunpowder; produce of the post-office, customs and tolls, duty on wine imported into the capital, and fines imposed for misdemeanors; also a tax on the alienation of landed property in the French district; the interest of money accumulated from a regular progression of savings, of which near 500,000l. were lodged in the English funds.

The whole revenue has been stated, by the best authorities, as not exceeding 300,000 crowns, which were always more than sufficient to supply the expenditure, and to construct and support the magnificent public works. A large treasure was always reserved in a vault of the capital for the supply of sudden emergencies, and the care of this vault entrusted to the principal magistrates, who had each a separate key, and without their concurrence, and a special order from the sovereign council, the door could not be opened.

The amount of this treasure could not be accurately ascertained, but it must have been very considerable as not less than 160,0001. Sterling was deposited in the mountains of Hasli and Oberland. The pillage of this treasure was one of the principal objects of the French directory, to defray the expences of their armament against Egypt. In the plunder of Bern, the French did not acquire less than 400,0001, in specie.

I have only described these eight magistracies, as being the chief offices of the state and exercised by members of the senate. But although the form of this constitution is aristocratical, and the senate possesses a very considerable influence, yet it does not enjoy that almost exclusive authority, which is observable in many aristocratical governments. For, by several wise and well-observed regulations, the sovereign council, although it delegates the most important concerns of government to the senate, yet as-

sembles at stated times, and superintends the administration of public affairs.

It may also be remarked, that although the ancient houses retain very considerable influence, and are more readily entrusted with the administration of affairs; yet the principal charges are not exclusively contined to them; many new families being admitted into the sovereign council on every election. It must nevertheless be acknowledged, that, as the citizens are continually diminishing, and the vacancies never supplied; it would well become so wise a government to receive occasionally new families into the barghership, in order to prevent the ill effects arising from the partial and narrow spirit of too confined an oligarchy. Government is administered throughout its several departments with great precision, and every ordinance executed with as much dispatch as in a monarchical state. The administration is conducted with great wisdom and moderation, and the rulers are particularly cautious not to encroach upon the privileges of the subject.

The canton is divided into a certain number of districts, called bailliages, over who bailiffs are chosen from the sovereign council; and these posts being the most profit in the disposal of government, are the great objects of general pursuit. Formerly the bailiffs, taken indifferently from the scuate or great council, were nominated by the bannerets; but as this method rendered the members entirely dependent upon those who had the chief credit and influence in the commonwealth, the mode of election was altered in 1712, and they are now chosen by lot. No competitor, however, can be received as a candidate, in opposition to a more ancient member of the gree, council; for instance he who was admitted in 1766, cannot stand against one chosen in 1756. None but married men or widowers are eligible; nor can any person occupy more than once the principal bailliages; those of a less profitable kind may be possessed three times.

The bailiffs are representatives of the sovereign power in their respective districts; they enforce the edicts of government, collect the public revenues, act as justices of the peace, and are judges in civil and criminal causes, except where there is any local† justicition. In civil causes, beyond a certain value, an appeal lies to the course of Bern: meriminal affairs, the process undergoes a revision in the senate, and is referred to the criminal chamber, which inflicts punishment for small misdemeanors; in capital cases, the sentence must be confirmed by the senate, and by the sovereign council, if the delinquent is a citizen of Bern. The bailiff delivers his accounts to the economical chamber, to which court an appeal lies, in case of exaction on the part of the bailiff, or of his officers; and with respect to misdemeanors punishable by fine, of which the bailiff is entitled to a share, the proportion of the penalty is not left to the arbitrary decision of an interested judge, but settled by the legislature with the most scrupulous exactness.

† The lord of the estate of Diesbach enjoys, within his own lands, the same powers in criminal affairs, as are possessed by the bailiffs in their respective districts.

^{&#}x27; Since the publication of this work, the government admitted some new burghers both from the Pays de Vaud, and from the German district. Among these was M. Cerjeat of Lausanne. But the number was too small to produce any material effect; and the admission was clogged with so many restrictions, that no advantage could be derived before the third generation.

both from the nne. But the with so many

in criminal af-

Although, from all these considerations, it should seem, that every possible precaution has been taken by government to prevent the extortions of the bailiffs; yet instances have not been wanting to prove, that these wise and strict regulations may be cluded; these instances are very few, but several examples occur in which extortions have been severely punished, and the government has even shown great readiness to listen to all appeals, and to afford speedy redress.

The profits of the bailiff's office arise from the produce of the demesnes, of the tythes, certain duties paid to government in the respective bailflages, and from the fines imposed for criminal offences. In some part of the German division, the bailiff is entitled, upon the death of every peasant, to a determinate part of the inheritance; although his share is very inconsiderable, yet in some situations it may prove an oppressive tax upon the family. This tax is the only instance that has fallen under my knowledge, where the peasants of this canton are liable to any imposition, which can justly be deemed grievous

Although there are no standing armies in Switzerland; yet in many of the cantons, and particularly in Bern, the militia is so well regulated, that government can assemble a very considerable body of men at a moment's warning. To this end every male at the age of sixteen is enrolled, and about a third of the whole number are formed into particular regiments, composed of fusileers and electionaries; the former consisting of batchelors and the latter of married men. Every person thus curolled, is obliged to provide himself, at his own expence, with an uniform, a musket, and a certain quantity of powder and ball; and no peasant is allowed to marry, unless he produces his uniform and arms. Every year a certain number of officers, who are called land majors, are deputed by the council of war, to inspect the arms, to complete the regiments, and exercise the militia. Beside this annual review, the regiments are occasionally exercised by veteran soldiers, appointed for that purpose.

Beside the arms in the arsenal of Bern, a certain quantity is also provided, in the arsenal of each bailliage, sufficient for the militia of that district; and likewise a sum of money amounting to three months' pay, which is appropriated to the electionaries in case of actual service. The dragoons are chosen from the substantial farmers; as each person is obliged to provide his horse and occourrements. In time of peace, the avoyer out of office is president of the council of war, and a member of that council is commander of the militia in the Pays de Vand; but during war a general in chief is nominated for the forces of the republic. A certain number of regiments being thus always in readiness, signals are fixed on the highest part of each bailliage, for assembling the militia at a particular place in each district, where they receive orders for marching.

Before I close this letter, I shall just mention an institution called the exterior state, as remarkable for its singularity as utility. It is a model of the sovereign council, and is composed of those burghers, who have not attained the age requisite for entering into that council. It has a great council, a senate, two avoyers, treasurers, bannerets, and scizeniers; all of whom are chosen in the usual manner, and with the accustomed ceremonies. The post of avoyer in this mimic community is solicited with great assiduity, and sometimes obtained at a considerable expence; as the successful candidate is always admitted into the great council, without any farther recommendation. This body possesses a certain number of bailliages, which consist of several ruined eastles dispersed over the canton; it has also its common treasure, and its debts. In this last article, however, it by no means resembles the actual government of Bern, which is not only free from debts, but possessed of a very considerable fund in reserve.*

The badge or cont of arms borne by this mimic commonwealth, is an ape sitting on a lobster, and viewing himself in a mirror.

This remarkable institution, may be considered as a political seminary for the youth of Bern. It renders them acquainted with the forms of the constitution; and, as the members debate upon all kinds of political subjects, affords them an opportunity of exercising and improving their talents, and by that means of becoming more capable of saving the public, whenever they may be admitted to a share in the administration.

Lam, &c

LETTER LVII.

Biographical and Literary Anecdotes of Haller.

BERN has produced few men highly eminent in literature; but has established her

glor in being the birth-place of the celebrated Haller.

Albert Haller, "the youngest of five brothers, was born on the 16th of October 1708. His father, Emanuel Haller, a citizen of Pern, practised the law as an advocate with great success; and in 1713 removed from the capital to Baden, where he was appointed se-

cretary of that bailliage.

Although many accounts are usually related concerning the early genius of distinguished persons, which do not always deserve implicit credit; yet the premature abilities and application of Haller are incontestably proved. When he had searcely attained his fifth year he was accustomed to write the new words, which he recollected to have heard in the course of the day. His progress in the language was so rapid, that in his tenth year he could translate from the Greek, and composed for his private use a Chaldaic grammar, a Greek and Hebrew lexicon. His passion for letters was also so general and ardent, that, about the same period, he abridged from Bayle and Moreri an historical dictionary, comprising above two thousand lives, and distinguished himself by a satire in Latin verse against his preceptor Abraham Padodz, a person of considerable learning, but of a capricious and morose disposition.

Such innwearied application, and astonishing progress in a youth, ought to have ensured the approbation and encouragement of his family. On the contrary, his father, who had destined him to the law, reproved his growing taste for polite literature, was particularly offended at his inclination for poetry, as likely to draw him from the severer occupations, and objected to the variety of his pursuits as too desultory and superficial.

"The materials for this biographical sketch, are chiefly collected from the following lives of this great man, which, I was informed by his eldest son, since deceased, are those to which most credit may be given.

1. Leben des Heren von Haller, by George Zimmerman. Zuric, 1755. The author was the disciple and friend of Haller.

2. Lobrede anf Herrn Albrech von Haller, von Karrn von Balthasar. Basel, 1778. The author was Haller's intimate friend, and was well acquainted with the principal events of his life. He is the same gentleman whom I have mentioned in vol. i. Letter 23.

3. Lobrede anf Herrn Albert Haller. Durch, V. B. Tscharner des Grossen Raths, &c. Bern, 1778. M. Tscharner, being a native of Bern, and an intimate acquaintance of Haller, his account deserves implicit credit. He was author of several esteemed works of the topography and history of Switzerland. He died in 1779, a short time after he had pronounced this panegyric on his deceased friend.

4. Eloge Historique d'Albert de Haller, avec un Catalogue de ses Ocuvres. Geneve, 1778. Sennebier, the writer of this culogium, is well known as the learned author of Bibliotheque de Geneve, and of Historic Litteraire de Geneve. He informs us, that he received several anecdotes from the family of

Many other panegyries and lives of Haller have been published in various parts of Europe; but as they were mostly written by those who were not personally acquainted with him, t have not cited them as authorities. His son mentions nineteen lives and panegyries of his father, that had fallen under his notice in 1784 — See Bibl. Schweit. Geshich. vol. ii. No. 882—906.—I have been enabled to add several anecdotes which I procured at Bern, and from his closest son the late bailiff of Nyon.

The completest list of Haller's works is to be found in the 6th volume of "Epistolæ ad Hallerum scriptæ." Bern, 1775. His subsequent publications may be supplied from Sennebier's catalogue

of this great edit may be hor was the i Balthasar, ic principal 3, Lobrede 1778. M. escryes imswitzerland, 4, 4, Elogomebier, the and of Hisie family of

ope; but as t cited them n under his to add seye-

d Hallerum catalogue He did not consider, that, during childhood, the principal object of education is to in fuse a taste for application in general; and, that when the base is rendered as broad as possible, it may always, like a pyramid, be reduced to a point. But neither his father's repeated exhortations, nor his preceptor's severe admonitions, could confine his studies to one object, or check his insatiable thirst for general information.

In this manner he was educated until 1721, when, on his father's death, he was removed to the public school at Bern. He was placed in a class far above his age; and usually wrote in Greek the exercise which he was expected to compose in the Latin tongue. In 1723 he obtained permission to accompany a young friend to Bienne, in order to be instructed in philosophy by the father of his companion, who was a celebrated physician. But his new preceptor being a bigot to the Cartesian school, Haller soon rejected with disdain that logic and philosophy, which tended to cramp his genius rather than extend his knowledge, and continued to cultivate history, poetry, and polite literature, but with as little order and method as might be expected from his years.

Haller, during his residence at Bienne, began a custom which he afterwards followed through life, that of writing his opinion of the books which he perused, and making large extracts fromthem. His genius being also awakened by the romantic scenery of the country to poetical enthusiasm, he composed various pieces in the epic, dramatic, and lyric styles. He was at this time so entirely absorbed in this favourite study, that, a fire breaking out in the bouse in which he resided, he rushed into his apartment, and rescued his poetry, leaving his other papers, with little regret, to the flames. When a more mature age had ripened his judgment, he was frequently heard to say, that he had preserved from the flames those compositions which he then thought the finest productions of human genius, in order at a future period to consign them to destruction as unworthy of his pen.*

In this period of life, Haller compares himself to a wild plant, which is left to grow without pruning: yet this very circumstance was probably the principal cause of his future proficiency, and the foundation of that universal knowledge, which he afterwards acquired.

He was originally intended for the law; but his active mind could not submit to follow a profession which would limit his inquiries; which entirely depended on precedent and authority; and which, to use his own quotation from Horace, in a letter to his friend Bonnet, obliged him,

Jurare in verba magistri.

And although he could not submit to the shackles of that narrow philosophy, so strongly recommended and enforced by his new preceptor, yet he appears to have been principally determined by his advice to dedicate himself to physic; the study of which comprehends such a variety of literary pursuits as seemed congenial to the zeal and activity

VOL. V.

^{*}Many of his biographers have confounded these two facts; and, from a natural proneness to exaggeration, have asserted, that at Bienne, Hailer, with a greatness of mind above his years, burned his poetical compositions, from a strong conviction that poetry tended to alienate his mind from the severer studies; whereas, the very centrary happened. He saved his poetical pieces in preference to his other papers, and burned them alterwards, because they would have disgraced his reputation; although as juvenile productions, they were not wholly without merit. I have in this instance preferred the authority of his particular friends, Balthasar and Tsenarmer, to his other biographics, who had not such opportunities of obtaining the truth. Besides, as a confirmation of their evidence, Hailer and not intermit his poetical studies; and wrote at Tubingen his Morgen-gedanken and Scha-Sucht, which are the earliest specimens he ever gave to the public.

of his capacious mind. He no sooner formed this resolution, than he adopted a more regular and uniform plan, than he had hitherto been able to pursue: he removed towards the end of 1723, to the university of Tubingen, where he prosecuted his studies, under the professors Camerarius and Du Vernoy, with that unwearied application which never forsook bim. From Camerarius he learned those sound principles of rational philosophy, which teach us first to doubt, and afterwards to believe, and which are equally removed from creduity and scepticism. From the lectures of Du Vernoy he i abibed his first taste for botany, and made so rapid a progress in the study of anatomy, that his master from several dissertations predicted his future proficiency. Notwithstanding his strong and invariable attachment to these two branches of natural history, he represents himself as studying, invita minerva, against nature; anatomy though he could not support offensive smells, and botany though he was extremely short-sighted. At Tubingen he also distinguished his knowledge in mineralogy by refuting the error of Tournefort, in ascribing to fossils a vegetating power.

During his continuance in that university, he gave an instance of controll over his passions; a difficult conquest for a young man of strong feelings and lively imagination. A single deviation into excess, into which he was harried by the example of some of his fellow-pupils, so greatly affected a person like him, no less commoured of virtue, than susceptible of ingenuous shame, that he instantly formed a resolution to abstain from wine, and adopted a strictness of morals, which renders highly probable the assertion of Condorcet, his French encomiast, that he was descended from a family in which

piety might be said to be hereditary.

In 1725, Haller repaired to Leyden, to which place he was drawn by the great reputation of Boerhaave. Here he found a more ample field for the improvement of his mind, and the display of his abilities. He became the favourite scholar of Boerhaave, by whose example and encouragement he strengthened his growing inclination for botany. He noted down his master's lectures on the Institutes of Medicine with such precision, as afterwards gave birth to one of his most useful publications. He continued his anatomical studies under Albinus, then rising into fame, and the venerable Ruysch, who so highly improved the art of injecting anatomical preparations. The precarious state of his health, probably occasioned or at least increased by his intense application, induced him to accompany two of his countrymen through part of Germany. On his return in 1726, he received his doctor's degree, though only in the nineteenth year of his age, and published on that occasion his inaugural dissertation de Ducta salivali Coschwiziano.

In 1727 he visited England, was favourably received by Cheselden, Douglas, and Sir Hans Sloane; and improved his knowledge of medicine and surgery under the auspices of those celebrated men. At Paris, whither he next directed his course, he studied botany under Geoffroy and Jussien; anatomy under Le Pran and Winslow, a celebrated surgeon. Winslow was indeed his favourite master, whom he proposed to his disciples as the best model for their imitation, as an anatomist, who, shaekled by no system, described simply and faithfully what he himself observed in his dissections.

Haller proposed to continue his travels to Italy, that country were medicinal know-ledge first revived in the darker ages, and where,

" Smit with the love of sacred song,"

he might indulge his enthusiasm and improve his taste in classical literature; but the uncertain state of his health, the maladie du pays which so remarkably affects the Swiss in foreign parts, at d on which he has composed a poem, together with the advice

of his friends, prevailed over his inclination, and induced him to return to his native city.

In his way to Bern he stopped at Basle, in order to study mathematics under the celebrated John Bernoulli; and in this, as well as in every other instance of his life, applied with such indefatigable perseverance, as if that science was the sole object of his future researches. His proficiency in these studies is sufficiently proved by several treatises still extant in manuscript on arithmetic and geometry, and particularly by his remarks on the marquis de PHospital's Analysis of Infinitesimals, and his attachment to them by his being deeply employed in a profound calculation on the day of his marriage.

But though he made such a progress as astonished Bernoulli himself, he continued his other pursuits, being appointed to read lectures on anatomy during the sickness of the professor. While he fulfilled the duties of that office, he also attended the lectures of Tzinger on the practical parts of medicine; thus at the same time displaying, with equal propriety, the dignity of a professor, and the humility of a pupil.

During the summer of 1729, he accompanied his friend John Gesner into the mountains of Switzerland; an excursion rendered memorable by its suggesting to him the plan of a Flora Helvetica, and by inspiring his poem on the Alps, which he composed in the twenty-first year of his age; a poem as sublime and immortal as the mountains which are the subject of his song.

Not long after his poem on the Alps, he wrote his ethic epistles, on the Imperfection of Human Virtue, on Superstition and Infidelity, on the Origin of Evil, on the Vanity of Honour, Various Satires, Doris, a Pastoral on his first wife, and his much admired Elegy on her death. It is a convincing proof of Haller's versatile genius and mental powers, that he so eminently excelled in poetry, which, except in his early youth, he never considered otherwise than as an amusement, either to soothe him under afflictions, and in the bed of sickness, or to console him for the envy and neglect of his contemporaries.

The soundest German critics | ce Haller among the most eminent of their poets; and consider sublimity as the grand characteristic of his writings. They acknowledge, that he improved the harmony and richness of his native tongue; that he possessed the highest powers of invention, and great originality both in his ideas and language; that he is the true colourist of nature; that he sounded the depths of metaphysical and moral science; that he equally excelled in picturesque descriptions, in soft and delightful imagery, in elevated sentiments, and philosophical precision. A my supercitious critics have reproached his poetry with occasional obscurities; and accuse him of introducing a new language affectedly differing from the common modes of diction. Cold criticism may censure; but twenty-two successive editions of his German poems, and the translation of them into the principal languages of Europe, prove, that they possess the great aim of poetry, that of pleasing and interesting the reader. And it may be remarked with truth, that although Haller's stupendous labours in crudition and science render his poetical talents of inferior account; yet had he confined himself to the muses, poetry alone would have immortalized his name.

It is time to accompany Haller to his native city, where he returned, in 1729, expecting from his countrymen the same respect and patronage, he had so liberally received abroad. But he had the mortification to experience that neglect and envy to which every man of genius is exposed in his own country, and which he seems to have augmented by his satirical compositions.

He continued three years without having the interest to procure any public employment; though he prevailed on government to establish an anatomical theatre, and gave

but the Swiss advice

tecture's gratis; yet he did not succeed in obtaining the place of physician to the hospital, which he much desired. He also solicited a professorship, and was repulsed. He too sensibly felt these disappointments, and expressed his impatience and indignation in his satirical poems, while he redoubled his application and services in order to force

himself into public notice.

The first distinguished tribute to his literary talents was paid by the royal society of Upsala, which, in 1735, chose him a member. This election was the prelude to more honourable and beneficial employments; in the same year his countrymen a length acknowledged his merit, by appointing him director of an hospital and public librarian. As director, he distinguished himself by his zeal and humanity; as librarian he bestowed great pains in arranging the books, and in forming the first catalogue. Scarcely any branch of literature, however remote from his usual occupations, was omitted by Haller, whenever an opportunity presented itself, either of improving his general knowledge, or of being useful to science. Finding in the public library a collection of ancient medals, which had been hitherto neglected, he took considerable pleasure in classing them. His love of history induced him to pay great attention to the study of medals, which he justly considered as the most authentic documents of historical truth, and the most certain monuments to ascertain the ever-fluctuating state of language.

His literary reputation began now to spread by various botanical, anatomical and medical publications, and by a collection of poems,* which first made its appearance

in 1732.

At length, in 1736, he received, unsolicited, the offer of the professorship of physic, botany, and surgery, in the university of Gottingen, newly established by George the Second. Notwithstanding all the advantages and honours which accompanied this offer, he, for some time, hesitated whether he should accept it. He had, in 1731, espoused a young lady of good family, whose great beauty and accomplishments were rendered still more endearing by her affectionate subservience to his manner of life. She had brought him three children, and these ties attached him more strongly to his native place where his merits procured him many sincere friends, and the air of which he considered as in some respect necessary for the preservation of his health. On the other hand, the honour of being invited by so great a monarch, the dignity of the establishment to which he was called, and the consideration of having a more ample theatre for the improvement of his knowledge, induced him to remove to Gottingen.

He quitted Bern with much regret; presaging the heavy stroke which overtook him soon after his arrival in that university; he lost his wife. The death of his beloved Marianne, whose memory he has celebrated in a pathetic clegy, afflicted him so deeply, that it almost brought him to the grave. In this crisis of despondency he redoubled his application, as the most probable means of subduing his sorrow, and the duties of his

station forced him from the contemplation of his own grief into public life.

During seventeen years, in which he resided at Gottingen, where his abilities expanded in proportion as his opportunities of acquiring knowledge increased; he obtained from government the establishment of a botanical garden, which he superintended; of an anatomical theatre, a school for midwifery, and a college for the improvement of surgery. He formed the plan for a royal society of sciences, of which he was appointed perpetual president.

The comprehensive mind and versatile genius of Haller, united with his unremitting diligence and ardour in all his pursuits, enabled him to cultivate with uncommon success a variety of knowledge. Had not the great Swede pre-occupied the field, Uniter

remitting mor sucld, Hader would have stood the first among his contemporaries as an improver of botany. Yet botany was not among his earliest pursuits: for he informs us, that he had made no advances in it until his return from his travels; during his residence at Basle, in the year 1728, as if inspired, he says, by the genius of that place, which had nurtured the Bauhins, and where at that period botany was successfully cultivated by Staehlin, he laid the design of his future Flora. From this time he made annual journeys into various parts of Switzerland, and principally among the Alps. He cultivated the correspondence of the most eminent botanists, particularly with Scheutzer, Ludwig, Linnæus, Van Royen, and Dr. John Gesner of Zurie, who also meditated a design to publish a Swiss Flora, and freely communicated his materials to Haller.

His establishment at Gottingen enlarged his views and opportunities; and at length, in 1742, his great botanical work on the plants of Switzerland, the result of fourteen years study, made its appearance. It was entitled, Enumeratio Methodica Stirpium Helvetiæ, in two volumes, folio, and was the most copious Flora ever published, comprising 1840 species. The preface contains a compendious description of Switzerland, particularly the Alps; on account of the authors who had written on the Swiss plants; the recital of his own journeys; acknowledgments to those who had assisted him; con-

cluding with the order and method which he pursued.

After the preface follows a chronological account of 268 volumes, cited in the work, each accompanied by a general character; in which, with great candour and impartiality, he points out the merit or demerit of the author, in the manner which heafterwards pursued in the Methodus Studii Medici, and in the Bibliotheca Medicinae. This is a very useful and entertaining part of his work, as it forms almost a history of the progress of the science from the time of Brunfelsius to his own. He next delineates his own system of botany, according to which the plants are disposed. Throughout this great work Haller is entirely an original, not satisfying himself with giving the descriptions of former writers, he appears every where to have described the plant himself, and to have formed new genera, and commonly new specifical characters for the whole, accommodated to his own system. He acquaints us, that it was his custom to write down the natutural characters of each plant on the day he discovered it.

In treating on each species he has not only added a most copious number of synonymes, but appears to have consulted all the old authors, extracted their synonymes with uncommon diligence and singular discrimination, and arranged them, as much as possible, in chronological order; a method highly worthy of imitation, as it exhibits, at one view, a brief history of the plant, by pointing out the first discoverer, and the regions of its growth. This, to the curious botanist, is a very meritorious part of Haller's labour. To each plant is subjoined a summary account, from the best writers, of the qualities and uses, both economical and medical. The work is embellished with plates

of some rare species, remarkable for their exactness and delicacy.

Having, in 1741, obtained from the king of Great Britain the establishment of the physic garden at Gottingen, Haller published the following year a catalogue of its plants; this was but a small volume, but the list served to show the diligence with which he fulfilled the intention of the royal founder. In 1753 he much enlarged it, and comprehended the plants spontaneously growing in the environs, especially those of the Black Forest. He informs us, that this volume was the production of a three months' vacation, and laments, that the importance of his other employments prevented him

^{*} I should not have presumed to give any detailed account of Haller's botanical, medical, or anatomical works, had I not received assistance on these subjects from my very judicious friend Dr. Pult ney.

from fulfilling his intention of describing the plants of Germany at large. This little work is curious, since it exemplifies his system as extended to exotics, of which the new and rare kinds are described; but the small size of the volume precluded the intro-

duction of the generical characters.

In 1745, he gratified the botanists by a new edition of the Flora Jenensis of Ruppius, and, that he might do justice to the work, he took a journey to Jena, where he gained access to the papers and hortus siecus of the author. He prefixed to this book anecdotes of this extraordinary man, and, by reforming and augmenting the whole from his own discoveries, he in some measure made it a Flora Germanica. These performances were by no mains the termination of his botanical labours. On his return to Switzerland he continued his discoveries in this branch of natural history; he also sent, at his own expense, persons properly qualified into the less frequented parts of the Alps.

The result appeared in a new edition of the Enumeratio, which was so much improved, that he considers it as a new work. It was published in three volumes, folio, in 1768, under the title of Historia Scirpium indigenarum Helvetiae, inchoata. The subject is arranged in his own method, with the alteration of inverting the order of the classes, beginning with the Compositie, or the Syngenesia class of Linnaus, and earling with the Cryptogamia, which stood first in the Enumeratio; both of which are objectionable, as subjecting the student to the most difficult parts of the system at his entrance on the study. Several interesting particulars of the former publication are also omitted in these volumes, of which curious botanists will much regret the loss; for, though he has inserted, with enlargement, the physical geography of Switzerland, together with the account of those authors who had previously investigated the plants of the country, and has recited his own excursions for that purpose; yet he has not introduced the critical catalogue of the authors, satisfying himself with giving a bare list of all the botanical writings, from the time of Theophrastus to 1768. It is still more to be regretted that Haller has suppressed in this edition a great number of synonymes under each plant, inserting only a few of later date; for although, in all possible instances he has introduced the synonymes of Linnæus, yet he has unfortunately for such as use the works of both, omitted the trivial names; a circumstance which renders his book much less useful to those who are conversant in the sexual system. Yet these defects are doubtless more than compensated, by the innumerable improvements made in the descriptions, both of the genera and species, by the great addition to the number of plants, which are extended from 1840 to 2486, of which more than 800 are of the Cryptogamia class; Haller having, after Micheli, beyond any of his contemporaries, enlarged the order of Fungi, of which, he tells us, he had paintings of more than 400 species made under his own inspection. It is not, however, surprising that Switzerland should produce a greater variety of vegetables than the middle parts of Europe; when we reflect that the Alpine situations afford growth to the plants of the arctic regions, and the warm vallies, to many of those common to southern. The value of this edition is much enhanced by enlarging the observations on the uses of plants; and by referring to his authorities for what is not his own, with his accustomed accuracy. As an accession to this work, it may be added, that the author has in the notes, under each genus, introduced the plants of Theophrastus and Dioscorides, in as many instances as they admit of being ascertained.

Few botanists have laboured more than Haller, and yet his discoveries in botany occupied only a comparatively small portion of his time. To such as feel not, in the fullest extent, that enthusiasm which the love of science inspires, it may appear a paradox to assert that the dissection of human bodies could be a pleasurable employment; yet Hal-

of being

ier, in 1742, pronounced a spirited enlogium, in the university of Gottingen, on the subject, and his zeal in the pursuit of anatomical discoveries was attended with uncommon success. He seems early to have apprehended, that the knowledge of the distribution of the arterial system had not kept pace with that of the bones, muscles, nerves, and viscera, which had been separately and ably treated by men of eminence. Haller, therefore, wished to illustrate more perfectly this part of the human frame, and gave to the world a more complete system on the subject than had yet appeared. He published the first part of this great work in 1743, and the last in 1756. His tracts on other parts of anatomy, when collected in 1768, formed three volumes in quarto. The curious reader may see an enumeration of his many discoveries in anatomy and physiology, at the head of the sixth volume of his Physiology: although some of these discoveries may have been contested by his contemporaries, yet his unalienable right to most of them, and the light particularly which he threw upon incubation, ossification, irratability, and several other parts of the animal economy, will unquestionably secure to him a large and honourable share of fame with posterity.

Haller's emoluments augmented as his merits were displayed; and honours flowed upon him from all quarters. He was elected in 1748 into the Royal Society of Stockholm, into that of London in 1749, and in 1754 chosen one of the eight foreign members in the Academy of Sciences at Paris. In 1739 he was appointed physician to George the Second, and king's connsellor in 1740. In 1749 the emperor Francis conferred on him letters of nobility at the request of George the Second, and about the same time the king, in a visit which he paid to the university, distinguished Haller with particular marks of approbation; an honour which the author gratefully acknowledges in an English publication, entitled, "A short Narrative of the king's Journey to Gottingen," and in the dedication to George the Second, prefixed to his edition of Boer-

haave's Methodus Studii Medici.

He declined, in 1745, an invitation to Oxford, which would probably have terminated in his nomination to the professorship of botany, vacant by the death of the celebrated Dillenius; a second from the university of Utrecht, and, in 1750, a third from the king of Prussia, with the offer of a very considerable pension.

But of all his promotions none gave him more real satisfaction than his election into the great council of Bern, as it insured to him a retreat with digrity, and probably with emolument, in his native city, to which he looked forward with ancetion and attachment.

At length, in 1753, induced by the precarious state of his health, by the desire of removing from Gottingen, which he called the grave of his wives, and by his earnest anxiety to dedicate the remainder of his days to the service of his country, he took a journey to Bern, in order to procure an establishment, which, though not adequate to his present appointments, might place him in the bosom of his beloved Switzerland. Soon after his arrival, he fortunately obtained by lot the office of Amman. Although this office was of small emolument, yet, as it might be considered a prelude to future appointments, and gave him an immediate opportunity of serving his children, he resigned his professorship at Gottingen, and settled at Bern. Such was the general joy of his countrymen on this event, that Morikosof struck a medal to commemorate his return.

Having formed this resolution, he could not be shaken by the most splendid offers. He declined, in 1755, the pressing invitation of Frederic the Second, to superintend the academies of Prussia, and to accept the chancellorship of the university of Hall, vacant by the death of Woiff. In 1767, he rejected the offer of a very advantageous and ho

nonrable settlement at St. Petersburgh, made by Catharine the Second, and, in 177n, the still more dignified promotion to the chancellorship of the university of Gottingen, with a very considerable appointment; although George the Third wrote not only to Haller but to the senate of Bern, requesting their influence to prevail on him to accept it.

His grateful country rewarded this disinterested attachment with the most liberal and imbounded confidence, and employed his talents in the public service. In 1757, he was sent to reform the academy of Lausanne, and in the following year was deputed by the senate to examine some curious remains of antiquity discovered at Culm. About the same time he was appointed director of the salt works at Bex and Aigle, with an annual salary of £500. During the term of this appointment, which continued six years, he resided at La Roche. In this retirement, he employed himself in superintending and improving the salt-works, of which he has given a short account; in making occasional excursions into the neighbouring country, which he has fikewise described; but more particularly distinguished his retreat by preparing and publishing his great work on physiology.

Notwithstanding the amplitude and success of Haller's labours in the various branches of medical knowledge, it was principally on physiology, which seems to have been his peculiar delight, that he displayed the whole force of his genius, and founded his merit as

an inventor in science.

His outlines of Physiology, or Primæ Lineæ Physiologicæ, published at Gottingen in 1747, delineate the plan, and were the prelude to his immortal work, which he modestly styles Elements only, or Elementa Pysiologiæ Corporis Humani, in eight volumes in quarto, which successively made their appearance from 1757 to 1766. In conformity to Boerhaave's plan, this part of the science of physic is emancipated from theoretical subtlety, from the shackles of metaphysical, mechanical, and chemical hypotheses, with which, for ages, it had been incumbered, and, for the first time, built on the true basis of anatomical science.

The exquisite knowledge which he has displayed in relation to the structure of the human body, his indefatigable researches into the discoveries and opinions of all his predecessors, the judicious selection of them to establish his own, his skill in comparative anatomy, and the application of the whole to illustrate the human frame, afford a

striking instance of learning, industry, penetration and genius.

On his return to Bern he was elected member of the chamber of appeal for the German district of the council of finances, of the committees for matrimonial affairs, and for improving the small livings in the French district of the canton; he was also appointed perpetual assessor of the council of Health, with an annual salary of about £100 as a token of his country's gratitude for having declined so many splendid offers from foreign courts, and for preferring his native place to the advancement of his fortune. In these several offices he performed essential services to the state by promoting the most useful institutions, proposing necessary alterations, and framing new laws and ordinances. In his capacity of assessor to the chamber of Health, he was particularly useful in forwarding the most important regulations; such as the prohibition of empirics, the recovery of drowned persons, and the means to prevent the spreading of the distemper then prevalent among the cattle in various parts of Europe.

He also shewed himself a friend to humanity, by the zeal with which he assisted in obtaining from government a public establishment for orphans, by his activity in providing a fund, and by drawing up the plan. As a member of the Economical Society, he laboured much to improve the state of agriculture, and made many experiments for

ost useful mees. In n forwarde recovery then pre-

assisted in in providociety, he iments for that purpose. In the meetings of the great council he delivered, on important occasions, his opinion with a manly freedom and lively coopience, the result of the soundest judgment and the most feeling heart.

In 1766 and the following years this great man, who had hitherto enlightened science from his closet, displayed in the theatre of public life the more active and distinguished parts of a patriot and politician. He re-established the harmony and settled the dispute between the Vallais and the canton of Bern by a successful negotiation, in which he fixed the boundaries of the two states; he was associated with the most enlightened characters of the republic in terminating the dissentions of Geneva; he drew up the principal dispatches to the court of Versailles on the subject of the changes projected at Versoi, on which occasion he held a personal conference with the French ambassa dor, and was employed to prepare the plan of a treaty between the canton of Bern and the elector of Bavaria, relating to the purchase of salt.

On the conclusion of these public employments Haller, who had now attained the sixty second year of his age, withdrew from the bustle of life, and lived in a retired manner, fulfilling the duties of a farther, a citizen, and a magistrate; and, although his health gradually declined, yet his activity was undiminished. He resumed his literary labours, which had been necessarily interrupted amidst his other more important avocations. He published, in 1768, his history of Swiss plants; and, in 1771, the first part

of his Bibliotheca Medicinæ.

No part of Haller's writings affords a more striking example of the value of early and persevering industry, than this publication. That habit which he formed so early as the eighteenth year of his age, of noting his opinion of books and authors, accumulated a considerable mass of materials, and thus enabled him afterwards to turn them to very useful purposes. By these means the foundation of his Medical Library was laid, even before he gave the improved edition of Boerhaave's Methodus Studii Medici, in 1751.

Boerhaave used to recommend to his students the books which they ought to consult on each subject; this catalogue was, in 1726, surreptitionsly and inaccurately printed, and formed only a small volume in octavo; many necessary observations were forgotten, and various authors both modern and ancient omitted. Haller undertook to supply these deficiencies; and extended the publication to two volumes in quarto. In order to appreciate the merits of his compilation, it is necessary to observe, that various lexicons and catalogues of medical authors were extant; but the writers had merely given bare lists and titles, unaccompanied by that critical discrimination of the design, doctrine, and general merit of each author, which rendered these volumes so highly acceptable. In this manner Haller has given, under that classical method which Boer haave recommended, his opinion of more than four thousand volumes.

In the extension of this plan, as it appears in his own Bibliotheca, Haller begins, by tracing the history of each branch of medicine from its origin through the preceding ages, and, by connecting the history of each in the several periods, has, in some measure,

made his publication a compendious history of physic.

His extensive knowledge of ancient and modern languages enabled him to comprehend a large field; his indefatigable industry, united to great penetration in investigating the doctrines of the ancients, equally exhibits his crudition, and that sound judgment by which he has appreciated the merit of those sages of physic, in a manner highly interesting and instructive. In his judgment of the moderns he is candid and impartial; his great knowledge of his subjects qualified him to distinguish all original doctrines, new facts and observations, and to guard against such errors as might mislead young and VOL. V.

constitues practitioners, who are too apt to be influenced by imbibed theories, and pre-

nadice towards particular authors.

He has given additional value to his work, by annexing to the account of celebrated books short biographical anecdotes of the authors. He mentions all the different editions that came to his knowledge, particularly marking such as were in his own library. And it is a matter of astonishment that, in this manner, he notices and reviews not fewer than 11,000 volumes. As the literary bistory of physic was among the favourite objects of Haller, this publication cannot but be highly acceptable to such as possess a congenial taste; while the general use and information it affords are sufficiently obvious. Eight volumes were published between the years 1771 and 1778. The anatomical, including the physiology, the botanical, and the chirurgical, were each comprised in two volumes, and bring down the respective subjects nearly to the present time. Two, on the practice of physic, were published by Haller himself, a third after his decease by Dr. Tribolet, and a fourth by Dr. Brandis of Childensheim, from the manuscript of Haller, which the learned editor has considerably augmented.

Haller employed the latter period of his life in sending extracts from eminent publications for the Bibliotheque Raisonnee; furnished many of the articles for the supplement to the Paris Encyclopedic, for the quarto improved edition of the same work publish d at Yverdun, and for the dictionary of natural history printed at the same place. It is meditated also a new edition of his great physiological work, of which he put forth the

first volume in 1777, only a few months before his death.

His active imagination brooding on the civil and political affairs in which he had been lately engaged, produced between 1771 and 1774, his three political romances, Usong, Affred, and Fabius and Cato, which treat of the despotic, monarchical, and republican governments. In Usong he sketches, with a masterly hand, the abuses of absolute authority, and sets forth, in the character of the principal personage, the happy effects which may be derived from a virtuous and intelligent sovereign, even amidst the horrors of oriental despotism. In Fabius and Cato he describes, with an animation and spirit worthy of ancient Rome, but with a partiality natural to a republican, the aristocratical government as most friendly to the display of patriotism, and most congenial to the exertions of genius. In Alfred he displays the advantages of a limited monarchy, wherein the balance of power is wisely distributed, and which, while it avoids the extremes of either, enjoys the benefits of both. In these romances he discovers sound principles of legislation, great political sagaeity, a deep insight into human nature, and an extensive acquaintance with history.

When we consider Haller as a man of piety and a Christian, we observe him tracing, from a comprehensive view of the creation in its grandest as well as in its minutest parts, the necessary existence of a Supreme Being, and the great principles of natural religion. We see him demonstrating the divine origin of Christianity from a profound study of the New Testament, from the excellence of its morality, its manifest influence over the happiness of mankind, and its tendency to meliorate our nature; we find him proving himself, both in his life and writings, a zealous friend and able advocate of the revealed doctrines.

Haller, at a very early period of his life, undertook the defence of natural and revealed religion. In 1732, in his preface to his poetry, he declared himself firmly convinced of their truth; in 1747 he rejected with horror the declared now hien La Metrie offered to prefix to his work entitled "L'Homme Machine," and he declared in various literary journals, that he neither acknowledged as his friend, or his disciple, a man who entertained such impious notions. In a preface which he published in 1751, to Formey's abridgment of Crouzza's "Examen du Pyrrhonisme," he paints in the strongest

Lolours, the dreadful effects of infidelity both on society and individuals. He put forth, in the German tongue, "Letters to his daughter on the Truth of the Christian Revelation;" he published an extract from Ditton's "Truth of the Resurrection of Jesus Christ," which he acknowledges to have first cleared any doubts he entertained on that subject. He avows, at the same time, that he received infinite satisfaction from the study of the New Testament, because he was never more certain of holding converse with the Deity, than when he read his will in that divine book.

In 1775, he finally gave to the public, also in the German language, "Letters concerning several late Attempts of Freethinkers yet fiving against Revelation." In this work the author examines and refutes the objections to Christianity, advanced in so lively and dangerous a manner by Voltaire in his Questions sur P Encyclopedie. "If this latter publication," adds Semebier, "may be considered as an Index to the Doubts and Arguments against the Christian Religion, the work of Haller may be entitled an Index to the answers in favour of the same Revelation, to be consulted by those who wish impartially to discuss both sides of this important question. When learning and philosophy, instead of being employed in supporting sceptical tenets by artful sophistry, thus lend their united assistance to the cause of religion, they truly become an honour

But even this great and good man was not exempt from a too anxious solitude for his welfare in a future state. That depression of spirits, which ought justly to be considered as the effects of disease, and the warmth of his imagination conspiring perhaps with the narrow principles of Calvinism, in which he had been educated, led him to reflect rather on the justice than the mercy of the Deity, and to bewilder himself in the endless mazes of predestination and grace. In one of his desponding fits, he compared himself to a man placed on the edge of a precipice without any support, and expecting every instant to fall. At another moment, animated with a passion for science, he breaks out, in a letter to his friend Bonnet, into an exclamation, expressive of his regret to quit a world which he had improved by his discoveries, and which he might still further illuminate by his zeal and application. "O my poor brain, which must return to dust; and all the knowledge and information which I have been collecting with such unwearied labour, will fade away like the dream of an infant."

These little weaknesses of a great mind, overpowered by constitutional irritability, and struggling against early prejudices, are more interesting to the man who feels and respects the imperfections of human nature, than the most pompous and exaggerated accounts of unerring wisdom, or uniform virtue. And it is a pleasing satisfaction to learn, that reason and religion rose superior to the gloomy despondency of sickness; and that Haller met death with the calmness of a philosopher, and the faith of a Christian. In a letter which he wrote, a few days before his decease, he speaks indeed of the tremendous grandeur of eternity, but with hope rather than with fear, and looks back upon his past life with satisfaction: amidst a few complaints uttered on his painful sufferings, he mentions his country with the most ardent affection, and offers up his last prayer for its preservation and welfare.

He continued his literary labours, and preserved his senses and composure to the moment of dissolution; he beheld his end approaching without fear and regret; "My friend," he said to the physician who attended him, "I die, my pulse is stopped," and then expired. He deceased on the twelfth of December 1777, in the seventieth year of his age.

Thus lived, and thus died, the great Haller; a man to whom Michaelis, the eminent orientalist, justly applies an observation on the genius of Aristotle; Neque caeloneque terra, neque mari quiequam relimpiere voluit incognitum, indole præterea adeo mirabili, ut ad singula natum præcipue dicas."*

In his person Haller was tall and majestic, of a serious and expressive countenance, he had at times an open smile, always a pleasing tone of voice, usually low, and seldom elevated, even when he was most agitated. He was fond of unbending himself in society, on those occasions was remarkably cheerful, polite, and attentive; he would converse with the ladies on fashions, modes of dress, and other trifles, with as much case as if he had never sceluded himself from the world.

Bonnet informed me, that Haller wrote with equal facility the German, French, and Latin tongues; that he was so well acquainted with all the European languages, except Russian, Polish, and Hungarian, as to speak with the natives in their respective idioms. When he conversed on any topic of literature, his knowledge appeared so extensive, that he seemed to have made that his particular study. His profound crudition in every branch of science, is well known to all who are conversant with his works; but the variety of his information, and the versatility of his talents, are thus delineated by a person† who was his particular friend. "He possessed a fundamental knowledge of natural history; was well read in history both ancient and modern, universal and particular; and uncommonly versed in the state of agriculture, manufactures, trade, population, literature, and languages of the respective nations of Europe; he had read with attention the most remarkable voyages and travels; and was particularly conversant in the late discoveries which tend to illustrate the geography of the globe. He had even perused many thousand novels and plays; and possessed such an astonishing memory, that he could detail their contents with the utmost precision."

As it was his custom to make extracts, and to give his opinion of every book which came into his hands, as well for his own private use, as for the Gottingen Review,‡ he read most new publications, and so eager was he usually in the perusal, that he laid them upon the table even when he was at dinner, occasionally looking into them, and marking those parts with a pencil, which he afterwards extracted or commented upon. He made his remarks on small pieces of paper, of different sizes, which he placed in

order, and fastened together; a method he learned from Leibnitz.

He derived from nature extreme sensibility, or rather irritability of temper, which is ever the child of genius. He spoke therefore from his own experience, when, in a letter to Voltaire, he thus expressed himself; "Providence holds with an equal hand the balance of human happiness. He has loaded you with riches, he has loaded you with glory; but misfortune was necessary, and he preserved the equilibrium by giving you sensibility. If my wishes could take effect, I would bestow upon you that tranquility which flies at the approach of genius, which is inferior to genius in relation to society, but far superior in regard to ourselves; then the most celebrated man in Europe would be also the most happy."

† Ticharner Lobrede, &c. p. 87.

Halter reviewed, as his department for that literary journal, all publications on history, medicine, anatomy, natural history, and several miscellaneous works, particularly those which appeared in Italy.

^{*} He left nothing unexplored, either in the heavens, or on the earth, or in the sea, and was of such a worderful capacity, that he seemed born for the immediate object of his pursuit.

[§] Il faut bien que la providence veuitle tenir la balance egale pour tous les humains. Elle vous a comble de biens, elle vous a comble de gloire; mais il vous-falloit du malheur, elle a trouve l'equilibre en vous rendant sensible. Si les soubaits avoient du pouvoir, j'ajouterois aux bienfaits du destin; je vous donnerois de la tranquillire qui suit devant le genie, qui ne le vant pas par rapport a la societe; mais qui vant bien davantage par rapport a nous-meme: des-lors l'homme le plus celebre de l' Europe feroit aussi le plus heureux.

He was impatient under sickness as well from extreme susceptibility, as because he was precluded from his literary occupations. He was fond, therefore, of taking violent remedies, more calculated to remove the immediate effects of pain, and to check his disorder, than to cure it radically. In his latter years he accustomed himself to opium,* which, operating as a temporary patiative, only increased his natural impatience. This restlessness of temper, which occasionally disturbed his tranquility even in his younger days, and in the full flow of his health and spirits, was considerably heightened by the advances of age, and the disorders which shattered his frame towards the close of his life.

His correspondence in every period of life was extensive, punctual, and carried on in the English, French, German, Latin, and Italian languages. Six volumes of Latin epistles, and three in the German tongue, addressed to him from men of learning in various parts of Europe, have been given to the public, but his own have never made their appearance. It is much to be limented, that he seldom preserved any copies; being himself too much occupied for that purpose, and never sufficiently rich to maintain a secretary. His two principal correspondents to whom he opened his heart, were Bonnet of Geneva, and John Gesner of Zuric; to Gesner he wrote either in German or Latin, to Bonnet in the French tongue. This celebrated friend of Haller possesses seven manuscript volumes of his letters; being an uninterrupted correspondence of twenty-three years; begun in March 1754, and finishing only a few days before his death, in December 1777. This epistolary commerce comprehends a great variety of subjects, principally concerning physiology, natural history, the structure of the globe, politics, morality, and religion. Haller being accustomed to consult his friend on all occasions, to disclose his most secret thoughts, and to relate his diurnal occupations; these effusions of the moment discover the successive train of his studies, the progress of his discoveries, and gradual advances in knowledge.

"These letters of my most respectable friend," added Bonnet, "display his genius, his understanding, and the goodness of his heart, more fully than any of his publications. His style, concise, energetic yet picturesque, corresponds with the strength and originality of his ideas; and be speaks with no less sublimity than conviction of the great truths of natural and revealed religion. Though he treats the numerous advocates for infidelity, and particularly Voltaire, with sufficient severity; yet his heat is the ardour of conviction, and did not proceed from either pique or spirit of contradiction; he seemed as if he was personally interested in all questions on revelation, and pleaded its cause as if it had been his own. He is no iess severe against those writers, who exclude the intervention of a first intellectual cause in the creation and arrangement of the universe, and particularly censures the materialists who endeavour to deduce mechanically the formation of organized bodies. In a word, his philosophy was entirely practical, because it was entirely Christian; and nothing secured his approbation, but what tended to im-

prove the understanding, or to amend the heart."

I am concerned to find, that the publication of this correspondence, between two such enlightened and virtuous philosophers as Hiller and Bonnet, which in some works had been amounted to the public, should, for private reasons, be relinquished. Religion, morality, philosophy, and learning, would be greatly benefitted by this epistolary commerce.

^{*} Zimmerman informs us, that he took daily so large a quantity as eight grains. Uelber de die Einsam keit p. 216. ed. Leips. 1784.

Haller's library, consisting of about 4,000 volumes, was purchased for 2,000l. by the emperor, for the public library of Milan, where I examined it in 1785. The collection is particularly rich in books of natural history, and is rendered invaluable from numerous

amotations of Haller, written on the margins.

Holler was three times married, first to Marianne Wytsen, in 1731, who died in 1736.

2. To Elizabeth Buchers, in 1733, who died in childbed the same or the following year; both natives of Bern. 5. In 1739, to Amelia Frederica Teichmeyer, a German hady, who survived him. He has written and published the lives of his two first wives He left eight children, four sons and four daughters, all of whom he lived to see established.

His cldest son, Gotlieb Emanuel, who was born in 1735, followed his father's example in dedicating himself to the service of his country, and to the pursuits of literature. He was elected member of the great council, and obtained various employments under government, particularly the bailliage of Nyon, in which situation he died in 1736. He distinguished himself as an author by various publications tending to illustrate the history and literature of Switzerland, and particularly by his Schweitzer-bibliothek, or Swiss Library, in 6 volumes 8vo. of which he lived to publish only the first. In this work, deservedly esteemed for method and accuracy, the indefatigable author animerates all the books which treat of Switzerland, in all languages, and all the works published by the Swiss on all subjects. He even descends to the minutest articles which have appeared in reviews and journals, and in most instances, where the publication deserves detail, analyses the contents, corrects the errors, and gives his opinion on the merits of the performance.

I was personally acquainted with the learned author, and am indebted to him for some curious information on Switzerland, and for several anecdotes relative to his illustrious

father, which I have introduced into these biographical memoirs.

LETTER LVIII.

M. Sprungli's collection of Swiss birds.... Of the Bearded Vulture.

M. SPRUNGLPS cabinet of natural history, is remarkable for the collection of stuffed birds, both local and migratory, that are found in Switzerland. In 1776 this collection consisted of two hundred specimens; and when I last visited Bern, in 1786,

had received an addition of fifty species.

One of the most remarkable birds in this collection, is the vultur barbatus of Linneus, the vultur aureus of Gesner, or bearded vulture of the English ornithologists. As many fabulous tales have been related concerning its uncommon strength and rapaciousness; as great confusion has arisen from the variety of names applied by different naturalists to the same bird, and as some travellers have doubted whether this specimen is the large vulture of the Alps, or the golden vulture of Conrad Gesner; I shall subjoin a description of some particulars principally communicated to me by M. Sprungli himself, accompanied with a drawing of the head of the natural size.

This specimen was a female bird, eaught in the canton of Glarus; it measured from the tip of the beak to the extremity of the tail, six feet six inches French* measure; and eight feet from the tip of one wing to that of the other expanded; it weighed when first taken, eleven pounds. This bird, though always called a vulture, yet differs from that genus, and is referable to the eagle, in having the head and neck co-

sured from * measure; it weighed are, yet difnd neck co-

nths.

vered with feathers, whereas one of the distinctions of the vulture, according to Linnaus, is that the head is destitute of feathers.

Notwithstanding this distinguishing mark, yet Linnæus was probably induced to class it with the vultures, from the general form of the body, and shape of the beak, which is the first essential characteristic in the genera of birds.

M. Sprungli, however, is of opinion, that it might be classed between the vulture and the eagle; and Stor* proposes to form a new genus of it, under the name of Gypaetus, by the following characters:

Rostrum rectum, basi cera instructum setis porrectis confertissimis barbatum: apiec auctum unco sulcato.

Caput pennis tectum.

The specific character he would define thus:

Gypactus (grandis) albido-rutilus dorso fuscus, tænia nigra supra et infra oculos.

It inhabits the highest parts of the great chain of Alps which separates Switzerland from Italy, forms its nest in clefts of rocks inaccessible to man, and usually produces three young ones at a time, sometimes four, if we may judge from those which accompany the old birds, when they descend into the lower regions for prey. They live on animals which inhabit the Alps, such as the chamois, white hares, marmots, snow hens, kids, and particularly lambs, from which circumstance it is called lammer-geyer, or lamb vulture.

If common report may be credited, this rapacious creature sometimes attacks even man and carries off children. M. Sprungli, without absolutely denying the possibility of this account, has, notwithstanding all his researches, never been able to ascertain a well authenticated instance; and thence rather concludes it a fable invented by the peasants to frighten their children. This species does not appear but in small companies, usually consisting of the two old birds and their young.

Conrad Gesner has given a short but accurate description of this bird under the name of vultur aureus, or gold-geyer;† and an engraving from a skin sent to him from the Grisons. The figure though rudely executed, yet exhibits with sufficient accuracy the distinguishing characters of the species and genus such as the configuration of the beak, the legs feathered down to the claws, and particularly the beard. In fine a comparison with the specimen in Sprungli's collection evidently proves it to be the same bird.

Since this great naturalist, no other person seems to have described it from nature, except Edwards under the denomination of the bearded vulture. The description of that bird, and the engraving‡ from a specimen sent from Santa Cruz in Barbary, correspond exactly with the vultur barbatus of Sprungli; and the head, if compared with the drawing annexed to this account, will be found to answer sufficiently.

Sprungli also favoured me with the following remarks, in answer to those travellers who assert, that his specimen is not the large vulture of the Alps, sometimes called, from its yellowish plumage, the vautour jaune, but a smaller species; because the larger sort measures occasionally fourteen feet, or more, from the tip of one wing to that of the other. He possesses two specimens of this bird; the one a full grown female, from which my description and drawing are taken, measuring eight French feet: the other a male, but young, and somewhat less. He has examined four specimens, neither of which measured more than nine feet; but as these specimens were not full grown males,

he is ready to allow that an instance or two may possibly have occurred, in which this bird measured near twelve feet from tip to tip of the wings. Those who give it a greater expansion, have derived their information either from persons who were not naturalists or from uncertain and exaggerated reports. The same remark may also be applied to the labulous stories recorded by the peasants, concerning its wonderful strength as well as size. It is likewise to be observed, that the peasants do not confine the name of lammer-gever to this species; but extend it indiscriminately to several large birds of prey, from whence has arisen great confusion of names, and much uncertainty in the accounts

Some ornithologists seem to have formed of it several species, which on comparison will appear to be the same, or only varieties of the same species. Thus the bearded vulture, the cinercous vulture, and the fulvous vulture, which Mr. Latham has deseribed as three different species, are probably the same bird as that in this collection. Of the first there can be no doubt, since Mr. Latham refers to the bearded vulture of Edwards, which I have shown to be that of Sprungli. The cinercous vulture is described by Latham after Brisson: "Beneath the throat hangs a kind of beard, composed of very narrow feathers like hairs; legs covered with feathers quite to the toes, which are yellow; claws black."* This description accords with the bird in question, and particularly in the beard, which is the distinguishing characteristic. The fulvous vulture of Latham is the griffin of Buffon, and the Freuch naturalist doubts whether it is not a variety of Gesner's golden vulture, which is proved to be the same as Sprungli's

While the most celebrated ornithologists have thus given to the bird different names, they have also in other instances confounded it with other birds, to which it has no other

resemblance than size, strength, and voracity.

Thus Buffon erroneously conjectures the vultur gryphus of Linnæus, or the condort of America, to be the same as the lammer-geyer, or vulture of the Alps; whereas the description of the condor given by Linnæus, as well as by those who had seen it, differs entirely from that of the bearded vulture. The condor is described by the Swede as having "the head destitute of feathers, but covered with a slight brown coloured down, with a comb reaching along the top of the head, and having the throat naked and of a reddish colour." Frezier, in his Voyage to the South Seas, also thus describes the condor: "We one day killed a bird of prey called a condor, which was nine feet from the end of one wing to the end of the other, and had a brown comb or crest, but not jagged like a cock's; the fore part of its throat is red without feathers, like a turkey, and they are generally large and strong enough to take up a lamb. In order to get them from the flock, they draw themselves into a circle and advance towards them with their wings extended, that being drove together and too close, they may not be able to defend themselves; then they pick them out and carry them off." Gracilasso says, "there are some in Peru sixteen feet from the point of one wing to the other, and that a certain nation of Indians adored

Mr. Latham seems also to be no less mistaken, when on the authority of the translator of the abbe Fortis's Travels into Dalmatia, he conceives the vultur perenopterus of

* Syn. vol. i. p. 14.

[†] Mr. Latham, in his Supplement of the General Synopsis of Birds, p. 1, seems also to adopt the conjecture of Buffon, in classing the Laumer-geyer and Condor under the same species; though he conlesses, "that it still remains dubious, whether the Lammer-geyer be the same with the Condour, or a mere variety of the Bearded vulture." He aids also, with a candour which does him honour, "It is much to be feared, that other authors as well as myself, have greatly confounded the species of Vultures, for being like the folcon tribe, long lived, their plumage puts on a great variety of dress, sufficient to deceive those who have hitherto attempted to discriminate them."

Linnaeus to be the vautour des Alpes described by Conrad Gesner, and the same as Sprungli's specimen; whereas on the authority of Hasselquist, who saw great numbers of the percuopteri in Egypt, the head of that bird is "naked and wrinkled;" and Ray says, the feet are naked; two characters that essentially distinguish it from the bearded vulture, in which the head is wholly covered with feathers, and also the feet down to the ends of the claws.

The bearded vulture not only inhabits those Alps which separate Italy from Switzer land, but is also found in Corsica and Sardinia. De Halm informed Sprungli, that he saw a bird in Corsica which was wounded in the wing, and was unquestionably of the same species as the stuffed specimen: and Lettel, in his Natural History of Sardinia, gives a figure and description of the same bird, under the name of bartgeyer, or bearded vulture. It has also been found in the mountains of Africa; for Mr. Edwards received his specimen from Santa Cruz in Barbary, and frequently on Caneasus and the mountains of Dauria, or the south-eastern part of Siberia, as we learn from the travels of both Pallas and Gmelin.

I was surprised not to find among the Swiss birds in the eatalogue, the aigle Blane, or aquila alba of * Brisson; the falco Italieus,† and the falco montanus of the same;‡ as particularly zwitzer-fale, the German name of the latter, seems necessarily to imply that it must be a Swiss bird; Sprungli, however, assured me, that he never had been able to discover any of these species in the Alps; that probably the aigle Blane, if it exists, is a variety of the chrysactos; and that both Brisson and Willoughby do not cite Gesner for their descriptions of the falco italieus, but the authority of those writers only who have never been in the Alps.

Of the crows it is worthy of observation, that the corvus graculus of Linnaus, or coracias of Brisson, is faithfully represented by Pennant, in his British Zoology, under the denomination of the red-legged crow. It is the same bird of which Conrad Gesnerý has given a figure, and to which he applies the German appellations, taha, steintahen, steinkrae, and which he justly suspects to be the cornix cornubiae, or red-legged crow. The pyrrhocorax of Gesner, which some ornithologists seem to have confounded with the corvus graculous, is, however, very different, and called by Linnaus corvus pyrrhocorax. Both these species inhabit the Alps, but the pyrrhocorax is the most common; and these appear, according to Sprungli's observations, to be the only species of the crow that prefer Alpine situations. As to the corvus cremita of Linnaus, Sprungli acknowledges it is totally unknown to him. All the ornithologists indeed mention this bird as an inhabitant of the Alps, on the authority of Conrad Gesner, who describes it under the name of corvus sylvaticus, accompanied with a figure, which has not the least resemblance to a crow, but rather to a curtew; yet Gesner's description of it is much too imperfect to assist us in ascertaining the bird of which he treats.

LETTER LIX.

M. Wyttenbach's Collection....Account of the Chain of Hills and Alps seen from the environs of Bern

THE reverend Mr. Wyttenbach of Bern possesses a very carious cabinet, principally relating to the natural history of Switzerland, and of this canton in particular. It contains specimens of several thousand plants, among which is a large number of the Alpine

plants of Switte (land; and he has already begun to arrange the capsules, seeds, and

fimits.

It is still more interesting for the great variety of fossils, stones, and petrifactions collected by himself in the neighbourhood of Bern, and from the upper and lower Alps. M. Wyttenbach also possesses various shells, insects, and numerous drawings of the glaciers and upper Alps. But I was most struck with that part of his cabinet, comprehending those objects of natural history, which in any degree influence agriculture, physic, arts, and trades, and which sufficiently prove the utility of that science in the progress and improvement of human comfort and knowledge. On this subject he has already published a dissertation in the acts of the œconomical society at Bern.

He has not formed this ample collection from mere motives of curiosity, or from desultory views; but with a settled intention to illustrate the natural history of Switzerland in general, to form a typographical and mineralogical description of this canton in particular and to clucidate the original formation of mountains which is the favourite object of his researches, and which his frequent visits to the Alps will enable him to

execute with fidelity and accuracy.

At my request, this indefatigable observer favoured me with a plan and description of that range of Alps which is seen from Bern, and of the intervening district; an ex-

tract of which I submit to your perusal.

That part of the chain of Alps seen from Bern distinguished by the different names of Wetterhorn, Schreckhorn, Eger, Jungfrauhorn, Lauter-Aar-horn, Blumlis Alp, &c. is represented on the plan annexed to this letter. You will there observe this immense amphitheatre, gradually rising from the environs of Bern, to elevated peaks, covered with

eternal snow, and hitherto inaccessible.

The plains and hills between Bern and Thun, are composed of rounded stones, and argillaceous stones called molasses, frequently ranged in alternate strata. The molasse at Gurten, about two miles from Bern, contains though rarely, glossopetræ; and the strata of Belpberg, about seven or eight miles from the capital, are full of different species of chamites, ostracites, globosites, selenites, strombites, and other similar petrifactions.

The ridge of hills which borders the high road between Bern and Thun contains in several places, and particularly above Musingen, an extensive strata of ostracites, some pieces of which weigh more than fifteen pounds each. The situation of the strata in these different hills, their direction, their nature, and the bodies which they enclose seem to prove, that these hills formed anciently one great plain, which has been since hollowed

and divided by the waters, particularly by those of the Aar.

On the slopes and summits, which in some places are of considerable clevation are frequently found those large masses of granite, that are used for the public works and buildings of Bern. These masses so nearly resemble the granite of the Grimsel, and of the mountains which compose the great central chain of the Alps, as to render it probable, that in the ancient revolutions of the globe, they have been brought by the waters to the places where they are at present found, before the deep vallies, which now separate them from their original mountains, existed. The same remark may be as justly applied to the blocks of marble and other calcarcous stones, which though now removed to a considerable distance from their native situation, are also discovered in large quantities upon the hills adjacent to Bern, and likewise serve for the buildings of that capital.

As we approach the town and lake of Thun, the view opens, and discovers, towards the south-east, that high calcareous chain, of which the Stockhorn, the Neuneren, and

the Garacush rave been illustrated by the botanical labours of the celebrated Haller. This chain which joins that of Schwartzenburg towards the canton of Friburgh, i chiefly calcarcous, and contains fewer petrifactions than the above mentioned hills; ich not of sufficient elevation to be covered with snow in summer.

The Niefs, which is the last mountain in this calcareous chain, stands on the border of the lake, and separates the valley of Frutingen from that of Simme; it is peculiarly interesting to travellers, on account of the fine view from its summit; and to naturalists, because it joins to the Alps. Towards its foot beds of slate have been discovered, higher up it is of calcarcous stone, and near its top is found a species of pudding-stone, filled

with small fragments of petrifactions.

In traversing the lake of Thun, the borders, which are planted with vines, are composed of rounded stones, united by a calcarcous cement, as far as the mountains of St. Beat. There, near Rallingen, the rocks are calcarcous and rugged, containing in a few places broken petrifactions, of which it is often difficult to ascertain the species. On continuing my route at the foot of the St. Beat, I observed the first rocks that are absolutely perpendicular, and even impending, and which are marked at different elevation-with furrows, occasioned by the waters of the lake that, in former periods, was probably several hundred feet above its present level. I remarked the same furrows nearly at the same elevations, in the vallies of Lauterbrunnen and Hasli, which coincidence seems to prove, that the lake of Thun once extended over all these parts, covered the whole plain of Bern, and reached as high as the Lengenberg, where Gruner discovered those petrifactions called Pholades.

Having traversed the lake of Thun, I entered the narrow but agreeable valley of Unterseven and Interlachen, on each side of which the mountains approach each other, and form, if I may so express myself, the vestibule of the Alps. The valley separating the lakes of Thun and Brientz, which appear to have been once united, is entirely formed by stones brought by torrents from the Alps. On the right is Abendberg, covered with trees and herbage, and stretching towards a group of mountains of considerable extent,

yet little known, though their tops may be seen at Bern.

The Ballenhoechst, Sulek, Schnabelhorn, Schwartzberg, Schwalmern, Schilthorn, Kirchfluh, Latreyenfirst, and Dreyspitz, are the most remarkable mountains in this group, which on one side borders the valley of Lauterbrunnen, and on the other towers opposite to the Neiss, at the commencement of the valley of Frutingen. It is united by means of the Schinen Alps with the Dents Rouges, and the great central chain of granitical mountains. The mountains of this group stand on a base of argillaceous schistus, containing a few petrifactions, which is rarely visible but at certain elevations. Towards Lauterbrunnen particularly a fine-grained calcareous stone abounds.

To return to the valley of Unterseven. On the left is another group of calcareous mountains, extending along the lake of Brientz towards Hasli, and standing also on an argillaceous schistus, which is but rarely visible. And though the granitical chain is at a very small distance, it is, however, so entirely concealed by these secondary mountains, as to be nowhere discovered, except between Unterseven and Interlachen, where

the Jungfrau presents herself in all her majesty.

From these delightful plains I attempted to penetrate towards the granitical chain of Alps through narrow vallies enclosed between perpendicular rocks of an enormous height; but every where I met with secondary mountains, which, to a considerable elevation, conceal the primitive bed of granite, and render the approach to it extremely dangerous, if not impracticable. Thus the valley of Lauterbrunnen is berdered by calcareous rocks even to its farther extremity. At Sichellauenen the first masses of

towards ren, and grante appear, toeming the base of the calcareous rocks, which are of a very great neight. Continuing my route towards the chain, which stretches from the Jungfrau to the Grosshorn and Breithorn, I observed a rock of steatite, in which some veins of lead have occurred and worked at Hohalp.—Higher up is the true granitical chain, which,

however, even there is frequently covered with calcarcous peaks.

I found the approach to this chain less difficult at Wengenalp, the last of a group of alcarcous and schistous mountains between Lanterbrunnen and Grindelwald, which there joins the Jungfran, the summits whereof appear to be granite. In the valley of Grindelwald I observed only the argillaceous schistus and calcarcous stone; the external parts of the Eger, of the Mettenberg, and of the Wetterborn, are chiefly calcarcous, and cover the granite of the central chain, and the only pieces of granite are the fragments brought into the valley by the two glaciers. That chain, which is opposite to these glaciers, and borders the northern side of the valley of Grindelwald, has an argillaceous base, which, in several places, particularly towards Hasli, contains cornua ammones, and is covered with calcarcous rocks, through which it often penetrates at different heights.

I will now take a nearer view of the primitive chain, and trace the Alps in the same order as they are marked upon the annexed plan. I shall consider the Jungfrau as the centre, from which I will ake my departure on one side towards the Gemmi, and on

the other towards the Schreckhorn, Wetterhorn, and Grimsel.

The Jungfiau, or Virgin, is one of the highest and most beautiful mountains in the canton of Bern. The gratite does not appear till a very considerable elevation; its foot being in most parts covered by rocks, which are of calcarcous stone, called by the natives Staldenfluh, of which an elevated peak is denominated the Monk. On following these rocks to Siehellauiren, about two leagues from Lauterbrunnen, I observed a red stratum, that seems to form the separation between the granite and the calcarcous substance; it is composed of an argillaceous slate, spotted with brown and green, and of a fine grained iron ore (as I was surprised to find) containing anomites. I observed the same stratum at the bottom of the Eger and Wetterhorn, and of several mountains towards Hash; I remarked it at different heights; but as all access to them has been hitherto found impracticable, I cannot attempt to explain a phenomenon which merits a nearer investigation.

The chain of the Jungfran stretches to the right by those inaccessible peaks called the Gletscherhorn, Ebenfluh, Mittaghorn, Grosshorn, Breithorn. I am entirely unacquainted with their structure, except from the fragments, which I have observed at their feet, or on the masses of ice descending from their tops. Limestone occurs at very considerable heights; particularly white marble, and a fine gray marble, which is the matrix of a red hematite filled with immunerable small crystals of iron of an octagon figure, and attractable by the magnet. Besides these stones I noticed on the glaciers of Breitlauinen and Breithorn, various species of granite, both foliated and in blocks, of iron-stone, of saxum fornacum, or stelstein, and of argillaceous and micaceous schistus. All these fragments sufficiently prove that granite prevails in the higher parts, although it is fre-

quently covered with secondary mountains.

To the right is the majestic Blumlis Alp, which is a fine object from the plains; a large glacier mentioned by no author stretches at its feet. I first noticed it from the opposite heights of Oefchenengrat, and at the same time observed, that the feet of the Alpschelenhorn and Blumlis Alp are covered with black schistus, and that the granite is not apparent, but at a considerable height.

ains; a on the of the ranite is

A few days after this expedition, I mounted to the summit of the glacier, called by the peasants Gamehigletcher, where it forms a very steep ridge towards the valley of Lanterbrunnen. From thence I heald the vast amphitheatre of the Lanterbrunnen glaciers; I remarked also, that the valley of Lanterbrunnen ends at this place; that in has only one issue behind Blumlis Alp, where a large glacier, with a plain and unbroken surface, stretches towards the valley of Gaster. Here then is the extremity of the valley of Lauterbrunnen, which expands at the feet of the Eger and the Jungfran, continues almost in a straight line as far as Sich-dlauinen to the foot of the Gletcherhorn and of the glacier of Stuffistein, where it forms an angle, and bends towards Blumlis Alp.

The ridge of the glacier of Gamehi is of a black calcareous stone, which, in many places, is of a fine texture, and splits into lamina of a rhomboidal form; in other parts it is coarsely granulated, containing white and black spar. The sides of the Blumlis Alphordering the glacier are black slate, in which I found several balemnites, and a fragment of a cornu ammonis, a foot in diameter. The pieces of granite which are discovered upon the glacier, and which most probably fell from the summits of the Blumlis Alp and of the Dents Rouges, is very similar to that granite, containing veins of lead, near Sichellauinen in the valley of Lauterbrunnen.

The granitical chain which extends on the right by the Alpsehelenhorn and the Altits, is entirely concealed and lost in Mount Gemmi, where only calcarcous stone and slate are discovered. As I have not yet had any opportunity to examine the mountains of Simmenthol and of Gessenay, I cannot inform you, if the granite appears through their calcarcous covering.

But let us return to the Jungfrau, and trace the mountains towards Grindelwald and the Grimsel. The two high pyramids which tower near the Jungfrau are the two Egers, called from their position exterior and interior. Calcarcous stone is visible to a great height; many persons indeed pretend, that the whole side of the exterior Eger towards Grindelwald is entirely calcarcous; but I am convinced, from repeated observations, that the substance of these mountains is granite, though it is covered with calcarcous stone lying on reddish slate, which in many places forms a species of brescia, composed of an argillaceous base, covered with calcarcous fragments. You observe behind the exterior Eger two small peaks which seem united by a ridge; these are the Viescherhorn and the Zesenberg, which overlook the inferior glacier of Grindelwald. The stones that have fallen on the glacier shew, that their summits, as well as that of the Schreekhorn, are of granite in blocks, veined granite, and other lamellatedrocks, which frequent ly contain great steatites, amianthus, and crystals of quartz.

The high peak which appears to stand near the Zesenberg is at a very considerable distance, and probably separated from it by large vallies of ice. This peak, which has hitherto escaped the mention of travellers, seems to be the Finster Aar-horn, and can only be approached from the Grimsel, or by traversing the glacier of the Aar. I have seen it from the summits of the St. Gothard, from one of the heights which separate the valley of Grindelwald from the lake of Brientz; I have been at its foot upon the glacier of the Finster-Aar; on all sides, and in all places, its elevation is stupendous, and appears to me to exceed even that of the Schreckhorn, which has been hitherto considered as the highest.*

* This conjecture of M. Wyttenbach is confirmed by actual measurement taken geometrically by Traffes

	Heig	ght of			s in the canton of	Bern:

The Schreckhorn, or peak of terror, rises between the two glaciers of Grindelwald Concealed by its base, the Mettenberg, it is not seen from the valley of Grindelwald, and the rugged paths which lead across the superior glacier to its foot are extremely difficult and dangerous; part of it is observed from that glacier. The tops of the Mettenberg are of granite, and the lower parts of lumellated rock, blended with mich and quartz. The piked summits of the Schreckhorn, which rise to an enormous height, appear to be of pure granite and other primitive stones.

The next in this chain is the Wetterhorn, or Stormy Peak, whose perpendidar sides border the superior glacier. The exterior part of this mountain is of calcarcons stone to a very considerable elevation, but the summits are undoubtedly of primitive rock. I noticed along the sides the same red stratum, which makes its appearance on the Eger and at the foot of the Jungfran. Behind the Wetterhorn is seen an elevated rock, which is said by the inhabitants of Grindelwald to border the glacier of the Lauteraar, and

which from thence has been ascended by several chasseurs.

Examining the stones brought down by the superior glacier, I did not discover much granite in mass, but often veined granite, and lamellated rock, which frequently enclose pieces of the corneus spathosus mixed with steatites, pyrites, and quartz. The foot of the Wetterhorn and that of the Mettenberg contains, in several places, a fine species of white marble, with red, green, and yellow veins; a quarry of which, now covered by the inferior glacier, was formerly worked.

In passing from Grindelwald to Meyringen I traversed the Scheidek, which stands on the foot of the Wetterhorn, and entirely consists of black slate; this slate continues to compose the chain that divides Grindelwald from the plains of Hasli and the lake of

Brientz

Descending the Scheidek I observed, on my right hand, the chain that joins the Wetterhorn and runs towards the Grimsel. As I have not particularly examined this chain, I shall only remark in general, that from an investigation of the stones and fragments which strew the vallies and sides of the hills, it appears to contain the same species of marble which I found on the superior glacier of Grindelwald, also red slate, argillaceous brescia, and various granites. But this much is certain, that the front of these mountains is entirely concealed by secondary substances, and that the true region of granite was not apparent, until I had passed Meyringen and ascended the Grimsel, during the greater part of which ascent I only noticed lamellated rocks and granite. All the mountains which form the Grimsel and the neighbouring chain are concealed in my plan by the Wetterhorn; they extend behind the Schreckhorn as far as the Finster-aar-horn. This is the true region of granite and other primitive rocks, the heart of the central chain, and the great observatory of the naturalist.

LETTER LX.

Excursion to Thun, Worke, and Hindelbank Tomb of Madame Langhans.

THE environs of Bern are in general extremely delightful, and no road exhibits a more pleasing variety of hill and date than that which leads to Thun. It runs through an agreeable country, winds through fertile meadows, enriched with dark forests of pine and fir, and occasional groves of beech and oak; the eattle, lately descended from the Alps, were browning on the pastures, and added to the animation of the scenery. The well-being of the inhabitants is visible from the cultivation of the grounds, and from the number and neatness of the cottages and farm-houses which are scattered about the fields, skirted by trees, or half concealed amid tufts of wood.

Thun is distant about twelve miles from Bern; * it occupies the bottom and brow of a hill, and stretches on both sides of the Aar; it contains twelve hundred souls, enjoys considerable immunities, has its own magistrates and courts of justice, in which the bailiff from Bern always presides, and from whose decision an appeal lies to the capital. The inhabitants employ themselves in earding and spinning silk for the manufactures of

Basle; some of the burghers possess large herds of cattle.

To the north-east stand, on an eminence, the church, and the eastle which is the residence of the bailiff and occupies the highest point. From its windows I enjoyed a most pleasing and extensive view, not inferior in its kind to any prospect in Switzerland. Underneath is the town, occupying both sides of the Aar, standing in a rich plain of pasture, and bounded by a chain of hills, black with forests of fir, which extend from Bern and join the Niess, a brown and rugged mountain, that rises rapidly from the edge of the lake. To the east a small ridge covered with vines and trees; and to the south-east part of the lake of Thun, bounded by hills rising to the mountains and Alps of Lauter-brunnen and Grindelwald, "piled up to the clouds."

The Aar flows from the lake between two level promontories prettily sprinkled with trees, on one of which stands the eastle of Schadan. The lower parts of this view contrasted with the rugged rocks and mountains, resemble a painting of Claude by the side

of a Salvator Rosa.

From Thun I returned about six miles to the village of Massie, where I quitted the high road, and passed through pleasant thickets of beech and oak, over fields and inclosures; the cottages and hamlets agreeably situated in lawns and amid clumps of trees. In about an hour and a half I entered the road which leads from Bern to Langenau, and ascending to the upper part of the village of Worbe, passed an agreeable day with an amiable family, who favoured me with a most cordial and polite reception. The view from their house, which stands in the midst of a field, is not inferior to that from the castle of Thun; it commands a rich inclosed and well-wooded country, gently broken into hill and dale, and watered by many lively streams; the huge white peaks of the Jungfrauhorn, Schreckhorn, and Wetterhorn, overtopping a hill embrowned with firs.

I made also an excursion to Hindelbank, a village about four miles from Bern, in order to examine the tomb of Madame Laughans, a most celebrated work of Nahl, a Saxon sculptor. Being employed in constructing a sepulchre for count d'Erlach, he was lodged in the house of the elergyman, his particular friend, whose wife, a woman

^{*} Musingen, midway between Bern and Thun, is rendered memorable in the unhappy fate of this country, by the assassination of general d'Erlach, commander of the Bernese army, and lord of Hisdelbank. See the Introduction.

of uncommon hearty, expired in child-bed on Easter-eve. Struck with the time of her death, animated by the recollection of her beauty, sympathising with the affinion of her husband, he conceived and finished this affecting monument. It is placed in be body of the church, sunk into the pavement like a grave, and covered with two folding-doors. When these are opened a grave-stone appears as if just rent into three fractures, through which is half discovered the figure of a woman slightly veiled with a shroud. She is represented at the moment of the resurrection, when "the graves are commanded to yield up the dead;" her right hand is gently raising that portion of the broken stone which lies over her head; and the other holds a naked infant struggling with its little hands to release itself from the tomb. "Here am I, Lord, and the child whom thou gavest me," are the sublime words which form the inscription. Below is the name of the deceased, "Anna Magdalena Langhans, wife of the elergyman. Born 1723; died 1751." The workmanship is by no means inferior to the original design; the artist has formed the whole sepalchre out of one block, and so naturally expressed the swelling of the stone, that the fragments seem as if they had just burst, and were in the act of opening. The only circumstance to be regretted is, that the materials are not so durable as such a monument descrives; being of sand stone, they are too soft to resist the effects of time, and even now exhibit some symptoms of decay.

Nothing perhaps can more strongly display the superior effect of simplicity over magnificatee, than the comparison of this tomb with the mausoleum of count d'Erlach in the same church. The mausoleum consisting of several marble figures, executed in a masterly style, and loaded with all the emblems of rank and opulence, scarcely attracts a momentary attention; while this simple grave stone "speaks home" to every heart

of taste and feeling.

LETTER LXI.

Visit to Michael Schuppach, the Physician of Langenau.

Langenau, September 18.

YOU have heard perhaps of Michael Schuppach, the famous Swiss doctor; of whose sagacity in discovering the seat of disorders, and applying suitable remedies, many wonderful stories are recounted; and which, like Virgil's Progress of Fame, have increased in the marvellous in proportion as they receded from the scene of action. I am now lodged in the house of this celebrated Æsculapins: it is situated above the village of Langenau, on the side of a steep acclivity; from which circumstance he is generally styled the physician of the mountain.

On our arrival we found the Doctor in his apartment, surrounded by several peasants, who were consulting him; each having brought with him a small bottle, containing some of his water; for, by inspecting the urine, this medical sage pretends to judge of the patient's case. His figure is extremely corpulent; he has a penetrating eye, and a good humoured countenance. He seats himself opposite to the person who consults him, one moment looks at the water, the next at the patient; and continues examining alternately the one and the other, whistling occasionally during the intervals. He then opens the state of the case, acquaints the consultant with the nature of his complaints, and has sometimes the good fortune to hit upon the true cause. In a word, his knack of discovering disorders by urine, has gained such implicit faith in his skill, that we might as well question the pope's infallibility to a zealous catholic, as the doctor's in the pre-

^{*} Hier Herr bin ich; und das kind, so du mir gegeben hast. An engraving of this monument is published by M. de Mechel of Basle.

sence of his patients. He has certainly performed several great cures, and the manout of them hath brought persons from all quarters of Europe for his advice.

The Doctor was formerly a village surgeon, has a slight knowledge of anatomy, and a tolerably versed in botany and chemistry. His acquaintance with the theory of physicis said to be limited; the greater part of his knowledge being derived from his extensive practice, though he never stirs a quarter of a mile from his own house; for he would not take the trouble of going to Bern, even to attend the king of France.

It is more than probable, that much of this extraordinary man's success is owing to the benefit which his patients receive from change of climate, to the salubrious air of this place, and to the amusement arising from the constant succession of company. But whatever may have been the causes of his celebrity, it has come to him, as all accounts agree, unsought by himself. He has certainly many excellent qualities; is humane and charitable to the highest degree, not only furnishes the indigent peasants who consult him with medicines gratis, but generally makes them a present in money besides, and always appropriates a certain portion of his gains to the poor of his parish. His wife and grand-daughters are dressed like the peasant women of the country, and he has shewn his good sense in giving the latter a plain education; the eldest he bestowed in marriage, when she was but fifteen, upon one of his assistants, and with her 1300l.; no inconsiderable portion for this country. He procured a match for her so early he said, to prevent her being spoiled by the young gentlemen telling her that she was pretty, and inspiring her with the ambition of marrying above her rank.

If domestic harmony, and the most perfect simplicity of manners, have any pretensions to please, you would be highly delighted with his rural family. The wife is a notable active woman, and superintends the household affairs with remarkable eleverness; she assists her husband likewise in preparing his medicines, and, as he talks no other language than the German, she serves occasionally as his interpreter. As a proof of his confidence in her administration of his affairs, she acts as his treasurer, and receives all his fees, which in the course of a year amount to a considerable sum; for, although he never demands more than the price of his medicines, yet no gentleman consults him without giving an additional gratuity. She has likewise received many presents from those who have reaped benefit by her husband's prescriptions; several of these presents consist of valuable trinkets, with which on days of ceremony she decks herself to the best advantage, in the simple dress of the country.

The family sit down to table regularly at twelve o'clock; there are always some strangers of the party, consisting not only of those persons who are under the Doctor's care, but of travellers, like ourselves, led by motives of mere curiosity. When the weather is fine, and their guests more numerous than usual, dinner is served in an open shed that overlooks the adjacent country, with a distant view of the Glaciers beyond the lake of Thun. Vesterday some peasants whom the Docter invited formed part of our company; after dinner he gave some money to those that sat near him, and ordered one of his grand-daughters to distribute his bounty to the others. The benevolence of the old man, his gaiety and good-humour, the cheerfulness of his family, the gratitude of the poor peasants, the beauty of the prospect, and the fineness of the weather formed altogether a most agreeable and delightful scene; and I do not remember to have ever partaken of any meal with a more sensible and heartfelt satisfaction.

This singular man is very often employed in giving advice from eight in the morning till six in the evening, with no other intermission than during the time he is at table. His drugs are of the best kind, for he collects the simples, and distils them himself; his house, like those of the peasants, is constructed of wood; and, though always full you. y.

peasants, ontaining judge of eye, and consults xamining He then implaints, knack of we might

the preonument is of people, is remarkably neat and clean; in short, every thing about him bears the ap-

pearance of the pleasing simplicity of former ages.

I had almost forgotten to tell you that I consulted him this morning; and have reason to be highly satisfied with his prescription; for he told me I was in such good health, that the only advice he had to give me, was " to car and drink well, to dance, be merry,

and take moderate exercise."

It is now Langenau fair, and the village is crowded with the neighbouring peasants. Great numbers of the men have long beards, and many of them cover their heads with a woman's straw hat, extremely broad, which makes a grotesque appearance; their dress is chiefly a coarse brown cloth jacket without sleeves, with large puffed breeches of ticking. The women, who are remarkably handsome, wear their hair plaited behind in tresses, with the ribband hanging down below the waist; a flat plain straw-hat, which is very becoming; a red or brown cloth jacket without sleeves; a black or blue petticoat bordered with red, and scarcely reaching below the knees, red stockings with black clocks, and no heels to their shoes; their shifts of extremely fine linen, fastened close round the neek by a black collar with red ornaments; the better sort have chains of silver between the shoulders, brought round under each arm, and fastened beneath the bosom, the ends hanging down with silver ornaments.

I am so charmed with the situation of this village, the cheerfulness and singularity of this rustic and agreeable family, and the uncommon character of the humane Doctor, that I could with pleasure continue here some days; but I am pressed for time, and

have a long journey before me.

This celebrated empiric died in March 1781; and Langenau, which I again visited in August 1786, was no longer the resort of the sick, the valetudinarian, the curious, and the idle. The Doctor gained by his practice 10,000l.; of which sum his wife received a third, and the remainder was distributed among his son-in-law and grand-children.

Langenau is situated at the commencement of the Emmathal, a valley remarkable for its cultivation and beauty. Many of the farmers are extremely rich; the people appear in general contented and happy; the wooden cottages scattered about the fields, are uncommonly neat and comfortable, and announce, in their appearance, the happy condition of the peasantry.

ITTTER LXH.

Payerne Moudon Geneva Calvin.

Geneva, Sept. 6.

I TOOK leave of my friends at Langenau, in order to proceed to Avignon: where I am going to pay a visit to the Abbe de Sade, author of the interesting memoirs of the life of Petrarch. Monsieur de Vignr, a senator of Soleure, offered me a piace in his carriage to Bern, as my principal object in travelling is to acquire intelligence, I gladly embraced this opportunity of leading my worthy and well-informed companion into a conversation, not only concerning the government of Soleure in particular, but in relation also to Switzerland in general, and I found him exceedingly well-disposed to answer the several questions he allowed me to propose.

The next day I repassed through Morat and Avenches, and slept at Payerne, a town in the canton of Bern, which enjoys considerable privileges. Upon the bridge over the

ion: where noirs of the biace in his be, I gladly mion into a but in relad to answer

rne, a town ge over the Moudon is a handsome town, the principal burgh of the bailliage, and formerly the capital of all that part of the Pays de Vaud, which belonged to the duke of Savoy. It was the ordinary rosidence of his chief bailiff, and the place where the states were accustomed to meet. The bailiff appointed by the sovereign council of Bern resides in the eastle of Lucens, built upon the summit of a mountain, in a situation exceedingly picturesque; it formerly belonged to the bishops of Lausanne, and was one of their favourite seats, before the reformation was introduced into this country.

Geneva lies upon the narrowest part of the lake, where the Rhone issues in two large and rapid streams, which soon afterwards unite. That river separates the city into two unequal divisions, receives the muddy Arve in its course, and flows through France into the Mediterranean. The adjacent country is uncommonly picturesque, and abounds in magnificent views: the several objects which compose this enchanting prospect are the town, the lake, the numerous bills and mountains, particularly the Saleve and the Mole, rising suddenly from the plain of a variety of fantastic forms, backed by the glaciers of Savoy, with their frozen tops glistening in the sun, and the majestic Mont Blane rearing its head far above the rest.

Geneva, which stands partly in the plain upon the borders of the lake, and partly upon a gentle ascent, is irregularly built; the houses are high, and many in the trading part of the city have areades of wood, which are raised even to the upper stories. These areades, supported by pillars, give a gloomy appearance to the street; but are useful to the inhabitants in protecting them from the sun and rain. It is by far the most populous town in Switzerland, and contains 24,000 souls. This superiority of numbers is undoubtedly owing to the great industry and activity of the inhabitants, to its extensive commerce, to the facility of purchasing the burghership, and to the privileges which government allows to all foreigners. The members of this city are distinguished into citizens and burgesses, inhabitants and natives.* The citizens and burgesses are alone admitted to a share in the government; the inhabitants are strangers allowed to settle in the town with certain privileges, and the natives are the sons of those inhabitants, who possess additional advantages; the two last classes form a large majority of the people.

The liberal policy of this government in receiving strangers and conferring the burghership is more remarkable, as it is contrary to the spirit and usage of the Swiss. It is here indeed more necessary, the territory of this state being so exceedingly small, that its very existence depends upon the number and industry of the people; for, exclusive of the city, there are scarcely 16,000 souls in the whole district of the Genevois.

The reformed doctrines first preached at Geneva in 1553 by William Farel, a native of Gap in Dauphine, and Peter Viret of Orbe, owed their final establishment to John Calvin, who was born at Noyon in 1509, and being driven from France by the persecutions which Francis the First raised against the protestants, made his first appearance in this city in 1536.

Zuingle, Œcolampadius, and Haller had reformed the greater part of Switzerland some years before that period; but Calvin has given his name to the sectarics of the reformed religion, in the same manner as the new continent took its appellation from Americus Vespucius, notwithstanding the original discovery was made by Columbus. Although Calvin was not the first reformer of Geneva, yet, as he gave strength and solidity to the new establishment, and founded the ecclesiastical form of government, he

^{*} Since the late revolution in 1782, there is a fifth class, called domicilies, who receive from the magistrates an annual permission to remain in the city.

totally celipsed the fame of his friend William Farel, who scattered the first seeds of reformation. In truth, so great was the ascendency which Calvin, although a foreigner, acquired over the citizens, that he possessed considerable influence even in civil matters, and bore a large share in settling the political constitution. Conscious that religion derives support from every branch of knowledge, historally promoted the cultivation of science, and the study of elegant literature. To his end, as well as to encourage theological crudition, he prevailed upon government to establish a public academy; but with singular disinterestedness declining the offer of being perpetual president, he obtained that office for his friend and fellow-labourer Theodore Beza. In this new seminary Calvin, with Theodore Beza, and his other colleagues, eminent for their superior knowledge, read lectures, with such uncommon reputation and success, as attracted students from all quarters.

There is such a striking splendour in the brighter parts of this celebrated reformer's character as to render us, at first glance, almost insensible to those dark spots which in some instances obscure its glory. But when we reflect on his asperity and arrogance, and, above all, on the cruel persecution of Servetus, we cannot but lament, that he did not rise superior to the intolerant principles of the age, which, in all other instances, he helped to enlighten. With regard to his intolerant principles, it must be acknowledged, that the same uncharitable spirit prevailed also among many of the most celebrated reformers, who unaccountably conceived, in opposition not only to the genius but to the clearest precepts of the gospel, that persecution for conscience' sake, although unchris-

tian in every other ecclesiastical establishment, was justifiable in their own.

The republic of Geneva is at present the most tolerating of all the reformed states in Switzerland; being the only government in this country which permits the public exercise of the Lutheran religion. In this respect the clergy, no less wisely than suitably to the spirit as well as the letter of the Christian revelation, have renounced the principles of their great patriarch Calvin, although they still hold that able reformer in high veneration; yet they know how to distinguish his virtues from his defects, and to admire the one without being blindly partial to the other. I am, &c.

LETTER LXIII.

On the Literature of Geneva.

TO a man of letters Geneva is particularly interesting; learning is divested of petantry, and philosophy united with a knowledge of the world; the pleasures of society are mixed with the pursuits of literature, and elegance and urbanity give a zest to the profoundest disquisitions. Nor are letters confined in this city merely to those who engage in them as a profession, or to those whose fortune and leisure enable them to follow where genius leads. Even the lower class of people are exceedingly well informed, and there is perhaps no city in Europe where learning is more universally diffused. I received great satisfaction in conversing even with several tradesmen upon topics both of literature and politics; and was astonished to find in this class of men, so uncommon a share of knowledge. But the wonder ceases, when we are told, that all of them were educated at the public academy, where the children of the citizens are taught, under the inspection of the magistrates, and at the expence of government.

One circumstance in this seminary particularly contributes to excite the industry and emulation of the students; prizes are annually distributed to those who have distinguished themselves in each class. These rewards, consisting of small medals, are conferred with

such solemnity as cannot fail of producing great effect. A yearly meeting of all the magistrates, professors, and principal inhabitants, is held at the cathedral, when the first syndic himself distributes, in the most public manner, the honorary retributions. I met this morning one of the scholars, and, seeing his medal, inquired its meaning. "Je la porte," replied the boy, scarcely eight years old, "parce que j'ai fait mon devoir." I required no stronger proof to convince me of the beneficial influence upon young minds, from these encouraging and judicious distinctions, than appeared from this sprightly specimen. The citizens enjoy the advantage also of having free access to the public library; and by this privilege not only retain but improve that general tincture of learning which they imbibe in their early youth.

The public library owes its origin to Bonnivard, prior of St. Victor, who was twice imprisoned for having asserted against the dukes of Savoy the independence of Geneva, and who considered the hardships he had suffered, and the perils he had escaped, as ties that endeared him more strongly to a city which he had adopted as his own. He was a principal promoter of the reformation by gentle means and gradual instruction. He closed his benefactions to his beloved city by the gift of his valuable manuscripts and books, and by bequeathing his fortune towards the establishment and support of the seminary. His works, which chiefly relate to the history of Geneva, are preserved with

that care and reverence due to so eminent a benefactor.

The library contains twenty-five thousand volumes, and many curious manuscripts, of which an accurate and learned catalogue has been lately published by the Reverend M. Sennebier the librarian. He has attempted to determine the ages of the several manuscripts; he describes their form and size, the materials on which they are written, the ornaments, the characteristic phrases, and mentions the proofs on which he grounds his opinions; he adds the notes, and distinguishes those which have never been printed. Sennebier has also favoured the world with "Histoire Litteraire de Geneve," accompanied with biographical anecdotes of those natives who have been celebrated for their learning. As I should trespass too much on your time if I were to attempt sending you an account of the principal men of letters in Geneva, I shall confine myself to those only

with whom I am personally acquainted.

Charles Bonnet was born in 1720. His life has been devoted to the pursuits of lite rature, and to the improvement of philosophy and science. He has proved by his publications, that his indefatigable industry in searching into the phenomena of the creation is equalled only by his ingenuity in explaining them. His works, printed at Neuchatel, form nine volumes in quarto, or eighteen in octavo, and contain divers subjects of natural history, many accurate observations on insects, on the vegetation of plants, considerations on organised bodies, and the contemplations of nature. By several treatises, and particularly his Analytical Essay on the Faculties of the Soul, he has shewn himself an acute metaphysician. Like his friend Haller, he has also stood forth an able advocate for the great principles of natural and revealed religion. His * Philosophical Researches on Christianity, and his treatise on the Existence of God, prove, that an intimate knowledge of nature necessarily tends to establish a rational belief of those great truths. I had frequent opportunities of conversing with this respectable philosopher; though now in the sixty-sixth year of his age, he possesses an uncommon degree of vivacity and animation, still retains his enthusiasm for the pursuits of science, and speaks with the same perspienity and elegance as are observable in his writings.

^{*} A translation of his Recherches Philosophiques sur les Preuves du Christianisme has been given to the public by John Lewis Boissier, Esq. under the title of "Philosophical and Critical Inquiries concerning Christianity." + Bonnet died since the publication of the last edition.

I was no less ambitions of being known to his nephew de Saussure. Born in 1740, he was elected professor of philosophy in 1762, and has given to the public numerous specimens of his indefatigable industry, and of the versatility of his talents: he has made various remarks and experiments on microscopic animals, observations on electricity, on basaltic lavas and volcanic productions, on the physical geography of Italy. He has invented an instrument for measuring the degrees of magnetic force, and so much improved the electrometer of Gavallo, that it may be almost considered as a new instrument. But above all, his invention of the hairgrometer, for measuring the moisture of the atmosphere, has enabled him to make many theoretical and experimental researches that are detailed in Essai sur PHygrometre. And although a controversy subsists between him and de Luc, concerning the propriety of hair for this purpose, yet it cannot depreciate this invention, and new lights must be thrown on that subject by the opposition of two such able naturalists.

His Voyages dans les Alpes, of which two* volumes in quarto have made their appearance, treat of the physical geography of the Alps, the formation of mountains, the origin of the glaciers, and various phenomena of nature, which peculiarly distinguish Switzerland. Unlike some philosophers of the presentage, who from their cabinet, and with no other knowledge of the earth than what is acquired by books, peremptorily and presumptuously decide on the theory of the globe; this indefatigable observer draws from repeated excursion and incessant experience a fund of facts, which may enable him to complete the great design and object of all his researches, that of establishing a more perfect theory of the earth.

The cabinet of Saussure is an object worthy of the traveller's curiosity; it contains a collection of foreign and Swiss butterflies, various petrifactions and fossils, more particularly a large variety of basalts and volcanic productions, numerous specimens of granites and other primitive stones, collected during his various expeditions, and from parts which have been only visited by himself. Saussure has lately resigned the professorship of experimental philosophy, and is succeeded by my very worthy and ingenious friend M. Pietet Turretini, who has already distinguished himself by various publications,

which clucidate several important branches of experimental philosophy.†

Paul Henry Mallet, born at Geneva in 1730, passed the earlier part of his life at Copenhagen as preceptor to the present king Christian the Sixth. His introduction to the history of Denmark, under the title of Northern Antiquities, proves him a profound and accurate antiquary, and his Histories of Hesse, Brunswie, and Denmark, shew him no less eminent as an historian. I should on this occasion be unmindful of the honour conferred on me, if I omitted to mention, that his latest work is a translation of my Travels into Poland, Russia, Sweden, and Denmark, to which he has added many remarks, and a Journey into Norway.

De Lue, reader to the queen of Great Britain, and resident in England, is also a native of Geneva. He was born in 1727, and published in 1772 his celebrated work on the modification of the atmosphere, and on the theory of baronicters and thermometers; a performance which marks a distinguished æra in the history of experimental philosophy, and which he continued under the title of Idees sur la Meteorologie. But in his Lettres Physiques et Merales, sur i'Histoire de la Terre et de l'Homme, de Luc appears to singular advantage. In this learned performance, he displays a most extensive knowledge of na-

. The third and fat h have been since printed.

[†] Saussure died in 1799 Seam bier, the logenious author of Histoire Literaire de Geneve, has published an histoireal memoir on his fife and writings.

care, and applies it with great segacity in forming a new theory of the earth, and in a bappy accommodation of his hypotheses to the Mosaic account of the creation.

The cabinet of de Lue is not only remarkable for the number and rarity of many specimens; but more particularly claims the attention of the number and rarity of many specimens; but more particularly claims the attention of the number and rarity of many specimens; but more particularly claims the attention of the number and rarity of many specimens; but more particularly claims the attention of the naturalist, as a systematic collection, tending to illustrate his theory of the globe. With this view it may be divided into three principal parts: the first contains petrifactions and fossils; the second stones, and the third lavas and volcanic productions. The first part is arranged in such a manner, under three distinct heads, as may enable the naturalist, 1. To compare the petrifactions of animals and vegetables with the same bodies which are known to exist in distant countries; 3. To consider the petrifactions of those bodies which are no longer known to exist. The second particularly comprehends the stones under three points of view: 1. Those of the primitive mountains which contain no animal bodies; 2. Those of the secondary mountains which contain only marine bodies; 3. Those which contain terrestrial bodies. In the third part, the lavas and other volcanic productions are distinguished into, 1. Those from volcanos now in a burning state; 2. Those from extinct volcanos. I am, &c.

LETTER LXIV.

Government of Geneva in 1776.

THE city and territory of Geneva were formerly united to the German empire, under the successors of Charlemagne; but as the power of the emperors, feeble even in Germany, was still weaker in the frontier provinces, the bishops of Geneva, like other great vassals of the empire, gradually acquired very considerable authority over the city and its domains, which the emperor had no other means of counterbalancing than by increasing the liberties of the people. During these times of confusion, constant disputes subsisted between the bishops and the counts of the Genevois, who, although at their first institution considered as vassals of the bishops, yet claimed a right to the exclusive administration of justice. The citizens took advantage of these quarrels, and, by siding occasionally with each party, obtained an extension of their privileges from both.

But the house of Savoy having purchased the Genevois, and succeeded to all the perogatives of the counts, with additional power; the bishops and the people united oppose encroachments, which were no less prejudicial to the authority of the one than to the liberties of the others. During this period, the respective pretensions of the counts, bishops, and citizens formed a government equally singular and complicated. The harmony, however, between the bishops and citizens was at length broken by the artful management of the counts of Savoy, who had the address to procure the episcopal see for their brothers, and even for their illegitimate children. By these methods their power in the city so much increased, that, towards the commencement of the sixteenth century, Charles the Third, duke of Savoy, obtained an almost absolute authority over the citizens, and exercised it in an unjust and arbitrary manner. Hence arose perpetual struggles between the duke and the citizens, and two parties were formed; the zealots for liberty were called eidgenossen, or confederates, while the partisans of the duke were branded with the appellation of manimelues, or slaves.

The treaty of alliance, which the town contracted with Bern and Friburgh, in 1526 may be considered as the true æra of its independence: for, the duke was soon after

deprived of his authority, the bishop driven from the city, a republican form of government established, and the reformation introduced. From this time, Charles and his successors waged incessant war against Geneva; but his efforts were rendered ineffectual by the intropid bravery of the citizens, and the assistance of Bern.

In 1584 Geneva concluded a treaty of perpetual alliance with Zuric and Bern, by

which it forms part of the Helvetic confederacy.

The last attempt of the house of Savoy against Geneva, was in 1602; when Charles Emanuel treacherously attacked the town during a profound peace. Two hundred soldiers sealed the walls in the night, while the inhabitants reposed in unsuspecting security; but being timely discovered, were repulsed by the desperate valour of a few citizens, who gloriously sacrificed their lives in defence of their country. As a tribute of public gratitude, these brave Genevans were buried with great pomp, and their names recorded on a sepulchral stone. In memory of this event, some of the scaling-ladders, by which the enemy entered the town, are preserved in the arsenal, and the petard, which was fastened to one of the gates, when the gunner was killed before it could be discharged. The war occasioned by this perfidy was concluded in the following year by a solemn treaty: since that period, uninterrupted peace has been maintained between the house of Savoy and Geneva; although the king of Sardinia did not till 1754, formally acknowledge the independence of the republic.

Peace was no sooner concluded with the house of Savoy, than the sparks of civil discord, so apt to kindle in popular governments, and which had been smothered by the apprehension of a foreign enemy, again burst forth. During the greater part of the last century to the present period, the history of Geneva contains little more than a narrative of contentions between the aristocratical and popular parties, and their struggles were occasionally exerted with so much animosity, as to threaten for a moment, a total revolution in the state; but, have been hitherto compromised without producing

any fatal effects.*

The power of the great council in 1707, was restrained by an edict, decreeing that every five years a general council of the citizens and burghers should be summoned to deliberate upon the affairs of the republic. Agreeably to this law, a general assembly being convened in 1712, the very first act exerted by the people in their collective ca-

pacity, was the abolition of the above edict.

In consequence of this extraordinary repeal, the power of the aristocraey continued increasing till within these few years; when the citizens, by a singular conjunction of favourable circumstances, joined to an uncommon spirit of union and perseverance, procured several changes in the constitution of Geneva; by which the authority of the magistrates has been limited, and the rights of the people enlarged. Happy if they know where to stop; lest, by continuing to extend the bounds of their own privileges, and by too much restraining the power of the magistrates, they shake the foundation of civil government.

The present constitution of Geneva, may be considered as a mean between that of the aristocratical and popular cantons: more democratical than any of the former, as the sovereign and legislative authority reside in the general assembly of the citizens; more aristocratical than the latter, because the powers yested in the great and little coun-

cils are very considerable.

^{*} The reader will recollect that this letter was written in 1776, before the revolution of 1782, which is related in the subsequent letter. See an excellent narrative of these intestine commotions, and of the gradual change from an aristocratical to a popular form of government, in Planta Mistory of the Helvetic Confederacy, chap. ix.

2, which s, and of ry of the The members of the senate, or Little Council of twenty-five, enjoy in their corporate capacity several prerogatives, almost equal to those possessed by the most aristocratical states. They nominate half the members of the Great Council, supply the principal magistrates from their own body, convoke the Great Council and the General Council, and previously deliberate upon every question laid before these councils; in other words, in them is lodged the power of proposing; consequently as every act must originate from them, no law can pass without their approbation. In this sente is vested also the chief executive power; the administration of the finances, and, to a certain degree, jurisdiction in civil and criminal causes. They nominate, to most of the smaller posts of government; and enjoy the same privilege of conferring the burghership. They compose, in conjunction with thirty-live members, chosen by them selves, the Secret Council, which never assembles but on their convocation, and only upon extraordinary occasions.

These prerogatives, however, are counterbalanced as well by the privileges of the Great Council, as by the franchises of the General Council. The privileges of the Great Council consist in choosing the members of the senate from their own body, in receiving appeals in all causes above a certain value, in pardoning criminals, in disposing of the most important charges of government, except those which are conferred by the General Council, and in approving or rejecting whatever is proposed by the

senate to be laid before the people.

The General Council, or assembly of the people, is composed of the citizens and burghers of the town; their number on an average amounts to about 1,500, but seldom more than 1200 meet at the same time; the remainder being either settled in foreign countries, or absent. I ought to have explained to you sooner, the distinction between citizens and burghers: the burghers are either the sons of citizens or burghers, born out of Geneva, or have obtained the burghership by purchase; the citizens are the sons of citizens or burghers, born in the town. The burghers may be chosen into the council of two hundred, but the citizens alone can enter into the senate, and

The General Council meets twice a year, chooses the principal magistrates, approves or rejects the laws and regulations proposed by the councils, imposes taxes, contracts alliances, declares war or peace, and nominates half of the members in the Great Council. All questions are decided by the majority of voices; and each member delivers his vote without having the liberty of debating. The restriction is certainly reasonable: for, in a popular assembly, like this of Geneva, composed of citizens, the meanest of whom is well versed in the constitution of the commonwealth, and where the people in general have a strong propensity to enter into political discussions; if every voter was permitted to support and enforce his opinion by argument, there would be no end of debate, and the whole time would be consumed in petulant declamation.

But the principal check to the authority of the senate, arises from the right of reclection, or the power of annually expelling four members from the senate at the nomination of the four syndies, and from the privilege of representation. The right of re-election was obtained by an edict of the General Council in 1768, and is thus exercised. From eight senators appointed by the senate and approved by the Great Council, the General Council annually choose the four syndies. But should the General Council reject the eight candidates, and all the other senators who are successively presented to them, four members of the Great Council occupy their places.

VOL. V.

^{*} The children of those who are employed in foreign countries, in the service of the state, at though born out of Geneva, are emitted to all the provileges of citizens.

With respect to the second restraint upon the power of the senate, the right of representation; every citizen or burgher has the privilege of applying to the senate in order to procure a new regulation, or of remonstrating against any act of the magistracy. These representations have, perhaps, proved one of the principal means of securing the liberties of the people from the encroachments of the two councils; the magistrates are obliged to give an explicit answer to these representations; for, if the first is not considered as satisfactory, a second remonstrance is presented. According to the nature and the magistrates are of the complaint, the representation is made by a greater or less number of the second in the sometimes happened, that each remonstrance has been accompanied by several hundred, in different bodies.

The salaries of the magistrates are so inconsiderable, as not to offer any temptation of pecuniary emolument: a sense of honour, a spirit of pre-eminence, the desire of serving their country, together with that personal credit which is derived from an office in the administration, are the principal motives which actuate the candidates to solicit a share in the magistracy. Accordingly, the public posts are generally filled by men of the first abilities, and of the most respectable characters. The revenues of government, at the highest calculation, scarcely amount to 30,000 pounds a year; a sum, however, which, by a well regulated economy, is more than sufficient to defray the

current expences.

It is very remarkable that, in a republic so free as Geneva, and where the true principles of liberty are generally understood, there should be no precise code of penal law; for, although the form of the prosecution is settled, yet the trial of the criminal is private, and the punishment left to the decision of the magistrate. Nor are the franchises of the people ascertained with that accuracy which might be expected. Under Ademar Fabri, bishop of Geneva in the fourteenth century, a certain number of political regulations, both civil and criminal, together with several particular customs and franchises, were drawn up in form, and the bishop took an oath to observe them. These statutes, if they may be so called, were confirmed by Amedus the Eighth, duke of Savoy. This code, to which the people appeal in all cases of controversy, is compiled in a very maccurate and confused manner, and the magistrates refuse to submit to its authority, because it was published before the independence of the republic was confirmed. The people have repeatedly demanded a code of municipal and penal laws, so express, as to prevent the arbitrary decision of the magistrate, and although such a code was ordered in 1738 and 1768, yet the compilation has been hitherto deferred.

The code of civil law is the most perfect part of the constitution; all matters concerning commerce being well-regulated, and private property securely guarded. It is unnecessary to trouble you with a particular detail of the sumptuary laws which nearly resemble those in most other states of Switzerland, where the restrictions of that kind are enforced. But there is one law, relating to bankrupts, too singularly severe not to be mentioned: if a member of either council becomes a bankrupt, he is immediately degraded, and from that moment rendered incapable of holding any post under government, until he has discharged all the just demands of his creditors; even his children are subjected to the same disgrace; and no citizen can exercise any public

employment, while the debts of his father remain unpaid.

In this city, as in all the other principal towns of Switzerland, a public granary is established. Magazines of this kind, useful in all states, are more particularly necessary in so populous a place as Geneva, which if the neighbouring powers were to prohibit the exportation of corn, might be exposed to famine. The corn is dried by means of ingenious machines, and retailed to the inn-keepers and bakers; a considera

ple profit accrues to government, and there is always in case of necessity, a sufficient

quantity in reserve to support the inhabitants during a year and an half.

Geneva is strongly fortified on the side of Savoy, and a garrison constantly maintained; but these fortifications, and this garrison are only sufficient to guard them from any sud den attack, and could not be long defended against a regular siege. The great security of the republic consists in its alliance with the Swiss cantons, by means of Zuric and Bern: as it is the interest both of the kings of France and Sardinia to be in friendship with the Swiss and to preserve the independence of Geneva; it derives its greatest security from a circumstance which, in some cases, would be the source of danger; namely, its vicinity to the dominions of such powerful neighbours.* Geneva is the only republic in Switzerland, which has no regular companies in any foreign service. † I am, &c.

LETTER LXVIII.

Como....Mendrisio....Lake of Como....Pliniana....Fort of Fuentes....Laghetto di Chu venna.... Entrance into the country of the Grisons.

DEAR SIR, Chiavenna, July 21, 1779.

SINCE I travelled over part of Switzerland, I have been desirous to make a tour through the remainder of that country, particularly to visit the Grisons; and I shall now take the opportunity of indulging my curiosity, and propose to myself the satisfaction of continuing to send you, on this as on the former occasion, my observations and remarks.

I quitted Milan last week, and proceeded through a gently rising country, wellwooded and fertile in corn and vines, to Como. This town being distinguished by the birth of Pliny the younger, the inhabitants have placed his statue in a niche on the outside of the church, with a Latin inscription beating the date of 1499. I need not remind you, with how much rapture and enthusiasm Fling mentions the delightful situation of his native town, and the romantic scenery of the envirings, in those letters of which you have given to the public so accurate and elegant a translation.

Como is indeed most pleasantly situated, he is thereby value expressed by hills, upon the southern extremity of a heaptiful lake; it is stirridially by a wall flanked with picthe southern extremity of a manifest principle of the stands the ruins of an ancient castle. The houses are neatly built of stants and the ruins of an ancient castle. The houses are neatly built of stants and the ruins have established markles because the markles because the ruins have established markles because the ruins have established the ruins have established the ruins have established the ruins have established the ruins of an ancient castle. fice of white marble, hewn from the neighbouring quarries: \[\] \

From Como I made an excursion to Mendrish, the of the Italian builliages belonging to the twelve cantons of Switzerland. These ballflages formed part of the Milanese, and in 1512 were ceded to the cantons by Maximilian Sforza, who was raised to the ducal throne by the Swiss, after they had expelled the troops of Louis the Twelfth, and taken possession of the dutchy. Francis the First, successor of Louis, having re-

^{*} The conquest of Savoy by the French destroyed this equilibrium, and was the certain probable to the subjugation of Geneva.

[†] The account (given in Letters 65, 66, and 67) of the revolutions of Geneva 1782, 1789, "a pud dle in a storm," is omitted as little interesting at this period of grand revolutions.

[†] Appenzel is excluded from the co-regency because the cession was made in 1512, the year before that republic was admitted into the Helyetic confederacy. Beside Mendrisio and Balerna, the other Italian bailliages are Locarno, Lugano, and Val-Maggia. Uri, Schweitz and Underwalden, possess three bailliages, Bellinzona, Riviera, and Val-Brennas which were equally dismembered from the Milanese

covered the Milancre and secured his conquest by the victory of Marignano, purchased the friendship of the Swiss by confirming their right to the coded territory; a right

which the subsequent dakes of Milan were too prudent to dispute.

Mendrisio and Balerna* is one of the smallest of these transalpine bailliages: the baillift or governor is appointed successively by each of the twelve cantons, and remains in office two years. He is supreme judget in criminal affairs without appeal: a power too great to be entrusted to a stranger, commonly ignorant of the laws, and interested to increase his revenue. In civil causes an appeal lies to the syndicate of Switzerland. The inhabitants cojoy considerable privileges, civil, ceclesiastical, and commercial. The district is extremely fertile in vines, corn, and pasturage, and yields a great quantity of excellent silk.

Returning to Como, I embarked upon the lake; the banks near the town are richly wooded, and studded with country houses and small villages, which lie upon the gentle acclivities near the margin of the water. At first the lake is searcely a quarter of a mile broad, but it widens near a neck of land upon which is situated the small village of Turnio. The neighbourhood of Turnio, and the districts bordering the lake of Como, supply, for the most part, those Italian emigrants who wander through Europe vending barometers and thermometers; of whom numbers annually

resort to England.

After an hour's rowing we reached Pliniana, remarkable for a singular fountain. which is still to be seen in the same state as described by Pany. Pfiniana, a villa belonging to a Milanese nobleman, is constructed upon the edge of the water, in a most romantic situation, backed by rocks covered with trees and pasture. The master of the house received me with much civility and politeness, and kindly accompanied me to the fountain. It is a spring, which bursts from the rock close to the house, and falls in natural cascades into the lake. I examined some of the phænomena alluded to in the following description, and received the account of the others from the gentleman himself, who had repeatedly made them the subject of his observation. The spring cbbs and flows three times a day; it gradually rises, until it forms a considerable stream, and then as gradually subsides, till it becomes almost dry. I saw it in its flow, and measured the increase by placing stones at different distances, which were successively covered in a small space of time. This increase and decrease is regular, excepting in bad weather: in the late season, which has been extremely fair, the ebb and flow were remarkably uniform. The original passage, in which Pliny describes the ebb and flow of this spring, is written upon the wall of an adjoining apartment.

Fons oritur in monte, per saxa decurrit, excipitur cænatiuncula manu facta; ibi paululum retentus in Larium lacum decidit. Hujus mira natura: ter in die statis auctibus ac diminutionibus crescit, decrescitque. Cernitur id palam, et cum summa voluptate deprehenditur: juxta recumbis, et vesceris, atque etiam ex ipso fonte (nam est frigidissimus) potas: interim ille certis dimensisque momentis vel subtrahitur vel adsurgit annulum; seu quid aliud ponis in sicco, alluitur sensim, ac novissime aperitur; detegitur rursus paulatimque descritur: si diutius observes utrumque iterum ac tertio videas.‡

† In case of capital punishment, he is obliged to consult the secretary, notary, and the other officers

of the district; but as they have no vote, his power is supreme.

^{*} In the new division of Switzerland, Mendrisio and Balerna were included in the canton or department of Lugano.

¹ Plin. Epist, lib. iv. Ep. xxx. "There is a spring which rises in a neighbouring mountain, and ranaing among the rocks is received into a little banquetting-room, from whence after the force of its current is a little restrained, it falls into the Larian lake. The nature of this spring is extremely sur-

Having gratified my curiosity at Pliniana, I embarked, and continued to Clarice, where I passed the night. The weather, which has lately been uncommonly sultry, is suddenly changed, and this morning a violent thunder-storm overtook us upon the lake the water being extremely agitated, we landed at a small village upon the western shore, in order to wait until the storm should subside. The navigation of these lakes, which are enclosed between the mountains, is occasionally dangerous, according to Virgil's description of the Benacus, or Lago di Guarda.

To, Lari maxime, tuque Pluctibus et fremitu assargens, Benace, marmo

The lake of Como is about thirty-six miles in length, in general from two to three broad, and four at the widest part, where it is divided into two branches. The great branch leads directly to Como; the small branch, called the lake of Lecco, discharges the Adda, and communicates by means of that river and the canals* of the Adda and the Canale Vecchio, with Milan.

The borders are high hills covered with vines, "panish chesnut, walnut, and almoud trees, and dotted with numerous villages and small towns. The hills bounding the lake rise gradually higher and higher, from those which encircle Como to the crags which tower near its upper extremity.

The storm at length subsiding, I embarked, and proceeded to Bellano, whose streets are so narrow as scarcely to admit the smallest eart. It is situated at the foot of a lofty precipice, rent from top to bottom by a chasm, through which a furious torrent forces its way. A bridge is thrown across the chasm, from whence the spectator looks down with terror into a gulf scarcely inferior in depth to that at the Panten-Bruck,† in the canton of Glarus, and an aqueduct is conducted along the precipitous sides of the rock. I again embarked, and proceeded to Domasio, where I waited upon the governor, to obtain the permission of visiting the fort of Fuences: my request being readily complied with, I crossed the lake, accompanied by a soldier, and landed at Collico.

A fittle above Domasia, on both sides of the lake, begins the malaria, or unwholesome air; the borders are no longer abrupt halfs but a flat swamp, formerly covered with water. The inhabitants are subject to intermitting fevers; on which account during the heats of summer, when the malignity of the atmosphere is at its height, the greater part quit the plain, and retire to the neighbouring mountains. I found Collico and its neighbourhood almost entirely deserted; the cottages were shut up; and had it not been for the appearance of a straggling man and warman, should have concluded this part of the country to have been uninhabited. After walking about two miles from Collico, we came to the bottom of the rock, upon which stands the fort of Frientes. But before we ascend, I shall detain you a moment with a short history of this fort, which at the beginning of the last century was so much celebrated in the annals of Europe.

prising; it with and flows regularly three times a day. The increase and decrease a plainly visible, and very entertaining to observe. You sat down by the side of the fountain, and whilst you are taking a repast and drinking its water which is extremely cool, you see it gradually rise, and fall. If you place a ring, or any thing else at the bottom when it is dry, the stream reaches it by degrees till it is entirely covered, and then again gently retires from it; and if you wait you may see it thus advance and recede three times successively."....Melmoth's Translation.

and ranof its curmely surOne of the articles in a treaty between Francis Sforza, duke of Milan, and the Grisons, expressly stipulating that no fort should be constructed in the district of Piantedio, was confirmed by the Spanish branch of the house of Austria, which succeeded Charles the Fifth in the possession of the Milanese. Notwithstanding this agreement, when the religious disputes, occasioned by the introduction of the reformed religion into the Valteline, created a j-alousy between the house of Austria and the Grisons, the count de Fuentes, governor of Milan, laid, in 1603, the foundation of the fort, which he called after his own name, and saw it completed in 1606. From this place situated in the Piantedio, he introduced troops into the Valteline, and supported the inhabitants in their hostilities against the Grisons. Henry the Fourth of France, alluding to the construction and situation of this fort upon the borders of Italy, and near the confines of the Grisons, used to say, Il yout du meme nœud serrer la gorge de PItalie et les pieds aux Grissons.*

If you are not fatigued with this preliminary account, we will now mount to the fort, and take a view of its present state. It is built upon an insulated rock, about a mile and a half from the nearest ridge of mountains, and two miles from the lake, so that it completely commands the only great opening which leads into the Valteline, either from the Milanese or the Grisons; a situation of great importance, when the possession of the Valteline was an object of consequence to the house of Austria. The fortifications are a quarter of a mile in circumference, constructed with stone, and contain a few ruinous barracks for soldiers, and the governor's house, which is in a most wretched condition. The whole garrison consists of three soldiers, who at the expiration of three days, return to Domasio, and are relieved by an equal number: the only inhabitants are a peasant and his wife, who have resided there a year, and have been almost constantly afflicted with the ague. The plain below the rock being entirely marshy, and covered with rushes, exhales a pestilential effluvia, which infects the atmosphere, and occasions the unwholesomeness of the fort. The Spaniards were accustomed to style this place, from its peculiar situation, the voke of the Grisons, while the Grisons, in allusion to its bad air, termed it with more propriety the grave of the Spaniards.

The view from the fort is remarkably fine and picturesque. On one side, the rich Valteline, watered by the turbulent Adda; on the other, the lakes of Como and Chiavenna, beautifully encircled with numerous towns and villages. The hills which skirt the Valteline and the lake of Como, present a variegated landscape of forests, cornfields, and pastures, finely contrasted, towards the Grisons, by the rugged Rhetian Alps covered with eternal snow.

Having taken leave of the three soldiers, and bid adieu to the peasant and his wife, I descended into the plain: the soil is fertile, but being subject to frequent inundations, is not capable of constant cultivation. That part which lies between the fort and the lake is so marshy, that although the straight line to the place of embarkation scarcely exceeded two miles, yet I was obliged to make a circuit of five before I arrived. I passed a range of square stones which form the boundary between the Milanese and the country of the Grisons: on one side of each stone was inscribed Stato di Milano, on the other Grigioni: they were put up, as the date informed me, in 1763, the year in which the treaty, or the capitulation of Milan, was concluded between the empress of Germany, as sovereign of Milan, and the Grisons. By this treaty the limits of the two states were finally settled; and several other subjects of dispute amicably adjusted. Having reached the Adda, which, for a short space, makes the line of separation between the Milanese and Grisons, I walked along its banks; its stream is muddy, and navigable

only by rafts. Most of the maps of the lake of Como are erroneous, in representing that lake and the Laghetto di Chiavenna as one great piece of water, and the Adda as flowing into the former; whereas the two lakes are distinct bodies, and the Adda joins a small stream which issues from the Laghetto, and thus united falls into the lake of Como.

I embarked near Dacio, the last village in the Milanese, at which place all boats laden with merchandise are obliged to pay a small duty. Soon afterwards I entered the lake of Chiavenna, which belongs to the Grisons. The views of this lake are extremely wild and magnificent; surrounded as it is with barren rocks, craggy, and rising into spires sprinkled with snow: the bases of the dreadful precipices are lost in the dead and overshadowed water, dangerous on account of its malignant vapours, and affording no asylum, scarcely a landing-place, to the crews of those frail boats caught unwarily in the violent storms to which it is subject. I landed at Riva which consists of a few scattered cottages and warehouses, and having procured some horses, proceeded to Chiavenna by moor-light. The villages were almost deserted, and the inhabitants withdrawn to the mountains. The people in general are so greatly alarmed at the unwholesome state of the air in this season, that the watermen who rowed me from Como, although exceedingly fatigued, went back to Domasio, and exerted all their eloquence to dissuade me from my first intention of remaining in the plain: overcome by their repeated importunities I pursued my journey to Chiavenna. Indeed no other proof of the tainted air is requisite than the aspect of the inhabitants; the few peasants whom I met in the villages, as well near the Fort of Fuentes as in the valley of Chiavenna, were mostly wan and livid The narrow valley through which I passed from the lake to Chiavenna, is enclosed between the first and lowest chain of the Rhetian Alps; it is watered by the torrent Maira, and produces Turkish wheat, pasture, chesnuts and mulberry-trees, together with a great abundance of willows. The ascent is rapid to Chiavenna, which is built in a higher and more wholesome situation.

LETTER LXIX.

Plurs....Its destruction in the last Century by a Fall of a Mountain....Valley of Pregalia.

July 25.

MY last letter left me at Chiavenna, of which town I defer sending you any description, as I propose returning there in my way to Coire. The morning after my arrival, I rode about four miles, to the spot formerly occupied by the town of Piura, or Piurs, which was totally overwhelmed by the fall of mount Conto. This terrible catastrophe

happened on the 25th of August 1618.

Plurs was a large and flourishing town, subject, as well as Chiavenna, to the Grisons. Contemporary writers mention, that it contained three churches, many large houses, and a stone bridge over the Maira, and that its population amounted to at least 1500 inhabitants who carried on no inconsiderable commerce. The valley in which it was situated is very narrow, and the whole town was buried in one undistinguished ruin. A contemporary account relates, that the cloud of dust and rubbish was so great as to cover the heavens like smoke, and even to extend as far as Chiavenna; the inhabitants of which place, alarmed at this phenomenon, were still more terrified at the sudden disappearance of the Maira (whose course was stopped by the fallen fragments of rock) and apprehensive that the torrent had undermined Chiavenna, precipitately fled in great numbers to the mountains.

I walked over the spot where Plurs was built: parts of the ancient walls, and the ruins of a country house, which belonged to the Franchi, the richest family in the place, are the only remains of its former existence; and these would not be noticed by a passenger. A peasant who has a cottage close to the ruins, pointed out to me every place as it had been explained to him Ly his grandfather. He shewed me where stood the churches and principal houses, the channel through which the river then flowed, and where the bridge was constructed. He informed me, that in digging, several dead bodies had been found; particularly the bones of a priest, covered with shreds of garments, which indicated that he was employed in divine service when the rock overwhelmed the town. Household utensils are frequently dug up; the other day several corpses were discovered, and on the finger bone of one were a silver and two gold rings. Vineyards, chesant-trees, and houses cover the spot where this unfortunate town was once situated.

The valley in this part has an oval appearance, and is skirted by a beautiful grove of chesnut-trees; the surrounding mountains are steep and rugged, and from the top of Mount Savonne, Paequa fragia, a considerable torrent precipitates itself, at first in a full unbroken stream, and afterwards divides into three separate falls, highly ornamental to

the beautiful scenery.

I next followed my guide to the house of a gentleman near Chiavenna, to see a drawing of Plurs before it was overwhelmed; his ancestors had large possessions, and were the richest family in the town. The master of the house shewed me the picture, and explained to me the situation of the different buildings. He then politely accompanied me through his grounds to a manufactory of stone-pots called Lavezzi, which are made near Chiavenna, and much used for kitchen utensils throughout these countries, and some parts of Italy. This manufacture is very ancient: Pliny mentions the* stone under the denomination of lapis Comensis, because the pots were sent to Como, and there exported.

These utensils are made by the following process: the workmen hew from the quarry semicircular blocks of stone, from which, with an instrument resembling that used by turners, they hollow a vessel about a foot in diameter. From the remaining mass they frame another of inferior dimensions, and continue their operation till they have produced a series of semicircular pots, gradually decreasing to the size of a small basin. From Plurs I continued along the valley of Santa Croce, and entered the country of the

Grisons at the small village of Casta Segna, in Pregalia.

At Bondo, which is a small village in the valley of Pregalia, count de Salis, formerly British envoy to the Grisons, has constructed a large and commodious house entirely fitted up in the English taste. It is situated at the extremity of a small plain scarcely half a mile in length, and about four hundred paces broad, bounded on each side by a chain of the Rheiian Alps, whose sides are covered with forests intermixed with luxuriant pasture. The plain is enclosed by some rugged rocks, behind which others shoot to an enormous height, crowned with perpetual snow; this little plain produces excellent pasture, barley, tye, vegetables of all sorts, and some fruit trees. Through it dashes the torrent Maira over broken fragments of rock.

I rambled about the valley of Pregalia and the neighbouring mountains; and observed the domestic occonomy of the peasants. Their food is chiefly salt meat, rye,

[·] Lapis Ollaris. Pliny's Lapis Comensis is classed by Wallerius among the steatites, by Linnæus among the caies. It is opaque, manuous to the touch, and composed of mica and steatites. When first taken from the quarry it is easily cut and turned; on being exposed to the air it hardens, but will take no polish-

bread, milk, theese, polenta, and chesnuts, which are so plentiful at this season of the year that they make a principal ingredient in all their meals; the most common me thods of dressing them are to boil, and serve them up with crimbs of bread, or to grind them to a paste and then heat them with milk. The peasants are well clothed. They manufacture linen and coarse cloth at home, every family having a loom, which is worked in the winter season; the finer cloth, which they wear only on Sundays and festivals, is procured from Germany.

The valley of Pregalia reaches from the Podesteria of Plurs to the confines of Upper Engadina, and contains about eighteen hundred inhabitants; it is a high jurisdiction in the league of God's House, and is divided into the two independent communities of Sopra and Sotto Porta; so denominated from a wall with an opening called Porta, through which the road passes, and which separates the valley into two equal parts. These two communities enjoy a democratical form of government: a short account of which will convey some idea of the mode in which the administration of affairs is carried on in these little states.

Each community has its general assembly, in which the sovereign power is vested. every male at the age of eighteen has a vote; in each of these assemblies the magistrateand representatives to the general diet are chosen by the majority of voices; instruc tions are given to the representatives, and all appeals from the diet decided in the last resort. For civil causes the two communities have separate tribunals, composed of the Landamman, who is president, and twelve assistants; and an appeal lies from one to the other. For criminal affairs there is one court of justice, composed of a Podesta and an equal number of judges from each community. The Podesta is thus chosen. each community appoints two persons, who nominate nine others, and these nine choose two candidates, who draw lots for the office. The same person is not unfrequently nominated Podesta by both parties; and then it is decided by lot to which he belongs. This criminal court of justice is always held at Vico Soprano, in Sopra Porta. In all delinquencies the punishments are extraordinarily severe, and the remission or alle viation is entirely left to the judges, who generally take a communication in fines; so that if the criminal is poor he undergoes the punishment, if rich, he redeems himself by money.

LETTER LXX.

Description of the Marmot.

The marmot is extremely common in the mountains of Switzerland, and particularly in this part of the Grisons; and, as many erroneous accounts of this sagacious little animal have been given, I shall send you an extract, selected from a description written in the German tongue by Dr. Girtaner.*

The marmot inhabits the highest and most inaccessible mountains, prefers the narrow valleys, and particularly the western or southern aspect, as the warmest, and avoids moist places. After sleeping during winter, he issues from his hole at the opening of spring, and descends to the lower regions, where vegetation is forward. In summer he again ascends the rocky heights, and frequents solitary caverns. He feeds upon herbs and roots, and particularly on the alpine plantain, mountain spingel, alpine lady's mantle, mountain sorrel, alpinetoad-flux, alpine trefoil, and alpine starwort; † when

* A French translation of this account is given in Rozier's Journal for 1786.

Vol. v.

[†] Plantago alpina, Phelkandrium mutellina, Alchemilla alpina, Rumex digynus. Antirhimm alpinum, Trifolium alpinum, Aster Alpinus. 5 Y

tame, Le cats almost every thing except flesh. On drinking, he raises up his head like fowls at every sip, looking on each side with timorous watchfulness; he drinks but little,

and is extremely fond of butter and milk.

At break of day the old marmots come out of their holes and feed; afterwards they bring out their young ones, who scamper on all sides, chase each other, sit on their hind feet, and remain in that posture, facing the sun, with an air expressive of satisfaction. They are particularly fond of warmth, and when they think themselves secure will bask in the sun for several hours. Before they collect grass either for food or for their winter habitations, they form themselves into a circle, sitting on their hind legs, and reconnoitre on all sides; on the least alarm, the first gives instantly a shrill cry, which is communicated from one to the other, and they escape without repeating the noise. The chasseurs, by imitating these successive whistlings, approach so near as to come within shot of them.

The marmot has a quick eye, and discovers the enemy at a considerable distance. He never does the least injury to any animal, and flies when he is pursued. In fact, when apprehensive of being followed, whole families quit their dwellings, and wander from mountain to mountain; but when flight is impossible, they defend themselves with spirit against men and dogs, and attack all who approach them with their teeth and

claws.

They live together in societies. They have both summer and winter dwellings, which are easily distinguished. The former remain open during the whole year; whereas the latter are closed et the end of September. In the summer dwellings is found dung in great abundance, but no hay; on the contrary, the winter habitations never contain any dung, but much hay; near the latter is perceived a more considerable quantity of earth, which annually increases according to the size of the dwelling, and the augmen-

tation of the family.

In the formation of their dwellings they scoop out the earth with great dexterity and expedition; a small part they throw away, and by beating the remainder close, render the passage very compact and solid. The opening being searcely more than six or seven inches in diameter, is just large enough to admit the animal. The interior is from eight to twenty feet in length; it consists of a passage, which, at about five or six feet from the entrance, divides into two branches; the one leading to a small cavity, the other to the chamber in which they repose. The passage and the two branches are always carried in a straight line, unless the intervention of a rock, or any other impediment, obliges them to take another direction. The chamber is round or oval, arched at top, and resembles the shape of an oven; it is from three to seven feet in diameter, and is strewed with hay, in which the marmots lie in a dormant state during the whole winter.

On retiring to this dwelling about the beginning of October, they carefully close the entrance so as to exclude all air, with a cement of earth mixed with stones and hay. On opening this chamber three weeks after it is closed, the marmots are discovered lying on the hay close to each other, and rolled up like hedge hogs, without the least appearance of life. Usually from five to sixteen are found together; sometimes, but rarely, two families occupy the same dwelling, and occasionally, but very seldom, one marmot has been discovered alone. If exposed to warmth they awaken. The tame marmots do not sleep during winter; but on the approach of that season, excited by instinct, collect materials towards constructing their dwellings. The wild marmots occupy their winter habitations in October, and quit it towards the latter end of March or the beginning of April. In removing the cement which closes the opening they do not push it iead like iut little,

on their satisfaces secure od or for ind legs, hrill cry, ating the near as to

nce. He ct, when der from lives with teeth and

fully close es and hay, vered lying ast appearbut rarely, one marmot ne marmots astinct, colceupy their the beginnot push it outwards, but draw it inwards, and probably convey the materials, which would block up the principal passage, into the small cavity.

They copulate soon after coming out: in June or July young ones have been observed

about the size of rats.

It is probable that they do not eat during their torpid state; for the same quantity of hay is observed both in spring and autumn in their winter habitations, and those which have been dug out in that season are thin and perfectly empty. The flesh of the marmor is eatable, and its skin is used for furs.

LETTER LXXI.

Passage of the Malloggia....Lake of Siglio....Selva Piana and St. Morezzo....Expedition to the Julian Columns...Bevio.

St. Morezzo, July 31

THE road through Pregalia to Coire admits carriages, but is very indifferently paved. I passed through the village Promontogno, then through the Porta to Stampa, Vico-Soprano, Borgo Nuovo, and Casaucia. The houses in this valley are of stone, plastered and white washed; are not scattered, as in the small cantons of Switzerland, but every

half mile a cluster of habitations presents itself.

Beyond Bondo the country produces no more chesnut-trees, but principally larch and firs; it yields grass, barley, and rye. Near Casaucia is the barren and lofty mountain of Set. I here quitted the high road which turns towards Coire, and about a mile and a half further where the valley terminates, I began to mount a very steep ascent, by the side of the torrent Maira, which rushes amidst a forest of firs; it descends from the glacier of the Malin, a ridge of Alps separating the Valteline from the country of the Grisons. A little further I reached the top of the Malloggia, and observed the Orlenga, a glistening torrent, falling from the Lungin mountain, and forming the remotest source of the Inn. The Malloggia is the point of partition, dividing the waters which run towards the Black Sea, from those which flow into the Adriatic. The tops of the circumjacent mountains are mostly rugged, and covered with snow; lower down they are enlivened with underwood, firs, and pasture.

I stopped at a single house, a kind of inn, where travellers are accommodated. The landlord and his family speak an Italian jargon similar to the Milanese dialect, which is common in Pregalia. The next place is Siglio in Upper Engadina, where Romansh is the general tongue. On inquiring whether it was similar to the Italian spoken in Pregalia, the landlord informed me that the two languages are totally different; and the servant assured me, that she could searcely comprehend a word which was uttered by the inhabitants of Siglio. From Malloggia I descended, crossed the Orlenga, and continued along the banks of the lake of Siglio; the way was bad and craggy until I came

to the confines of Engadina, where an excellent road commenced.

The small lake of Siglio is about five miles in circumference, and finely situated between high perpendicular rocks; it takes its name from Siglio, which we left at a little distance on our right. I crossed the Inn soon after it issues from the lake, and pursued my course over the dry bed of the torrent Fait, which formerly flowed into the Inn, but bas lately changed its course, and now falls into the lake of Selva Piana. These torrents often shift their channels; and I could observe evident traces, that some of them had, at former periods, watered the small plain between the lakes of Siglio and Selva Piana. The village of that name stands pleasantly upon a small rising ground, and the lake, though much smaller than that of Siglio, far surpasses it in the beauty of its banks,

5 y 2

which are tring'd with hanging groves of fir and larch. From this lake the Inn issue, in a larger stream, falls again at a little distance into the lake of St. Morczzo, from whence it dashes through a deep rocky channel into the plain of Celerina, where it flows in a more tranquil current. These little plains, or vallies, are broader and longer than

that of Bondo, and produce as much grass, which is now mowing.

At Selva Piana, I attempted to converse with some of the inhabitants, but could scarcely comprehend them; I have been endeavouring also to talk with the natives of this place. Many speak Italian, as it is much frequented by strangers for the sake of the waters; but the greater part understand nothing but Romansh. This morning being Sunday I attended divine service; the elergyman preached in the language of the country, and I could comprehend little more than that the text was in the 22d chapter of St. Luke. The sermon, which is the principal part of the service, was about an hour long; the prayers were short, the girls sung psalms; some of them had delightful voices, and performed with great taste and propriety, a proof of their neighbourhood to Italy.

St. Morezzo, or, as it is most commonly called, St. Maurice, stands agreeably upon the side of a hill, overlooking a small lake which lies in the bosom of the mountains, and is bounded by rising banks studded with wood and pasture. This village is remarkable for a plentiful spring of mineral water, much esteemed for its efficacy in curing several disorders; it issues from the ground about the distance of half a mile on the other side of the river Inn, is a very plentiful source, and strongly impregnated with vitriol. On plunging Reaumer's thermometer into the source it sunk from 12 to $4\frac{1}{2}$. I was informed that, from repeated observations, the thermometer varied according to the greater or less degree of rain; but upon an average the mercury generally stood be-

ween 4 and 7.

I am lodged in one of the boarding-houses, which abound in this place for the accommodation of persons who firink the waters. The company at table consist at present of only two merchants of Appenzel, who are established at Genoa, and a clergyman of Lower Engadina. As I soon discovered the clergyman to be an intelligent man, I discoursed with him upon the state of religion among the reformed part of the Grisons, and particularly relating to the Pietists, a seet which has lately made great progress in these parts. From the account given by the clergyman, who evidently leaned towards their opinions, these Pietists appear similar to our Methodists: they exalt faith above good works, affect to be uncommonly rigid and pious, condemn all diversions, card-playing, and assemblies, as criminal; frequently despair of salvation, fancy visions, enjoy supernatural inward illuminations, and employ so much time in prayer as to neglect their ordinary business. The clergymen of this sect are for the most part ignorant and superficial, are vehemently vociferous in the pulpit, thunder out reprobation, and expatiate upon justification, without explaining the methods of avoiding the one, and of a btaining the other.

These preachers, notwithstanding their affectation of a total indifference to worldly matters, do not confine their views merely to theological speculations, but pay a considerable degree of attention to political affairs; and as by means of their authority in religious concerns they possess a considerable influence over the votes of their parishioners, they are on that account much caressed and countenanced by several leading per-

sons among the Grisons.

The dress of the women is singular, and not unbecoming; it consists of a black or blue jacket with red sleeves, striped blue and white petticoats, a small black velvet cap trimmed with gold or silver lace, with a black or white lace border hanging over the forchead.

n issue o, from it flows ger than

it could atives of sake of sake of general being a chapter about an elightful rhood to

by upon buntains, go is rein curing the other of vitriol.

Was ingressed to the tood be-

c accomt present gyman of in, I dis-Grisons, progress aned tocalt faith versions, visions, is to neignorant tion, and e, and of

worldly y a conhority in arishionling per-

k or blue trimmed head. From St. Morczzo I made an excursion to the Inlian columns, or which Schenzer has given a description and an engraving in his Itinera Alpina: he supposes them to have been creeted by Inlius Ciesar, in order to mark the limits of his conquests in these parts, and asserts that Ne plus ultra, and Omitto Rhetos Indomitos, are inscribed upon them.

After passing Selva Piana, I turned up a path which leads to the Julian Alps, continued about two hours over rugged rocks, and reached the Julian columns, if they deserve so dignified an appellation. They are of a circular shape, somewhat similar to the Roman mile-stones, placed at the distance of about forty feet from each other. Their height above the ground is four feet, and they seem to be buried a foot, or scarcely so much; their circumference is about five feet. They have neither pedestals nor capitals, and are flattish at top, with a small round hole in the middle four inches diameter and six deep; they were formed by art but in the rudest manner, and do not contain the smallest traces of any inscription. We have no reason therefore to conclude, that these pillars were creeted by Julius Cæsar to ascertain the boundary of his conquests, or at least we have no proofs upon which we can depend for the truth of this popular story. I do not however regret that I made the excursion; for my curiosity, disappointed in a view of the pillars, has been gratified in visiting these wild and romantic Alps.

The Julian Alps produce much pasture, but no wood, which is a proof of their great elevation. Near the stones just described is a piece of water called the Julian lake; it is supplied from a glacier on a superincumbent mountain, from which a torrent descends to the lake of Selva Piana, and may be considered as a source of the Inn.

I soon afterwards stopped at a cottage, the only house in the whole extent of these Alps; it is not occupied but during summer; the tenants every night house the eattle that graze upon these mountains, and make large quantities of butter and cheese. Having taken a refreshing bowl of thick cream, I began my descent, and observed numerous small streams; some issuing from the rocks, others falling from the glaciers, and forming the first sources of the Little Rhine. The path was so steep and eraggy that I gave my horse to the guide, and preferred walking; about five miles from the pillars I arrived at Bevio, a small village upon the Little Rhine, in the high road leading to Coirc. Every one being employed in hay-making, I could not gain admittance into the inn.

ing, as I had proposed, to the cottage upon the Julian Alps.

On questioning these friars concerning the constitution of the republic of Bevio, they informed me that Bevio and Valmorara form one community, governed by eleven magistrates, though the number of voters who appoint these magistrates searcely exceeds forty; the chief is called Ministrale, and is confirmed every year; for which act of politicness each voter annually receives a florin. About one-third of the merchandise from Como to Coire passes by Bevio, but the greater part is sent by Splugen. After dinner

some friars, however, offered metheir house and dinner, and prevented me from return-

returned over the Julian Alps to St. Morezzo.

LETTER LXXII.

Upper Engadina....Bever....Zutz....Scampf.

Zutz, August 2.

The ride from St. Morczzo to Zutz, through Celerina, Samada, Ponto, and Madulein is extremely pleasant. These villages lie chiefly upon the sides of the mountains gently rising above a plain, which in some parts is a mile broad, in others so narrow as to be entirely occupied by the Inn. The valley is enclosed on both sides by a chain of Alps, covered for a considerable height with woods interspersed with pasture, and capped

The river, which here is free from cataracts, is joined by innumerable tor-

rents that rush down the sides of the rocks, or burst from the ground.

The Inn, during its progress in this part, is very unlike most of the rivers which I traced in my former tour. The Rhone, the Reuss, and the Aar, for instance, fall, near their sources, in a continual cataract, over fragments of rock, and through the most wild and uninhabited tracts of country; while this river directs its course through a cultivated and populous district, in an equable unbroken stream. The country is picturesque, and its beauties of a milder east than usual in these Alpine regions. The burghs, or villages, are pleasantly dotted about the plain, at the distance of a mile from each other; each vil-Lige consists of a cluster of fifty or a hundred houses of stone, plastered and whitewashed, and in such excellent repair as to appear newly constructed. The spirit of neatness indeed is so general in Upper Engadina, that I seareely observed one bad house through the whole district, and even the barns are as good as the cottages in many countries.

As I was riding through Bever the clergyman, who was smoking his pipe at his door, stopped me with a compliment, and invited me to see his library; I slighted accordingly and looked over his collection. He shewed me some English books, and many in the Romansh language, particularly the * bible printed at Core, which is dedicated to George the Second when prince of Wales. He also oblightly accompanied me a little way; and about half a mile from Bever pointed out a single house called Alles Angues, where the depottes of the two communities of Upper Engadina assemble for the purpose of deciding, in the last resort, appeals in civil causes. A little further he desired me to observe a small spring, which falls into the Inn a few paces from its source; it is called Fontana Merla, and would not be worthy of notice, did it not separate the two communities of Upper Engadina. Soon afterwards I took leave of the clergyman, mounted my horse, and proceeded to Zutz. I passed the Inn several times over bridges of single arches, which have a very striking appearance; they were constructed by scholars of the famous Grubenman,† and in the same style of architecture as the bridges of Schaffhausen and Wettingen, excepting that they are not covered.

Zutz, although not the largest, is esteemed the principal place of Upper Engadina, because it contains the criminal court of justice. The Landamman of Sotto Fontana Merla, who always presides in this court, is chosen every other turn from the family of Planta, established at Zutz: this peculiar privilege, which gives to that family no inconsiderable influence in the political affairs of this country was formerly granted by a bishop of Coire, who was uncle to one of the Plantas. On my arrival at Zutz I waited upon M. Planta, formerly envoy from the republic of the Grisons to that of Venice; he was appointed to that embassy in order to renew the ancient league which had been interrupted by the last treaty of 1763, between the empress of Germany and the Grisons; and on which occasion the Venetians were so much enraged as to expel the Grisons from their territories. This negotiation however, though conducted with great ability, was ineffectual. 31. Planta received me with great politeness and cordiality, and invited me to supper, and, as the evening was not set in, he accompanied me to what is called the camp of Drusus, which I was desirous of examining.

You recollect the campaign which Drusus, the adopted son of Augustus, and brother of Tiberius, carried on against the fierce inhabitants of these mountainous countries;

and to which Horace, in compliment to his patron, has alluded:

and brother s countries:

Videre Rhæn bella sub Alpibus Drusum gerentem et Vindelier, Alpibus impositas trenscudas Dejecit acer plus vice simplier.

This campaign of Drusus against the Rheitians was attended with great success, and he defeated the barbarous inhabitants, before deemed unconquerable (indomitosque Rhætos) with great slaughter. The supposed remains of his camp consist of several deep pits, and a mound of earth about thirty feet high and sixty paces in circumference. These works did not appear to me to be of Roman construction; being probably a rude fortification thrown up during the turbulent times, when the barons of the country were engaged in perpetual acts of hostility: a desire to render them venerable by the remoteness of their origin, and the splendour of the Roman name, seems the only cause of their being attributed to Drusus. Having satisfied my curiosity I returned to Zutz, and passed an agreeable evening with M. Planta.

Scampf, August S

The little burghs in these parts are situated at such small distances from each other, that my daily journies are scarcely so much as a morning's walk, and I am so delighted with the country and its inhabitants, that I could willingly take up my abode here for some time longer. On my arrival at Scampf I carried a letter of recommendation to M. Perini; who introduced me to M. Aporta, the elergyman of the place, a native of Lower Engadina, of the ancient and illustrious family of Aporta. He studied* some time at Deprezin in Hungary; but returning to his native country, was soon afterwards appointed pastor of Scampf. His income is small, scarcely amounting to 201.† per annum, and yet his living is esteemed one of the best in Engadina; with this moderate revenue he maintains a wife and large family. His chief work, which is a sufficient proof of his extensive knowledge and indefatigable industry, is the history of the reformation among the Grisons, in two volumes quarto. It is written in Latin, and compiled with great impartiality and exactness; the style is classical and perspicuous. This excellent publication is not merely confined to ecclesiastical transactions; for as the affairs of religion are intimately blended with political events, the latter make no inconsiderable figure in every history of the reformation. The reader will find in M. Aporta's performance a minute and faithful account of the animosities between France and Spain, in relation to the Grisons, of the rebellion in the Valteline, of the massacre of the Protestants, and of the subsequent war carried on under the semblance of religion. This interesting narrative comprehends almost all the important events in the history of the Grisons, from the beginning of the reformation to the peace of the Valteline.

I look up with reverence to this learned author, for his unwearied industry in completing so laborious a work with little encouragement, and under all the disadvantages which arise from a difficulty of procuring books, and straitened circumstances. All that he ever obtained, except fame, was a present of twenty-five guineas, which enabled him to bear his expences to Zurich, for the purpose of collecting materials from the manuscripts in the public library. The work, printed at Coire, at the expence of the typographical society, has never produced any emolument to the author. This respectable

* He received his education, I believe, in the University of Basle.

[†] Considering the different modes of living, and different value of money, this sum is perhaps equivalent to about 601, in England.

ilivine, beside a critical knowledge of the learned languages, understands and speaks Italian and German, is able to read French, and has some acquaintance with the Hungarian and Wallachian tongues. During the little time I passed in his company, I had frequent occasion to be surprised at his profound crudition and comprehensive abilities, and I am particularly indebted to him for much exact information concerning the Romansh tongue, the general purport of which I shall transmit to you in a future letter.*

Upper Engalina is divided into two communities, called Sotto and Sopra Fontana Merla, from their situation above or below that spring. They have both the same court of criminal justice, which is held at Zutz, and consists of the Landamman of Sotto, who is president, and sixteen jurymen, called Trouadors, taken equally from each district instice is more equitably administered in this court than in any other throughout the Grisons, excepting at Coire; a circumstance which arises from the following causes. The code of criminal laws was composed in 1563 by Juvalta who had been envoy from the republic of the Grisons to Venice, and had there imbibed more enlarged conceptions of jurisprudence, than at that time prevailed among his rude countrymen. This excellent code was drawn up in Latin, and in 1644 was translated into Romansh. The fines enjoined for criminal offences do not belong to the judges, but the community; the expences of the process are defrayed, and a salary is allowed to the judges from the pulme fund; the judges by these means being not so much interested to convict the prisoner, are not so ready to employ the horrid expedient of torture for the purpose of enforcing confession.

Another cause of the equity observable in this court is the mode of electing the judges: they are not, as in many other communities, chosen by the people collectively assembled, but by sixteen deputies, who represent the several districts. By these means the election is carried on with more prudence, and with a greater attention to the qualifications of

the judges than can be expected amidst the confusion of a popular meeting.

The same deputies choose all the civil magistrates by a majority of voices, and finally decide all legislative and political questions, which have before been separately proposed to their several districts. Their constituents have the power (which they frequently exercise) of peremptorily directing their vote. It is, however, no inconsiderable alleviation of the mischiefs frequently attendant on governments purely democratical, that the whole body of the populace on no occasion assemble upon one spot; but discuss matters in detached parties, and send the result of their deliberations by their representatives.

Upper Engadina is a very beautiful valley, yet, on account of its elevation, produces nothing but pasture and a small quantity of rye and barley. The winter sets in early and ends late, during which time sledges are the ordinary vehicles. The air, even at the present season, is cold and piercing, and the corn in the midst of summer is occa-

sionally much damaged by the hoar-frosts; hence the Italian proverb,

Engadina Terra Fina, se non fosse la pruina,†

The district not yielding sufficient productions for the sustenance of the inhabitants, many migrate into foreign countries; the gentry in the military line, as is common in Switzerland, others in the capacity of mechanics, tradesmen, and merchants, their favourite occupation is to keep coffee-houses or pastry-cook shops in different parts of Italy and France. Generally two persons enter into partnership to carry on the same trade; one remains in his own country, the other attends the business for a year, when he is relieved by his partner, and returns to his family for the same term. These part-

habitants, ommon in their fait parts of the same ear, when hese partiers are commonly as faithful as industrious; they annually bring considerable sums of money into this district, which is esteemed the richest among the Grisons.

Many of the inhabitanta feed numerous herds of cattle in the summer months upon the Upper Alps, and export large quantities of cheese and butter; in autumn, when pasture begins to be scarce, they send great part of the cattle for sale into the Tyrol. They live much upon salted meat, particularly in winter, on account of the dearness of fodder. The bread of the country is mostly brownish; it is baked in little round cakes, only two or three times in the year, and becomes so hard that it is sometimes broken with the hatchet; it is not an unpleasant food with cheese or butter, which are very common. The principal part of the butter is made on the Alps; it is afterwards melted, put into bottles, and frequently continues good during the whole year. The wine of the Valteline is much esteemed, and is by no means scarce in this country; it bears keeping to a very considerable age; I have tasted some wine from the cask of a very fine flavour, about fifty years old, although it grows sour in the space of three years in the warm climate of the Valteline.

The people are, for the most part, remarkably polite and well-bred; they bow to me as I pass with great civility, and will perform any kind offices in the readiest and most obliging manner. I am indeed no less delighted with the politeness and hospitality of the inhabitants, than with the romantic scenery of the country. Although many of the natives spend a great portion of their time in foreign parts, they seldom lose their attachment to Engadina; and return with great eagerness to their family and friends

after their occasional absence.

The inhabitants of Upper Engadina are computed at about four thousand, and out of these, four or five hundred, upon an average, earn their livelihood in foreign countries.

LETTER LXXIII.

Lower Engadina....Cernetz....Huldric....Campel....Trasp....Remus....Entrance into the Tyrol....Santa Maria.

Cernetz, August 4.

THE valley of Upper Engadina, from Celerina to a few miles beyond Scampf, is nearly level; it is enclosed between two ridges of mountains, which are most elevated at Celerina, and gradually diminish in height and ruggedness. About Zutz and Scampf is the finest part of the valley: it there produces some rye and barley, and the mountains are clothed with verdure to their very summits. Beyond Scampf the plain ends; and the river Inn, which had hitherto winded in a gentle course, is contracted into a narrow channel, and falls in continual cataracts. The road ascends and descends along the sides of the mountains, and the country is thickly overspread with woods of fir and pines.

I passed through several villages similar to those described in the preceding letter, and near Brail I crossed a small bridge thrown over a precipice overlooking a foaming cataract: it is called in the language of the country Pont Alta, or High Bridge, and forms the separation between Upper and Lower Engadina. Even if the limits of the two districts had not been thus marked out, the sudden alteration of the road, for the worse, would have led me to suspect that I had quitted Upper Engadina. The road from the lake of Siglio to Pont Alta is like our turnpikes in England, and sufficiently broad to contain two or three carriages abrest; no common circumstance in these mountamous regions. It has been lately made, in consequence of a proposal from the house of Austria, as the late treaty of Milan, to improve the roads leading through the vol. v. 5 z

Pregalia and the two Engadinas, that the merchandise to and from Pregalia might be transported this way through the Tyrol, instead of being carried, as it is at present,

The house of Austria offered to defray the whole expence of this undertaking. The inhabitants of Upper Engadina declining, with a spirit of disinterestedness rarely to be found in demogratical states, the offer of indemnification, carried the plan into execution within their own territories; but the intrigues of the citizens of Coire, whose interest would have suffered by the new arrangement, together with an inveterate persuasion, that good roads would render the country too accessible to the neighbouring powers, prevented the people of Pregalia and Lower Engadina from co-operating in this useful project; accordingly that part of this road which runs through their districts remains in its orginal state.

After crossing Mont Alta, I passed along a wild and almost uninhabited tract of forest until I reached Cernetz, where I am now comfortably lodged in the house of M. Planta. That gentleman is at his government of Morbegno, in the Valteline; but having accidentally met me at Chiavenna, he kindly gave me a letter of recommendation to his

uncle, who would not permit me to continue at the inn-

Cernetz is situated in a small ..eh plain, bounded by two ridges of mountains converging at both extremities: it produces wheat, barley, rye, flax, and abundance of rich pasture. I feel an essential difference between the climate of this little plain and that of Upper Engadina; it is much warmer, and has all its natural productions much farther advanced towards maturity. Large quantities of wood are felled upon these mountains, and floated down the Inn as far as Inspruck. In this plain the Inn is joined by the large torrent Spælg, that descends from the mountains of Bormio; by the side of this torrent, and at the extremity of a narrow pass leading to Bormio and Munster, I observed a square tower, which in 1624 the marquis de Cœuvres garrisoned with a body of French and Grison troops, in order to check the Austrian army posted at Munster. The pass is still further fortified by a stone wall, carried from the foot of an inaccessible rock to the tower, and from thence to the torrent.

The marquis de Cœuvres to whom the guard of this important pass was committed, was son of the marquis d'Etrees; he was bred up to the church, and created bishop of Noyon; but upon the death of his elder brother renounced the ecclesiastical line, and embraced the profession of arms. He distinguished himself in several campaigns under Henry the Fourth, and was afterwards employed in the reign of Louis the Thirteenth as amb.ssidor to Turin and Rome. In 1624 he was appointed ambassador extraordinary to the Republic of the Grisons, and commander in chief of an army of French and Swiss troops, sent to the assistance of the Grisons during the war of the Valteline. He penetrated through Coire into Lower Engadina, and seized, without delay, this important pass; by which manœuvre he secured the only avenue leading to Bormio, the reduction of which place was followed by the submission of the Valteline. For these important services the marquis, on his return to France, was created due d'Etrees, and raised to the highest honours. He died in 1670, in the hundred and second year of

I employed the greater part of this morning in making extracts from cambel's account of the Grisons, esteemed the best topographical and political history of this country yet extant. It is written in Latin, has never been printed, and is very rarely met with. I had the good fortune to find a copy in the library of count Firmian at Milan, who, with that readiness to oblige which peculiarly distinguished his character, permitted me to consult it. My stay at Milan being very short, and employed in other researches, I i might be at present.

had not made so good an use of this indulgence as I could have wished; and as I have now found the same work in M. Planta's library, I embrace this opportunity of perusing the most interesting parts, which has given me great insight into the geography, history

and government of this country.

Huldric Campel, the author of this valuable work, was born in the beginning of the sixteenth century at Suss, in Lower Engadina, and made an uncommon proficiency in every species of literature. He was one of the earliest reformers in this country, and became by his active zeal, as well as by his extensive crudition, the chief instrument in spreading the reformation through this district. An event of small consequence, which happened in his family, gave rise to the sudden and wide dissemination of the new doc-

trines, and ended in the abolition of the Roman Catholic religion.

Being absent, in 1537, upon the prosecution of his studies, his wife was delivered of a daughter, who seemed upon the point of expiring. Gaspar Campel, father of Huldric, a man strongly attached to the reformed doctrines, refused to have the child christened by the popish priest of the parish, and would not suffer even the midwives to sprinkle it according to the custom of the Romish church, with holy water; and, as there was no reformed minister at hand, peformed the ceremony of baptism himself. The Roman Catholics of Suss, in abhorrence of this act, assembled in a tumultuous manner, and attacked Gaspar with such fury, that he narrowly escaped assassination. His enemies then brought an accusation against him before the diet, which at first referred the cause to arbitration; but no satisfactory decision being obtained, a public conference was ordered to be held in the church of Suss, before deputies from the several communities, upon the following question, "Whether, if a child is born and likely to die before a priest can be sent for, the baptism performed by a layman was preferable to that by midwives?"

This ridiculous inquiry led to discussions of great moment; the reformed ministers refused to acknowledge any authority but the Holy Scriptures; while the Catholics considered the writings of the fathers and decrees of the church as infallible. Each party thus regarding every point through a different medium, could not be induced to admit the arguments of its antagonist, and the dispute lasted seven days with little prospect of a satisfactory conclusion. Fortunately, however, an accommodation was summarily adjusted by the moderation of the deputies; they decided that, in cases of extreme necessity, where no priest was present, either a layman or the midwives might baptise, and that the layman was preferable to the midwife: but what was of the greatest consequence, they decreed that, in regard to the other controverted points of faith debated in the course of the argument, every person might safely hold that doctrine, which from full conviction he was persuaded to be the word of God.

This conference was productive of the most beneficial effects; for the people, who flocked thither in great numbers, were taught to consider the Holy Scriptures as the only authority in controverted questions. The tendency of this maxim is obvious; in fact, it produced such rapid effects that, within the space of twenty years, the Reforma-

tion was completely established throughout* Engadina.

To return to Huldric Campel; he not only approved his father's conduct in the affair of his daughter's baptism, but became a zealous proselyte to the new doctrines. Having entered into holy orders, he undertook the care of a reformed church in the valley of Pretigau, where he was indefatigable in the performance of his duty, and the propagation of the Protestant religion. In 1550 he was drawn to Suss by the friends of the Reformation, as a person the most qualified to combat the Roman Catholic church. His labours were attended with such success, that, a short time after his appearance in his native place, mass was abolished, and the reformation publicly adopted. Nor was Suss the sole theatre of his exertions; at Cernetz, and several other places, the persuasion of his eloquence, and the force of his arguments, gained numerous converts.

He passed the decline of his life at Schlins, where he was pastor, and persevered to the last period of his existence in disseminating and defending the doctrine of the reformed churches, as ably with his cloquence as he recommended them by his example. Amidst the occupation of religious duties, he found leisure to continue his history of the Grisons to 1580. He died the following * year at Schlins in an extreme old age, leaving a name highly respectable in the religious and literary annals of this country.

The history of Campel consists of three volumes. The first dwells chiefly on the topography of the Grisons, and describes the different districts and towns; it likewise delineates the nature of the several governments, and the various forms of civil and criminal jurisprudence in the petty republics into which this country is subdivided. The second volume comprises the history of Rhætia, from the earliest period to the Suabian war in 1499, under the emperor Maximilian I; the materials are chiefly drawn from Tschudi, Stumpf, and other Swiss historians. The third volume, in which the history is brought down to his own times, is the most interesting and authentic. Campel having submitted his work to the examination and correction of Bullinger and Simler, presented, in 1577, a copy to the diet of the three leagues, and received public thanks. But as his own fortune was inadequate to the expences of publication, and as no bookseller would undertake to print so voluminous a work, it has never been given to the world.

Remus, August 4.

The road from Cernetz to Scuol is a continual ascent and descent, and so rocky and bad, that I employed above eight hours in riding only twenty miles. The small plain of Cernetz soon ends, and is succeeded by a rude assemblage of rocks and forests. Suss is situated in a narrow pass between the river Inn and a ridge of rocks a little beneath the ruins of an old castle: close to it is a small fertile plain, which agreeably di-

versified the wildness of the rocks and forests.

The road to Ardetz follows the course of the Inn, which murmurs below in a deep narrow channel, heard but not seen. From Ardetz (over which hangs, upon a lofty rock, a ruined eastle called Steinberg) I descended a very steep craggy path to the Inn, which I crossed, and mounted a rapid ascent, leaving on my right hand the valley of Scharla, in which are silver mines belonging to the house of Austria, formerly rich and yielding a considerable advantage, but now exhausted. I passed through the straggling village of Trasp, close to a castle of the same name, situated upon the highest point of a perpendicular rock. Count Dietrichstein, as lord of the castle, is a prince of the German empire; it was given to his family by the emperor Leopold, on condition that its possessor should always vote in the diet of the empire for the house of Austria; the formality of a garrison is maintained by a single Austrian soldier. From Trasp I again descended to the river, crossed it and ascended it to Scuol, where I arrived late, and set off early this morning.

From Scuol to Remus the mountains on the left slope gradually, and are richly cultivated; producing great quantities of wheat, rye, barley, flax, and hemp; the trees are chiefly pines, firs, and small birch, intermixed with underwood of nut-trees and

chly culthe trees rees and

wild roses. The corn fields are raised in gradations (if I may so express myself) along the sides of the hills, like the vineyards in the Pays de Vaud. The ridges of the mountains on the right beyond the Inn are steep, and in many places perpendicular, with little appearance of vegetation.

It is now harvest time; and I have observed several elergymen employed in reaping the corn. The clergy are very poor in Lower Engadina, and are more numerous than in any other part of the Grisons. The income of no benefice amounts to more than 201. per annum; that of the inferior cures to little more than 81, and this scanty pittanee is sometimes subdivided among two or three elergymen, or as many as happen to be un-

provided for in the same parish.

I stopped at Remus to bait my horses. Near it is a ruined eastle which once belonged to the bishop of Coire, and was given by one of the former prelates to the Plantas of Zutz; in right of which donation they claim the privilege of administering the oath to the Landamman of Sotta Tasna. The only remains of this eastle are two square towers, in one of which is a miserable apartment, where M. Planta gives an annual dinner to the Landamman.

Lower Engadina is divided into three communities, which send three deputies to the general diet. The first is composed of the parishes of Cernetz, Suss, Lavin, Guarda. and Ardetz; the second comprises Vettan, Scuol, and Sent, and the third contains Remus, Schlins, and Samun. The two former communities make one High Jurisdiction;

and the third forms another with Bevio, Valmorura, and Avers.

In civil causes there are two separate courts of justice, one for that part of the country which lies to the north, the other for the district to the south of the torrent Tasna, from which the two parts are called Sopra and Sotto Tasna: from each of these courts there lies an appeal, in the last resort, to the civil tribunal of Sotto Fontana Merla, in Upper Engadina, or to the neighbouring community of the valley of Munster. In criminal causes there are likewise two distinct courts, but without appeal; one for the tract to the north of the mountain Falon, another for the region to the south: according to this division the two parts are denominated Sopra and Sotta Montfalon.

By this complicated arrangement Vettan is connected with Scuol and Sent in political concerns, in civil affairs with Scuol, Sent, Remus, Schlins, and Samun, in criminal causes with Cernetz, and the other towns of the first community. This intermixture of various interests creates such an intricacy in the election of deputies, magistrates, judges, both civil and criminal, as would be uninteresting for me to detail, or for you

to read.

One circumstance, however, cannot fail to strike the most inattentive inquirer; that although the mode of electing the judges is nearly the same with that of Upper Engadina, yet justice is by no means so impartially administered. I cannot forbear ascribing this material difference, in an affair of such importance, to the different condition of the two people; the inhabitants of the Upper Engadina, being more enlightened and affluent than their neighbours, are less open to the influence of illiberal prejudices and petty cor-

Party runs very high both in Upper and Lower Engadina: there are some considerable families in these districts, of which the principal are those of Desalis and Planta, both subdivided into numerous collateral branches. The history of this country is filled with the disputes and struggles between these rival houses, and presents in many periods fittle more than an uniform picture of demestic feuds. The two parties are distinguished by the appellations of Scarbonada, black, and Alba, white; the former devoted to the Plantas, the latter to the Desalises. At the time of elections for depu

ties and magistrates the inhabitants of Lower Engadina seldom abstain from blows,

which not unfrequently terminate in bloodshed.

I have more than once had occasion to mention the superiority of politeness which distinguishes the inhabitants of Upper Engadina from those of the lower district. This pre-eminence probably arises from the constant emigration of the former into other countries, and their intercourse with foreigners. I find also a great difference in the comforts of life in the two districts: although Lower Engadina produces necessaries abundently sufficient for interior consumption, yet the inhabitants are less industrious, and consequently poorer. In Upper Engadina I was always able to procure at the commonest inns fresh meat, good oil, and excellent wine, none of which I could obtain in the lower district. The villages are less commodious, and the houses of the peasants are also far inferior in cleanliness, neatness and convenience. This difference probably proceeds, in a certain degree, from the nature of the country: Upper Engadina, yielding but few productions, the inhabitants are obliged to seek from without some means of subsistence, and industry once excited brings with it its usual companion, opulence; on the contrary, the soil of lower Engadina, fertile in all the fruits of the earth, lays the inhabitants under no necessity of extraordinary exertion, and therefore has recourse to foreign trade.

Santa Maria, August 5.

In my way from Remus to St. Martin's bridge, being overtaken by a violent storm of rain, I took shelter in a cottage, and was cheerfully received by a well-looking old woman: my horse was put under a shed, and myself safely housed from the pelting of the shower. I found the rooms perfectly neat and clean, with much better furniture and accommodations than I expected from the external appearance of the cottage. The old woman talked, besides Romansh, German and Italian, and the latter remarkably well. The storm continuing two hours without intermission, I held a long conversation with her, and was greatly pleased with the polite and ready manner with which she expressed herself upon different topics. Upon taking leave I made several apologies for having dirtied her house, thanked her for her kind reception, and endeavouring to slip a piece of money into her hand, was surprised at her declining to accept it.

All these circumstances exciting my curiosity to obtain some intelligence concerning this elderly person, I collected the following account: she is a native of Lower Engadina, of a good family, and formerly possessed a tolerable fortune; she married when very young, a nobleman of the first family of Milan, who came into Engadina, renounced the Roman Catholic, and embraced the Protestant religion. They lived for many years in the greatest harmony, till having dissipated almost all her fortune, he one day took leave of her, with a promise of returning in a short time. From that moment she never saw nor heard from him, and was afterwards informed that he was gone to Italy, and had turned monk; upon receiving this information, his wife collected the scanty remains of

her fortune, and retired to the spot where I found her.

Towards the extremity of Lower Engadina I crossed the Inn which struggles through a very narrow channel, between two ridges of high and rugged rocks, over St. Martin's bridge, into the Tyrol. I here took a farewell of the Inn, which I had accompanied from its source. At St. Martin's bridge it forms the separation of Engadina and the Tyrol; on receiving the torrent Schargenbach, it quits the territory of the Grisoas, and passing through the Tyrol and the Electorate of Bavaria, joins the Danube at Passau with so large a body of water, as to equal, if not surpass, the celebrated river in which it loses its name; hence Scheutzer has laboured to prove, that the Danube may be said rather to rise in the Rhetian Alps than in the mountains of Suabia.

In the village of St. M rtin Romansh is spoken; on the other side of the bridge German is the common language. From the steep banks of the Inn I ascended a high mountain, along an excellent road, lately formed at the expence of the emperor, to facilitate the communication between Milan and Tyrol. On the top I had a fine view of the Inn and Lower Engadina, and then descended to Nauders, where I dined upor a cold fowl, with which Mr. Planta had kindly supplied my servant, and without which precaution I should have made but a scanty meal.

From Nauders I traversed a small pleasant valley, bounded on the left by a ridge of mountains which separate the Tyrol from Engadina; the valley is about a quarter of a mile broad, and almost level; it is covered with rich pasture, and watered by a lively torrent that falls into the Inn. At the end of this valley I gently ascended to a lake, one of the first sources of the Adige; beyond this is another lake, and further on a third. the banks of these lakes are prettily skirted with villages, at one of which I passed the

night.

Having a long day's journey from thence to Bormio, I set out at five this morning, and proceeded by the side of the torrent which flows from the lakes and forms the Adige. The country is agreeable, and in high cultivation, especially where it opens into a rich and extensive view beyond Mals, which town I passed at a little distance on my left hand, and turned short into the road that leads to the valley of Munster. At the bottom of the first ascent I went through Laitch, which is subject in spiritual affairs to the bishop of Coire, in temporal to the house of Austria, and mounted along a rich valley rising to Santa Maria. Tauven is the last village in the Tyrol where the inhabitants speak German; a little beyond I passed the barrier, and again entered the territory of the Grisons, where Romansh is the common tongue.

Passing through Munster, which derives its name* from a monastery for women supposed to have been founded by Charlemagne, I proceeded to Santa Maria, from whence

I am now writing.

The valley of Munster contains Santa Maria, Munster, Valdera, Cierfs, and several other villages, which form a community in the league of God's House. Formerly the bishop of Coire had considerable influence in the government of this valley; justice was administered in his name, and he received the amercements for criminal offences; but having violent disputes with the inhabitants, he sold these rights in 1727 to the emperor Charles the Sixth. The republic of the Grisons, however, objecting to this transfer of immunities, which they considered as unalicnable, the bishop was obliged to repurchase and dispose of them to the inhabitants, who are now perfectly independent. The people are divided into Catholics and Protestants; the former inhabiting the town of Munster, with its immediate dependencies, the others the remainder of the valley; the magistrates and judges are chosen equally from both parties, who live together in tolerable harmony. The common language is the Romansh, the same as spoken in Lower Engadina, though not quite so pure; as, on account of its proximity to and con nection with the Tyrol, it is blended with the German.

LETTER LXXIV.

Passage of Mount Bralio County and Town of Bormio.

Bormio, August 7

THE passage from Santa Maria to this place was very tedious, and would have been attended with some danger had I been detained a day later; as the great quantity of

* Monasterium

rain, which now pours down without intermission, would have rendered the Alpine paths extremely slippery. I continued to ascend two hours from Santa Maria to the top of Mount Bralio, which separates the valley of Munster from the county of Bornio. This body of Alps is supposed to be the same which Tacitus mentions under the name of Juga Rhætica.* I ascended the whole way by the side of the torrent Ramo, the same which flows by Laitch, and falls into the Adige† below Mals; I traced it to its source, where it rushes from a glacier, amidst an enclosure of rocks. A few paces further, near the summit of the Bralio, another torrent falls from the same glacier in a

contrary direction, and forms the first source of the Adda.

From this point a descent continues, with little interruption, to Bormio. The tops of these mountains produce no wood, but yield excellent pasture; they were covered with cattle. The most elevated parts are of granite, but not so fine grained as that which I observed upon the St. Gothard, and some of the other Swiss Alps. I then went down a very narrow rugged path, and in an hour entered a small plain in the county of Bormio, about a mile in length, in the midst of which is a single house, termed an inn, the first habitation I met with since I quitted the valley of Munster. I found no one within but a woman and two children, who spoke a corrupt Italian; the woman was greatly affronted on my inquiring if she talked Romansh; being a Roman Catholic, she seemed to consider it as a kind of heresy to understand that language.

I followed the course of the Adda which flows through the plain; at first a small torrent, but gradually increasing by a continued accession of water from the neighbouring mountains. At the end of this small plain the descent recommences, and the track from thence to Bormio is as eraggy as the highest part of Switzerland. Since I have travelled in the country of the Grisons, I have not yet met with such asconishing scenes of wildness, horror, and majesty, as occurred in this day's journey. Description generally fails in representing the most ordinary exhibitions of nature; how inadequate then must it be to the singular combination of sublime objects, which I

shall now attempt to delineate?

I had no sooner quitted the small plain than I entered suddenly into the most barren and desolate region; on my right hand huge piles of misshapen Alps, on my left a large mass of ice and snow. Close to the path the Adda foams from precipice to precipice in broken cataracts; lower down it shoots over a succession of natural steps, which seem as if hewn by art; at the distance of about a mile, it is contracted into a narrow channel, through which it labours with incessant fury. Over this tremendous gulf is a slight wooden bridge, partly supported upon a detached fragment of rock, and partly suspended upon the sides of the opposite mountains; as I passed over, it tottered with my weight. I then continued upon the edge of a deep abyss, the Adda roaring beneath though no where visible, suggesting to my imagination cataracts more stupendous than any I had hitherto seen. Its channel is cut perpendicularly in the rock which has evidently been hollowed to the depth of some hundred feet by the attrition of the waters.

I now arrived at a barren spot, where the vale was entirely closed by an impassable mountain: a stream bursts from a small opening in the rock, and then expanding as it falls, forms a considerable torrent, foaming amidst vast fragments of stone. I turned suddenly to the left, by an opening through which the Adda seems to have forced a passage, and discovered some ferthe fields lying upon the side of a distant mountain, which beautifully contrasted with the wild and uncultivated scenes I had just quitted: a

tow paces further was the prospect of a rich plain extending to Bornno, the Addal flowing in a milder stream, which a moment before roared underneath our feet, over broken precipices. In half an hour I reached the baths of St. Martin, in the valley of Promaglia; they are formed by several hot springs which rise near Molina, and are much frequented at this season of the year; they are of the same nature with those of Bath, but did not appear so hot.

From thence I descended into the plain, which produces some corn, and yields excellent pasture, and in a short time arrived at Bormio. Every thing now wears an Italian look: the villages are very inferior to those in the Grisons; the houses are plastered, and have a dirty appearance; and it was no bad remark of my servant, that the villages

looked as if the inhal itents were mostly dead, and the place deserted.

This road over the Bralio, although so indifferent, was formerly the principal passage for the merchandise sent from the Tyrol, through the Valteline, into the Milanese: at

present it is much less frequented.

The county of Bormio, subject to the Grisons, lies at the foot and in the midst of the Rhetian Alps, and borders upon Engadina, the valley of Munster, the Valteline, Tyrol, Trent, and the Venetian territories. It is entirely enclosed within the moun tains except a narrow opening, which connects it with the Valteline; the other accesses lie across the rugged Alps, and are similar to the passage over the Bralio; in winter they are frequently impassable.

This country, once a part of the Milanese, became subject to the Grisons in 1512: the concurrence of extraordinary circumstances, which occasioned this revolution, will be related in the subsequent letter, upon the history of the Valteline; for, as the Valteline came under the dominion of the Grisons at the same period, and from the same causes, the two histories are so intimately blended, that they cannot be

separated.

The county is divided into five districts. 1. Bormio, which comprises the capital, and several dependent villages. 2. The valley of Furba. 3. The valley of Pedinosa. 4. The valley of Cepino. 5. The valley of Luvino. The inhabitants of the Luvino possess several privileges, particularly the power of judging civil causes within a certain value; they do not, however, appoint any of the magistrates, who are all chosen from the four districts.

The country of Bormio enjoys ample immunities, some of which are not extended to the Valteline, or Chiavenna; and the inhabitants are exempt from the oppressions so wantonly exercised by the Grison governors in the other subject countries. 1. The inhabitants pay a fixed contribution, which is very moderate, and cannot be increased. 2. They collect and enjoy their own duties upon exports and imports, which secures them from injudicious and oppressive taxes. 3. The fines for criminal offences belong to the community; a circumstance very friendly to the administration of justice: for no part being assigned to the governor, as is the case in the other subject provinces, he is not interested to convict criminals. 4. But the principal privilege which distinguishes this country from the Valteline, is the freedom of its government, and the limitation of the podesta's authority.

Bormio, like the other subject countries, is governed by a supreme magistrate called Podesta, who is sent from the Grisons, and communes two years in office: his authority is exceedingly circumscribed, and he enjoys scarcely any power, but with the concurrence of the councils. He presides in these councils without giving a vote, except in case of equality; he has neither the power of arresting a criminal, nor of pardoning or lessening the punishment; he receives a yearly stipend from the country of about 80h arising

VOL. V.

6

partly from a payment in money, partly from an allowance in rye, and partly from the costs of suit in civil and criminal causes. But the restrictions laid on his authority will best appear from a short sketch of the established government.

The supreme authority resides in the podesta, and councils, consisting of a civil and

criminal tribunal, whose members are annually chosen by the people.

The criminal court, or the council of sixteen, who are changed every four months, is composed of two regents, the treasurer, the notary, and sixteen counsellers, ten of whom are taken from the town, and two from each of the vallies Furba Pedinosa, and Cepino; of these members only the sixteen counsellers have any vote. At the request of the two regents, this council is convened by the podesta. In order to arrest a criminal, the whole council ought to assemble, or at least seven of the members; but in any case of importance, the podesta and two regents may give an order of arrest; this, however, being contrary to law, must be referred to the first meeting of the council, which, if satisfied, decrees in the words of their code, Male captus; bene detentus; the arrest was illegal, but exp. dient. The process is formed, and the prisoner examined by the podesta and two regents, who lay the proceedings before the council. Should the criminal be convicted, and will not confess his crime, the majority of the council decide whether the proofs are strong enough to justify torture: if that horrid expedient should be deemed requisite, it must be applied in the presence of the podesta, the two regents, the treasurer, and notary.

The fines are paid to the community, which, when the prisoner is insolvent, defrays the expence of the process. If the proofs against the prisoner appear insufficient for his conviction, the podesta and counsellers receive nothing for their attendance. This regulation, which was designed to prevent frivolous prosecutions, is productive of this ill effect, that it induces the judges to strain the slightest circumstances into proofs of

guilt, and not unfrequently occasions the infliction of torture.*

The civil tribunal consists of twelve members, taken from the town of Bormio, who determine all civil causes in the first instance: from their decision lies an appeal to the

syndicate of the Grisons.

The members of these councils are chosen annually by the assembly of the people. consisting of, 1. All those who have been magistrates; 2. Of sixty persons from the town, nominated by the two chief of the people; 3. Of sixty persons chosen equally by the three vallies; 4. Of three deputies from the valley of Luvino. All these representatives assemble on the 15th of June, in the town hall of Bormio: the election is carried on in the most democratical manner, upon a plan calculated to prevent all influence, which cannot however be entirely excluded by the most complicated mode of election ever invented. Without enlarging upon the form of voting by ballot used at Bormio, I shall, on account of its singularity, only briefly describe the ceremony of choosing the two regents. After the nomination of the counsellers, the regent last in office points to some person in the assembly; and at the same instant the treasurer mentions some number, as for instance, ten, fifteen, &c. This number is immediately counted by the regent, beginning from the person to whom he is pointing: the last six of the persons counted retire into a separateroom, and choose six members of the assembly, namely, three from the district of Bormio, and three from the vallies, who appoint six candidates. The names being thrown into six bags, and ballotted for, and the two, who

^{*} Little more is wanting to the reformation of criminal jurisprudence in Bormio, than to render the examinations public, to pay the judges for their attendance, whether the prisoner is innocent or guilty, and to abolish forture.

than to render is innocent or have the greatest number of ballots, are regents. They remain in onlice only four months, in order to prevent the abuse of their power, which is very great.

The expences of government are regulated with extreme jealousy, and the accounts are annually submitted to the inspection of each district: when the regents retire from office, the treasurer delivers a summary of the expences and receipts incurred during their administration, which is read to the council of sixteen, and cannot pass without their approbation. In October the council elects three examiners, two of whom are always taken from the inhabitants of the town, and one reciprocally from each of the three vallies. These examiners make a report, which is laid before a deputation from the town and the vallies on the 3d of May, and five copies are distributed to the several deputies, for the inspection of their respective constituents; lastly, the report is read before the assembly of representatives, who meet for the election of the magistrates, when it is either finally approved or rejected.

The revenue of the county, however trifling, is nearly adequate to the current expen

ces: it arises in the following manner:

ces: it arises in the following in	unci .					for	5.	d.

						212	2	2

In this calculation a few occasional expences are omitted, which render the general outgoings greater than the receipts; the overplus is supplied by equal assessments. For the purpose of assessing, there is a perpetual committee, consisting of twelve members chosen from the town, and two from each valley, which is convoked by the regents. The sum required being laid before them they fix the quota according to a calculation of property.

The mountainous parts of this country produce only pasturage and wood; the lower district about Bormio yields corn, but not sufficient for domestic consumption. The inhabitants export cattle, a small quantity of cheese, and iron, obtained from the mine of Freli, in the valley of Pedinoso, worked at the expence, and for the profit of a private person, who pays to the community a small annual rent. Wine is imported from the Valteline, corn from the Tyrol, corn and rice from Milan, linen from Bergamo and Appenzel, and cloth from Germany.

6 A 2

The Roman Catholic is the established religion, and the exercise of every other worship is prohibited; even the podesta himself, if a protestant, is not entitled to any indulgence in this particular.* Spiritual affairs are under the jurisdiction of the bishop of Coire,

who has a vicar's court at Bormio, in which all ecclesiastical causes are tried.

The priests have peculiar privileges, which are even extended to those who wear a clerical dress. Although many abuses result from those exorbitant immunities, yet, from the nature of the government, they are more restrained here than in the Valteline. Most of the peasants possess a small portion of land, and in consequence of the freedom of the government, are much happier than the people of the Valteline and Chiavenno.

The town of Bormio is not unpleasantly situated, at the foot of the mountains, close to the torrent Fredolfo, which falls at a small distance into the Adda. It contains about a thousand inhabitants, but has a desolate appearance; the houses are of stone plastered; a few make a tolerable figure amidst many with paper windows; several, like the Italian cottages, have only wooden window shutters. This custom may not be uncomfortable in the mild climate of Italy, but cannot be agreeable in a country, subject to sudden changes of weather, and occasionally cold even in the mildst of summer, when the bleak winds blow keenly from the Alps.

The landlord of the inn in which I am lodged is one of the regents, and a man of great consequence. I sit down to table with him, the podesta, and his wife. The podesta has been lately appointed to this government, and I can collect from the conversation which has passed, that he is perfectly ignorant of the laws and constitution of this country; in all my questions he refers me to the landlord, who is thoroughly acquainted with the theory and practice of the courts of justice, and well versed in the most minute

circumstances, relative to the administration of affairs.

It has rained all day without intermission, and the showers in these Alpine countries pour down with such uncommon violence, that I esteem myself very fortunate in being well sheltered. The bad weather, however, did not prevent me from seeing every thing which is worthy of attention in Bormio, and in paying several visits to the principal families of the town, who consider an Englishman in this country as a kind of phænomenon, and shewed me every attention and civility in their power.

The Palazzo, or town house, contains a suit of wretched rooms for the residence of the podesta, a chamber for the courts of judicature, and an apartment where the representatives of the people assemble. In one of the rooms is an engine of torture, which, in defiance of common sense, as well as humanity, is still used in these countries to force

confession.

Being desirous of seeing the archives, I found it occasioned more trouble than I at airst apprehended. The door of the apartment, in which they are deposited, having several locks, it was necessary for all the magistrates, who are entrusted with the different keys, to be present at the same time: no objection, however, was made to my admission, and all parties readily assembled upon this occasion. The archives, which are in the greatest disorder, contain many records relating to the history and constitution of Bormio, the criminal and civil statutes, and several charters from the sovereigns of Milan, confirming original privileges and adding others. The earliest of these acts is dated 1578, and signed by John Galeazzo Visconti.

^{*}For the causes of this probibition, which takes place in all the provinces subject to the Grisons, see the next letter

the Grisons.

The most important of the papers is the charter by which the Grisons confirm, in the most ample manner, the immunities granted to this country by the dukes of Milan, it was passed in the duct of Hantz, under Paul bishop of Coire, in 1513, the year subsequent to that in which the Grisons annexed Bormio to their dominions. Many circumstances have concurred to deter the Grisons from infringing this charter: the two principal are, the situation of Bormio, and the spirit of freedom which distinguishes the inhabitants. By its situation upon the confines of the Tyrol, the people, in case of the least discontent, would receive encouragement and assistance from the house of Austria. This local advantage procured them, while under the government of Milan, much better treatment than was experienced by their neighbours in the Valteline, and a similar reason still continues to operate upon the conduct of the Grisons.

The spirit of freedom which pervades the constitution, has no less materially contributed to the security of their privileges: these people have always watched with a jealous eye the slightest advances of encroachment, and never failed to remonstrate with great unanimity and resolution, whenever the podesta has discovered the least inclination to exceed the bounds of his authority. Hence the Grisons have uniformly acted towards them with great moderation, and paid the readiest attention to their representations and

remonstrances.*

LETTER LXXV.

Tirano ... Sketch of the History of the Valteline.

Tirano.

VIITED Bormio this morning about ten. The torrents are considerably swelled want the late rains, and the sides of the neighbouring mountains are sprinkled with yesterday's snow. I passed along the narrow valley of Cepino, through several wretched villages, among which not the least wretched is Cepino itself, consisting of a few straggling cottages, many of which are in a ruinous state. Having crossed the Adda, and continued on the left bank of the torrent, which dashes with great violence through a rocky country, in three hours I arrived at a pass called La Serra, where almost the whole

space between the impending rocks is occupied by the Adda.

The path runs under the gateway of an ancient tower, and leads from the county of Bormio into the Valteline. At Sondalo, which stands on the banks of the river upon an eminence, under a richly cultivated mountain, the valley widens, and becomes more and more fertile, in some places it is about a mile, in others scarcely a hundred yards in breadth. Near Tirano it exhibits an appearance of extraordinary fertility; the left ridge of mountains is chiefly overspread with hanging groves of chesnut-trees, intermixed with a few vines, above them are meadows and forests of fir. The ridge facing the south is richtly covered with vines, which reach almost to the summit, studded occasionally with clusters of large trees; on both sides churches and houses half concealed by the foliage enliven the prospect. Below runs the Adda; the plain on each side of its banks produces abundance of corn and pasture, mulberries, walnuts, and other fruit-trees, and vines carried over the corn and pasture in beautiful festoons from tree to tree.

Tirano is the capital of the Upper Terzero, and the residence of the podesta. Although the town contains several handsome buildings, yet, on account of the narrowness of the streets, and number of ruinous houses, the general appearance is desolate. The Adda divides it into two parts, which are connected by a stone bridge of a single

^{*}In the new division of Switzerland the county of Bormio was, with the Valteline and Chiavenna, annexed to the Cisalpine republic.

arch. Tobserved the remains of stone walls which formerly surrounded this place; $\mathcal{P} = \mathcal{E}$ walls, together with an adjoining fortress, were built by Ludovico Sforza; but doons at

led by the Grisons when they acquired possession of the Valteline.

Tirano carries on but little trade, except during the time of the fair. The staple commerce of the town consists in the exportation of wine and silk; the wine is sent in large quantities into the country of the Grisons, to Bormio, and into the territories of Venice; the silk which is drawn from this district of the Valteline, is not of the best quality, nor very abundant; part is forwarded to Venice, and the remainder through Chiavenna to Germany.

About half a mile from the town, on the other side of the Adda, is the church of the Madena, or the Virgin Mary, much visited by Catholic pilgrims; it is a large handsome building, constructed with marble and stone stuccoed. Part of the church is ancient, for I observed a date of 1206; and the carved ornaments are grotesque, but by no means badly finished. The modern building is in an elegant style of architecture; the principal entrance is formed by two Corinthian pillars ornamented with foliage and festoons of flowers, while the pilasters are neatly adorned with basso relievos, in the style of the antique. The area of the workmanship, as I collected from an inscription over the door, was 1533.

In the large area before the church is held, in the month of October, the fair of Tirano, remarkable for the number of cattle which are brought for sale: they are fed upon the highest Alps, where they continue until the snow begins to fall, and are chiefly sent from hence into Italy. The fair continues three days, during which time the authority of the podesta is suspended, and the governor of the Valteline has absolute jurisdiction over the town and district.

I cannot describe how much I am perplexed with a variety of languages. I speak Italian or French with the principal gentry, sometimes hold a conversation in Latin, talk a smattering of German with my servant, and with my guide and the common people a kind of corrupt Italian, like the Milanese. I write my notes in English, and during my progress through Engadina, was employed in collecting a vocabulary of the Romansh. You will not therefore be surprised should you find a confusion of tongues in my Letters.

The Valteline, called by the inhabitants Valte-Telina, extends from the confines of Bormio to the lake of Chiavenna, about the length of fifty miles. It is entirely enclosed between two chains of high mountains; the northern chain separates it from the Grisons, the southern from the Venetian territories; on the east it borders on the county of

Bormio, and on the west on the dutchy of Milan.

The Valteline, together with the counties of Chiavenna and Bormio (which had long been the source of hostility between the bishops of Como and Coire) came in 1336 under the dominion of Azzo Visconti, sovereign of Milan, who quietly transmitted them to his successors. Upon the death of John Visconti, who was archbishop as well as sovereign of Milan, his extensive territories were divided between his nephews Galeazzo and Barnabas. On the demise of Galeazzo his son John Galeazzo secured the person of his nucle Barnabas, and having confined him in the eastle of Trevio until his death, which happened in 1395, annexed his dominions to his own, and became by this union the greatest and most powerful prince in Italy. Mastino, son of Barnabas, received an asylum under Hartman, bishop of Coire, and as a mark of gratitude formally ceded to him his right to the Valtefine, Chiavenna, and Bormio.

^{*1} do not mention Matthias, the eldest brother, because he died soon afterwards.

To this cession, at that time of no avail, the Grisons owe the possession of these provinces. The claim lay dormant for above half a century, until discontents arising in the Valteline, the Grisons made an irruption into the country in support of the bishop's right; but their arms not being attended with success they purchased a peace, by renouncing all pretensions to the Valteline. They renewed, however, their claim in 1512, when Ludovico, called the Moor, duke of Milan, was taken prisoner by Lewis the Twelfth, and the whole Milanese, comprising the Valteline, was occupied by that monarch.

Soon after this revolution the Grisons, in conjunction with the bishop of Coire, entered the Valteline, and, having expelled the French troops, took possession of the country; they were received with joy by the inhabitants, who did homage to their new sovereigns, and in return obtained from them the confirmation of all their privileges. A compromise was immediately entered into between the bomop of Coire and the three leagues, to share the sovereignty of this country. In the following year Maximilian Sforza, raised to the ducal throne of Milan upon the expulsion of the French, ceded in perpetuity the possession of the Valteline, Chiavenna, and Bormio, to the bishop of Coire, and the Grisons; a cession ratified by Francis the First, in the treaty of peace which he concluded with the Swiss and their affics the Grisons in 1516, when he obtained possession of the Milanese.

In 1530 the Grisons acquired the whole dominion of the Valteline, to the exclusion of the bishop of Coire; under pretence that the bishop had not furnished his quota of men and money in the war with James of Medici, in defence of these coded countries, they compelled him to sell his share of the sovereignty for a yearly income of 573 florins payable to him and his successors out of the customs of Chiavenna. From that period these provinces were possessed by the Grisons without molestation, until the rival interests of France and Spain, the intrigues of the pope, religious enthusiasm, the zeul of party, and exactions of the Grison governors, kindled an insurrection, which commenced with a general massacre of the Protestants, and raged for a series of

years with the most savage and unremitting fury.

In no country has the spirit of discord been more prevalent, or religious disputecarried to a greater height. The zeal of contending factions has communicated itself to the historians of these events; on both sides religion has been pleaded as a sanction to the most attrocious actions, and alleged by one party as an excuse for tyranny, and for rebellion by the other.

As the Valieline, Chiavenna, and Bormio originally belonged to the Milanese, the sovereigns of that dutchy always looked upon the Grisons with a jealous eye, and secretly embraced every opportunity to foment the disturbances with which they, in com-

mon with all democratical states, are occasionally convulsed.

Upon the extinction of the family of Sforza in the person of Francis the Second, the emperor Charles the Fifth seized the Milanese as a fiel reverting to the empire, and, disregarding the claims of the French king, gave the investiture to his own son Philip. With the possession of the Milanese Philip succeeded to pretensions upon the Valteline; and although both he and his successor Philip the Third entered into treaties of alliance with the three leagues, by which they resigned all claims to this country; yet they never finally relinquished all intention of recovering a province which had been once dismembered from the Milanese, and which the contests between France and Spain rendered more valuable to them, than to their predecessors in the dutchy of Milan.

During the constant wars which, from the accession of Philip the Second, the restless ambition of the Spanish court entailed upon Europe, the German and Spanish branches

of the house of Austria were inseparably united; and the councils of Vienna were directed by the cabinet of Madrid. Under these circumstances the Valtetine, which, by connecting the Tyrol and the Milanese, afforded the only secure passage for the junction of the Austrian and Spanish troops, became of signal importance. Hence the Spanish governors of Milan, highly solicitous to acquire influence among the people, secretly fomented the spirit of disaffection, which the conduct of the Grison governors too justly provoked; promised assistance to the aggrieved inhabitants, and gained by these means a powerful party in favour of their court. The minds of the inhabitants being thus gradually won over to the Spanish interest, the count Fuentes, governor of Milan, ventured, in defiance of the Grisons, to construct the fort* which bears his name, for the purpose of commanding the passage of the Valteliae.

The same reasons which rendered the Spaniards desirous to secure the Valteline, induced the French to obstruct their designs. Henry the Fourth, with his usual vigour, zealously espoused the cause of the Grisons, and was preparing to send effectual assistance against the attempts of Fuences, when he was assassinated; and the intestine troubles, which took place upon his death, for a time totally withdrew the attention of France from this quarter. The Spaniards, thus freed from their most formidable rival, pursued their projects upon the Valteline without opposition, and availed themselves of the do-

mestic dissentions between the Grisons and the inhabitants.

The Grisons had long attempted to introduce the Reformation into the Valteline with the most injudicious zeal, and without paying sufficient attention to the prejudices of a superstitious people. Churches for the worship of the reformed religion were constructed, and ministers regularly settled with a permanent salary; schools for Protestant children were established at Sondrio, notwithstanding the remonstrances of the Romish priests, and the opposition of the people. Many privileges of the popish ecclesiastics were taken from them; privileges† which, though repugnant to every principle of sound government, were sanctified by usage, and could not be hastily abolished without exciting general discontent.

To these religious grounds of dissatisfaction were added others, arising from the tycannical proceedings of the Grison governors, whom the advocates for rebellion painted, and it is to be feared with too much justice, in the most odious colours. "A system," they cried, "of avarice and extortion is established by law; the magistrates purchase their offices, and indemnify themselves by the plunder of the country. All things are venal; life, honour, and even conscience itself has a price; it is not possible for the governors to be more iniquitous, nor for the people to suffer a greater complication of

Julymite "

These well-grounded complaints were aggravated, and the crisis of rebellion accelerated by an act of flagrant injustice. Many inhabitants of the Valteline, suspected of favouring the Spanish court, particularly those who had opposed with the greatest zeal the introduction of the reformed doctrines, were arrested, and conveyed into the country of the Grisons. Mock courts of justice were established in several places, by which the prisoners were fined to a large amount; and some were even wantonly sentenced to the torture.

Among the sufferers was Nicholas Rusca, a priest of Sondrio, who had gained the universal esteem of the Catholies, by his unremitted resistance to the Protestant doctrines, and who, for the rigid austerity of his manners, was revered by the multitude as a saint.

The death* of Rusca, amidst the most excruciating torments, raised a spirit of thay among the people too violent to be appeased. The emissaries of Spain did not fail to increase the general ferment, and to suggest the most plausible motives for immediate insurrection, by representing that, as the Grisons were convulsed by factions, and France disturbed by intestine commotions, a favourable opportunity presented itself to shake off the yoke under which they ground. The suggestions had their effect; and the inhabitants commenced hostilities by a general massacre of the Protestants.

The 20th of July 1620, was the day appointed for the perpetration of this horrid design. At dead of night Robustelli, the leader of the conspiracy, accompanied by a hundred followers, arrived at Tirano, and, having assembled the chief Catholics, laid before them the intention of extirpating the Protestants; the dreadful proposal was embraced with all the zeal of resentment, inflamed by fanaticism. At break of day the signal for massacre being given by ringing of bells, great part of the inhabitants issued from their houses, and repaired to the market-place with terror and anxiety. In this moment of perplexity the conspirators fell upon the Protestants, and encouraged the people to follow their example, by destroying the enemies of the Catholic faith. Few words being necessary to exasperate an incensed and superstitious multitude, every person seized the first arms which presented themselves, secured the streets, stormed the houses, and assassinated the Protestants.

During this dreadful scene, the podesta, his family and some of the principal Protestants took refuge in the town-house, and barricadoed the doors; the Catholies however soon forced a passage, and burst into the apartments where the fugitives were collected. Their fury was for a moment suspended at the affecting sight of the podesta and his wife upon their knees, presenting their infant children with uplifted arms. But such was the implacable barbarity of the enraged multitude, who demanded with repeated instances the death of the podesta and his family, that this short respite was of no avail, and only served to embitter their fate; they were first imprisoned, and then put to death, without distinction of sex or age.

The next scene of the massacre was exhibited at Teglio, whither some of the conspirators were dispatched from Tirano; they were dressed in red, as a signal to the inhabitants that the rising at Tirano had succeeded. The Catholies soon collected in a body, and repaired to the church, where the Protestants were assembled for the celebration of divine service. One of them levelled his piece against the minister, who was preaching; but missing his aim, the Protestants rose up, drove out the Catholies, and barricadoed the doors. The assassins then climbed up to the windows, and shot from the outside upon the crowded andience; the doors at length being burst open, will the

Protestants were put to the sword excepting those who renounced their religion.

Another party of Catholics made their way towards Sondrio; but the governor of

the Valteline, apprised of their design, ordered the inhabitants to take arms, and summoned the people of the neighbouring district to his assistance; in obedience to this injunction, both Protestants and Catholies began to assemble, but the Protestants were intercepted and destroyed. Some attempting to escape towards Engadina and Pregalia were overtaken in their flight, and involved in the common slaughter. Even the women laid aside the natural softness of their sex, and, hardened by superstition, practised every species of outrage upon the bodies of the deceased. Meanwhile the Catholic troops entered Sondrio, and exciting their partisans with the cry of "Pown with the enemies of the Catholic faith," made a general slaughter of the unhappy Protestants. Mercy, here

ever, was extended to the governor and his family, in a manner which does honour w the chiefs of the revolt who conducted the attack of Sondrio. He was first imprisoned, but afterwards, in consideration of his mild behaviour to the Catholics, dismissed with

his family, and escorted in safety to the confines of the Valteline.

It would be shocking to humanity to enumerate all the particulars of this savage massacre, or to trace its devastation in the several towns of the Valteline. It continued three days without intermission; nor were its horrid effects confined merely to those who were assassinated upon the spot. Many who escaped into the country were hunted down like wild beasts; others, after cluding the fury of their pursuers, were consumed by hunger and fatigue, and numerous dead bodies were discovered in the woods, caverus, and torrents. Several Catholies, who were allied to the Protestants, shared in the general disaster; even women and infants were slain in the most deliberate manner. Some Protestants saved their fives by abjuring their religion, and many, who refused to purchase their safety by this concession, were burnt alive.

In the midst of this dreadful carnage, one instance of singular humanity deserves to be recorded. Bartholemeo Peritti, the principal Catholic at Berbeno, being exhorted to put all the Protestants of that town to death, apprised them of their danger, and assisted them in effecting an escape. But this act of elemency was the occasion of his own

destruction, and he was executed as an enemy to religion.

All the Protestants being either destroyed or driven out of the country, the remaining inhabitants renounced their alliance to the Grisons, and framing a new form of government, threw themselves under the protection of the king of Spain, who sent an army to their support. The people of Bormio followed the example of the Valteline, with this difference, that they did not massacre, but only expelled the Protestants. Having entered into an offensive and defensive alliance with the inhabitants of the Valteline, they also formed an independent commonwealth.

The Grisons, divided among themselves, were totally unequal to the chastisement of their revolted subjects. The Catholics were desirous of employing the mediation of Spain, for the purpose of recovering the Valteline; the Protestants, inclined to vigorous measures, proposed an application to the Swiss cantons, Venice, and France. After violent dissentions, which were not terminated without bloodshed, the Protestant interest

prevailed, and a deputation was sen, to those powers.

Zurie and Bern instantly dispatched a body of troops, while the Catholic cantons reaused to act against those of the same persuasion. Venice, alarmed at the growing power of the house of Austria, and desirous of a passage through the Valteline, gave a flattering answer to the request of the Grisons, but with a spirit of delay natural to a republic, deferred sending any actual succour. France too, having just emerged from a civil war, was more disposed to negotiate than to act with decision. Bassombiere was dispatched to Madrid to solicit the restitution of the Valteline; and, although a league was conrladed betwixt the king of France, the duke of Savoy, and the Republic of Venice, to assist the Grisons unless the Valteline was restored; yet all that could be obtained from the Spaniards was, that the forts of the valley should be placed in the hands of the Pope; but as the Pope was a secret partisan of the house of Austria, and inclined to layour the rebellion of the Valteline, it was evident that he would restore the forts to the Spaniards upon the first opportunity. In this interval the united troops of the Grisons, Zurie, and Bern being deleated with great slaughter, the Valteline seemed upon the point of being for ever dismembered from the Grisons, when the French court suddenly changed its plan of operation, entered into the war with a zeal as sincere as it was politic, and vigorously interposed in behalf of the Grisons.

This revolution in the French polities was owing to the ascendancy of cardinal Richeren, who no sooner began to preside in the cabinet, thrut the kingdom scemed to awake from that deep lethargy into which it had sunk, during the feeble administrations of Ancres and Luynes. That great minister instantly perceived the importance of the Valteline; without wasting a moment in deliberation, he demanded an immediate restitution of that country, and enforced this demand by sending a detachment of troops of the assistance of the Grisons, under the command of the marquis de Couvres.

The general, animated with the spirit of the new minister, penetrated into these parts joined his army to the Swiss and Grisons, and in two campaigns drove the Spaniard-from the Valteline, Chiavenna, and Bormio. The two latter provinces were immediately restored; but when the Grison deputies repaired to the French general at Sondrio, to demand the cession of the Valteline, Couvres proposed that the exercise of the Protestant religion should be abolished throughout the valley; that the inhabitants should appoint their own magistrates, and pay a yearly tribute of 20,000 crowns; and he shewed himself so strongly inclined to circumscribe the authority of the Grisons over the inhabitants of the Valteline, that he was suspected of being bribed by them. But it soon appeared, that this conduct was occasioned by directions from his court, and proceeded from a reconciliation which, unknown to the Grisons, had taken place between the kings of

France and Spain. Richelieu, the soul of the French monarchy, having brought to maturity his project for subjugating the Hugonots, was too great a poli in to enter into a foreign war at the eve of a civil commotion; and well aware that he could not maintain possession of the Valteline without an expense of troops, which he could ill spare, temporised for the moment, and made overtures to Philip the Fourth, who, harassed by the long continuance of hostilities, seemed equally desirous of an accommodation: accordingly prelimi naries of a new treaty were immediately adjusted by the contracting powers, at Mosson in Arragon. It was agreed that the Valteline should again be restored to the Grisons, under the following conditions: no other religion but the Roman Catholic to be tolerated: the inhabitants to elect their own governors and magistrates either from themselves or from the Grisons, but always from persons of the Roman Catholic persuasion; and the governors to be confirmed by the Grisons. In return for these privileges it was stipulated, that the inhabitants should pay an annual tribute, the amount of which was to be settled by mediation. In consequence of this treaty, concluded on the 5th of March 1626, the French resigned the forts of the Valteline into the hands of the pope, and evacuated the country.

In conformity to this alliance, the inhabitants having elected Robustelli, who began the massacre, for their governor, and appointed twelve magistrates, sent a deputation to Coire to demand the confirmation of the Grisons, who were by no means disposed to accede to a treaty so destructive to the rights of sovereignty, which they possessed over the Valteline. Openly excited by the republic of Venice, and secretly encouraged by the French minister, they refused to acknowledge the treaty of Mosson. But as they were not in a state to support their claims by force of arms, they could only remonstrate and negotiate, without producing any immediate effect.

Affairs continued in this state for three years, until Richelieu, having completed the reduction of the Hugonots by the capture of Rochelle, turned the whole force of France against the house of Austria; the diminution of whose power he had long meditated. He now threw off the mask: the dominions of the house of Austria were invaded on all sides, and every part of Europe became the theatre of his vast designs. Among other enterprises the Valteline engaged no inconsiderable share of his attention; the duke of

Rohan was dispatched to the Grisons with a formidable army, and, worsting the Spanish

troops in various encounters, dispossessed them of the Valteline.

Upon this decisive success the French abated much of their solicitude for the interests of the Grisons; although they began the war with demanding an unconditional restitution of the Valedine, yet they were no sooner in possession of the country than they professed, as on the former conquest, a great tenderness for the privileges of the inhabitants; and refused to surrender their acquisition to the Grisons, unless upon terms more favourable to the people than had been offered even by the treaty of Mosson.

The Grisons, having no prospect of assistance from any other quarter, found them selves under a necessity of according to these humiliating stipulations. The French, with a view probably of retaining the Valteline in their own hands, continued to delay the restitution, and clogged every subsequent negotiation with conditions still more

infavourable.

The Spaniards artfully availing themselves of these circumstances, held out the most flattering overtures of accommodation. The Grisons, encouraged by these well-timed offers, and incensed at the repeated instances of duplicity they had lately experienced, rose up in arms, and drove the French from the Valteline. The treaty of Milan was the consequence of this revolution: a close alliance was concluded between the Spaniards and the Grisons; and the Valteline was restored under the guarantee of that very power

which bad originally excited the inhabitants to revolt.

This treaty, contracted in the year 1635, secured to the Spaniards the passage of the valley, which was the great object of the war, and restored the Valteline, Chiavenna, and Bormio to the Grisons, under the following conditions: an act of oblivion; the immunities of the subject countries to be confirmed as they existed before the revolution of 1620; no religion but the Catholic to be tolerated; no person of any other persuasion to be permitted to reside, excepting the governors, during the two years they should continue in office, and the Protestants possessed of lands, who should not be allowed to remain in the country above three months in the year; the privileges of the ecclesiastics to be restored in their full latitude.

A few alterations were made in the government of the Valley, and some regulations introduced for the purpose of stemming the torrent of injustice and corruption; they consisted chiefly in a new method of nominating the governors, and in creating the office of assessor. The articles were guaranteed by Spain, and inserted in the capitulation, or treaty, ratified in 1639, at Milan, in the presence of the deputies from the Valteline.

The deputies reproached the Spaniards for having summoned them to Milan, in order to be present, in silence and with tears, at the subversion of their liberty; and, when the treaty was announced to the inhabitants of the Valteline, a general despair spread through all ranks. The people universally lamented that they had been deluded into a revolt under a promise of protection; that they had expended during this fatal war above 25,000,000 of florins,* for no other purpose than to procure an alliance between Spain and the Grisons, and to be restored to their original masters, exasperated by their revolt, and preparing to renew the former acts of injustice and tyranny which had driven them to rebeliion. Nor were these murmurs ill-grounded; for, except the total exclusion of the Protestant religion, no material alteration was made in the fate of this vailey.

Since this treaty the laws have been no less perverted than before, the exactions of the governors have continued as exorbitant, and the courts of justice as iniquitous and

corrupt. The change in the administration of justice has proved no alleviation; the creation of the assessor's office served only to give the sanction of law to the most infiguitous proceedings, or to vary the mode of appression. This innovation has been moreover attended with this had effect to the bulk of the inhabitants; before the rebellion the nobles were principally subject to the rapacity of the Grison judges; but since the pacification, the people have been more exposed to exactions.

I have thus brought down the history of the Valteline to the pacification of 1637. Since that period no material change has taken place in the situation of affairs. The sovereigns of Milan have always cultivated the friendship of the Grisons; and the inhabitants of the Valteline endured a regular course of tyrathy under the government of a free state; confirming a fact notorious in the annals of ancient Grevee, that no people are more oppressed than the subjects of a democracy.

LETTER LXXVI.

Government of the Valteline.

THE Valteline is divided geographically into three principal districts, and politically into five governments.

The three districts are, 1. Terzero di Sopra, or the Upper District; 2. Terzero di Mezzo, or the Middle District; 3. Terzero di Sotto, or the Lower District.

The five governments are, 1. Of the Upper District; 2. Of the Middle District, called also the government of Sondrio; 3. Of Teglio; 4. Of Morbeguo; 5. Of Traona.

Each of these five governments is subject to a magistrate appointed by the Grisons, who is changed every two years. The magistrate over the middle district is called Governor of the Valteline, and possesses, in some respect, a superior degree of authority to the others, who are styled Podestas; he is also captain-general of the Valteline.

But before I proceed to explain the form of government, it may be necessary to lay before you the method of electing the governor and podestas, to whom the Grisons delegate their authority over the Valteline.

In 1602 some efforts were made to restrain the excessive venality and injustice of these magistrates, which were derived from the public sale of the governments, and the

• During the late contests between France and the house of Austria the Validline became an object of great importance, and the neutrality of the Swiss and Grisons alone prevented the occupation of the country by one of the contending parties. The inhabitants, irritated by a long series of oppressions, eagerly adopted the new principles diffused by the French agents and were anxious to deliver them selves from the yoke of the Grisons. During the progress of hostifities, Bomapare, well aware of the advantages derived from the neutrality of the Veltefine, defined all interference, that he concluded the armistice with the emperor, which terminated in the treaty of Campo Formio. He then availed thinself of an insurrection which broke out in the Valteline. The inhabitants animated by the establishment of the Cisalpine republic, took up arms, drove out the Grison governors, and declaring themselves independent were soon afterwards joined by the natives of Bormio and Chiavenna.

The Grisons, who had recently experienced a revolution in their form of government, and hopeless of deriving assistance, either from the Swiss cantons of from the house of Austria, requested the mediation of the French republic, which being also accepted by the revolted provinces, the subject of dispute was referred to Bonaparte, and two deputies on each side ordered to repair to Milan. The deputies from the revolted provinces instantly made their appearance, but the Grisons, torn by intestine factions, and averse to the mediation of the French, which they had been unwarily induced to solicit, not only declined scuding their deputies, but returned no answer to the repeated summons of the French general. In consequence of this silence, Bonaparte decided the contest, by declaring the revolted provinces independent, and confirmed the union which they solicited with the Cisalpine republic. Thus after a period of near three centuries, the Valtetine, Chiavenna, and Bermie were again incorporated with the Milanese, under a republican form of government.

hare of the fines for criminal offences between the Grisons and the governors.* To prevent corruption in the distribution of their offices, and exaction in the governors, two important changes were made. Instead of appointing one person, four candidates, nominated by the community to whom the turn of election belonged, drew lots for the charge. But this alteration would have been attended with few beneficial effects, had it not been followed by another, which tripled the stipend of the governors, and precluded them from any share in the fines: yet these salntary regulations, which prevented the Grisons from selling the governments at so high a price, were a few years after abolished by the diet. In octer, however, to preserve some appearance of impartiality in the choice of magistrates, it was stipulated in the treaty of Milan, that three candidates should be nominated by the community to whom the election belongs, and that one of a these should be appointed by the diet. Yet this mode is a mere formality; three are always presented, but the dict never fails to nominate the person recommended by the community. These magistracies are allowed to be openly purchased: in general, part of the money is assigned to the public fund of the community, and the remainder distributed among the body of the people, in whom the right of election is vested, and whose votes are seldom obtained without additional bribes. It will easily be imagined what a dreadful scene of † corruption is opened by this mode of proceeding; and how frequent ly persons are appointed to the governments, who are totally inadequate to the discharge of their trust.

These magistrates, as representatives of the sovereign state, enjoy the supreme authority, and are entrusted with the power of life and death; and, though apparently controlled by the laws, devise means to evade them. But their authority will be best under stood from an account of the civil and criminal courts of justice.

The criminal tribunal is composed of the governor, vicar, and assessor.

The governor arrests, imprisons, and examines the delinquent; though, according to the letter of the law, no examination ought to be made but in the presence of the vicar and assessor. The criminal being convicted, and the sentence passed, the governor enjoys the power of remitting the punishment, excepting in cases of high treason, premeditated murder, or other enormous crimes. He has a small annual stipend paid by the Valteline, but derives the chief part of his income from the fines for criminal offences, of which he receives two thirds. In all trials he is bound to follow the penal statutes, which are drawn up with great precision and clearness.

The vicar is always a Grison, and is chosen by rotation from the several communities: three candidates are presented to the inhabitants of the Valteline, who appoint one of them to the vacant office. This mode, adopted in the treaty of 1639 to check cor-

It is necessary to apprise the reader that, when I use the word governor simply, I apply it indiscriminately to the governor of the Valedine and the four podestas.

† All authors, both natives and foreigners, who have written upon the Grisons, have not failed to enumerate the ill effects resulting from this sale of governments, which is authorised by law; but none have expressed their disapprobation in stronger terms than Fortunatus Juvalta, in the following passage from a manuscript account of the Grisons:

Quid ad honores et præsertim ad quæstuosas illas præsecturas aspirabant, non-aliter quam ambitu et largitionibus voti compotes fierent — Omnia enim vendia prostrabant, non-secus ac aliæ merces.

Neque vero privati tantum homines mercimonia illa exercebant, sed communitates integræ etiam cauponobantur, neque etubescebant præfecturam communitatis cum legationibus ad dictas seu convertas publicos, quarum in ipsorum manu erat electio, cum officits ad subditos et alits emolumentis communitati provenientibus, consilio publico, solemiter, constituto pretio, in multos amos vendere, et ne quid ambigi posset, publicis tabulis perscriptis consignare. Indigni prorsus aurea libertate, unpete qui illam tam turpiter et scelerate profanarent ac prostituerem. Emtores isti emebant, ut carius venderent, ideoque ubi spes aliqua lueri affulgebat, merces suas venales exponebant, et plus offerentibus addiceban:

quam ambit**u** liæ merces. negræ etian ctas scu conemolumentis mos vendere, rea libertate, i emebant, ut ebant, et plus

ruption, has not been attended with the desired effect. The community, in whose turn it is to elect the three candidates, leaves to the purchaser of the office the power of nominating his two associates; the diet, in delivering in the three names, recommends the person who had been previously designated by the community, and this recommen dation is always accepted by the Valteline. The vicar ought to attend in person all trials when the governor examines the prisoners; but this custom is now fallen into disuse, and in lieu of his attendance, he receives an annual sum of 1127 Grison florins, about 831, from the governor of the Valteline and each of the four podestas: a shameful clusion, as the vicar was designed to be a kind of coursel in favour of the prisoner, and to prevent injustice in the mode of examination. When the prisoner is convicted, an account of the process is laid before the vicar, who must confirm the sentence. Torture, for the purpose of forcing confession, cannot be inflicted without his consent, and in his presence, which is never dispensed. Besides a small salary, and the annual sum of 1127 florins, he has a stated allowance, as well for every consultation, as for each time that he is present at the infliction of torture.

The assesser must be an inhabitant of the Valteline; he is nominated by the vicar from three candidates, chosen reciprocally from each of the three Terzeros. His vote is necessary to concur with the vicar in ordering torture: he must also attend when it is applied, and confirm the sentence passed against the convicted persons. He has no regular salary, but his profits depend upon the number of processes in which he is consulted. This is the only office which gives to the inhabitants of the Valteline any share

in the criminal jurisprudence.

According to the original intention of the statutes, the assessor ought to be a person well versed in the laws of the country, and should be considered as an advocate for the accused; but as he is obliged to the vicar for his nomination,* he is commonly his

creature, and seldom gives his vote in opposition to him.

Such is the general theory of the criminal jurisprudence in this country, by which is appears that the power of the governor is limited as well by the strict letter of the law as by the interference of the vicar and assessor, whose concurrence is necessary for passing a final sentence. But this limitation exists only in theory; for the laws are easily cluded, and even made subservient to the conviction of the innocent as well as the guilty. The vicar and assessor, be they ever so upright, can hardly prevent the oppression of the judges; and if they are themselves rapacious, they receive their share of the plunder, for conniving at the governor's injustice.

Having gained insight into the practice of the courts of justice, I shall lay before you the general mode of proceeding, from the arrest of the criminal to his final sentence, interspersing the account with occasional remarks, which will serve to show the abuses

introduced into the administration of justice.

The governor issues the order of arrest, and commits the criminal to prison; he detains him in confinement as long as he pleases, delaying or hastening the inquiry as he thinks fit. The examination is secret, no one being present but the governor, or his substitute, and the notary, who writes down the process. It must be evident with how much case persons versed in the arts of chicanery can brow-beat the ignorant, and per plex the prisoner, who is allowed no counsel. If the criminal is found guilty, whatever is his crime, he may make a composition with the governor, before the case is referred to the vicar; or, in other words, as the examination is secret, the governor can draw

^{*}Usually the assessor either pays the vicas for his appointment or else delivers him all his a government. ices of office.

up the process in the most favourable manner, and may give what explanation he

If no composition is made, the case is laid before the vicar and the assessor, who are obliged to give their vote-according to the letter of the law; and as the statutes are very severe, the penalties are either heavy fines or corporal punishment. In the former circumstance, the governor receives two thirds of the fine; and, as in the latter, he has the power of remitting the punishment, excepting for the most atroctous crimes, he generally accepts a commutation in money, if the prisoner is able to pay it. By these means most offences may be easily compounded for; a circumstance which empowers the rich to commit crimes with impunity. It is, however, a matter of little consequence to the governor whether the prisoner is rich or poor; in the first instance, he may receive a composition from the prisoner himself, in the latter from the parish. For, in case the punishment for the crime is corporal, the expenses attending it are considerable, as the executioner of Coire must inflict it; for which reason the governor generally remits the penalty, and receives from the parish a composition in money somewhat less than the expences of inflicting cornoral punishment.

We may add to this list of grievances the power possessed by the magistrates of delegating their authority without residing in the government. If the delegate is a Grison, he is called Assistente; if an inhabitant of the Valteline, Tenente. He either purchases the fines and perquisites upon a calculation of their average value, or is responsible for them to the governor. In some places the delegation is almost always bought by the same person, who resides upon the spot, and becomes a perpetual judge; in others, a society of persons join to purchase the profits of the magistracy; they appoint the nominal delegate, and secretly direct the processes. Such a delegation may be called a settled tyranny, and, according to the expression of an elegant author,* "establishes a

wholesale traffic between criminals and courts of justice."

From this general view of the criminal jurisprudence, we may readily infer the wretched situation of the inhabitants; where the supreme magistrate purchases a temporary office at an exorbitant price, and has an inadequate salary; where the principal profits of his charge arise from the fines for criminal offences; where it is his interest to arraign and to convict; and where he is himself the interpreter of the laws, of which

he is commonly ignorant, the accuser of the party, and the judge.

I have already mentioned the power which the governor enjoys of pardoning all offences except the most atrocious crimes. A pardon of this kind is called liberatione; and there are printed papers that contain its form, in which blank spaces are left for the name of the person, the crime committed, the date, and the signature of the judge. I enclose a copy of a liberation;† it brings to my recollection those acts of indulgence,

· Eden's Principles of Penal Law, p. 61.

† The following is the form of a liberation:

Podesta Regeme della Giurisdizione di Tirano, e sue Pertinenze, &c. Ciudice de Malefici con Mero, e Misto Impero, e con autorita di Spada, &c.

lto, siccome

orso, o abbia

which the Catholies obtain from Rome for the absolution of their sins with this difference, that the acts of indulgence refer to a future state, the liberation to this life.

The price of these pardons varies according to the magnitude of the crime, the condition of the culprit, and more particularly the time in which it is granted; for the aum is greater when a governor first enters upon his office, than when he is retiring. Sometimes, during the last two or three hours previous to the expiration of the office, pardons may be procured at the lowest rate; and I was assured from good authority, that a liberation for homicide has not unfrequently been obtained for about four pence.

Do not suppose that this account of the venality which reigns throughout the Vaite line is exaggerated; for I have taken great pains to ascertain the truth, and it has been confirmed by persons of all ranks, both in the Grison and subject countries. Nor will you be led to imagine that all the governors are equally rapacious and unjust. Like the Roman proconsuls, some carry their rapine to the height, others are less exacting.

and a few are free even from the most distant imputation of injustice.

The civil courts of justice remain to be considered.

Although the governor presides and passes sentence, yet, by a singular privilege, the cause is not always left to his absolute decision: he examines the witnesses, and draws out the processes, but, at the request of either party, the cause may be referred to an arbitrator, who is called Savio. He is either nominated by the plaintiff and de fendant, or, if they cannot agree, is chosen by lot in the following manner: the plain tiff and defendant choose each six persons: from the six appointed by the defendant the plaintiff selects one; the defendant nominates one of the six chosen by the plaintiff, and these two persons draw lots who shall be arbitrator. The arbitrator then examines the acts of the process, gives his opinion, which is called in the statutes of the country, Il Consiglio del Savio; and should the governor refuse to pass sentence, the opinion of the Savo is ipso facto a decision.

From this decision an appeal lies to two arbitrators, called Probi, who are appointed by the parties in the manner above mentioned: should they disagree, then the two parties amicably nominate a counsellor, who accedes to one of the Probi; this sentence is final, if it concurs with that of the Savio, but otherwise, a farther appeal lies either to the syndicate or diet, and ultimately to the several communities of the three leagues. When the governor decides in the first instance he receives 3 per cent, of the contested property, but only 1 per cent, when recourse is had to arbitration, the other 2 per cent.

being paid to the Savio.

By this singular privilege of referring to arbitration in all causes of property, the civil courts of justice are not open to such corruption as the criminal tribunal; yet venality has taken so deep root in the affairs of this unhappy country, that bribery finds its way even into these tribunals. When the civil causes are brought into the governor's court, and decided by him without the intervention of the Savio and Probi, there is an appeal to the syndicate, a body whose office I shall now explain.

Here the crime is mentioned.

VOL. V.

At the end of every two vears when the magistracies expire, syndicates are appointed by the republic of the Grisons, for the purpose of inquiring into the administration of the several governors, and of hearing appeals from their decisions. This court is composed of nine members, including the president, chosen reciprocally by the communities, three from each league. They make a circuit into each of the subject provinces, send out proclamations, that they are ready to receive all accusations against the governors, examine witnesses, decide appeals, and mitigate fines, without the concurrence of the vicar and assessor. They do not, however, finally determine in civil causes, which may be referred from their decision to the diet. The syndicate which was intended to oppose corruption and injustice, is nevertheless the great support of both; nor can it be otherwise, for the syndies purchase their office from the several communities, and as their salary is very small, can only reimburse themselves by receiving bribes from the judges or from the appellants. Their office is bought for a greater or smaller sum, as more or less appeals of consequence are to be submitted to their arbitration. And what occasions still greater abuses, when a cause of great importance is to be referred to the syndicate the governors frequently purchase from the communities, in whose right the election is for that time vested, the power of nominating the syndies, and of course appoint their own creature. Hence this court is become so corrupt as to give rise to a proverb, "As venal as the syndicate."

Having thus endeavoured to draw a general sketch of the civil and criminal jurisprudence in this country, I shall now mention the domestic administration of affairs.

All public concerns which do not fall under the jurisdiction of the Grisons, are discussed and determined by a council composed of five representatives, one from each district, which meets as occasion requires at Sondrio. Previous to its sitting, the public notary writes to the several parishes of the five governments, informing them of the business to be transacted: each parish has its meeting, in which every householder possesses a vote; and each district has its assembly composed of deputies from the several parishes, who choose the representatives. In all affairs of importance, the representatives are bound to vote in conformity to instructions received from their constituents, and all eases of importance are decided by a majority of voices. The council is empowered to demand a redress of grievances from the Grisons, and to remonstrate against infractions of the privileges granted to the inhabitants by the capitulation of Milan. The governor of the Valteline is present, but has no vote.

The tribute which the Valteline pays to the Grisons is so small, the salaries of the governors so inconsiderable, and all duties so trifling, that most writers, who have had becasion to mention this valley, have described it as the most happy and the least oppressed of all subject provinces: without reflecting that notwithstanding these advantages the country is annually drained of a sum very disproportionate to the ability of the inhabitants.

It is difficult to ascertain the exact amount of this sum, as it arises chiefly from the secret as well as public profits of the courts of justice. But when we consider that the greater part is produced by extortion; that scarcely any distinction is made between innocence and guilt; that great crimes are committed with impunity, and petty offences severely punished; we may add, that the mode of exaction is more detrimental to the country than the loss of the specie itself; inasmuch as a corrupt administration of justice is the worst of all oppressions.

The clergy of the Valicline are not responsible to the ordinary courts, their immunities being so exorbitant as to render them almost independent of the civil authority; they are only amenable to the court of the bishop of Como. If a priest is guilty of any

ppointed ration of is commmuni ovinces; e govern rrence of es, which ended to ior can it nities, and ibes from iller sum, on. And be referred in whose es, and of

lilan. The

fly from the ider that the between inity offences ental to the tion of jus-

eir immunil-authority; guilty of any misdemeanor, his person cannot be secured without the concurrence of the bishop, and governor of the district in which the crime was committed. It is therefore extremely difficult to bring an ecclesiastic to justice; as impunity is easily purchased, either by securing the favour of the bishop's vicar, or of the magistrate. Nor are these permicious-privileges confined merely to the elergy, but extend to all persons wearing an ecclesiastical dress, with the permission of the bishop of Como.

The Grisons have frequently endeavoured to abolish these immunities, but always without effect. The nobles of the Valteline are interested to support the privileges of the clergy, because they can easily obtain the permission of wearing the coelesiastical dress, and can seeme their property, by leaving their estates to the elergy at the extinction of all the heirs named in the succession. Such estates, added beneficing entition, are very common in the Valteline, and cannot be seized for debt, or confiscated.

All civil causes of the elergy, below the value of two hundred livres, are decided by the vicar of the bishop of Como: above that sum they are brought before the bishop. An appeal from his decision lies to the pope's nuncio at Lucern, from him to the ecclesiastical tribunal at Aquilea, and from thence to Rome.

LETTER LXXVII.

Teglio Sondrio Anecdotes of the Painter Ligario Morbegno Delebis

INSTEAD of proceeding by the nearest road from Tirano to Sondrio, I made a eneuit by Teglio. I traversed the plain of Tirano, rich in all the productions of natural and continued for some way at the foot of the northern ridge of mountains, which are highly cultivated to their very summits. Lower towards the south-east, and further towards the north-east, the tops of the rugged Alps make their appearance glistening with snow. I passed through a continued vineyard, and the soil is so fertile, that corn, millet, flax, and hemp, are sown among the vines, which overhang in beautiful festoons. Every village is adorned with a thick grove of chesnut trees, whose rich and dark foliage produces a pleasing effect.

Teglio situated upon the top of a mountain, about nine miles from Tirano, and twelve from Sondrio, is a long straggling place, and contains about three hundred houses. Close to the town are the ruins of a fortress standing upon an insulated rock, and formerly esteemed of great strength. This elevated spot commands a very rich and extensive prospect from Tirano to the lower part of the valley beyond Sondrio, as far as Morbegno. The government of Teglio is said to comprise the twelfth part of the Valteline; it is the most pupulous district, and contains about eight thousand souls; it produces in a good season much more corn than is sufficient for the consumption of the inhabitants, and rivals Sondrio and Tirano in the goodness of its wine.

Finding little at Teglio but the face of the country to excite my enviosity, I proceeded in my journey to Sondrio, through a tract equally cultivated with that which I had already passed. I descended by a gentle slope until I came to the Adda, which I followed, as it roars through the plain, sometimes confined in a narrow channel, sometimes expanding in a wider bed, and threatening the country with continual inundations.

Sondrio is the capital of the valley; the residence of the governor and of the vicar, but like all the towns I have hitherto seen in the Valteline, seems descrited, and displays little appearance of trade or animation. The town, partly built in a plain, and partly

apon crock, is placed in a viry romantic situation, at the extremity of a narrow valiety, and occupies both sides of the Molein via furious torrent which frequently overflows its banks. Many of the houses are very account; for Lobserved the arms of the Visconti, formerly the sovereigns of this country partial upon the walls; these arms representing an enormous scriperal crashing a minerical language, are too remarkable to escape observation.

The Valteline, from its a ighbourhood to Italy, has imbibed a taste for the fine arts, and contains several collections of pictures which are not unworthy of notice. This country, however, has produced lew artists of any eminence. Pietro Ligario is almost the only painter who deserves to be mentioned, and his name is scarcely known beyond

the limits of the Valteline.

Ligario was born at Sondrio in 1686, of the ancient family of Ligario, which took its name from a neighbouring village. Having discovered a lively genins, and a taste for the elegant arts, he was sent when young to Rome, under the care of Lazaro Baldi, from whom he learnt that exactness of design which characterises the Roman school. From thence he repaired to Venice, and passed some time in studying that exquisite colouring for which the Venetian masters are distinguished. He made himself first known at Milan, where he met with some encouragement; and in 1727 returned to the Valteline; he found, however, but little employment, until he was honoured with the patronage of count Desalis, envoy from Great Britain to the republic of the Grisons. As he rose in reputation his business increased; but being always poor he was frequently compelled to finish his productions with such baste, as rendered it impossible to give all of them that perfection, which he was capable of bestowing. Hence arises that inequality which is so remarkable in his paintings.

There is scarcely a church in the Valutine which does not possess one of his pictures: the most capital of his pieces are the martyrdom of St. Gregory, in one of the churches at Soadrio, and St. Benedict, in the chapel of a numery near the town. These were his latest performances; and as they were, contrary to his usual custom, finished with great labour and exactness, may be considered as the test from which we ought to estimate his abilities as a painter. The figures are well grouped, the principal characters distinctly marked, and the expression of the heads is admirable: the style of colouring is lively without being gaudy, and chaste without being dull. A few days after he had painted St. Benedict, he was seized with a violent fever, and expired in 1752, in the

67th year of his age.

Ligario is described by the connoisseurs as a painter who united correctness of design to beauty of colouring. He is remarkable for grouping his figures to the best advantage, and his heads are drawn with a noble simplicity; he is, however, represented as too much inclined to an imitation of the antique; his figures often resemble statues, and the folds of his drapery fall with too much precision, like the wet drapery in the sculpture of the ancients. The character of his faces is chiefly Grecian; but, it is remarked, that they are too similar to each other, and look like the portraits of persons of the same family; a circumstance not musual to those, who too servicely copy the autique

Beside painting. Ligario was skilled in music, mechanics, and agriculture, and has left behind him specimens of no ordinary acquaintance with each of those arts. He made, for his own amusement, an organ of large dimensions, and constructed a clock with a cylindrical pendulum, remarkable for the accuracy of its movements. He was fond of rearing plants and simples, and was so much attached to the study of agriculture, that he wrote instructions to his family upon the cheapest and best method of enditivation. He endeavoured to infuse into his son and daughter, Caesar and Victoria, a

normness for the polite ares. They both followed their father's profession, but although not without some degree of morit, talled of equalling his reputation. Victoria was chichly disinguished for her skill in vocal and instrumental music.

I rode this morning to see the painting of St. Benedict, at a numery about a mile and an half from Sondria; having examined the painting, the abbess sent a message, desiring the favour of my company, which I accepted with pleasure. Upon entering the parlour, I made my obeisance to the abbess who, in company with two nums, was scated on the other side of the grate. After the usual compliments, and inquiries if I was pleased with the picture, wine and cakes were brought in; the wine was the produce of their own vineyards, and was excellent; the cakes were shaped like skulls and bones.

The abbess and her friends behaved with great case and politeness; they asked many questions relating to England, natural to persons sequestered from society; and one of them apologised for their enriosity, by remarking that women were not less inquisitive or less fond of talking, because they were shut up in a nunnery. The person who made this remark was pale, but not unhealthy; her figure was remarkably fine, and she had been very handsome; a disappointment in love, as I am informed, first induced her to take the veil, and to bury so much beauty and elegance in a convent. Struck with het manner and address, I could not help wishing that she may never live to regret such a step, and may feel all that case and tranquility of mind which are expected, but not always found, by those who take the veil.

I am just returned to Sondrio, from a small excursion to Morbegno, and towards the extremity of the Valteline as far as Delebio. Near Sondrio the valley is about two miles in breadth, and remarkably fertile in vines and all kinds of grain. The right chain of mountains is clothed atmost from the bottom to the summit with a continued vineyard, which is esteemed to yield the best wine in the Valteline. I rode along the plain which stretches, without interruption, from Sondrio to the lake of Como. The middle part of this plain is occupied, and frequently overflowed by the unruly Adda, and being marshy yields nothing but course pasturage; the sides rise gradually into gentle acclivi-

ties, and display a rich variety of natural productions.

Morbegno lies on the left side of the Adda at the foot of the southernmost chain; it is the handsomest town in the Valteline, and appears to have more shops, and to earry on more trade than all the others united. M. Planta, the present podesta of Morbegno, no sooner heard of my arrival, than he politely waited upon me at the inn, and invited me to his house. Finding that I was desirous of proceeding to Delebio, he insisted upon accompanying me; and having ordered his carriage, proposed an immediate departure, that we might return to his house by supper. M. Planta is the same gentleman to whom I was obliged for so hospitable a reception at his house at Cernetz; and I am happy to find that he is among the few who act with honour and integrity in this land of extortion. When vicar of the Valteline, he discharged the duties of that important office with great credit, and has entered upon his government with the same spirit of integrity. There is a pleasure in receiving acts of politeness in a foreign country; but it is a double satisfaction to be obliged to persons whose characters are deserving of the highest esteem.

The road from Morbegno to Delebio runs along the foot of the chain of mountains, which separate the Validine from the Venetian territories. This chain having a northern aspect yields few vines, but is righly clad with hanging groves of chesnut-trees, checquered with meadows and fields of corn. The Validine expanded gradually as we advanced towards the lake of Como; in this part the whole plain is chiefly a morass

exposed to the inundations of the Adda, which flows in a wide channel. The silk, which begins to be of great importance in the trade of this valley, is chiefly exported from Delebio, through Chiavenna, into Germany. Upon my return to Morbegno, 1 supped with M. Planta, and after the repast was entertained with an excellent concert.

After returning to Sondrio, I crossed the Adda opposite Morbegno, over a handsome stone bridge, and proceeded along a road carried at the foot, and on the sides of the northern chain of mountains. It was almost a continued vineyard with miller, Turkish

corn, flax, and hemp, growing between the ranges of vines.

The romantic beauties of the Valteline are greatly heightened by the numerous remains of ancient fortresses and castles; they were all dismaidled soon after the capitulation of Milan,* from a recent experience, that the inability of the Grisons to provide them with sufficient garrisons, exposed them to the enemy, and rendered them for the most part a source of annoyance rather than protection. It might be imagined, that some of these fortresses ought to have been retained for the purpose of aweing the inhabitants: such an implicit confidence, however, is reposed by the Grisons in the guaranty of the country by the house of Austria, that they do not maintain a single soldier throughout the whole Valteline.

LETTER LXXVIII.

Commerce....Productions....Population....Of the Valteline.

THE chief commerce of the Valteline is carried on with Milan and the Grisons. The principal exports are wine and silk, which turn the balance of trade in its favour; they enable the inhabitants to exist without any manufactures, and help to supply the money

which is exacted by the governors.

The wine is sent into the Grisons, Germany, the Venetian states, Bormio, and occasionally to Milan. Upon a rough calculation 73,000 soma, or horse-loads, are annually exported: this year the soma sold for a pound sterling, which may be considered its average value. The silk is sent to England, Zuric, and Basle. The district of Delebio and Talomara produces the finest silk, the neighbourhood of Soudrio the next in quality, and the district of Tirano supplies an inferior sort. Three thousand pounds of the finest sort, which is esteemed as good as the silk procured from Piedmont, is sent annually to England by way of Ostend. The greater part is wound in the Valteline, for which purpose there are silk mills in the principal districts.

Besides these commodities, the Valteline exports planks, cheese, butter, and cattle. The inhabitants receive from Milan, corn, rice, salt, and silken stuffs; from Germany

and Switzerland cloth and linen; from Genoa, spices, coffee, and sugar.

There are no manufactures in the Valteline, and almost all the menial trades are ex-

ercised by foreigners. The population of the Valteline may be estimated from the following rough sketch:

	Total		62,000
Lower District	•	-	16,000
Middle District -	•	-	18,000
Government of Teglio	-	-	8,000
Upper District contains	•		20,000 souls.

rades are ex-

ough sketch :

The cottages of the peasants, which are built of stone, are large, but gloomy, genecally without glass windows: I entered several, and was every where disgusted with an uniform appearance of dirt and poverty. The peasants are mostly covered with rags, and the children have usually an unhealthy look, which arises from their wretched manner of living. The last year's drought occasioned such a scarcity of provisions, that the poor inhabitants were reduced to the most extreme necessity. The price of bread was unaveidably raised so high, that in many parts the peasants could not purchase it. and their only food was for so he time a kind of paste, made by pounding the hulls and stones of the grapes which had been pressed for wine, and mixing it with a little meal. Famine, added to their oppressed situation, reduced the inhabitants to the lowest condition of human misery, and numbers perished from absolute want. But it is a pleasure to reflect, that they are in some measure relieved by the plentiful harvest of the

Perhaps no part of Europe is more fruitful than the Valteline, country in which the people are more wretched. Many reasons may be assigned for the misery to which they are reduced. The first and principal cause is the form of government. The governors generally abuse the exorbitant authority entrusted to them by the laws; the peasants are imprisoned upon the slightest information, and as all transgressions are punished by fines, an accused person is seldom acquitted; so that a

considerable number are annually ruined in the courts of justice.

Beside the individuals who are supposed to suffer for their own guilt, the parishes are subject to continual assessments, towards defraying the expences for the trial and imprisomment of the poor parishioners: if they are unable to pay the sum required, it is demanded from the parish to which the criminal belongs. In this case it frequently happens, that the assessments, instead of being laid upon the landholders, are imposed upon

each hearth, by which means the chief burden falls upon the poor.

Another cause of wretchedness proceeds from the present state of property. Few of the peasants are landholders; as from the continual oppression under which the people have ground for above two centuries, the freeholds have gradually fallen into the hands of the nobles and Grisons, the latter of whom are supposed to possess half the estates in the Valteline. The tenants who take farms do not pay their rent in money, but in kind; a strong proof of general poverty. The peasant defrays the costs of cultivation, and delivers near half the produce to the landholder; the remaining portion would ill compensate his labour and expence, if he was not in some measure befriended by the fertility of the soil. The ground seldom lies follow, and the richest parts of the valley produce two crops; the first is wheat, rye, or spelt, half of which is delivered to the proprietor; the second is generally millet, buck wheat, maze, or Turkey-corn, which is the principal nourishment of the common people; the chief part of this crop belongs to the peasant, and enables him in a plentiful year to support his family with some degree of comfort. Those who inhabit the districts which yield wine are the most wretched; for the trouble and charge of rearing vines, of gathering and pressing the grapes, is very considerable; and they are so apt to consume the share of liquor allotted to them, in intoxication, that, were it not for the grain intermixed with the vines, they and their families would be left almost destitute of subsistence.

Besides the business of agriculture, some of the peasants attend to the cultivation of silk; they receive the eggs from the landholder, rear the silk-worms, and are entitled to half the silk. This employment is not unprofitable; for although the rearing of the silk worms is attended with much trouble, and requires great caution; yet as the occupation is generally entrusted to the women, it does not take the men from their labour

With all the advantages, however, derived from the fertility of the soil, and the variety of its productions, the peasants cannot, without the utmost difficulty, and constant exertion, maintain their families, and are always reduced to the greatest distress, whenever

the season is unfavourable to agriculture.

To these causes of penury among the lower classes, may be added the natural indolence of the people, and their tendency to superstition, which takes them from their labour. Upon the whole, I have not, in the course of my travels, seen any peasantry, except in Poland, so comfortless as the inferior inhabitants of this valley. They enjoy indeed one great advantage over the Poles, in not being the absolute property of the landholder, and transferable, like eattle. They are therefore at liberty to live where they choose, to quit their country, and seek a better condition in other regions; a relief to which distress often compels them to have recourse.

Chiavenna, August 15.

I quitted Sondrio yesterday afternoon, and went up to the valley of Malenco; yielding vines, chesnut-trees, rye, oats, and pasturage. As I ascended, the sides of the mountains were clothed with birch and firs; and their summits produced nothing and a seanty herbage. The inhabitants of this valley appear healthier, better clothed, and more industrious, than the other peasants of the Valteline. In consequence of their distance from the scat of government, they are less exposed to the rapaciousness of the Grison governors, and for the most part possess a small portion of land. The valley is narrow, and watered by a torrent, which forms a continued cataract; the road is a faint path, by the side of a precipiee, and carried over huge fragments of rocks. I passed the night in a solitary but at the bottom of the Muret; the next morning mounted a rugged ascent in the channel of a small stream, observed nothing but bare rocks, without the least appearance of vegetation, came to the top of the Muret, and traversed a large mass of snow and ice.

In these Alpine situations the traveller sees within the space of a few hours, nature in all her shapes; in the Valteline rich and fertile; here barren and stupendous. These regions are so dreary and desolate, that were it not for an occasional traveller, the flights of a few strange birds, the goats browsing on the rugged Alps, and the shepherds who tend them, nature would appear quite inanimate. In these elevated spots, while I was

Placed above the storm's career,"

I noticed the pleasing effect produced by the vapours and mists floating in mid air beneath me; circumstances finely felt and described by the author of the Minstrel:

> "And oft the craggy clift he lov'd to climb, When all in mist the world below was lost: What dreadful pleasure there to stand sublime, Like shipwreck'd mariner on desart coast, And view the enormous sea of vapour, tost In billows lengthening to the horison round, Now scoop'd in gutts, with mountains now emboss'd!

From the top of the Muret I descended about three hours a craggy, desolate, and aninhabited country, and noticed the gradual increase of vegetation as 1 approached the road leading to Chavenna, a little above Casazza. This passage over the Meret, which serves for the transportation of wine and other merchandisc from the Valteline to the Grisons is only open about five months in the year.

LETTER LXXIX.

Chiavenna....Valley of St. Giacomo....Chapel of St. Guglielmo.

Chiavenna, Sept. 16.

MY correspondence with you has been for some time interrupted. The day after my arrival from the Valteline, I was seized with a lassitude which I attributed to the fatigue of journey; it ended in a violent pain and swelling of my right hand, the effects of a rheumatism, which probably seized me the night I passed at the bottom of the Muret: not being able to procure a bed, I slept in the hayloft, and suffered much from the piereing north wind, which blew from the glacier. I likewise imprudently walked the next morning, without intermission or refreshment, for the space of seven hours, from the top of the Muret to Bondo; so that the cold and fatigue brought on a rheumatic complaint which has detained me six weeks. During great part of the time I wore my arm in a sling, and was incapable of writing a line. What I must regret in this delay is, that I have been prevented from attending the general diet of the Grisons, which was held at Davos the latter end of last month.

The county of Chiavenna came under the sovereignty of the Grisons in the same manner, and at the same time with the Valteline. During the war of the Valteline it frequently changed its masters, but at the peace of Milan was finally restored to the Grisons. It is ruled, like the other subject provinces, by a Grison governor, who is called commissary, and in a few instances is even less limited in his power than the judges

of the Valteline.

The criminal court of justice is formed by the commissary, and the assessor, who is appointed by the commissary, from three candidates nominated by the county. He must attend all examinations, concur in ordering torture for the conviction of a criminal, be present when it is inflicted, and ratify the final sentence; but as the assessor owes his place to the commissary, and shares in his exactions, he is a mere cypner, and seldom ventures to exert his right of interposing a negative. This circumstance renders the courts of justice in Chiavenna more uniformly iniquitous than even those of the Valteline; for the close union between the commissary and assessor almost precludes a chance of redress, and gives unbounded scope to oppression. It would be unnecessary to describe the mode of proceeding established in this court of justice, as it is similar to that of the Valteline. In civil causes the commissary receives five per cent. of the contested property, and an appeal from his decision may be submitted to the syndicate. Chiavenna, the capital, is situated at the foot and upon the side of a mountain, and contains about three thousand souls. The inhabitants carry on but little commerce; the principal article of exportation (excepting the stone pots mentioned in a former letter*) is raw silk, of which the whole country produces about three thousand six hundred pounds. A manufacture of silk stockings, the only one in the town, has been lately established. The neighbouring country is covered with vineyards, but the wine is of a meagre-sort, and only a small quantity exported. The great support of Chiavenna is the transport of merchandise; this town being the principal communication between the Milanese and Germany, and from hence the goods are sent either by Coire into Germany, or through Pregalia and the Engadinas into the Tyrol. A duty is laid by the Grisons upon all the merchandise which passes through Chiavenna, but is so small that the whole customs, including those in the Valteline, are farmed for 17,000 florins. or about 1260l. per annum.

The principal object of curiosity in the environs is the fortress in ruins, seated upon the summit of a rock, which overlooks the town, once celebrated for its almost impregnable strength. The only road which leads up to it is steep and craggy; the walls occupy a large space of ground, and are now covered with vines. The strongest part of the fortress was constructed upon an insulated rock, acnt, as some persons conjecture, from the contiguous mountain, by a violent convulsion of nature. It is on all sides absolutely perpendicular, and the only communication with the castle was by a draw-bridge thrown across the intervening chasm. Others * suppose that the separation of this rock was the work of art, and affirm that it was excavated in 1343, by order of Galeazzo Visconti. The length is above two hundred and fifty feet, the height about two hundred, and the greatest distance from the adjoining rock about twenty. This fortification, though always deemed impregnable, was taken at different periods, sometimes by assault, but me executently by funine or stratagem; it was finally demolished by the Grisons thems.

Close to Chiavenna is a rock of a bestos, a kind of mineral substance, of a grayish silver colour, which can be drawn into longitudinal fibres as fine as thread, and was manufactured by the ancients into a species of cloth resembling linen: it is frequently mentioned by Pliny, and being indestructible by fire, was principally used for shrouds, to preserve the ashes of the dead bodies separate from those of the wood. The art of weaving asbestos into linen is not lost; but, as it is very troublesome and expensive, and as the custom of burning bodies, which gave it a value, is no longer in use, the manufacture is discontinued. Besides the rock of abestos near Chiavenna, several other mountains yield the same substance; the best sort is found in the mountains that border

the valley of Malenco, of which I have seen many fine specimens.

Quitting Chiavenna I entered the valley of Si. Giacomo, which is narrow, and watered by the torrent Lira. It is part of the county of Chiavenna, contains about ten parishes, is under the jurisdiction of the commissary, and possesses several important privileges that preserve the inhabitants from the oppression which their neighbours endure. All causes are tried in the valley. The criminal statutes are those of Chiavenna, with this difference only, that, instead of the assessor, the valley chooses four persons, who are always present at the examination; and without whose concurrence torture cannot be inflicted, nor sentence passed. The valley has its own code of civil jurisprudence, and courts independent of the commissary, from the decision of which an appeal lies to the diet.

The Lower part of the valley produces vines and corn; the upper, rye, barley, and pasture, mixed with large groves of fir and pine. On my left I passed the church of St. Guglielmo, supposed to have been creeted in honour of William King of Sicily, the last sovereign of the male branch of the Norman line, which commenced in count Roger, who conquered Sicily from the Saracens in the latter end of the eleventh

century. Roger was twelfth son of Tancred de Hauteville, a Norman baron, and brother of the celebrated Robert Guiscard, the bravest of those brave Norman adventurers who sallied from their native country, formed a flourishing but temporary establishment in the southern parts of Italy, and furnished by their exploits ample materials for history and romance. The son of count Roger, who inherited the name and spirit of his father, erected Sicily into a kingdom: and, at the extinction of the male line of Robert

We may perhaps reconcile these two opinions, by a mitting that the opening was originally occasioned by a violent convulsion of nature, but afterwards enlarged by art.

was originally

Guiscard in the person of William, duke of Apulia, annexed Apulia and Calabria to Sicily, and reigned over those territories, under the title of the Two Sicilies, which now comprehend the present kingdom of Naples and Sicily. The throne of Roger was successively filled by his son William the First, surnamed the Bod, and by his grandson William the Second, distinguished by the name of Good. On the demise of William the Good wit, but issue male, the Sicilians exchaded Constantia, daughter of Roger, and wife of the emperor Henry the Sixth, and elected Tenered, illegitimate grandson of the first king. Tancred dying in 1193, William, his only surviving son, was crowned while an infant. Being dethroned by Henry the Sixth, who claimed the Two Sicilies in right of his wife Constantia, he was imprisoned with his mother Sibilla, in the fortress of Ems, near Coire. Some authors assert that he was deprived of his sight, others that he was mutilated by order of Henry. Some relate that he died in prison, others that he was released together with his mother Sibilla; that he accompanied her to France, but, disgusted with the world, retired to this spot, passed the latter part of his days as an hermit, with great reputation of sanctity, and was canonised after his death. Such contradictory accounts occur frequently in the history of the dark ages. Muratori, who, from his knowledge of the ancient records of those ages, is the most capable of solving this difficulty, leaves the question undecided; but seems inclined to believe, that William was released from his captivity, and afterwards turned hermit.

I shall subjoin a genealogical table of the Norman line, which is very complicated and

obscure, and erroneously represented by many writers.

I employed three hours in mounting from Chiavenna to the pleasant plain of Campo Dolcino, and ascended from the extremity of that plain to Isola, the last village in the

valley of St. Giacomo, from whence I am now writing.

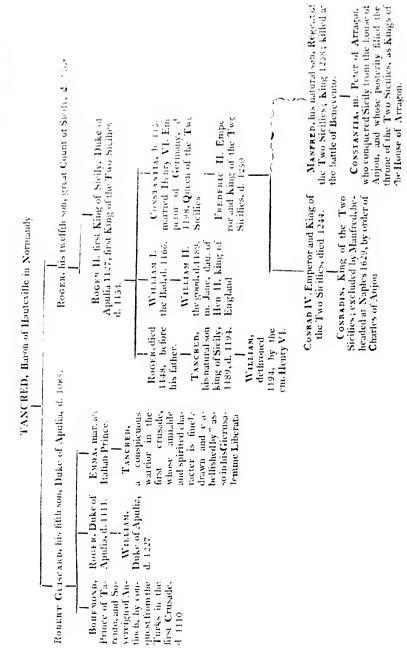

In these parts where mountains rise over mountains, and Alps tower above Alps, those fallings of snow, mentioned in a former letter,* under the name of Avalanches, are extremely common; they are justly and warmly described by the poet of nature of

Among these hilly regions, where embrac'd In peaceful vales the happy Grisons dwell: Oh, rushing sudden from the loaded cliffs, Mountains of snow their gath'ring terrors roll. From steep to steep, loud thund'ring down they come A wintry waste in dire commotion all; And herds and flocks, and travellers and swains, And sometimes whole brigades of marching troops, Or handets sleeping in the dead of might, Are deep beneath the smothering ruin hurl'd.

GENEALOGICAL TABLE OF THE NORMAN SOVEREIGNS OF NAPLES AND SICILY.

LETTER LXXX.

Spagen ... The Gray League Rheinwald ... Via Mala Tusts No bolas Russe

FROM Isola the ascent is steep and rugged to the top of mount Splugen, and the torrent Lira roars from precipice to precipice in stupendous cataracts. The road is hewn in the solid rock, in many places it has the appearance of steps, in others is perferted through the mountain; in pursuing my way over this dreary tract, I was frequently reminded of the road down the Gemmi.* Toward the summit of the Splugen is an oval plain, about two miles long and one broad, encircled with craggy points; it produces no trees, but yields rich pasturage; near the summit are rude blocks of a whitish kind of marble.

I baited my horses at a small inn which stands at the extremity of the oval plain, and is the only house between the valley of St. Giacomo and Splugen. Before the door I observed at least a hundred horses laden with merchandise; not less than three hundred

are said to pass daily in this season of the year.

Gently ascending from this oval plain I observed the source of the Lira, which falls into the lake of Chiavenna, and soon afterwards crossed the highest ridge, on the other side of which the torrents flow towards the Rhine. The country is wild, and searcely produces a single tree; as I descended firs began to make their appearance, at first thinly seattered over the rocks, and gradually thickening into large forests. This passage over mount Splugen is principally used for the transport of merchandise to and from Coire; it is kept open even in winter, though not without great difficulty; in that season the merchandise is chiefly transported on sledges, of which forty or fifty pass in a day.

The territory of the Gray League occupies all the eastern tract of this mountainous country, and is by far the most considerable, in extent as well as population, of the three Grison leagues. The etymology of the word Grigia or Gray, which gives its name to this league and the whole country, is extremely uncertain. Some authors have conjectured, that the people of this district were the original inhabitants of the country, and were called Gray, to distinguish them from the more modern inhabitants, gray hairs, an emblem of antiquity. Others, on the contrary, dating this appellation from more mo dern times, assert that the first authors of the revolution which, in 1424, gave liberty to the communities in the Gray League, were dressed in the coarse gray cloth of the coun try; and, in commemoration of this great event, the league was called Gray. This ap pellation, however, is of very high antiquity, and existed long before the revolution. Tacitus calls the inhabitants of this country Rhætos Griscos, id est canos; and Ammianus Marcellinus styles the district about Coire, Canos Campos, or the Gray Fields. Hence it appears how very fruitless must be any investigation concerning the true ety mology of this word, which lies hid in remote antiquity, beyond the reach of our most inquisitive researches.

Without entering too minutely into etymological disquisitions, we may only remark in general, that the term Grisons, or Gray people, was the general name by which all the inhabitants of Rhetia were distinguished, and was not confined to that particular district called the Gray League. The appropriation of the term to that particular body may be thus accounted for. When the inhabitants of this district first rose in arms for the purpose of asserting their independence, they naturally styled themselves, the League of the people called Grisons, or the Gray League; while those of the two other districts, who atterwards formed similar associations, although equally known by the name of Grisons, took other appellations to distinguish themselves from the first con-

federacy.

The territory now occupied by the Gray League was formerly subject to the abbot of Disentis, the counts of Werdenberg, of Sax, of Masox, and the baron of Retzuns. The people seem to have originally possessed considerable privileges, which were gradually indermined, and occasionally violated by their chiefs and barons, who, being engaged in perpetual hostilities with each other, laid great exactions upon their subjects, in order to pay their troops. At length, the people, impatient of oppression, and excited by the example of the neighbouring Swiss republies, determined to deliver themselves

from the grievous subjection under which they laboured.

The meeting of the insurgents was by no means attended with any unwarrantable excesses, natural to an enraged populace, but was conducted with the greatest composure. The leading members of the several communities having previously concerted the plan, a solemn deputation was dispatched to the respective sovereigns assembled at Truns; the deputies laid the grievances before the chiefs, from whom they not only extorted redress, but procured a confirmation of several obsolete privileges, and the addition of many others. In consideration of these concessions, the chiefs reserved to themselves certain prerogatives, which some of their descendants or successors possess at this day; a distinction which is now peculiar to this league, and renders the general constitution in some respects more aristocratical than that of the two others.

These prerogatives consist in being present at the annual diet of the league, and in alternately proposing three candidates for Landrichter, or chief of the league, from one who is nominated by the deputies. The counts of Wirdenberg being extinct, these prerogatives are now confined to the emperor of Germany, as baron of Retzuns, the abbot of Disentis, and the temporary count of Sax. No real count Sax now exists; for, upon the extinction of that family, certain communities* of the Gray League seized the domains, and continue to exercise the rights which were formerly enjoyed by the counts

of Sax.

The mode of creating a titular count is as follows: a few days before the meeting of the diet of the league assembled at Trans, the communities in question reciprocally elect a person who represents the count. He is called in Romansh† Cau de Saxe, and, although not unfrequently a common peasant, sits at the diet upon the same bench with the representative of the house of Austria and the abbot of Disentis, is addressed by a title equal to his supposed dignity, nominates the Landrichter every third year, and, having discharged his office, sinks at the expiration of a few days into his ordinary rank.

Another distinction peculiar to the Gray League ought not to be omitted. Like the other leagues, the particular districts possess their courts of criminal justice in the last resort; but in all civil causes above a certain value, an appeal lies to sixteen deputies annually assembled at Truns; I only mention the fact in this place, but shall have occasion to enlarge upon it in a future letter.

Splugen, situated upon the rise of an hill, at the bottom of a rugged chain of Alps, is the principal place in the valley of Rheinwald, which forms a high jurisdiction of the

^{*} These communities are Lungnetz and Vals, Hants and Grub, Flims and Castris t Literally head of Sax. Can is supposed to be a corruption from caput.

Gray League. The Rheinwald is so called from the Hynder Rhine, which takes its rise upon the Vogelsberg, at the distance of twelve miles, and runs through this valley It was my intention to visit this source, but my late indisposition will not permit me at

present to take fatigning journeys in these mountainous regions.

The inhabitants of the Rheinwald speak German, although they are entirely sm rounded by people who use a different Luiguage. Towards the south, beyond the mountains of Splugen and St. Bernardin, in the valides of St. Giacomo and Masox. Italian is the common tongue; towards the north and east, in the vallies of Schams, of St. Peter, and of Lugnetz, Romansh is spoken. This remarkable circumstance ha led many authors to conjecture that the people of this and other districts of the Grisons, who talk German, are descended from the Lepontii, supposed to be a Celtie nation, and considered as the original inhabitants of this country, before the establishment of the Rhetians. But this conjecture is not founded on facts, for, although the inhabitants of this district are immediately encircled by people who talk Italian and Romansh; yet the German language is spoken at Avers, Cepina, Tusis, and Furstenau, which are only at a small distance from the Rheinwald.

I quitted, on the other side of Mount Splugen, the Italian climate and productions. the air of this valley is so piercing as to justify the truth of the proverb, "Nine months winter and three months cold." Two high roads meet at Splingen, one from Chia venua, which I traversed yesterday, the other leads over the Bernard into Bellinzone. From Splugen to Arder the road continues by the side of the Hyader Rhine, through a mountainous region, which presents at every step the most awful magnificence or

scenery.

Alps,

of the

The inhabitants of Suffers, the last village of the Rheinwald, talk German; and at a small distance I entered the valley of Schams, where the peasants speak Romansh. I made myself tolerably understood by a kind of jargon, composed of German, Italian, and Romansh. I took out my vocabulary of the Fagadina language, and compared the different modes of expression and pronunciation. The inhabitants call their laugu ge Romansh; but it differs widely from the Romansh spoken in the valley of Sur set, and still more from that of the Engadinas. The Bible and other books used in this valley are in the same dialect as those which are read in the other parts of the Gray League, and the language is similar, with a small variety in the pronunciation.

The valley of Schams, a community of the Gray League, contains eight or nine inconsiderable burghs or villages, situated at small distances upon each side of the Rhine. and is much lower and more fruitful than the Rheinwald. I crossed the Phine at Zillis, leaving on my left hand Donat, where the collective body of people meet annually to choose their magistrates, and regulate all civil and political affairs. Soon afterwards I came into the Via Mala, so called from the supposed difficulties and dangers of the passage. Such dreadful descriptions have been given by different travellers, that I expected to find it the worst road which I had hitherto travelled. But I was agreeably deceived, for it was not more incommodious than the way from Splugen to Anders; nor did I once think it necessary even to dismount from my horse, except when I stopped to take a nearer view of any particular scene; the road even admits carriages. No reason occurs to me, why this particular way should be distinguished by the appellation of Via Mala, unl-ss it alludes to former times, and modern writers have adopted them as the mere whos of ancient travellers. Perhaps the peculiar gloom of the valley, through which the road passes, may have helped to convey these ideas of terror to persons not accustomed to Alpive regions.

The Via Mala runs through a dark and solitary valley, overspread in many parts with thick forests, which admit only a kind of twilight gloom, and so exceedingly narrow, that the steep rocks which enclose it hang over, and seem almost to meet towards their summits. The Rhine foams at the bottom, sometimes not visible, and sometimes faintly glimmering through

- darksome pines, that o'er the rocks reclin'd.
Wave high, and murmur to the hollow wind.

About three miles from the commencement of the Via Mala, is a stone bridge of a single arch, thrown across a gulf; a sublime scene, which I stopped to admire, and which I left with regret. The Rhine falls in a beautiful easeade, rolls in a narrow channel at the depth of above four hundred feet, furiously dashes under the bridge, expands itself into a wide basin, and then is lost under a rock, through which it has forced a passage. The impending mountains, partly bare and partly embrowned with firs, east an awful gloom over the gulf beneath.

I here was greatly struck with one circumstance, which I had observed in several other vallies of Switzerland, but never in such perfection as in this place. The Rhine, which is at present about four hundred feet below the bridge, seems to have once flowed as high, or even higher than the present bridge, has, in the lapse of ages, gradually worn

away the rock, and excavated the deep channel in which it now runs.

Having passed the bridge, I went through a subterraneous opening a few paces in length, which had been cut in the overhanging rock, and a little further crossed a

second bridge similar to the first.

Soon afterwards I quitted the Rhine, and began ascending. This part of the country is entirely uninhabited, and I did not meet with a single house until I reached Roncalia, a village in the community of Tusis, upon the top of a steep mountain. From thence I descended to Tusis, situated near the torrent Nolla, at the beginning of the valley of Tomliasea, and said by antiquaries to have been built by the Tuscans, when they took refuge in these parts under Rhætus.

Tusis is well known in the history of the Grisons for the Staffgericht, or court of justice, which sat in 1618, for the trial of persons accused of holding a correspondence with Spain, and of opposing the introduction of the Protestant religion into the Valteline. Amongst those who suffered in this iniquitous tribunal, the most remarkable was Nicholas Rusca, whom I mentioned in my letter on the troubles of the Valteline, the cruel circumstances of whose death excited the resentment of the Catholics, and

occasioned an open rebellion.

Nicholas Rusca, a native of Bedano, in the bailliage of Locarno, was educated in the Jesuic's college at Milan, at the expence of Cardinal Boromeo, and made so great a progress in his studies, that, in 1589, he was appointed principal of the church of Sondrio, although only in the twenty-fourth year of his age. He immediately signalised himself by his zeal in preaching against the reformed doctrines, and was one of the disputants who supported the Roman Catholic faith against the Protestant ministers in two public conferences held at Tirano in 1595, and the following year. His character has been placed in the most opposite lights by the respective historians of the two contending parties; by the one he is represented as a saint, and by the other as an assassin. But if we examine his life with impartiality it will appear, that, though he was hurried on by a violent spirit of fanatic zeal, yet he cannot be supposed guilty of the atrocious crimes which his enemies have laid to his charge. Soon after his promotion to the be-

actice of Sondrio, a misunderstanding arose between him and the Protestants, which gradually increased during the violence of the religious disputes, and was carried on the following occasion to the highest degree of animosity.

One Chiappinus, and three gondoliers of Venice, were arrested under suspicion of edesign to assassinate Scipio Calandrinus, the Protestant minister of Sondrio, at the instigation of Rusca; a confession of guilt and of Rusca's privity being drawn from Chiappinus by the force of torture. The governor of the Valteline referring the affair to the diet of the Grisons, Rusca was cited before that assembly, but declined to appear; either, as his enemies pretend, from a consciousness of guilt, or, as his friends allege, from a dread of the Grisons, who were incensed against him. Having escaped from the Valteline, he waited at Bedano while his cause was publicly pleaded before twelve judges deputed by the Grisons. Being acquitted, he returned to Sondrio, where his zeal inflamed by his late persecution, continued to display itself by an unremitting opposition to the establishment of a Protestant school at Sondrio; a favourite measure of the op-

posite party.

His enemies, baffled in their first attempt, brought against him a charge of a more public nature: they accused him of opposing the decrees of the Grisons, and of exhorting the inhabitants of Morbegno not to bear arms against the king of Spain, the protector of the Catholic religion. In consequence of these insimuations, a troop of sixty Grisons arrived at Sondrio by night, and, seizing Rusea, carried him to Tusis, where he was not only impeached of high treason in the temporary court of justice there assembled, but was again examined, contrary to every principle of equity, for abetting the assassination of Calandrinus; and as he peremptorily denied these charges, he was condemned to the torture; which horrid sentence was three times inflicted in the dead of night. The execution of the sentence failing to extort the smallest confession of guilt, he was, on the following night, twice subjected to a repetition of the same dreadfal process. Being of a weak frame, and full of infirmities, he was overcome by excess of agony, and expired amidst the torments.*

Some writers have asserted that Rusea died of poison, which he had taken previous to his last examination; but this supposition seems to be totally devoid of foundation, and was only advanced in order to rescue the judges from the odium of having tortured him to death. For when it is considered that, according to the common mode of applying torture in this country, he was five times drawn up by a pulley, with his arms tied behind, so as to occasion a dislocation of his shoulders; that he remained in that exeruciating position above half an hour each time, and that he was in an infirm state of body, we have no occasion to seek for any extraordinary cause of his death.

The advocates for the Protestant party in vain endeavour to exculpate Rusea's judges from an intolerant spirit of bigotry, by asserting that the whole transaction was a civil and not a religious process; for theological rancour, however disguised under the mask of patriotism; was the leading motive to this prosecution. Independently indeed of all theoretical reasoning, every rational Christian, whatever his persuasion may be, must recoil with horror from enormities so inconsistent with the first principles of humanity.

LETTER LXXXL

Talley of Tombasca ... Retzuns ... Reichenau.

Corre, Sept. 21

FROM Tusis I continued my route along the valley of Tomliasca, by the side of the Rhine, which here separates the Gray League from that of the House of God;† nu merous towns, villages, and easiles, the agreeably scattered through the vale in the most romantic situations. Passing through Catzis, and leaving on my left the fruitful mountain of Henzenberg, called in Romansh Montagnia, and remarkable for its fertility and population. I proceeded to Retzuns, and turned to the castle of that name, which makes a conspicuous figure in the history of the Grisons. Antiquaries derive the name of Retzuns from Rhætium or Rhætia Ima (Lower Rhætia) and give the following account of its construction: In the early ages of the Roman history a numerous army of Gauls overran Lombardy, which was then occupied by the Tuscans. A considerable body of whom driven from their native country followed their leader Rhætus, and established themselves in these Alps. Rhætus gave his own name to the whole region, and constructed a fortress which he called Rhatia Ima, since corrupted into Retzuns. Livy relates the emigration of the Tuseans into these parts without mentioning the namof their leader, who is called Rhætus by Pliny and Justin; and the number of plac still existing in these Alps, which bear a resemblance to that appellation, seem strong testimonics in support of this account.

But as events of such high antiquity are liable to much doubt, let us descend to later times, which admit of no dispute. The eastle was the residence of a baron, who possessed the adjacent territory, and was called Baron of Retzuns. His name frequently occurs in the ancient history of this country, when the territory of the Grisons was divided into several petty sovereignties. He is also mentioned among the chiefs, who assembled in 1424 at Truns, and enlarged the privileges of the people, when the communities united and formed the Gray League. At that time the Baron reserved to himself certain prerogatives, which are now possessed by his successors. In 1459, the male line being extinct, the barony descended to a collateral branch, and in 1470 came by purchase into the possession of the emperor Maximilian the First. Ferdinand the First mortgaged the barony for 14,000 florins to John Planta, in whose family it continued until the year 1679, when it was redeemed by the emperor Leopold, and now it belongs to his grand-daughter Maria Theresa, the present empress. The revenues of this territory are very small, amounting to 2000 florins, or searcely 2001, per annum; but, by the possession of it, the house of Austria enjoys considerable influence in the political affairs of the Grisons. The delegate of the empress, who is called Administrator, has a vote in the diet of Fruns, and nominates every third year the Landrichter, or chief of the Gray League.

Being desirons of seeing the eastle, I sent my compliments to the Austrian delegate, who instantly made his appearance, and politely attended me. The present building

† Guler, the historian of Rhetta, says, that no region of Europe contains such a number of ancient castles as the country of the Grisons; and adds, that, in the small valley of Tomliasca, not more than

a German mile long and a querter broad, there are more than seventeen.

Aporta with the impartiality of an honest historian, speaking of the iniquitous acts of this tributal, says, a Deum inamortalem! Quid est carbones irritare, hostes studio conquirere ac in se concitare, summis ma miscere, si hoc non crat? Nullus tamen actus majorem huic tribunali invidiam contilavit quam subita mors Nicolai Rusex, qui tormentis solutus sub judicium oculis exspiravit." Hist. Ref. Eccl. Rat. vol. ii. p. 66.

i ancien iore than

was raised by Leopold the First, upon the foundation of the ancient structure, of which there are scarcely any remains; and I could not discern the slightest traces of Roman

The castle is the usual residence of the Austrian envoy to the republic of the Grisons. but as the present envoy dwells in his own house at Reichenau, is now occupied by the Austrian delegate. It is situated upon an eminence, and commands a fine view of the adjacent country; the rich plain, which extends as far as Reichenau, is bounded on all sides by high mountains, and yields, among other productions, abundance of wheat;

the Lower Rhine flows through it in a wide and stony channel.

The delegate finding, during our conversation, that I had a letter of recommendation from count Firmian to the envoy at Reichenau, invited me to dinner, and politely offered to accompany me in the afternoon to Reichenan; an invitation which I made no scruple to accept. The company at table consisted of the delegate, his wife, and a capuchin friar. The lady spoke nothing but Romansh, so that I was not able to enjoy much of her discourse; I could only drink her health, and make her a short comptiment, which I had learned by rote. But I held a long conversation, in the French tongue, with the delegate, upon the barony of Retzuns, on which subject he kindly gave me much information. The barony comprises the villages of Retzuns, Bonadutz, Embr. and Feldsberg, which form a high jurisdiction in the Gray League, and send two deputies to the general diet of the Grisons: the people are free; they assemble annually in the court of the eastle to elect their magistrates, and every male at the age of fourteen has a vote. As delegate of the empress of Germany, he has a kind of territorial jurisdiction over the village and district of Retzuns. He nominates the Landamman from three candidates appointed by the people; the empress receives the fines for criminal offences, and pays the expences of the process; the prisoners are confined in the castle, but are tried by judges chosen by the people.

After dinner I accompanied my host through a rich and fertile plain to Reichenau, and waited upon M. Buol, the Austrian envoy, who received me with great politeness, and obligingly invited me to remain some time at Reichenau; an invitation I declined for the present, through my impatience of arriving at Coirc, where I expected to receive several letters from my friends in England, from whom I had not heard since my departure from Milan. Reichenau is situated upon the conflux of the two branches which form the Rhine. The lower branch is the same which I followed during the greater part of its course from Splugen; the upper branch rises near the mountain of St. Gothard, and flows through the valley of Sopra Selva. The castellated mansion of M. Buol stands in a most romantic situation upon a small eminence backed by a perpendicular rock, and between two singular bridges constructed by the nephew of Grubenman. One, which is thrown across the lower branch, measures about a hundred and five feet; the second, built across the river below the point of union, forms a most beautiful object. It is a wooden bridge of a single arch covered like that of Schaffhausen, and constructed upon the same principle, with this difference however, that the road is not carried in so perfect a level; the span of the arch is two hundred and twenty feet. As the banks of the Rhine in this spot are more elevated than at Schaffhausen, the bridge of Reichenau is raised considerably higher above the surface of the water;* and as it presents to the eye but a single curve, the general appearance is far more picturesque, and the effect more striking. But it is not so beautiful a piece of architecture as the bridge of Wettingen, which is Grubenman's master-piece. F. The

> tSm Let de 6. c. 2 *Letter ... p. 5

more I examine these bridges, the more I am struck with the simplicity of the structure; the more I am astonished, that the person who first conceived the plan was a common

carpenter, and totally unacquainted with the theory of mechanics.

In my way from Reichenau to Coire, I inquired at Embs for the remains of an old castle, in which William, son of Tancred king of Sicily was confined: at present there is not the smallest vestige of such a fabric; but according to the tradition of the country

it formerly stood upon a hill, whereon the church is now erected.

The valley from Reichenau to Coire is two miles broad, and produces corn, pasture, and some vines, which begin to make their appearance near Embs. The Rhine flows through it with the rapidity of a torrent; several insulated rocks are scattered on the banks of the river, some barren, others covered with wood, which greatly diversify the scenery. The chain of mountains fronting the northern aspect is overspread with groves of fir; while the opposite ridge is richly mantled with oaks, and its summit crowned with firs and pines. A little way beyond I entered the League of the House of God, and arrived at Coire.

LETTER LXXXII.

League of God's House Town and bishopric of Coire Convent of St. Lucius.

THE whole territory, which is now comprised within the League of the House of God, was under the dominion of the bishop of Cohe; until the people, oppressed by their rulers, threw off the yoke, and forming a general league, compelled the bishop to

ratify their independence.

The æra of this important revolution is not precisely marked in the annals of this country. Some historians have even asserted, that it happened so early as the latter end of the fourteenth century, and was anterior to the formation of the Gray League. But this opinion does not seem to be grounded upon sufficient evidence: as the facts alledged in its support intimate little more, than that the bishop granted several privileges to the inhabitants; but by no means prove, that the communities formed themselves into a league at such an early period, and afforded the first* example of liberty in these parts, an honour which is undoubtedly due to the Gray League. The revolution, which finally exalted this league into its present state of freedom, probably took place between 1424, the æra of the formation of the Gray League, and in 1436, the year in which the Ten Jurisdictions rose into independence.

This league is denominated into Romansh La Ligia de la Chiada;† in German, Gottshausbund, from which we call it the League of the House of God: it takes this appellation as well from the cathedral situated in its capital, as because it was once under the

jurisdiction of the bishop of Coire.

It is divided into eleven districts; each of which (Coire excepted) is subdivided into two little republics, or communities, and sends twenty-two deputies to the general diet.

Formerly the hurgomaster of Coire was pernetual chief of the league without elec-

Formerly the burgomaster of Coire was perpetual chief of the league without elec-

† Chiada, or as it is sometimes written, Ca-de, signifies cathedral: hence the French call it La Ligue

Cadde.

^{*} Campell espouses this notion, and his authority undoubtedly carries great weight; but we must consider that he grounds his opinion merely upon conjecture, and that, as a member of the League of God's House, he was inclined to give to that League the preference in point of antiquity over the Gray League.

of nominating to this office in their turn. The affair being referred to the arbitration of Zuric, it was decided, that for the fiture the twenty-two deputies should choose two candidates from the members of the senate of Coire, who should draw lots for the charge; a mode of election now in use. The chief thus appointed is called Bunds-president, and has several privileges which distinguish him from the chiefs of the two other leagues; he receives all the letters addressed to the republic of the Grisons from foreign powers, and is perpetual president of the congress, because that assembly is always held at Coire.

Coire is situated at the foot of the Alps, in a rich plain between two and three miles wide; a considerable breadth of valley for this mountainous country. Opposite is the chain of mountains which separate the country of the Grisons from the canton of Glarus; of this chain the Calendar is esteemed the highest point; but it is far inferior in elevation to several of the Swiss and Savoy Alps I visited in my last tour, and wants one

certain criterion of great height, perpetual snow.

The town lies partly in the plain, and partly upon the steep side of a rock, and is surrounded with ancient brick walls, strengthened with square and round towers, in the style of fortification, before the invention of powder; the streets are narrow and dirty; several towns of Upp r Engadina, although not so large, make a neater and more ele-

gant appearance. It contains about three thousand souls.

Many fables are related concerning the foundation of Coire; the most probable account seems to be, that it owes its origin to the emperor Constantius, who, in the 355th year of the Christian æra, penetrated into Rhetia, and fixed his station for some time near the present site of Coire. A town, as often happened on such occasions, was perhaps constructed near the camp; and from the imperial residence it is supposed to have derived the name Curia, its ancient appellation, since corrupted into Coira and Coire. The remains of two or three towers, which are evidently of Roman construction, attest its antiquity, and serve to establish the truth of these conjectures concerning its origin.

Coire was formerly a city of the German empire, subject to its own counts, and came in the ninth century under the dominion of the bishop. Like many other cities of Germany, it obtained considerable privileges from the different emperors; and the inhabitants, having gradually circumscribed the authority of the bishop, at length established

an independent republic.

The government of Coire is aristo-democratical; the supreme legislative authority resides in the citizens, whose number amounts to two hundred and ninety-four, divided into five tribes. Each citizen has a vote at the age of twenty: the suffrages are never collected in a general assembly; but the object of deliberation is separately laid before each

tribe, and decided by the majority of the five tribes.

The executive power is entrusted to the council of seventy, composed of fourteen members annually elected from each tribe. This sovereign council is divided into several lesser departments, of which the principal is the senate, or council of fifteen, who have the chief direction of affairs, either solely or conjointly with other members of the sovereign council. The chiefs of Coire are two burgomasters taken from the members of the senate, who, although liable to be removed, invariably continue in office for life. They enjoy the supreme dignity by rotation, each for the space of a year; during which term the acting chief, under the title of reigning burgomaster, presides in the usual councils. The criminal tribunal is composed of the senate and fifteen other members of the sovereign council. The prisoners are examined and the process drawn up by a secret council, formed of the seven oldest members of the senate, of whom the

majority must concur, to order the infliction of torture. After conviction the process is laid before the criminal tribunal, which ultimately passes sentence, and all offences ex-

cepting great crimes, are commonly punished by fines.

My curiosity led me this morning to the apartment in which the general diet of the Grisons is held every three years; although it contained no object worthy of description, yet it did not fail to strike my attention, as being the place where the parliament of a free nation is assembled.

Coire sends two deputies to this diet, who are generally the two burgomasters; but if one of these should be the chief of the league, the other deputy is chosen by rotation in the five tribes, with this condition, that he must be a member of the council of

seventy.

From the apartment in which the diet is held I went to the town-hall, to see the form of administering the oath to the new Bunds-president. In general the ceremony takes place just before the meeting of the dict, in the presence of the deputies of the League of God's house; but as the person to whom the office now devolves was not present, it was necessarily postponed. All the parties being assembled, M. Tscharner, the last president, with the public notary, stood at the upper end of the room; his successor at the lower end, with the Bunds-weiber, or secretary, dressed in a cloak half black and half white, the livery of the league. M. Tscharner addressed to his successor a short speech in German, acquainting him that he was appointed by the deputies of the league, Bunds-president for the ensuing year, giving him joy of his promotion, and congratulating the League upon the nomination of a person so well calculated by his integrity and abilities to fulfil the duties of the office. At the conclusion of this speech, the public notary reads the oaths for the president, for himself, and the secretary. M. Tscharner then told them to hold up three fingers of their right hand, and to repeat their several oaths; which ceremony being concluded, the new president declared that he was highly flattered with the honour conferred upon him, and would strive, as far as his abilities would permit, to promote the welfare of the League. Then the former president bowing, the new chief walked first out of the room; and thus ended the ceremony.

It is remarkable, that although the aristocratical party directs the nomination of the magistrates, president, and deputies, yet the appointment to the governments of the subject provinces is left wholly to chance. When the turn belongs to Coire, the five tribes meet separately, and a candidate is appointed by lot from each tribe. These five persons then draw lots for the office, and the successful candidate may sell the turn; with this restriction, that the preference of purchasing shall be given first to a member of the same tribe, secondly to any citizen of Coire, thirdly to an inhabitant of the League of God's House. It frequently happens, that the five candidates agree to divide the pro-

fits of the sale.

Upon the highest part of the town stands the bishop's palace, the cathedral, and the

houses belonging to the chapter.

The bishopric of Coire was probably erected soon after the first establishment of Christianity in these parts, under Constantine, or his son. The diocese once extended over the whole Roman province of Rhetia, which comprehended the present country of the Grisons, the Valteline, Chiavenna, and Bormio, together with the eastern district of Switzerland as far as the lake of Constance, and part of Tyrol; the bishop's territorial possessions were also considerable, and his revenues by no means inadequate to his power and signity. It would be uninteresting to trace the diminution of his authority, and the gradual annihilation of his jurisdiction over the town of Coire, and the

commonwealths of this League; I shall therefore observe, that his power was princi pally lessened by the formation of the League of God's House, and the limitation of his prerogatives in 1527: by the former he was compelled to ratify the independence of the communities; by the latter the principal prerogatives, from which he derived great influence in the political affairs of the Grisons, were at once annihilated; and he was reduced to the condition of a private person. These privileges principally consisted in having admission, and a vote in the general diet of the Grisons, in appointing several of the deputies, nominating the chief magistrates of several communities, and re ceiving appeals in civil causes from the decision of the provincial courts of justice. All these prerogatives were abrogated by a general diet of the Grisons in 1527, and the few remaining rights have been either purchased or suppressed. The introduction of the Protestant religion gave the final blow to his power; for his revenue suffered great diminution by the loss of the tythes, which were seized by the reformed communities.

The bishop is prince of the Roman empire; a dignity annexed to the see in 1170, by the emperor Frederic the First, and is styled lord of Furstenberg and Furstenau.

His annual revenues, which amount to about 2,0001, arise chiefly from estates near Coire, and in the Tyrol; he receives also the annual sum of about 70l. from the customs of Chiavenna, in return for having ceded his claims over the Valteline, Chiavenna, and Bormio, to the republic of the three leagues.* The only prerogatives remaining are the right of coining money, and an absolute jurisdiction both in civil and criminal affairs within the small district in which his palace and the chapter are situated. Beyond this district he enjoys not the least power; so far from interfering in the affairs of the town, he could not even enter it if the inhabitants choose to exclude him; a right which they asserted in 1764. A Catholic, to avoid an arrest, took refuge in the cathedral; and the inhabitants, inflamed by the bishop's refusal to deliver him up, raised a gate close to the only opening which leads into the episcopal district, by which means the avenue to the palace was closed, this manœuvre conquered the bishop's obstinacy: the gate still exists, and is ready to be used upon a similar occasion.

The bishop is chosen by the chapter. Many disputes relating to his election have arisen between the canons and the League of God's House; the latter, in virtue of a treaty contracted in 1541 with the bishop, protests, that only a native of the League can be promoted to the see. But a foreigner being elect d in 1692, the canons have since disregarded the right asserted by the League, and have without reserve given their votes to aliens, although the League remonstrates at every new election. The present

bishop is Francis Dionysius, of the ancient family of Rost, in the Tyrol.†

The episcopal district is only a few hundred paces in circumference, and is surrounded by high walls; the greater part of the palace is modern, excepting a square tower, which is supposed to have been constructed by the R mans; it is of strong but clumsy workmanship, and in no degree entitled to notice, except as a monument of antiquity.

In the cathedral I observed no object of curiosity, unless the bones of St. Lucius, richly ornamented after the fashion of Roman Catholic relies, should be thought worthy of attention. The empter consists of twenty-four canons, of whom six are resident; the inhabitants of this district are all Catholics.

Above the palace, and at the highest extremity of the town, is the convent of St. Lucius, which takes its name from a small chapel dedicated to that saint, who, according

^{*}See page 92. † In 1793, Charles Rodolph baron of Buol of Scharfenstein was elected prince bishop of Coire

to the legends of the Romish church, was a king in Britain in the latter end of the second century. Having embraced Christianity, and being inflamed with religious zeal, he quitted his throne, and wandering into these parts built an hermitage upon the spot where the chapel now stands, and by his preaching and example converted numbers to the gospel. He is styled the apostle of the Grisons, and is greatly revered as a saint by the Catholies; while the Protestants of the town pay him not the least veneration. Burnet, in his Travels, observes: "I endeavoured to shew the good old bishor that the legend of Lucius was a fable in all the parts of it, but most remarkable in that which related to the Grisons; and that we had no kings in Britain at that time, but were a province to the Romans; that no ancient authors speak of it, Bede being the first that mentions it; and that the pretended letter to pope Eleutherius, together with his answer, has evident characters of forgery in it. All this," he adds, "signified nothing to the bishop, who assured me that they had a tradition of that in their church, and it was inserted in their Breviary, which he firmly believed."

Well aware, that my endeavours to convince the monks of the falsity of the legend would have ended as unsuccessfully as the reasoning of Burnet, I did not imitate his example; but without entering into the merits or demerits of the story, contented myself with admiring the beautiful prospect, which induced me to visit the convent. The environs of Coire are delightful; the plain is richly diversified with corn and pasture; the hills gradually sloping to the foot of the mountains are covered with vines, which yield wine of a pleasant flavour, but not strong. The points of view vary surprisingly, from agreeable to romantic, from romantic to wild. The Rhine, which flows rapidly through the plain, begins here to be navigable by rafts, and merchandise is transported toward Lindau and Zuric.

LETTER LXXXIII.

Castle of Haldenstein.... Seminary of Literature.

I RODE this evening, in company with two gentleman of Coire, from whom I have received great marks of attention and politeness, to Haldenstein, which may be called the smallest sovereignty in Europe. We passed along the side of the hills, at the bottom of the rugged rocks which lead to the League of the Ten Jurisdictions, and enjoved a fine view of the rich plain, stretching from the town of Coire as far as Embs. The beautiful verdure of the meadows, the sloping hills clothed with vineyards, the craggy mountains partly covered with vines, pardy overspread with wood, and partly bare, formed altogether a striking prospect. We crossed the Rhine to Haldenstein, a small village consisting of about sixty houses, and proceeded to the house occupied by the present baron, Rhodolph de Salis, who received me with great politeness, and kindly indulged my curiosity, by shewing me his little territory, and answering my inquiries with great readiness and exactness. The baron, a gentleman of considerable learning and indefatigable industry, has formed a large collection of manuscript relative to the Grisons, from which he has drawn ample materials for a publication, in which he is at present engaged. His researches are chiefly biographical; and his work is intended to illustrate the memoirs of the principal persons, who have rendered themselves conspicuous among the Grisons by their actions and abilities.*

^{*} This work is announced as not yet linished, in Haller's Schweitzer, Bibliothek, vol. ii. p. 364, under the following tales: 1. Rhætia Illustrata, contenant l'histoire ou les principaus evenemens de la vie des

The barony of Haldenstein, he said, was formerly under the protestion or the seven ancient cantons of Switzerland; since the year 1568, it has been an independent sovereignty, under the protection of the three longues. In the middle of the sixteenth cen the Republic of the Grisons, and at his death in 1565, came into the family of Schan enstein; the male line being extinct, it was divided between two females of the collate ral branches, one of whom married a de Salis, and the other an Hartmannis. In the beginning of this century the descendants of de Salis purchased the other half, and again reunited it under one person.

The whole barony consists of a small semicircular plain, between the Rhine and the bottom of the Calendar, about five miles in length, and scarcely one in breadth; and occupies also part of the mountain, which is too steep to be inhabited. It contains only two villages, Haldenstein and Sewils, and the subjects amount to no more than between three and four hundred. The people were serfs, or vassals, until 1701, when the grandfather of the present baron gave them several immunities. At present the lord has territorial jurisdiction, the exclusive privilege of hunting and fishing, a claim of two days work annually from each of his subjects, and a load of dung from each peasant. He appoints the judge in the criminal court, receives the fines for offences, from which he pays the expences of the process, and has the power of pardoning. He nominates the president, and part of the jury in civil causes, and in all cases of appeal judges in the last resort.

The baron shewed me several coins struck by his predecessors; the most ancient was a gold piece of 1611, the year in which the emperor Matthias conferred the right of coining money upon the baron of Haldenstein; a privilege which he still enjoys.

The ancient castle of Haldenstein, from which the barons took their title, is now in ruins; but the remains are still visible upon the sides of the mountain. Above it is another ruined castle called Lichtenstein, formerly inhabited by an ancestor of prince Lichtenstein of Vienna, from which he is said to derive his title. The prince is so convinced of his descent from the ancient possessors of this castle, and so proud of their antiquity, that he procured a stone from these ruins, for the foundation stone of a superb palace which he has built at Vienna, that it might be said to contain some materials of the original eastle in which his ancestors once resided.

The present castle of Haldenstein, built in 1545, by James de Castion, is pleasantly situated near the Rhine, and commands a fine view of the town of Coire, and the ad-

A few years ago the castle was converted into a seminary for the education of youth. It was long a serious cause of complaint, that in the whole country of the Grisons there was no public seminary for completing the education of youth, and that all who followed any of the learned professions were obliged to repair to foreign academies. M. de Salis, of Marchlins, and some other persons of the first consequence among the Grisons, considering this defect a disgrace to their country, projected a plan for the institution of an academy; and having obtained the ratification of the general diet, which assembled at Davos 1761, carried it into immediate execution at their own expense, with a zeal which reflects the highest honour upon their exertions. The plan was extensive and useful, and seemed well calculated to secure success. For a short time is

were a flow shing appearance; but this prosperous beginning was not sweeeded by any beneficial consequences. Its decline was owing to the little countenance given to litera ture, was hastened by quarrels which aroso between the professors, and in 1779, within the space of fifteen years from its first establishment, the instinction

Literature among the Grisons is at a very low cbb; one of the most learned men in this country, who would not be inclined to depreciate the knowledge of his countrymen without sufficient foundation, thus expresses himself upon this subject: * "As the administration of affairs is entirely in the hands of the people, the greater part considering nothing but their own profit, despise every species of polite learning, and are unwilling to allow any salaries, or bestow any honours upon the professors; so that all persons who cultivate the sciences are incited merely by the love of glory, and a disinterested heal." If this is the case, it would be chimerical to expect the arts and sciences to flourish in an ungrateful soil, where they meet with no encouragement: but even amidst these obstacles to improvement, there have never been wanting, and are still to be found, men of superior souls, who have dedicated their time to the cultivation of letters; and who merit the highest praise, for labouring in the vineyards without hopes of

The Protestants who receive a liberal education repair for the most part to Zuric or

Basle, and the Catholics to Milan, Pavia, or Vienna.

Each community has a small school, in which the children are taught to read, write, and east accounts; but which is only open from the 9th of November to the 7th of March. Those parents who wish to give their children a better education, and can support the expense, must either send them to foreign parts, or maintain a private tutor.

There is a Latin seminary at Coire for the children of the burghers, and another instituted in 1763, for the education of persons intended for the cliurch; these establishments though poorly endowed have been productive of some literary advantages to the country. There is also a typographical society at Coire for Latin, German, and Romansh, and books in the Romansh are printed in the Lower Engadina and at Disentis.

LETTER LXXXIV.

League of Ten Jurisdictions Fatzerol Baths of Alvenew Davos Valley of Pre tigau.... Malantz.... Mayenfield.... Baths of Pfeffers.

I QUITTED Coirc yesterday morning, in order to make an excursion into the League of the Ten Jurisdictions: but before I proceed in my account of this expedition, I shall send you a short abstract of the History of the League, from the first foundation to its perfect independency.

This league ought properly to be called, and indeed is not unfrequently denominated in this country, the League of the Eleven Jurisdictions, from the number of commuuities of which it is composed; but as upon its first union it was formed of ten only, the original appellation is still retained, although one of the jurisdictions has been since

that period subdivided into two.

* In Rhætia nostra rerum administratio omnium a plebe dependet, cujus nuncrus potior non nisi que ante nasum sunt, aut lucrum adferunt, sapit, quicquid de reliquo agatur, litteras politiores, cum onni gloria et commodis quæ ex illis subsequentur, quasi rejicienda contemnit; nullum carum professoribus premium, nullum meritum, taudem nullum tribuit; sie ut qui litteras ament, ex colant, ex gene roso quopiam animi impetu id agant, seposito onmi alio fine, et absque ullo ad cas calcari. Et his tamen non obstantibus, reperti et apud Nos qui generosi ediderunt pectoris documenta; reperti ettam, qui scientiarum culturam, ac amorem quibusvis aliis prætulerum, licet illorum labores ac memoria fere cam ipsis intereat nec sit qui cam ab interitu vindicet. Aporta Hist. Reformat. Rhætic. Præfat

The territory was formerly under the dominion of the Barons of Vats, whose authority was limited, as the people possessed very considerable privileges. On the death of Donatus, the last baron, the count of Toggenburg, who married his eldest daughter, succeeded to his possessions; and Frederic, one of his descendants, dying in 1436 without issue, the communities united, formed an offensive and defensive alliance, and crected themselves into a league. But although by this alliance they increased their im munities, yet they were by no means perfectly independent; for the male heirs of the count of Tockenburgh still retained certain baronial rights, which consisted in appoint ing the criminal judge in several communities, in the power of pardoning, in a share or the fines, in nominating the principal magistrates from three candidates, and in other prerogatives. These rights, purchased by Sigismund, archduke of Austria, and en joyed by the emperor Maximilian the First, were exercised by means of a governor ap pointed with the concurrence of the league, and resident at Castels. In process of time the baronial prerogatives were gradually annihilated, either by purchase or concession the communities became free, and their independence was solemnly ratified by the em peror Ferdinand the Third, soon after the peace of Westphalia.

After half an hour's ascent from Coire, I entered the League of the Ten Jurisdictions near Malix, passed through the community of Churwalden, in which the hamlets are prettily scattered about the vale, and upon the sides of the mountains, and made a small circuit to the village of Fatzerol, which consists only of five or six houses, and stands at the bottom of some rugged mountains; it is celebrated in the history of the Grisons as the place where, in 1471, the first perpetual alliance was ratified by the deputies of the three leagues. I was accompanied to the spot by one of the principal inhabitants, who was not displeased with the cuthusiasm I testified at beholding the birth place of their liberties. The house is now in ruins, and the apartment which was remarkable for the meeting of the deputies no longer remains. Having, with the assistance of my companion, traced its site, I considered with respect the spot which was once sanctified by the ratification of a general union, lamented that so venerable a pile of building should be suffered to fall into decay, and felt disappointment, that no inscription, by public authority, consigned to posterity the date of the transaction, and consecrated the place which had been witness to an event the most incinorable in the annals of this

Having satisfied my curiosity in viewing these respectable remains, I descended through Brientz to the Baths of Alvenew, placed in a most romantic position, by the side of the torrent Albula, and at the bottom of the majestic Alps; the source is sulphareous.

and resembles both in smell and taste the waters of Harrowgate.

Having passed through Alvenew and Anderwisen, I mounted a rugged ascent through a thick forest, and pursued a narrow path upon the side of a rock called Zug, over a precipice, with a torrent flowing beneath. This rock is mostly bare, excepting a few stubbed firs, the remains of a forest which was formerly destroyed by fire; hence it is called the Burnt Wood, and exhibits a most desolate appearance; at the bottom of this rock, close to the torrent, are mines of silver, which were formerly worked. I entered the jurisdiction of Davos at the village of Glarus, and took up my lodging in a neat cot-

The district of Dayos is a long plain, a quarter of a mile broad, and gradually rising into hills, which terminate in high mountains; it is not unlike the valley of Upper Engadina, but is more fertile. Near the church of St. John is a small cluster of eight or ten houses, in the other parts the cottages are thickly strewed over the plain, and upon the gentle acclivities, as in the canton of Appenzel, each with its little territory. · non nisi res, cum rum procotant, ex i. Ethis erti etiam, memoria c. Præfat

produces oats, rve, large quantities of rich pasture, and yields yearly two crops of hay, it is now the second harvest, and the fields are covered with mowers. The bordering mountains are overspread to their summits with forests of fir and larch, intermixed with meadows; above them tower the rugged Alps. A clear murmuring stream flows through the midst of the plain, with a gentle though lively course; its banks prettily ornamented with scattered cottages, which are remarkably neat and commodious. Some are built of trees piled one upon another; others have stone foundations, and the upper part of wood; and a few are constructed with stone plastered and white-washed. I walked to the valley of Diesma, leading to Scamp in Upper Engadina, which is closed at some distance by a high mountain covered with snow, said to be one of the most elevated in the country of the Grisons; it is called the Swart-Horn, and is part of the Scaletta Alps, which communicates with the Julian Alps, the Set, and the chain that separates the Valteline from Upper Engadina and Pregalia. Close to the inn is the town house, in which the deputies composing the general diet of the Grisons assemble every three years; it is also the place of annual meeting for the deputies of this league, when they choose the Bunds Landamman, or chief, and transact any particular business; this building is plain and simple, like the people themselves.

The form of government established in this district of Davos, is like that of the small cantons of Switzerland, entirely democratical. The people must be assembled upon all extraordinary occasions, such as enacting new laws, deciding upon appeals from the general diet, and raising money; every male at the age of fourteen has a vote. The whole collective body of the people, however, do not meet in order to choose their magistrates, who are elected from deputies sent by each district. The administration of affairs resides in the great council of eighty-two, and the council of fifteen included in the former. The great council regulates all affairs relating to finance; the fifteen superintend the police, and are judges in the civil and criminal courts of justice without appeal.* In criminal cases torture cannot be inflicted without permission of the great council. The Landamman is elected every two years and is president of both these

ouncils

This remote corner has produced several persons eminent in literature; and parti-

cularly the two historians of the Grisons, Guler and Sprecher.

John Guler was born in 1562, and died in 1637, at a very advanced age. He was remarkable for his multifarious knowledge, and published in 1616, in the German tongue, "An account of the three Grison Leagues, and other Rhetian people." In this work, much esteemed by the natives, the author gives a circumstantial detail of the origin of the ancient Rhetians, and of their emigration from Tuscany into this country under their leader, Rhætus; traces their subsequent history under the Romans, and in the dark ages, to the beginning of the fifteenth century, when the union of the three leagues was established.

Guler has illustrated the history of ancient and modern Rhætia by wooden engravings of medals, towns, battles, genealogical tables, coats of arms, and maps, which, though rude, are curious for their antiquity. The author also meditated a second volume, on the union of the three leagues, on the topography and history of the whole country, and on the transactions of his own times. For this part of the work Guler was eminently qualified; as well from his extensive erudition, and for having carefully

^{&#}x27;It is remarkable, that through the whole League of the Ten Jurisdictions there is no appeal from the decision of the civil courts of justice, excepting in the community of Alvenew; the inhabitants of that place being Catholic and Protestant, an appeal lies to the civil tribunal either of Churwalden or of Davos.

al from tants of lden or digested Campel's account of the Grisons,* as from the various offices to which he was raised both in the civil and military line, and the repeated embassics and negotiations in which he was employed. It is, however, uncertain whether this part was ever finished; and, if finished, it is probably lost; for Aporta searched for it without success in the libraries and among the manuscripts of his countrymen.

The deficiency of this valuable performance, however, is supplied by Fortunatus

Spreecher, the contemporary, friend, and relation of Guler.

Sprecher, was born in 1548, and in 1617 gave to the world Pallas Rhætica armata et togata; or the military and civil history of the Grisons from the earliest ages to the æra in which it was published. In this work, which is a model for method and perspicuity, the author details the national history, in ten books. The first contains the emigration of the Tuscans, their settlement in this country, the description of the ancient Rhetians, and their transactions to the time of Augustus. The second comprises the period from the Augustan æra to the establishment of the empire of the Franks. The third treats of the Grisons under the empires of the Franks and Germans, till 1476. The fourth details the wars of the Grisons; namely the Swabian war against Maximilian the First, and the campaigns against James of Medici, from 1525 to 1531. The fifth comprises the wars in which the Grisons were engaged under the standards of foreign powers. The sixth relates the union and political state of the three leagues, and their alliances. The seventh, eighth, and ninth, separately describe the Gray League, the bishopric of Coire, the League of God's House, and the League of Ten Jurisdictions. The tenth concludes with an account of the Valteline, Chiavenna, and Bormio.

A second volume, which appeared in 1629, under the title of, Historia Motuum et Bellorum postremis hisce annis in Rhetia excitatorum et gestorum, relates the wars and troubles of the Grisons from 1617 to 1629, a period of turbulence and discord.

A third volume continued the history of the Grisons from 1627 to a short time before

the author's death, which happened in 1647; but has never been published.

Towards the extremity of the beautiful valley of Davos I came to a small lake, about four miles in circumference, which is remarkably deep and clear, and abounds with excellent tront. It lies at the foot of the mountains, and supplies a small stream, which being joined by one from the valley of Flola, and by another from that of Diesma, form the murmuring brook that waters the valley of Davos, and falls into the Albula above the baths of Alvenew; this lake is considered by some writers as a source of the Rhine.

From the banks of the lake I descended to another, half a mile in circumference, that lies in a wild and romantic situation, and supplies a torrent which is the source of the Lanquart. A little further I traversed a small pleasant plain strewed with cottages, which compose the village of Lower Lera; at the extremity of which the descent was so steep and rugged, that I dismounted until I reached the vale of Pretigau. I passed through Closter, Kublis, Jenatsch, and Schiers, following the torrent Lanquart. The country is delightful, and greatly diversified with all kinds of productions, yielding different species of grain, rich pastures, abundance of fruit-trees, with large quantities of hemp and flax; hemp is much cultivated, and seems to be carried to great perfection the peasants manufacture from it coarse but very strong linen.

The mountains on each side are in some parts covered with forests; and so great is the abundance of wood, that the fields are either studded or skirted with larch, pines,

^{*} See Letter 73.

[†] See Aporta Hist. Refor. Ecc. Ræt. Præfat. Haller, in his Schweit. Bib. No. 914, save that was prepared for the press, but unfortunately burnt

and beech. The hamlets are scattered through the plain, and along the declivities of the mountains, in a very pleasing manner; the houses are mostly of word, in the Swiss mode of construction, and not less convenient; the road through this vale descends gently all the way. I have not for some time visited a more agreeable, ferrile, and po-

pulous district.

A little beyond Crusch, which lies under some bare rocks in a fertile plain, the valley of Pretigan contracts, leaving only a narrow pass between impending rocks, just broad enough to admit the torrent and the road. The sudden change from the fertility of the country to the barrenness of this spot, sufficiently striking of itself, was still further heightened by the gloom of the evening, which added to the horror of the scenery. The road was curied for some way in continued ascent and descent along the craggy precipaes, some times above, and sometimes upon a level with the torrent. The path was so narrow and rugged, that I gave my horse to the guide, and, continuing my way on foot, soon emerged from this obscure pass, and, as far as I could judge by the dim light of the stars, came into a fine and rich country, and went through a series of vinevards to M dantz, in the district of Mayerfield.

The High Jurisdiction of Mayenfield is the most remarkable in the whole country of the Grisons, because the inhabitants are respectively sovereign and subjects. They are sovereign, because they form part of the League of the Ten Jurisdictions, send deputies to the general diet of the Grisons, and nominate to the governments of the subject provinces. They are subject because, like the provinces, they are governed by a baidff sont from the Grisons, who is changed every two years, and in whom resides the supreme authority. This strange intermixture of privileges and subjection is derived from

the following causes:

The lordship of Mayenfield was, like the whole territory of this league, subject to the counts of Toggenburgh, and, in 1436, joined the other communities to form a league. In 1509, the prerogatives enjoyed by the count of Toggenburgh were sold, by his heirs, for 20,000 florins, to the three leagues, which confirmed the privileges of the inhabitants. In 1537, Malantz and Jennius, the remaining part of this High Jurisdiction, were also purchased for 10,000 florins. Thus, while the inhabitants of all the other jurisdictions, who came under the dominion of the house of Austria, have procured their absolute independence, the people of Mayenfield and Malantz, although making part of the sovereign power, have continued in the same state as at the first formation of the league. The bailiff or governor is appointed by the communities of the three leagues in rotation, and the inhabitants of this very High Jurisdiction nominate the bailiff, when it is their turn to present to the office.

The bailiff appoints the Stadvogt, or chief magistrate of the town, with this condition, that he must be a member of the senate; upon a vacancy in the senate or little council, he nominates the new senator: he arrests and examines criminals, and has power to make a composition; he cannot order torture, or pass sentence, without the concurrence of the members of the criminal tribunal,* and, when they pass sentence, can pardon; he can give a liberation, in the same manner as the governor of the Valteline;† he receives part of the fines for criminal offences, and a certain portion of the great tythes; at Malantz he appoints the chief magistrate from three candidates presented by the people. Both Mayenfield and Malantz have their civil courts; from that of the former an appeal

lies to the bailiff.

^{*}The members of this tribunal consist of six judges from the district of Mayenfield, and six from that of Malantz, three from Jennins, and two from Flassch.

1 See Letter 76

From M dantz, a small but hundsome town, lying upon the advol a hill, I descended into a rich plain of pisture, about three miles in breedth, crossed the Rhin , and soon afterwards ascended into the country of Bug uis, through building groves of Eirch, fir, ter fi, beech, and oak. From the emissince I looked down upon a fine view, on the other side of the Rhmo, of hids gently rising from the river into mountains. Upon this chain are signated Mayenfield, Malantz, Jennius, and Flæsch, surrounded by cornfield, meadows, and vineyards; it seemed the richest part of this country. I observed beyond the confines of the Grisons, at a little distance, the road which I pass d in 1776, as I travelled from Appenzel to Wallenstadt.

Having reached Pfeffers, I left my horse at the village, where there is an abbey of Benedictine monks, the abbot of which is a prince of the empire, and took a guide to the baths, which are distant about three miles. I passed through a thick forest of beech, down a steep and rugged path, to the house which the abbot has built for the reception of the company. Formerly the accommodations were extremely indifferent, and the descent into the baths was attended with great inconvenience, if not with danger Affairs are now greatly changed; the waters are conveyed by pipes into commodious baths; and the house, which is not only convenient but superb, hangs in a most ro mantic situation on the side of a mountain, amidst the gloom of the forest, close to the

lively Tamina.

Being desirous of visiting the warm source, I crossed the Tamina, over a wooden bridge, and entered a chasm or marow opening, in a rock of lime-stone, through which the torrent has forced its way. The chasm is from ten to twenty feet broad, and from two to three hundred feet high. In some places it is open at top, and overspread with shrubs; in some its sides converge and almost touch; in others it is quite closed with enormous masses of fallen rock, and scarcely admits a feeble ray of light. The passage through this chasm is quite dreadful, and my head almost turns giddy at the recital. I went along a kind of scaffolding erected for the purpose of supporting a wooden aqueduct, through which the waters are conveyed: the planks upon which I walked either resting upon long beams, or suspended by iron cramps driven into the sides of the rock, lung over the torrent. I was frequently obliged to stoop for a considerable way to avoid the impending rock: in some places I traversed a single plank, which forms a kind of bridge suspended over the gulf, tottering under my weight, and so narrow that I was compelled to walk sideways. In this manner I continued for near a quarter of an hour before I reached the warm springs, which gush abundantly from the crevices of the rock. Here the baths were formerly constructed: the houses for the reception of the sick were built upon a platform, under the overlanging erags; a situation so dreary, that I no longer find the description given by the writers of the last century in the least degree exaggerated. Willing to convey a general idea of their gloominess, they represent these dwellings as never receiving the rays of the sun, and so dark that the inhabitants were accustomed to use candles at mid-day. The approach to the baths was very inconvenient; the company descended ranges of perpendienlar ladders, or were let down by ropes. As the rocks have fallen, and overwhelmed these subterrancous dwellings, I could observe no traces of them, except some holes in the rock for the beams which supported the houses.

These paths have been so renowned for their efficacy in curing the gout, rheumatism. and entaneous disorders, that, according to the general opinion, h y contain a small portion of gold; as if that metal would render them more salutary. The waters are

transparent, perfectly free from smell or taste, and about the warmth of milk immediately drawn from the cow. Persons who have analysed them say, that they deposit no sediment, are as light and pure as rain water, are impregnated with a small quantity of volatile alkali and iron, but contain no sulphur.

I returned from this source through the same clasm, and along the same tottering scaffold, and was not displeased when I issued again into day. I then mounted to the

village of Pfeffers, descended into the plain of the Rhine, and hastened to Coire.

LETTER LXXXV

Union of the Three Leagues....Diet....Constituent Parts....Mode of choosing the Deputus....Inalogy between the Grison Diet end the British Parliament, according to the Plan of extending to the People at large the Right of electing Representatives... Remarks on the Inexpediency of that Plan.

The country of the Grisons is divided into three leagues, which unite and form one equilic; the Gray League, the Cadee, or the House of God, and the Ten Jurisdictions. The respective communities of these three Leagues have their peculiar constitution, enjoy their municipal laws and customs, and are independent commonwealths, in all concerns, which do not interfere with the general policy of the whole republic, or the ar

ticles of the particular league of which they form a part.

It is remarkable that the precise period at which the three leagues formally united to compose one general republic cannot be ascertained from any positive record in the annals of this country. Campel, the best historian of the Grisons, places this event about 1436.* For, though the first articles of union which are transmitted to posterity were drawn up in 1524, it is plain that there were others of anterior date, because it is therein expressly mentioned, that the said articles were compiled from a former treaty, with great additions. This union has since been frequently renewed at different periods; but the articles remain without alteration.

The connections between the three leagues is maintained by means of an annual diet

of the congress and of the three chiefs.

The diet is composed of sixty-three deputies, and the three chiefs; the Gray League sends twenty-seven, and the House of God twenty-two, and the Ten Jurisdictions tourteen; they are chosen in the several communities by every male at a stated age.

The diet assembles annually about the beginning of September at Ilants, Coire, and Davos, by rotation, and continues sitting three weeks or a month. The chief of the league in whose district the diet is held, is president for that turn, and has the casting voice in case of equal suffrages. The supreme authority is not absolutely and finally vested in the diet, but in the communities at large; for in all affairs of importance, such as declaring war, making peace, enacting laws, contracting alliances, and imposing taxes, the deputies either bring positive instructions from their constituents, or reter those points concerning which they have no instructions, to the decision of the respective communities; so that in effect the supreme power constitutionally resides in the body of the people, and not in their representatives at the diet. All questions in the diet are carried or rejected by a majority of voices, and the mode of voting is as follows: In all cases where the communities send instructions, the deputies deliver them to the

† The age which entitles them to vote is not exactly the same in all communities; in some it commences as early as fourteen

^{*} Sprecher, however, in his Pallas Rhetica, fixes the union of the three Leagues in 1471, p. 228. Elz. edit. Most of the Grison historians follow Sprecher.

: it com-

sceretary, who reads them aloud; if these instructions are obscurely worded, as sometimes happens, either through accident or design, the diet determines by a majority, in what sense they shall be taken. In resolutions, which, for want of instructions, are subject, after the decision of the diet, to the revisal of the communities, each member is at liberty to vote as he chooses. The three chiefs have no suffage, when the communities send their instructions, because they are not representatives; but in all cases which are either not referable, or afterwards submitted to the communities, they comin the same manner as the deputies.

It is worthy of remark, that, although each deputy has the power of bringing in any bill, or proposing any question, yet be can only communicate it to the assembly through the medium of the president, who may lay it before the assembly, without any previous notice, at any time before its dissolution; a privilege which invests him with great in

fluence in promoting or opposing the success of a motion.

The deputies receive, for their attendance, a small salary from the public treasury,

which never exceeds five shillings a day.

Extraordinary diets are convoked at the request of any foreign court, who will discharge the expense of the sittings, and upon other important emergencies. This extraordinary assembly is semetimes composed of all the deputies, at other times of only half the number, in which case it is called a half diet; the deputies are chosen in the same manner as at the election of a general diet, and its powers are the same.

The aristocratical party is still further strengthened by the power delegated to the congress; an assembly formed by the three chiefs, and three deputies from each league. In the Gray League these deputies are nominated by the Landrichter; in each of the

other leagues they are chosen by rotation from the communities.

This congress generally meets in February or March at Coire; for which reason the chief of the League of God's House is president; its office is to receive the votes of the several communities, relative to the questions referred to their deliberation at the last diet, and to communicate to each the result of the general decision. Whenever the answer of a community is not clearly worded, the congress determines the meaning of the vote, and this circumstance gives an opening to much intrigue. For, if the leading persons in any community do not choose to form a positive decision, they have it obscurely worded, provided they are certain that a majority of the congress will affix that interpretation which they desire. This assembly issues decrees to the subject countries: if such decrees are agreeable to the governors, they carry them into execution; but if otherwise, and they can secure a majority at the approaching diet, they reject them, altedging that congress has exceeded its power. The three chiefs, as well as each of the other members of the congress, receive as a defrayment of their expences 50 floring, or about 41.

The three chiefs essemble regularly three times in the year at Coire, and, upon any emergency, may be also summoned by the chief of the League of God's House. The principal meeting is in the month of May, when they write circular fetters to the several communities, concerning the questions which are to be laid before the general diet. All the circular letters are written in German, and are translated into Italian or Romansh by the notaries of the district where those languages are spoken; all public acts and documents are compiled in German; at the diet all bills are proposed in that language, but the deputies who do not understand German may speak Italian.

Of all the constitutions in Swirzerland, that of the Grisons was the most democratic, and contain recontain many of the extential characteristics considered by the Trenchas constitution a perfect type, Vel., Vel.

Those theorists, who are so anxious to reform the English house of commons by transferring to the people at large the election of their representatives in parliament, might, on examining with attention the features of the Grison diet, fondly imagine, that an annual assembly, in the choice of whose members every make of the state has a vote, and which, in all material occurrences, is liable to be directed by its constituents, must necessarily be the purest sanctuary of general freedom. In this instance, however, their conjectures are by no means consonant to fact and experience; as corruption and influence are not in any national parliament more conspicuous than in the diet of the Grisons.

For although, in general, those deputies, annually chosen by every male of a stated age, are subject to be controlled in their votes by written orders from their constituents, yet they frequently contrive to clude this restriction. Sometimes the instructions are drawn up, with the consent of the community, under the sole direction of the deputy bimself; at other times, an exemption frem positive instructions, and the power of voting at his own pleasure, is purchased by the deputy from his constituents. Sometimes again, the deputy, although he cannot gain either of these points, has still sufficient address to get his instructions so obscurely worded as to admit a doubtful interpretation.

By various intrigues of this kind the greater part of the deputies ultimately acquire the power of voting as they please; and as they cheifly obtain this power by corrupting their constituents, most of them in return sell their vote to the leading members of the diet; for most questions are carried, and most causes decided, by bribery. Nor can it well be otherwise, when the electors are persons in needy circumstances; and the members, who have purchased their seats, are not themselves exalted by their possessions above temptation.

of representative government, such as primary assemblies, annual elections, universal suffrage, and general eligibility. Yet the French no less attempted to democratise the most democratic constitution on earth, and proved that possession, and not reform, was their object. It was not difficult to excite tumble and insurrection among a people divided into factions, and turbulent from the popular nature of their constitution.

As early as 1790, the agents of France were industrious in disseminating the new principles, but the great body of the people were averse to all innovation. At length, in 1794, a society of Grison accolins induced the people to abolish the ancient form of government, to substitute a National Convention in the place of the General Diet, and to throw themselves under the protection of France; and this revolution was accompanied with the usual horrors of pillage, banishment, and bloodshed.

This precarious tenure, however, did not satisfy the French rulers, whe coveted the possession of a ountry, which commanded the passes of Switzerland and the Tyrol; and Bonaparte had no sooner one hided the armistice with the emperor, than he dismembered the Valteline, Chiavenna, and Bormio, and annexed them to the Cisalpine republic. This perfidious conduct unveiled the ambitious resigns of France, inflamed the resentments of the people against their jacobin leaders, and the anti-tevolutionary party began to recover their ascendency. The proceedings of the French in revolutioning Switzerland, and the cruelties committed in the small cantons, particularly the massacre of Underwalden, excited general horror, and the people, inspired by the approach of an Austrian army rejected the mandate of the French directory to incorporate themselves with the Helvetic Republic, one and indivisible, re-established the ancient government, drove out the agents of France, recalled the exiles, decreed a defensive armament under the command of M. de Salis of Marchlins, and gave rotice to the court of Vienna of their intention to claim the number of troops stipulated by the capitulation of Milan.

General Schawembourg instantly marched lifteen thousand troops to the frontiers of the Grisons, on the side of Sargans, and prepared, with the aid of the French party, to regain possession of the country. The insurgents secretly assembled on the night of the 5th of October at Mayenfield and Stalantz; but the conspiracy being detected, the alarum-hell was sounded, the jacobins were disarmed, ten thousand peasants flew to the defiles, and the regents, equally disregarding the threats and promises of the French resident, demanded the assistance of the emperor, and committed the defence of their country to an Austrian army.

On the renewal of hostilities between France and Austria, the country of Grisons became the scene of bloody contests, and was alternately occupied by both armies; but is now (1801) in the possession

and under the power of France.

Thus the leading members secure an unbounded sway in the affairs of the dut; but till it should seem, that whatever influence they may obtain by corrupting the deputies yet, as the diet does not in many cases decide finally, they could not acquire the same authority in those concerns which must be referred to the determination of the communities at large. Here at least we might expect the unbiassed sense of the majority of the people. But it may be universally remarked, that the delegation of deliberative authority to the people at large, unavoidably tends to introduce an actual, though not an acknowledged, aristocracy. For a numerous populace summoned to determine upon political, legislative, and judicial questions, far above their comprehensions, must resign themselves to the direction of more informed men, especially when aided by the recommendation of superior wealth. The deputies being generally the chiefs of those com munities which they represent, have the principal influence, and easily find means to incline the opinion of the people to the side which they have espoused. In fact, without this aristocratical influence, the excess of freedom would degenerate into anarchy, and public deliberations be attended with endless disputes and factions.

If therefore corruption and aristocratical influence alone diminish factions and prevent anarchy in so poor a country as that of the Grisons, and in a republic scarcely known among the nations of Europe; to what a dreadful excess must the same evils prevail, it the same mode of electing, and giving instructions to members of parliament, subsisted in a kingdom like England, where riches and luxury are continually advancing with such rapid strides, where the most important political and commercial debates are agitated without restraint, and where the decisions of public affairs frequently affect the peace

and interests of all Europe.

Theoretical reasoners may, indeed, attempt to prove, that the best method of pre venting corruption is to augment the number of electors, from the chimerical idea, that large numbers cannot be bribed. But if we appeal from uncertain theory to more certain experience, we shall find that this argument is contradicted by the history of all ages. Among the Grecian republics, those commonwealths in which the magistrates were chosen by the people at large, were the most venal. Among the Romans, the most effectual means which Julius Cæsar, the ablest politician of his age, employed to subjugate his country, was to extend the privileges and votes of Roman citizens to all the inhabitants of Italy. The members of the Polish diet,* which is no less venal than the diet of the Grisons, are chosen by needy and numerous electors, of whom far the greater part possess no property; and whose numbers, instead of preventing, necessarily tend to increase influence and corruption.†

* See Travels into Poland, Russia, &c. Vol. I. b. I. c. vi. & viii.

† If instances were wanting to justify the truth of these observations, the French revolution will afford an uncontrovertible example. The great and leading features of their representative form of government, which was to give happiness and peace to mankind, were, as in the Grison diet, annual elections, universal suffrage, and general eligibility without any qualification. The consequences have been venality, persecution, anarchy, and universal spoliation, which have ultimately terminated in despotism. Fortunately the great majority of the English nation are fully convinced that the absurdity of realising the specious notion of a reform in parliament is proved by experience, and that universal suffrage, annual elections, and general eligibility without qualification, would be attended with the same fatal effects which they produced in France.

The French baving, in the commencement of the revolutionary career, made every thing subservient to personal liberty, and constituted their fabric of government on the basis of universal suffrage, are now hurrying into the contrary extreme, and in the new metaphysical system the rights of property are

alone considered.

LETTER LXXXVI.

Valley of Sopra Selva.... Hants.... Truns.... Disentis.... Tavetch.

iMPATIENT to return to England, after so long an absence from my friends, I resterday morning quitted Coire, passed by Embs, and over the bridge of Richenau, which I again stopped to admire, as it boldly projected over the Rlane. I then rode along the side of the mountains which separate the Grisons from the canton of Glarus, went through Tamins, and left Flims on my right, situated about a quarter of a mile from the road, in a pleasant plain. The houses of these towns are not scattered like those of Davos, but stand in separate clusters, resembling the burghs of Engadina. Having traversed thick forests of pines, and a very wild country, righly diversified with grain and

pasture, I descended to the deep bed of the Rhine, and crossed it to flants.

Hants, the capital of the Gray League, is a small town, containing about sixty houses, and partly surrounded by walls; a circumstance which serves to distinguish it, as it is the only walled town, excepting Coire, in this country. It is also remarkable as the place where the general diet of the three leagues assembles every third year. The adjacent country is fertile in every species of grain and pasture. The points of view are uncommonly fine, exhibiting a small plain skirted by cultivated mountains, and backed by a ridge of barren rocks which bound the valley of Lugnetz. The Romansh, which is spoken in these parts differs considerably, both as to pronunciation and orthography, from that of Engadina. By the assistance of some persons to whom I had letters of recommendation, I procured several books in the dialect of this league; these, in addition to others I obtained in Engadina, have so considerably swelled my travelling library, that if I continue to increase the collection, I must hire an additional horse for the purpose of carrying my baggage of information.

Carrying my baggage of mormation.

This tract of country, stretching from Reichenau to the mountain of St. Gothard, is called the valley of Sopra Selva, and is the most populous part of the Gray League.

Quitting Hants, I pursued my route at the foot of the mountains, through a plain covered with pasture and forest by the side of the Rhine, which is rapid and shallow; and passed through a rocky country, continually ascending and descending amid large tracts of forest. I crossed the Rhine several times during the last four or five miles: that river formed repeated cataracts, as I judged from the roaring sound, for the evening was so dark that I could not distinguish any object.

I arrived late at Truns, remarkable in the history of this country, as the place where the independence of the league was first ratified, and an alliance concluded between the chiefs and the communities. An aged oak still exists, under which, according to tradition, the three chiefs confirmed the liberties of the league; and near it a chapel, whose

walls are painted with a representation of the ecremony.

My enriosity led me to the town-house, in which the diet of the Gray League is annually assembled. The room is well adapted for the purpose, and is handsomely painted with the arms of the Laudrichters, beginning from those of John of Laubris, the first

^{*}Roederer, one of the principal supporters of democracy in the early periods of the revolution, altading to the evils of universal suffrage, which he calls the extension of the elective franchise, has recently declared "that it could produce nothing but the invasion of the republic by beggars, the subversion of the constitution, and an anarchy regularly organised;" and in speaking of frequent elections he also observes, "How could men hazard such a measure as that of annually agitating a mass of thirty millions of men."

person appointed to that office when the Gray League was formed. From this place of meeting the assembly is always called the Diet of Truns. It consists of the same twentyseven deputies who are appointed for the general diet of the hree leagues, the two Landrichters, the abbot of Discutis (the representative of the house of Austria) as baron of Retzuns, and the temporary Cau de Sax. All affairs relating to legislation, politics, and finance, which concern the general interest of the league, are agitated in this assembly, and the questions decided by the majority of voices.

At the same place is also a court of appeal, composed of sixteen* deputies, and the Landrichter, who has the casting ve ce; it decides in the last resort all civil causes above a certain sum, brought from the decision of the civil courts in the communities

of the Gray League.

Disentis, from whence I am now writing, takes its appellation from an abbey of that name, whose abbot was formerly sovereign over this part of the Gray League, and who, although he has suffered a diminution of his prerogatives, yet, as one of the chiefs of the league, still possesses no inconsiderable influence in the general administration of affairs. At the diet of Truns he not only votes, but has such weight, that few acts can pass in opposition to his will. In the court of appeal, although he is not present, he may be said to possess four votes, as the four deputies from the High Jurisdiction of Disentis are generally nominated through his interest. Nor is his ascendancy confined to the Gray League: by the nomination of the Landrichter every third year, he secures fourt votes in the congress for that sitting, and has also much power in the general diet of the Grisons, by his influence over the deputies of the Gray League. His present revenue is very small, searcely amounting to 100l. per annum; in addition he receives a pension from the house of Austria, which is interested to secure his concurrence. He is chosen by the Benedictine monks, who compose the chapter, and is a prince of the German

The abbey, situated upon the side of the mountain, is a large quadrangular building. and makes a magnificent appearance from the village. I was much disappointed that the abbot was not in the country; I had the pleasure of meeting him at Coire, and found him a person of considerable information. I no less regretted his absence, because he had in his possession the key of the archives, which are said to contain several curious records of high antiquity. The monks, who politely accompanied me over the abbey, were able to give me fittle intelligence. Besides the great church, they carried me to a small chapel, esteemed the most ancient in the whole country of the Grisons. Being previously informed that books in the Romansh tongue, for the use of the Roman

ticularly a vocabulary of the Romansh spoken in the valley of Sopra Selva.

Disentis is a straggling village lying upon a gentle declivity, which slopes gradually from the foot of the mountains to the banks of the Rhine. The sides of the mountains are clothed with groves of firs and small birch; the lower parts yield rich pasture, a small quantity of wheat, rye, and millet. Opposite Disentis is the valley of Medels, from which descends a torrent called the Middle Rhine, and joins the upper branch that

flows from the chain of the St. Gothard.

The communities of Disentis and Tavetch, which form a High Jurisdiction, occupy the western extremity of the valley of Sopra Selva, stretching as far as the confines of Uri. The whole body of people assemble every two years at Disentis, in the open air, for the choice of the Landamman, and for the confirmation of their magistrates, as well as for the purpose of enacting laws; they nominate also to the governments of the subject provinces. The courts of judicature are established at Disentis, and the judges chosen by the people in the separate districts. The general administration of affairs is entrusted to a council of sixteen, which gives instructions to their deputies sent by the two communities to the general diet of the three leagues. The Landamman is president, and has the casting voice. The abbot enjoys the privilege of being present at all political questions, and of giving his vote; he has considerable influence in these communities. Formerly the fines for criminal offences belonged to him; but one of his predecessors having disposed of that right, they are now divided among the judges.

September 30th.

I QUITTED Disentis this morning, and in about two hours entered the pleasant valley of Tavetch, lying at the foot of the Alps which separate the Grisons from the canton of Uri. The villages are numerous, and consist of scattered cottages chiefly constructed of wood, resembling the Swiss hamlets in the small cantons. I met many large herds of cattle just descended from the higher Alps, and driving towards the fairs of Tirano

and Lugano.

The valley of Tavetch produces pasture, hemp, and flax, and a small quantity of rye and barley; the trees are chiefly firs and pines, and their number gradually diminishes towards the extremity of the vale. From Tavetch I ascended a narrow path, and passed through Selva and Cimut, the last village in the country of the Grisons where I took my farewell of the Romansh. The country became more and more wild as I ascended; and the Upper Rhine gradually diminished as I approached its source. A little beyond Cimut I came into a small plain of pasture, watered by two streams which unite and form the Upper Rhine. I once intended to visit the source of the principal stream, that precipitates from mount Badus; but finding, upon inquiry from the inhabitants of Selva, that it would employ at least five hours; as the day was far advanced, and my late illness has disqualified me for such fatiguing journeys, I prudently pursued my route to Urseren. At Cimut, a peasant, who had frequently visited the spot, informed me, that the chief source of the Rhine descends from a glacier upon the summit of the Badus, and forms a piece of water about half a mile in circumference, called the lake of St. Thomas; from this lake a torrent precipitates itself down the mountain, and being joined by many springs and currents, forms the larger of the two streams, which unite in the above-mentioned plain. From this plain I ascended by the side of the smaller stream, until I traced it falling from a glacier close to the confines of the canton of Uri. The ascent, though abrupt and craggy, was not so difficult as the passage of the Braglio or the Muret. These Alps produce no trees, but are covered to a

great height with herbage.

After two hours continued ascent from the valley of Tavetch, I reached the highest point of the chain which separates the country of the Grisons from the canton of Uri; a few paces further I passed a post without an inscription, which marks the boundary between the two respective territories. Soon afterwards I arrived at a lake of an oblong shape, a mile and a half in circumference, formed principally by a torrent that falls from the northern side of the same chain which gives rise to the Rhine; the lake supplies a stream that may be called one of the sources of the Reuss. I followed it as it flows through a narrow plain, until I came to a steep descent, where the beautiful valley of Urseren suddenly burst upon my view.

LETTER LXXXVII.

General Idea of the Courts of Justice Religion Revenues Population.

DURING the course of my correspondence I have occasionally mentioned the judicial proceedings in some of the communities. I shall here remark in general, that throughout the three Leagues the Roman law prevails, modified by municipal customs. The courts of justice in each community are composed of the chief magistrate, who presides, and a certain number of jurymen chosen by the people: they have no regular salary, but receive for their attendance a small sum, arising in some communities from the expences of the process, which are defrayed by the criminals, in others from a share of the fines. They enjoy the power of pardoning or diminishing the penalty, and of receiving a composition in money. This mode of proceeding supposes, what is as absurd in theory as it is contrary to experience, that judges will incline to mercy when it is their interest to convict; or will impartially inflict punishment even when injurious to their own private advantage.

The prisoners are examined in private, and frequently tortured for the purpose of forcing confession, when the judges either divide the fines, or remit the punishment for a composition. In some districts a criminal trial is a kind of festival to the judges, for whom a good repast* is provided at the expence of the prisoner, if convicted: thus the allusion in Garth's Dispensary, applied with more wit than truth to our courts of justice,

is literally fulfilled:

"And wretches hang, that jurymen may dine."

Capital punishments, however, are extremely rare; a circumstance arising not from any peculiar lenity in the penal statutes, or a propensity to mercy in the judges; but because the judges draw more advantages from fining than executing an offender. In a word, to use the expression of Burnet, which is no less true at present than in his time, "Many crimes go unpunished, if the persons who commit them have either great credit or much money."

It is remarkable that torture is more frequently applied, and for smaller delinquencies, in these independent republics, than in the subject provinces. The infliction of it depends entirely upon the arbitrary will of the judges, a majority of whom may order it for an offence which by the statutes is not capital, nor even punishable by corporal penalties. Thus it is not uncommon, in those communities where fines are divided

^{*} A specific sum is allowed for the expense of the dinner, amounting in general to about 48 floring

among the judges, to torture women of loose conduct, for the purpose of compelling them to confess with whom they have been connected; for as some of necest are punishable by fine, the more persons are convicted, the larger share of morecy is distributed among the judges. Even in the districts where the fines are paid to the community, torture is often no less wantonly inflicted; because, when the prisoner is not found guilty, the expences of the process fall upon the public, and the judges receive less

Even in the civil courts most causes are decided by bribing the judges; and appeals, emolament. in those communities wherein they are admitted, scarcely serve any other end than to enlarge the sphere of corruption. Coire and a few other places are excepted from this general reflection. This description comprehends the course of jurisprudence throughout the Crisons; how then can it be expected that the governors of the subject provinces should impartially administer justice, where their power is enlarged, and where

they enjoy greater means of enriching themseives?

Before I close the account of the courts of judicature, it may be necessary to mention the Straffgericht, + or public chamber of justice, which was established upon particular occasions, and in the most alarming crisis of affairs, by the consent of the general diet; and which, during its sittings, had jurisdiction over the three leagues. It was chiefly held in cases of high treason, and is thus justly described by Burnet: "There is a part of this constitution that is very terrible, and which makes the greatest men in it tremble: the peasants come sometimes in great bodies, and demand a chamber of justice from the general diet; and they are bound to grant it always when it is thus demanded, which comes about generally once in twenty years. Commonly this tunnult of the peasants is set on by some of the malcontented gentry, and generally there are a great many sacrifices made. This court is composed of ten judges out of every league, and twenty advocates, who manage such accusations as are presented to them. This court is paramount to law, and acts like a court of inquisition; they give the question, and do every thing that they think necessary to discover the truth of such accusations as are presented to them; and the decisions of this court can never be brought under a second review: though there is an exception to this, for about a hundred years ago, one court of justice reversed all that another had done; but that is a single instance."

These meetings, very usual in the last century, were always attended with such dreadful effects as nearly to endanger the republic. The present generation, grown wiser by experience, and either aware of the dreadful effects of such ficentious proceedings, or less agitated with intestine dissentions, have never had recourse to these sangoinary measures: accordingly these courts are now tallen into disuse, and may be considered as ob-

solete, although not abolished by public authority.

The religion of the Grisons is divided into Catholic and Reformed, the only persuasions tolerated in this country. By the Reformed is meant what we call Calvinism,

 ullet In many of the communities, incontinence between married persons is punished by a fine of 209 floring A married and single person Persons unmarried

A pound sterling is equal to about 131 Grison florins.

Paschal, the French ambassador from Henry the Fourth to the Grisons, gives, in his Rucetica Legatio, the following definition of a Straffgericht: Straffgerichtum est is hominum paucis exceptis, imperitorum, ac truculentorum confessus, qui rebus turbidis a mota, et lasciviente, muttitudine educitur in hoc, ut saviat it, personas, et intunas corum, quos vel suo pravitas, si sacinorosi homines sint, aut si boni, sua infelicitas, his duris capitibus mactandos objicit: igitur ca cannia ibi aspere et violen ter ex rumore c. libidine plebis et partis fratæ agit, hanc sæviendi occasionem jundin occupantis

uthough it is not the same as was established at Geneva. For, as the reformation was introduced into this country by the disciples of Zuingle, the religion of the Protestant Grisons bears a greater resemblance to that settled at Zurie, than to the church of Geneva; although the difference between the two sects is extremely trifling. Among the Grisons the Protestants are more numerous than the Catholics, being estimated as about two thirds of the inhabitants; and Stanyan justly asserts,* that, "as all their elections are decided by the plurality of voices, the republic of the Grisons may be deemed a Protestant state."

The reformation was introduced very early: the new doctrines were first preached about the year 1524, and received at Flæsch, a small village in the Ten Jurisdictions, upon the confines of Sargans: from thence they were extended to Mayenfield and Malantz, and soon afterwards through the whole valley of Pretigan. The reformed opinions spread with such celerity, that before the end of the sixteenth century they were embraced by the whole league of the Ten Jurisdictions (excepting part of the community of Alvenew) the greater part of the House of God, and a few community

ties in the Grav League.

The difference of religion nearly excited a civil war between the two seets, as well at the first introduction of the reformation, as at the beginning of the troubles in the Valteline, where the two parties rose in arms; but the Catholies being overpowered by the Protestants, matters were amicably adjusted. Since that period, all religious concerns have been regulated with perfect cordiality. According to the general consent of the three leagues, each community, being absolute within its little territory, has the power of appointing its own mode of worship, and the inhabitants are free to follow either the Catholic or Reformed persuasion. In the administration of civil affairs religion has no interference, the deputies of the general diet may be members of either communion. By this moderate and tolerating principle all religious dissensions have been suppressed, and the most perfect amity subsists between the two sects.

In spiritual concerns the Catholics for the most part are under the jurisdiction of the bishop of Coire. For the affairs of the reformed churches, each league is divided into a certain number of districts, the ministers whereof assemble twice every year: these assemblies are called colloquia. Each colloquium has its president, and each league a superintendant, called a dean. The supreme authority in spiritual concerns is vested in the synod, which is composed of the three deans, and the elergy of each league; the synod assembles every year alternately in each of the three leagues. Candidates for holy orders are examined before the synod. The necessary qualification for admission into the church ought to be the knowledge of Hebrew, Greek, and Latin; but this rule inot strictly adhered to, many being ordained without the least acquaintance with either of those languages. Formerly Latin was solely used, as well in the debates of the synod as for the purpose of examining the candidates, but at present that tongue grows more and more into disuse, and German is employed in its stead.

The number of reformed parishes in the whole three Leagues amounts to one hundred and thirty-five. In the Gray League forty-six, in that of God's House fifty-three, and in the League of Ten Jurisdictions thirty-six. The ministers of these churches enjoy very small salaries. The richest benefices do not perhaps yield more than 201, or at most 251, per ann, and the poorest sometimes scarcely 61.

This scanty income is attended with many inconveniences. It obliges the elergy, who have families, to follow some branch of traffic, to the neglect of their ecclesiastical

^{*} State of Switzerland, p. 228

studies, and to the degradation of the professional character. Another inconvenience is superadded to the narrowness of their income. In most communities the ministers, though confirmed by the synod, are chosen by the people of the parish, and are solely

dependent on their bounty.

For these reasons the candidates for holy orders are generally extremely ignorant; they cannot support that expence which is requisite to pursue their studies; they are not animated with the expectation of a decent competence, and, from the dependent mode of their election, are not encouraged to deserve their promotion by a consistent dignity of character. But there are not wanting a few men of great knowledge and eminence, as well in their professional studies as in other branches of polite learning. Besides Aporta, whom I look up to as a kind of phænomena in the literary world, I have net with two or three elergymen who are greatly distinguished for their crudition, and who would do credit to any church.

It is remarkable, that the liturgies of these reformed churches are not exactly the same; a diversity owing to the independence of so many small commonwealths, which are absolute within their little territories in all concerns that do not affect the political unions of the three Leagues. The churches of the German communities use the liturgy of Zuric; but as this form of prayer was amended in 1766, some of the ministers ad-

rait the new, and others still retain the ancient liturgy.

Stephen Gabriel, pastor of Hants, a person of great learning, in the beginning of the last century translated into the Romansh of the Gray League the liturgy of Zuric; and the same form of prayer is used in the Upper and Lower Engadina, adapted to their respective idioms.* The ministers of the Italian churches employ a translation of the

Genevan liturgy.†

The old style is in use among the Protestants, the new style among the Catholies: a few years ago an attempt was made to introduce the latter among the Protestants. The inhabitants of Pregalia admitted it; and those of Upper Engadina offered also to receive it, if the town of Coire would set the example. Its admission, however, being strongly opposed from religious scruples, it was absolutely rejected, and the inhabitants of Pregalia again adopted the old style.

The revenues of the three Leagues arise from the following articles:

1. The duties upon the merchandise which passes through the Grisons, the Valteline, and Chiavenna; they are farmed at the annual rate of 17,000 florins, or about 1259l. 2. A third of the fines laid upon delinquents in the subject countries; the fluctuating state of this article cannot be ascertained. 3. A tribute of 500 philips) from the Valteline, and 100 from Chiavenna. 4. A small fund, the principal part of which is only 4000l. vested in the English stocks.

The public expenditure is very triffing, being chiefly confined to the expences incurred by the sittings of the diet, and the salary assigned to the deputies for their attendance.

Besides this public treasury, each League has a fund. The pensions received from foreign powers are paid annually at the meeting of the diet, when they are equally divided between the three Leagues, and each deputy distributes the share to the community which he represents.

* For the Romansh spoken in Upper and Lower Engadina, see Letter 90.

† In 1749 a new service was introduced into the churches of Pregalia; but, on account of its bength, soon fell into disuse.

I am informed, that stace my departure from the Crisons the new style has been adopted by stveral Protestant communities.

Many disputes have occasionally risen among the Grisons in regard to the power of coining, and several of the communities have asserted their claim to the exercise of that eight. The fact is, that each community might doubtless coin money, and order it to be taken within its own little territory; but as it would not pass in the other parts, the right is merely nominal. According to the general consent of the three Leagues, this privilege is vested in the town of Coirc, in the bishop, and in the baron of Haldenstein. No money is, however, struck in the Grisons, excepting a small copper coin call blutsger, which is somewhat less than a halfpenny. The gold and silver current in the country is chiefly Austrian and French.

From the best information which I have been able to collect, the population of the Grisons may be thus estimated:

The Gray League contains				54,000 sout
League of God's House	-			29,000
League of Ten Jurisdictions			•	15,000
				-
				98,000

If we add 87,000, the number of inhabitants in the Valteline, Chiavenna, and Bormio, the whole population of the Grisons, and the subject countries, will amount to only 185,000 souls; and, allowing for deficiencies, will scarcely exceed 200,000.

LETTER LXXXVIII.

Commerce of the Grisons ... Canal of the Adda.

THE commerce of the Grisons is extremely contracted; the only exports (exclusive of those from the subject provinces) being cheese and cattle. They import grain, rice, salt, and silk stuffs, from Milan; grain from Suabia and Tyrol; salt from Tyrol and Bavaria, fine cloth, chiefly English, French, and Silesian, through Germany; fine liner and muslins from Switzerland. As the only manufacture throughout the whole country is that of cotton established at Coire, it is evident that the balance of trade must turn considerably against them. They are enabled to support this deficiency by means of the estates which the Grisons possess in the subject provinces, by the sums which the governors draw from those provinces, by public and private pensions from France and Austria, by money saved in foreign services, and by the daties upon the merchandise passing through their territories.

As most of the Grison peasants weave cloth and linen for the use of their families, it would be no difficult undertaking to introduce manufactures in different parts. But in these little republies a strange prejudice prevails against commerce, and the project of establishing manufactures is opposed by many leading men of the country. It is difficult to discover the occasion of these illiberal principles; it has been imputed to a suspicion, that if the people should become opulent by commerce, they would be less open to influence, and the powerful families, who now direct the public affairs, would lose their ascendancy. Besides these reasons, which are of too delicate a nature to be openly acknowledged, other motives of a more generous complexion have been assigned.

The advocates for limiting commerce assert, that as the true riches of every country consist in the produce of agriculture, all occupations, which draw the attention of the people from that great object, are detrimental to the general good of society: in free

And I believe in the abbot of Disentis.

states particularly, manufactures tend to enervate the inhabitants, to introduce luxury, to depress the spirit of freedom, and to destroy the general simplicity of manners.

These arguments, however specious in appearance, will prove fallacious upon mature consideration. If in a country, which subsists chiefly by agriculture, manufactures are pursued to the total neglect of husbandry, they then become detrimental; but this is seldom the ease; for, by adding to the general consumption, manufactures usually tend to increase, instead of diminishing the produce of the earth. Such have been the effects in the mountains of Neuchatel, where the forests have been cleared, and the country converted into pasture, or sown with grain. Manufactures and commerce are still farther serviceable in augmenting the number of inhabitants, which form the true riches of a country. For whenever constant opportunities of employing a number of men occur, children will not be a burden to the peasants, and population will increase; which cannot happen in districts affording little employment.

With respect to the Grisons in particular, their territory being entirely mountainous, will not yield sufficient produce for interior consumption, consequently some means of supplying the deficiency must be adopted. Now surely it would be far more honourable to pursue commerce, even if attended with some unavoidable inconveniences, than to depend for subsistence on foreign subsidies, to oppress and exhaust the subject provinces, and to exhibit a regular system of venality, which almost pervades the whole mass of people.

Neither does the establishment of manufactures tend to enervate the inhabitants, and diminish the spirit of freedom. In fact, the manufactures in these democratical states are by no means similar to those introduced into large towns, where numbers of individuals are collected in the same spot; on the contrary, the work is divided, and distributed among the peasants, who, with their wives and children, weave the cloth at home. By this method they preserve (as I had occasion to remark in the canton of Appenzel) their original simplicity of manners, and maintain the spirit of freedom, even to a greater degree, than in those parts where there is no commerce. Examples are not wanting among the Grisons themselves: the natives of Upper Engadina, who are so much inclined to trade, are in reality more free and less influenced than the people of the other communities; nor is it observed, that the inhabitants of the Valley of Pretigau have become more enervated, since they have been employed in preparing cotton for the manufactory of Coirc. In fact, that kind of occupation does not always take the peasants from more active employments. In summer, they are at leisure to cultivate the earth, while their wives and children attend principally to the manufactures; during the long winters, which last in these Alpine regions for six months without intermission, agriculture is necessarily suspended, and these occupations succeed the more laborious exertions of the

As the principal commerce of the Grisons and the subject provinces is carried on across the lake of Como with Milan, I shall give an account of the inland navigation, which has been lately established for the purpose of facilitating that commerce; the several parts of which I had the curiosity to visit.

The water communication between the country of the Grisons and Milan is formed by the lake of Como, by its branch the lake of Lecco, by the Adda, by the canals of the Adda and Trezzo.

The canal of Trezzo, called also Canalie della Martesana, begins at Trezzo, situated on the Adda, and is carried to Milan. This cut, which is 24 miles in length, commenced in 1457, under the reign of Francis Sforza, and completed in 1460, did not at first serve for the purpose of navigation more than two days in the week; being principally used for overflowing the low grounds with water, necessary for the cultivation of

rice. In 1573, during the administration of the duke of Aberquerque, Spanish governor of Milan, the cut was cularged, and the body of water so much increased as to admit the passage of vessels every day.

Still, however, the Adda was not navigable during the whole way between the lake of Lecco and Trezzo; but formed a succession of cataracts for the space of a mile. To obviate this inconvenience, a canal was projected, in 1519, but no part was carried into execution, excepting a mole, which was thrown across the Adda. In 1591 the work was undertaken, and the canal completed in 1599. But the stream of the Adda was no sooner admitted into the cut, than the banks broke down, for so considerable a way, as to render all repairs impracticable. This breach, generally imputed to the violence of the current, was principally owing to the nature of the rock, in which the cut was excavated, and to an error in the original plan. The rock is a composition of gravel and sand, or a species of pudding-stone, of loose texture and unequal solidity; and as the cut was made too near the precipice, which overhangs the Adda, that part of the rock which formed the bank of the canal was not sufficiently strong to support the weight of water.

From that time the canal was considered an impracticable work, and abandoned until a few years ago it was again undertaken by order of the emperor Joseph the Second, and carried on with such expedition, as to be finished within the space of three years.

The canal is about a mile in length, and is excavated in the rock which forms the precipitous banks of the Adda. In some places the rock has been hollowed to the depth of 100 feet, and the breadth of 200. The fall of water, which is equal to the perpendicular height of about 80 feet is broken by six sluices: and the water is supplied by the stream of the Adda; the breadth of the canal is 70 feet.

The expense has already amounted to near 100,000l. The engineers, however, seem to have fallen into the same error which attended the original plan, by forming the cut too near the precipice. In consequence of this inadvertence, the water lately forced down the banks of the canal; and the damage was not repaired without much difficulty and considerable expense. Notwithstanding the precaution of letting out the superfluous water by flood-gates, there is reason to apprehend, that these breaches will be frequent; and that the recent labours may be rendered as ineffectual as those of the Spaniards.

But should the canal continue in its present state, and the navigation not be interrupted; the advantages will hardly compensate the expense of making and keeping it in repair. The commerce between the Grisons and Milan is extremely contracted, and if all the merchandise which passes was conveyed along the canals, the tolls and duties would be very inadequate to the expense.

The navigation, however, from the lake of Como to Milan is attended with many difficulties, and the greater part of the merchandise is sent by land, as the most commodious and less hazardous way. The current of the Adda is so rapid, that the vessels cannot be towed up without great expence and delay, and is in some parts so extremely dangerous, that boats are not unfrequently overset. The only persons, therefore, who forward their merchandise along the Adda and the canals to the lake of Lecco are the contractors, who furnish the Grisons with corn and salt, and who are compelled by the government of Milan to send those commodities by water. When it is considered that Milan receives from the Grisons only planks, stones for building, and coals, but supplies them with corn, rice, and salt; the articles of export evidently exceed those of import, and the navigation from Milan to the lake of Como is of more consequence than that from the lake of Como to Milan. The canal of the Adda, therefore, which

uated coml not princon of has only facilitated the inland navigation from the Grisons to Milin, and not trom Milan to the Grisons, though a work of extreme difficulty, and rebounding greatly to the honour of the Sovereign who completed it, will scarcely produce advantages equal to its original cost and frequent repairs.*

LETTER LXXXIX.

Alliances of the Grisons with the Swiss Cantons... France.... Venice....and the house of Austria.

THE alliances of the Grisons with foreign powers come next under consideration.

The Three Leagues, though always esteemed allies of the Swiss, yet are not, strictly speaking, in confederacy with all the cantons. In 1497 the Gray League, and in the following year the League of God's House, entered into a perpetual treaty with Zurie, Lucern, Uri, Schweitz, Underwalden, Zug, and Glarus. Although the League of Ten Jurisdictions was not included in the same treaty, yet it was afterwards declared that, in consequence of its connection with the other two leagues, it should be entitled to the same assistance and good offices. The Three Leagues are in close alliance with Bern and Zurie, to whose mediation they have frequently had recourse in points of disagreement. By these treaties the Grisons are called allies of the Swiss, and in consequence of a request from the particular cantons, with which they are united, ought, in case of invasion or rebellion, to be supplied with succours from the Swiss republics.

The Grisons contracted the first alliance with France in 1509, during the reign of Louis the Twelfth, and in 1516 were comprised in the treaty of perpetual peace between Francis the First and the Helvetic body. Since that period they have, as occasion offered, renewed their private confederacy with the kings of France; but where not comprehended in the late treaty of Soleure, concluded between Louis the Sixteenth and the other states of Switzerland. The king of France maintains an envoy in this

country, and has two Grison regiments in his service.

In 1707 a treaty was formed between the Grisons on the one side, queen Anne and the United Provinces on the other, for permitting the free passage of troops marching into Italy. This is the only alliance by which the Grisons, as a particular state, are connected with England. Our court formerly had a minister in the country; but for some time the English envoy to the Swiss cantons resident at Bern, has transacted business

with this republic.

The Venetians, for the purpose of procuring the free passage of the Valteline, had often solicited an alliance with the Grisons; but their projects were always defeated by the influence of the Spanish monarch, who possessed the Milanese; nor were they able to accomplish their design, until the Spanish branch of the house of Austria became extinct in the person of Charles the Second. Soon after that event, when Milan was the object of contention between the emperor and the French, the Venetians obtained the assent of the Grisons to a treaty of alliance offensive and defensive, which was ratified at Coire the 17th of December 1706. By this treaty it was stipulated, among other articles on the side of the Venetians, to pay an annual pension of 711 Spanish doubloons, and to furnish the Grisons, in time of war, with a thousand Venetian due ats per month; in return, the Grisons agreed to permit the passage of the Venetian troops

^{*}The curious reader is referred to the abbe Frisi's account of the canals of the Adda, and Trizzo, and of the other navigable canals in the Milanese. See Pouli Frisi Opera, tom. ii. Dei Canati Navigabili di Lombardia, quarto, tib. ii. cap. 3, 4, & 5.

through the Valteline, and to make a road leading from Morbegno over the mountain of St. Mark into the Venetian territories, by which accommodation merchandise might be conveyed to and from Venice to Germany without going through the Tyrol.

This treaty, concluded for twenty years, was to continue in force for the same additional period, unless one of the contracting parties should withdraw before the expiration of the first term; but though obtained by the Venetians with much trouble and expense, it was not long fulfilled by either of the negotiating powers. In a few years, the Venetians omitted the payment of the annual pension, and the Grisons neglected to make the road over the mountain of St. Mark. The two republies, however, continued upon terms of amity; and the Venetians, soon after the expiration of the forty years, desirous of renewing the treaty, offered to discharge the arrears of the pension if the Grisons would open the proposed communication over the mountain of St. Mark. For this purpose an envoy was dispatched to the Grisons in 1759, and no promises were spared to promote the negotiation: it failed, however, through the influence of the empress of Germany. The Grisons rejected the proposals of Venice, and still further alienated that republic by the earlitulation of Milan. The Venetians, incensed by this conduct, banished the Grisons who were settled within their territories, and all connection is now interrupted between the two republies.

The treaties with the house of Austria, as sovereigns of the Milanese, remain to be considered. It is not my purpose to mention any treaties which the Grisons contracted with the dukes of Milan of the house of Sforza, or those by which Philip the Second and his successors acknowledged their claim to the Valteline, Chiavenna and Bormio; but I shall begin with the celebrated alliance, or, as it is called, the Capitulation of Milan in 1639; because it superseded all others, and established that close connection between the Grisons and the house of Austria, which has since continued with little in-

terruption.

ps

The following are the principal articles in this capitulation, concluded between Philip the Fourth, king of Spain, as duke of Milan, and the Three Leagues: An hereditary and perpetual peace between the two contracting powers. Weekly fairs to be estab lished in the neighbouring towns of the Milanese, in which the Grisons may purchase grain, and also enjoy a free trade, for the purpose of importing and exporting all kinds of merchandise and arms, on paying only the accustomed duties. A free passage through the territories of the Grisons for the Spanish troops, with a reserve, that no more than a company of 150 infantry, and a troop of 60 cavalry shall march through the same day. Free passage of the Grison troops through the Mikaucse, upon condition that they do not march against the allies of Spain, and that more than two or three companies do not pass at one time. The king may levy at his own expense, in cases of necessity, a body of troops not exceeding 6000 nor less than 2000, for his service against all his enemics, except the confederates of the Grisons, and particularly the republic of Venice. All Grison troops in the service of any state or sovereign, intending to attack the territories of the king of Spain, shall be immediately recalled; and all officers and soldiers, who enroll themselves in any foreign service, shall be forbidden to invade his majesty's territories. If the Grisons should be engaged in war, the king obliges himself to famish, within fifteen days, 2000 infantry and 200 cavalry; but if they prefer assistance in money, to pay 100 scudi# per month as long as the war lasts; also to send into the country of Chiavenna six pieces of campaign artillery with amunition suffi cient for the service of war. No troops shall be allowed to pass through the respective territories to the disadvantage of the two contracting parties

^{*} A Milaneve scudo == to about 4s. 64

To each League the king promises an annual pension of 1500 scudi, and also to pay for the education of two students from each league at Pavia or Milan, besides a dona-

tion of sixty saudi to each student.

All ancient alliances with any other powers are to remain in force on both sides, particularly the treaty between the Grisons and France; they promise, however, not to renew it in ease of a rupture between the two crowns; and, if renewed, to declare at the same time that it is to be suspended during such a rupture, and to contract no alliance with any foreign power to the prejudice of this perpetual peace. Should either party be attacked, the other, without any regard to the stipulations in favour of their ancient allies, is bound to give assistance against such invasion, excepting however on his majesty's part, the German branch of the house of Austria; if that house should engage in war with the Grisons, for the maintenance of its rights in the territory of the Grisons.

The causes which gave rise to this capitulation, as well as the articles respecting the Valteline, having been already related; it will be necessary only to remark, that the Spaniards guaranteed to the Grisons the possession of their subject provinces, and to the subjects the confirmation of their privileges. In case of dissension between the Grisons and their subjects, the dispute is to be referred to the mediation of the king of

Spain.

This treaty, signed at Milan on the 3d of September 1639, by the marquis de Legnes, governor of Milan, on the part of the Spanish king, and on the other by the deputies of the Three Leagues, was preserved inviolate, and a good understanding maintained between the contracting powers, until the extinction of the Spanish branch of the house of Austria in the person of Charles the Second. During the war of the succession, which followed his death, the Milanese frequently changed masters, until it was secured to the emperor Charles in Sixth by the peace of Utrecht. Charles had no sooner established his power in his new dominions, then he turned his attention to the Grisons, and prevailed upon them to renew the capitulation of Milan. One of the principal arguments which gave success to his negotiation was the promise, not only of continuing the annual pension, but even of discharging the arrears, which amounted to twenty-nine payments.

This new treaty, in which the German branch of the house of Austria succeeded to the Spanish, was concluded on the 24th of October 1726, by count Daun, governor of Milan, in the name of Charles the Sinch, and the deputies of the Three Leagues. It confirmed and ratified the ancient capitulation of 1639, with a few modifications and additions, of which the principal are: The duties upon corn purchased by the Grisons in the Milanese are lowered two thirds. The tenth article in the first treaty, by which all Grison troops in the service of any state designing to attack the territories of the house of Austria are subject to immediate recall, is annulled; and the Grisons are free to serve any foreign prince in time of war without incurring the breach of this capitulation. The number of students educated at the expence of the emperor is increased

to twelve.

On the 8th of February 1763, this hereditary league was renewed by count Firmian, in the name of the empress of Germany as sovereign of Milan, and the deputies of the Three Leagues. By this treaty the capitulations of 1639 and 1726 are ratified, and serve as the basis of the present union; they are also augmented by the following articles:

The empress renounces all right to the lake of Chiavenna, together with a small portion of the adjacent territory, and cedes them in perpetuity to the Grisons. The limits between the Milanese and the territory of the Grisons are accurately fixed.

In return for this cession, the Grisons agree to creet no fortifications upon the cederaterritory, impose no new taxes upon the transport of merchandise, make no new roads, and, according to the former capitulation, no troops shall be permitted to pass to the prejudice of the state of Milan.

The empress promises to obtain from the Pope an abolition of several ceclesiastical privileges in the Valteline, highly detrimental to society; to prevent the bishop of Como from granting ecclesiastical immunities to laymen, who assume the elerical dress; also to correct several other abuses, which render the clergy of the Valteline independent of secular authority, and in civil and criminal causes only amenable to the bishop of Como The weekly fairs for the prochase of grain are abolished; and in their stead the house of Austria agrees to supply the Grisons with a certain quantity for themselves and for the subject countries, according to the current price of corn in the Milanese. The duties upon merchandise exported from the Milanese are lowered, and the customs both in that country and in the territory of the Grisons are established upon a permanent footing; for which purpose a table of the duties is annexed to the treaty.

At present the house of Austria directs all the affairs of the Grisons with the most unbounded authority. That power has acquired this sway by regularly discharging the public pensions, by holding the leading members of the diet in its pay, by being a guarantee of the Valteline, and mediator in all the disputes between the Grisons and their subjects.**

LETTER XC.

Languages of the Grisons....Particularly the Romansh...Its antiquity....Origin....and two principal Dialects.

THE languages of the Crisons are the Italian, German, and Romansh. The Italian, which is a jargon similar to the Milanese dialect, is spoken by the inhabitants of Pregalia and Puschiavo, and in the vallies of Masox and Calanca.

The German is spoken throughout the whole league of the Ten Jurisdictions, a few villages excepted; in the League of God's House, at Avers, Coire, and the four villages; and in the Gray League, at Splugen, Cepina, and other villages of the Rheinwald, at Valts, in the valley of St. Pedro, at Tusis, Reichenau, Feldsperg, Tamins, Meyerhof, Versam, and Valendros.

Some of the earliest and most authentic writers upon the Grisons have asserted, that the natives of the Rheinwald speak a Celtic idiom, a language neither German or Romansh, but more similar to the German; although they are entirely surrounded by people of a different tongue, and are neither contiguous, nor have any great intercourse with the German inhabitants. From this remarkable circumstance they are led to conjecture, that the natives of the Rheinwald are descended from the Lepontii, a Celtic nation, and considered as the original inhabitants of this country before the influx of the Tuscans; and they ground the proofs of this assertion upon the numerous names

^{*} This intimate connection with the house of Austria preserved the Grisons from the subjugation experienced by the other states of Switzerland, and the security of its freedom depends solely enth strength of that power to protect them from the arms of France

of many castles which seem to be derived from a * Celtic or German origin. This hypothesis, however, rests upon a wrong basis, and is grounded upon two mistakes. For, in the first place, the Imguage of the Rheinwald is German; secondly, although the inhabitants of this district are immediately surrounded by persons speaking the Italian and Romansh, yet they are within half a day's jor ...ey of Roncaglia, Tusis, and Furstenin, where German is the common language. It is more probable, therefore, that the Rheinwald was peopled by a German colony, which penetrated into these regions in the darker ages, when the Germans issued from their forests, and spread themselves over part of Europe. With respect to the German names of castles and towns we may remark, that many of them are corrupted from the Romansh, that others have been adopted in later times; and, as a proof that the Romansh is more ancient in this country than the German, the greater part of the mountains, vallies, and oldest castles, have Romansh appellations, even in the districts inhabited by the Germans.†

This circumstance leads me to the consideration of the Rhetian, or as it is more commonly called the ‡ Romansh, which is the vernacular tongue among the greater part of the Grisons; a language in former times more extensively diffused than at present, being spoken at Coirc and the adjacent districts, and through the Tyrol, as far as Inspruck.

That the good fortune to meet with a German translation of Planta's excellent Treatise upon the Romansh of the Grisons of which I had before seen the original in the Philosophical Transactions for 1775. The perusal of this treatise first excited my inquiries; and although I am obliged to differ from the ingenious author in a few instances; yet I hold myself indebted to him, for having greatly facilitated my researches, and for a more accurate knowledge of the subject than I could otherwise have obtained.

The Romansh of this country is divided into two principal dialects, the one spoken in the Gray League, and the other in that of God's House. These dialects, although materially varying as to pronunciation and orthography, are yet sufficiently similar in the general arrangement and expressions to be comprised within the same inquiry.

It must always be extremely difficult to trace the origin of any language; for etymologists are too apt to build a favourite system, by mistaking a partial for a general resemblance; and finding a few similar expressions in two languages, which in other respects are essectially different, conclude them to be derived from the same stock. The Grison writers, however, pretend, that the proofs of the antiquity and origin of their language are too well founded to admit of the least doubt. They assert that the Rhetian tongue is derived from the Latin, or from a dialect of the Latin; and the arguments upon which they ground their, assertion may be reduced to three principal heads.

1. The history of the country; 2. The names of places which have evidently a Latin origin; 3. Its similarity to the Latin, and to other languages derived mediately or immediately from the Latin.

* Claverius and other authors have erroneously supposed the Gothic and Celtic nations to be the same and their language to have given rise to the Teutonic or German: but the learned translator (Dr. Percy, bishop of Dromore) of Mallet's Northern Antiquities, has established, beyond a doubt, that the Celtic and Gothic nations were originally different, and that there was not the least affinity between the languages; the Celtic having given rise to the old Gallic, British, Erse, &c. &c. and the Gotnic to the German. See Translator's Preface to Mallet's Northern Antiquities.

† The German names adopted from the Romansh are very numerous; such as Chur from Curia of Coire, Splingen or Speluga, Cepina, Tusis or Tossan, Davos, Pretigau or Rheitigona, Castels, &c. The following German names are evidently of a very late date: Furstenau, Furstenburg, Haldentein, Lichtenstein, Heinzenberg, Reichenau, Rheinwald, &c. as will easily be allowed by any one conversant in that tongue.

t It is called by the native Arumaunsh, Rumaunsch, Remansch, Lingua Romansche

1. The history of the country. Livy, who has given the carliest account of these Alps, informs us, that, under the reign of Tarquinis Priscus, a colony of Tuscaus, driven from Lombardy by the Gauls, settled in these mountainous regions; and the same historian adds, that in his time the Rhetians, who were descended from these first colonists, still retained some traces of the Tuscan pronunciation, although vitated by lapse of time and change of situation.

Since that period, we have no positive documents of any subsequent emigration. although it is probable, that upon many occasions in which the Italians quitted their country, they retired to these Alps, and mixed with the natives. In some of these excursions it is likely, that the inhabitants of Latium, or others, who spoke the Latin, or at least a dialect of that tongue, which must have had a considerable affinity to the Tuscan, established themselves in these regions; but whether this settlement happened during the invasion of Hannibal, or at any subsequent period, cannot be exactly

About the time of the Cæsars, Rhetia became an object of Roman conquest; and frequent expeditions were made into these parts, until the whole country was reduced to a Roman province, and governed by a prætor resident at Coire. During that period, many Roman families established themselves in these Alps, and diffused the knowledge of their language. On the decline of the Roman power, Rhetia came under the dominion of the Franks, a German nation; who introduced their own tongue into many places, and in others gave a new turn and modification to the Latin, by the addi-

tion of auxiliary verbs, and by the frequent use of the articles.

2. The second proof of the derivation of the Romansh from the Latin, rests upon the numerous names of mountains, rivers, towns, and eastles, which evidently seem to have a Roman origin. To use the words of the ecclesiastical historian,* whom I have so often quoted, "Persons versed in classic antiquity, who travel among the Grisons, will, from the frequency of Latin appellations, conceive that they are passing through Latium, Etruria, and Campania. They will trace the ancient names Ardeates, Vettones, Sentinates, Samnites, in Ardets, Vettan, Sent, and Samnum. They will meet with mount Umbria, the river Albula, the towns Antium, Susa, Lavinium, Tutium, Seaptia, Silium, Cernetia, and many others; derivations so plain and so frequently occurring, evidently certify their origin."

3. The affinity of the Romansh, as well to the Latin as to the languages immediately

derived from the Latin.

First, a collateral argument in favour of its derivation from the Latin may be deduced from the word Romansh, the general appellation of the language, and the particular dialect of Engadina, called Ladin; both these terms having in effect the same signification, Ladin† and Roman being synonymous. But without insisting too much on this conjecture, we need only refer to a book written in the Grison tongue, to perceive the general affinity of its vocabulary to that of the Latin. In this comparison, however, great allowance must be made for the variation which must have taken place between a mother tongue, as written in the best authors, and its offspring, which for many centuries was merely colloquial, and not only been occasionally intermixed with other land

6 1 2

^{*} Aporta, Hist. i. p. 6. †Latin and Ladin are the same words, only differently pronounced; for it must be evident to any one the least conversant with different languages, how often the t and d are substituted for each other. Quintifran says that the old Romans frequently wrote a t, before they had any fixed rules of orthography, instead of a d; for Alexander, Alexander.

guages, but has suffered a change in its general modification by the admission of the

German syntax.

Yet it by no means follows, that the Romansh, although the undoubted offspring of the Latin, was derived immediately from that language, such as it is found in the best authors, or as consigned to writing during any period of the Roman æra; but rather, that it owed its origin to the vulgar tongue, as it was spoken by the people, or to some provincial dialect of Italy. In all living tongues there is a colloquial as well as a written language; for how different are the English and Scottish idioms, and even the dialects of Lancashire and Norfolk? In France the Parisian accent varies essentially from the provincial pronunciation; and the several patois of Provence, Lorrain, and Gascony, cannot be understood without respective glossaries. The same circumstance prevails in Germany, where the idioms of the Saxons, Austrians, and Suabians, are scarcely intelligible to each other. That this was equally the case with the Latin, we may collect not only from the general analogy of language, but likewise from the testimony of the best authors.

The origin of the Italian and of the other dialects, which are derived principally from the Latin, is frequently attributed to the invasion of the Goths under Alarie; when a new language was introduced throughout Italy and the Roman provinces. But this is not precisely the truth; for these several dialects arose from a corruption, or at least a variation, in the primitive Latin, antecedent to the irruption of the Goths, or even to the times of the Cæsars. Italy was occupied by many people originally independent: the Umbri, Osci, Samnites, Etrusci, and Piceni, all of whom differed in dialect, and many in language, from the Romans. But the Romans had no sooner couquered Italy, than the language came into general use, though in the provinces it was not uniformly pronounced in the same manner, as the natives of every district varied in their mode

of articulation.

Cicero mentions several * corruptions of the Latin which he could scarcely comprehend; and Horace alludes to the people of Canusium, in Græcia Magna, as speaking a mixed language.† Canusium contained, besides the original Greek natives, many inhabitants from different parts of Italy who spoke Latin. Hence their language was a mixture of both Greek and Latin; but so extremely impure as to give rise to the

proverb, Canusini more bilinguis.

In Italy there must have been many idioms of this sort, which were for a long time anobserved. For, while Rome flourished, the language of that capital was the standard of purity, and all other dialects of the Latin were disregarded. Yet, even at Rome itself, the Latin was corrupted at a very early period. Suetonius ‡ relates that Augustus frequently affected to write words as they were pronounced, without any regard to orthography, and to abridge them, by the change or omission of syllables. If this was the practice of the sovereign himself, in the purity of the Augustan age, and in the capital, we may be assured, that the same custom was still more prevalent among the people in the distant provinces, and particularly towards the decline of the empire.

Thus the Latin tongue was growing gradually more corrupt, and would, in process of time, have almost totally varied from its primitive purity, even had Rome continued

† Cam Pedibus caussas exsudet Poplicola atque Corvinus, patriis intermiscere petita Verba foris malis, Canusini more Bilinguis! Lib. i. Sat. x. v. 30.

i Non liveras modo sed syllabas permutat aut præterit, Communis hominum error

^{*} Amongst other examples he says, that the people, instead of dlem hanc, pronounced di hanc, and cume as instead of cave ne cas.

to be the seat of empire; yet it may be allowed, that its decline was hastened by the

irruption of Goths.

Should these remarks be founded on fact, the Romans must have left traces of their language throughout the different provinces of their vast empire; and the several dialects derived from the colloquial Latin, before they were refined and polished, must have borne a resemblance to each other, in some places more striking, in others more faint and distant. Although these dialects were in some measure changed and modified by the introduction of the Gothic or German idiom, which the conquerors gradually established throughout the Roman provinces, yet the same affinity must have been still observed; those changes affected all the dialects, and consisted not so much in varying the expressions, as in giving a new modification to the general syntax, by the introduction of the auxiliary verbs, by the indeclension of the cases, and by the necessary use of prepositions and articles.

If therefore the Romans established themselves in the country of the Grisons so effectually as to introduce their own language; and if that tongue, derived from the colloquial Latin, and still further modified by the adoption of the German syntax, is, from the peculiar situation of the natives, and from not being consigned to writing till within these last two hundred years, little changed from its primitive state; we have reason to expect, that it should bear evident marks of affinity to those dialects which have originated from the colloquial Latin, and were equally modified by the German syntax; it follows also, that the resemblance will be greater in proportion as we can trace earlier

and ruder specimens; this analogy is consonant to experience.

The earliest language, which undoubtedly draws its origin from the colloquial Latin, is the ancient Romansh, called Lingua Romana, the mother of the French tongue. It was understood in Italy, in the Morea, and at Constantinople, and was universally diffused throughout the southern parts of Europe in the eleventh and twelfth centuries. Planta has unquestionably proved that this tongue and the Romansh of the Grisons are

the same language.

We cannot expect, perhaps, the same evident affinity between the Romansh of the Grisons and any other language now existing; but in comparing it with the Italian, and particularly some provincial dialects of Italy, the Spanish,* the patois of Provence, Languedoe, Gascony, and Lorraine, we shall easily perceive, that they originated from the same stock, with the difference which time, a variety of pronunciation, and the mixture of other tongues, must necessarily occasion in all languages. With respect to the Italian, it is remarkable that the Romansh less resembles the pure Tuscan idiom than the provincial dialects; a circumstance easily accounted for. The Tuscan has been gradually purified and refined until it has undergone a considerable change; and the provincial dialects being less committed to writing, have not been subject to such variation.

To these languages I may add that spoken by the Vaudois inhabiting the vallies of Pictmont, in the sixteenth century, of which Leger has printed specimens, the originals whereof are now extant in the public library at Cambridge; also the Wallachian tongue, which is derived from the Latin, introduced by the colony of Romans established by Trajan on the banks of the Danube. The present natives, descendants of that colony, although surrounded by people speaking the Hungarian and Sclavonian, talk a language in which evident traces of the original Latin are still preserved. It bears a general re-

In comparing it with the Spanish, we make exclude cose words with have a strong gate a pronunciation, and are evidently derived for the A.A.F.

semblance to the Italian; and Aporta, who passed some time in Hungary, informed me, that, allowing for the variety of pronunciation, he comprehended the natives, and found in their expressions no inconsiderable degree of affinity to the Romansh.

The Romansh of the Grisons is divided into two principal dialects, that of the Gray League and the Ladin of Engadina; for it is needless to mention separately the Romansh

spoken in the valleys of Munster and Surset.

The two dialects perfectly agree in the grammatical arrangement, but differ widely in the pronunciation and orthography: of the two, the Ladin, being less intermixed with foreign words, is the purest; the Romansh of the Gray League, from the number of German colonics blended with the natives, abounds more in German expressions.

The Ladin is divided into the two idioms of Upper and Lower Engadina; the vocabulary of both is the same, with a small variety of accent* and pronunciation, which arises chiefly from the different manner of articulating the vowels. The inhabitants of Lower Engadina speak with a broader accent, like the Dorians among the Greeks; while those of Upper Engadina, like the Ionians, use a softer pronunciation. Hence is derived a variety in the orthography of the two idioms; and books, although perfectly

understood by both, are printed somewhat different in the two districts.

Before the introduction of the reformation among the Grisons, the Romansh was esteemed so barbarous a jargon as to be thought incapable of being reduced to grammatical form.† It is no wonder that the monks, whose interest it was to keep the people in the grossest ignorance, should have favoured this opinion; but it is a matter of astonishment, that the most learned among the native laies,, and such intelligent foreigners as Tschudi and Stumpf,‡ should have supported a notion so contradictory to common sense. For although it is an evident axiom, that all living tongues may be reduced to certain principles, and consigned to writing, yet the barbarism of the Romansh was so the contradictory to whom the Grisons owe the first production in their native tongue, was John de Travers; a man who, blending the characters of the soldier, politician, scholar, and divine, performed the most essential services to his country; by his valor in arms, by his skill in negotiation, by cultivating and protecting letters, and by favouring and assisting the introduction of the reformed religion.

This respectable person, of a noble and opulent family of Zutz in Upper Engadina, was born in 1483: before the eighth year of his age he was sent for his education to Munich, and from thence into Transylvania. Being there seized with a desire of travelling, he remained absent thirteen years, and returned to Zutz about the 28th year

· To give an instance of this difference.

The inhabitants of Lower Engadina pronounce the a open as we do in war, while those of Upper Engadina use e instead of the a.

[†] Rhetica lingua tam perplexa et impedita est, ut scribi nequeat; unde omnes literæ ab antiquis confectæ, Latine scriptæ sunt, et quas hodie parant, Germanice scribi procurant. See Tschudi Alp. Rhæt. p. 9. And, as Philip Galicius expresses himself in his preface to Campel's Psalter: Parce chia 'lg noas languak me nun ais stæt scritt, ne cir crett brick ch'eft s'poassa scriever insyn avannt brick b'lear anns, chia 'lg saimper deng da ngyr cun hunur nummad hunm Ser Joan Travers da Quotz baa ell impriim scritt in Ladin la noassa guerra

of his age. Highly distinguished* for integrity, learning, and abilities, he acquired universal esteem and was raised to every honour which his grateful country was capable of bestowing. Indeed, such was the respect generally shewn to his superior talents, that no affair of moment was transacted by the Republic of the Grisons in which he was not consulted. His acquaintance with foreign languages, his knowledge of the world, and the politeness of his address, rendered him the fittest instrument to negotiate with foreign powers; and he always acquitted himself with honour. In a military line he greatly signalised himself as commander of the Grison forces against James of Medicis, for the rapidity of his movements, his personal valour, and cautious conduct; and by laying siege to the fortress of Musson,† he brought the campaign to a speedy and successful issue.

He was greatly instrumental in forwarding the progress of the Reformation. Although inclined to favour the new doctrines, yet he was never hurried away by a misguided zeal. Unwilling to renounce the religion in which he had been educated, with out the strongest conviction of its superstitious tendency, he studied the controversy between the two sects, and weighed the arguments on both sides with the utmost delibera tion; but he no sooner became a proselyte to the reformed opinious, than he shewed himself as zealous in promoting, as he had previously been circumspect in adopting them. Nor did he only favour the reformation by his example and authority, but he even promulgated its doctrines. As few natives of Engadina were qualified, by their learning and theological knowledge, to preach in the Ladin, the progress of the reformation was considerably retarded. For these reasons John de Travers, who had critically studied and written in his own tongue, condescended to instruct the people. Having obtained the permission of the church, he ascended the pulpit, and explained in the most perspicuous manner the Christian doctrines. His distinguished abilities, his exalted rank, his venerable age, and his amiable character, drew from all quarters a numerous audience; while his discourses, delivered with a noble simplicity of eloquence, made the deepest impression, and never failed to increase the number of proselytes. This respectable man finished his career, which had been so useful to his country, and so honourable to himself, in 1560, and in the 80th year of his age. His writings in the Ladin, which gave rise to this digression, were a poem in rhyme, describing the war of Musson; many sermons; and several sacred dramas in verse.

The example of committing the Ladin to writing was next followed by Philip Salutz called Gailteins, one of the earliest reformers among the Grisons; who, in 1534, translated the Lord's prayer, the Apostle's creed, and the decalogue, into the dialect of Lower Engadina, and not long afterwards, some chapters of Genesis from the Hebrew, and the Athanasian Creed; which were distributed in manuscript among the natives. Huldric Campel wrote several sacred dramas, in the representation of which he himself assisted; and also turn d some of the psalms into verse.

Alp. arce aunt uotz But these compositions, being only in manuscript, were too scarce for general use; and Tutschet of Samada, more known by the name of Biveronius, was the first who ventured to publish in his native tongue. That celebrated reformer, finding, from experience, that the want of religious books in the colloquial language was a great obstruction to the progress of the reformation, printed at Puschiavo, in 1560, a small work,* which contained an alphabet, the Lord's prayer, the Apostles' creed, the Ten Commandments, and several occasional prayers. This little publication, being well received, was foll were by a work of the greatest importance, a translation of the New Testament.

In 1562, Hulding appel printed a poetical translation of the Psalms‡ of David, and other hymns, for the use of the reformed churches; this publication afforded a striking proof of the author's genius, who was able to give so much larmony of metre and variety of rhymes to the language in so rude a state. Besides the benefits which this psalter produced in a religious light, it was also serviceable in a literary view; as it contributed to diffuse a taste for poetical composition among his countrymen, and convinced

them that divine truths might be inculcated in a pleasing diction.

Aporta, in his excellent History of the Reformation among the Grisons, says that the language of Biveronius is (like infant dialects) rude an unpolished, both as to the mode of expression and orthography, and is scarcely understood at present; that Campel greatly refined it, and endeavoured as much as possible to reduce the words and orthography to a similarity with the Latin, which was the mother tongue. Hence we may observe, that the publications of Biveronius afford the most curious specimen of the Ladin, as it existed in its most ancient state, when it was chiefly a colloquial language.

The possibility of writing and printing the Ladin was no sooner proved by such authorities, than the press teemed with productions calculated to disseminate the reformed opinions. These publications, however (not excepting even the performance of Campel) as well as all which appeared in the fifteenth and in the beginning of the sixteenth century, are now obsolete, and, without a glossary, almost unintelligible to the natives

themselves, who have not made them their particular study.

No version of the whole Bible was published in the Ladin before the year 1679; it was printed at Scuol in the dialect of Lower Engadina; and republished with various explanations and a new index, in 1743. Besides the translation of the New Testament by Biveronius, which is obsolete, a new y version was printed 1640 in the dialect of Upper Engadina, and is in common use. But the natives of this district have no other version of the Old Testament than that of Lower Engadine.

As it would be uninteresting to send you a dry catalogue of the several publications in the Ladin, I shall therefore only remark in general that except a history of the Grisons compiled from various authors by Aporta, the books in this tongue solely treat of religious subjects. Some of our theological tracts, particularly those written by our

'I possess a copy of this scarce work, reprinted at Zuric 1621, but without the title page. At my request the learned Aport, favoured me with an accurate catalogue of all the books printed in the Romansh of Engadina and of the Gray League, accompanied with many critical remarks, which I have made use of in this letter.

I once proposed to print this catalogue, which gives the titles of 82 books printed in the Ladin, and 26 in the Romansh of the Gray League; but relinquished it because it would have swelled this work too much, and would be uninteresting to the generality of readers; I shall therefore only insert, in the Appendix, the titles of the Bibles, and of the books printed in the Sixteenth century, together with a vocabulary of the language.

*No. 1. | No. 3. | § No. 6 | ¶ No. 7

divines of the last century, are translated into their language; of these I observed, among the list of books in my possession, Bayley's Practice of Picty, and Baxter on Vows.

The Romansh of the Gray League remains to be considered. The earliest pub lication in this dialect is a catechism, translated from the German by Daniel Bo niface, pastor of Furstenan, and printed in 1601. It was soon followed by a metrical version of several psalms, accompanied with other hymns, published at Coire in

1611.

The author of this useful psalter was Stephen Gabriel, a native of Vettan, in Lower Engadina, and pastor of Hants; he was a man of considerable learning, and his zeal for the reformed religion exposed him to the fury of the Catholics, who, in 1620, plundered his house, burnt his tibrary, and hang him in effigy. Gabriel having escaped to Zuric, drew up, during his retirement, an account of the controversy, between the Protestants and Roman Catholics, which in those turbulent times nearly excited a civil war among the Grisons. This polemic treatise, written in the Romansh, was printed at Zutic in 1625, and answered in 1630 by a Roman Catholic priest in the same tongue; a work which is probably the first production printed by the Catholics in the Romansh. Upon the cessation of the civil commotions Gabriel returned to Hants, where he passed the remainder of his days in tranquility.

Stephen was succeeded in his preferment and literary pursuits by his son Lucius Ga briel, who, in 1648, gave a version of the New Testament, a work much wanted; as the inhabitants of the Gray League were mostly ignorant of any but their own language, and could with difficulty comprehend the translation in the dialect of Engadina. It is remarkable, that this version, which was printed only forty-eight years after the Romansh of the Gray League became a written language, should still continue in use . a proof either that the language has not received the same degree of refinement as the Ladin, or that the first persons who wrote in this idiom took great pains to settle the

orthography, and arrange the grammatical transituction.

The list of books published in this dialett que for the most part, far inferior, both as to number and merit, to those written in the Lading for excepting the two Gabriels, the Gray League has furnished few men who have distinguished themselves by superior

learning.

A complete translation of the Bible was not given in fure the year 1718; it was published at Coire, at the expense of the theight in the Gray League, and dedicated by the printer to George the First, while gent in fettin a present of fifty guineas. This sum being delivered to the printer, and chillied by him as his own property, occasioned a law-suit between him and the editors; the latter, little letter, editors in equity they had the sole right, were never able to obtain the pair of the distation.

VOL. V

LETTER XCL

FROM DAVID PENNANT, ESQ. 10 THE AUTHOR.

On the Italian Bailliages of Switzerland ...Journey from the Top of the St. Gothard to Milan....The Levantine Vailey. .. Bellinzone.... Locarno.... Town and Lake of Lic gano....Lago Maggiore....Boromean Islands.

LITTUE is wenting to complete your description of Switzerland and its dependencies; that chasm I now endeavour to fill up. Youth and inexperience must serve as excurses for errors and oneissions. Happy if this histy sketch may excite the corresity of yourseif, or any other traveller equally intelligent, whose observations may an use and instruct mankind. The route which I here attempt to describe, is connected with your work; a route which would afford satisfaction to the curious of all nations

who take you as their guide.

The highest parts of the principal Alpine passes are chiefly occupied by a small plain or basin; as the St. Bernard, the Gemmi, the Splingen, and the St. Gothard. From the stammit of the St. Gothard I commenced my route on the 2d of August 1786. I followed the course of the Tesino, which you mention in your letters; it passes by the Capuchin convent, and is soon after joined by two other rills from the neighbouring morniaius. Near this spot the Levantine valley begins, and Switzerland, properly so call d, may be said to terminate. The descent on the side of Italy is much steeper, the views more savage and picturesque, than in the ascent from Urseren, and the road is conducted with equal skill. The majestic scenery is heightened by the Tesino tumbling in an almost uninterrupted cataract; sometimes pent up in a narrow channel, or piercing its way through the remains of avalanches still unmelted, though fully exposed to the rays of a meridian sun. These chormons masses obstruct the road; and workmen are continually employed in promoting their dissolution; as the aggregate of unmelted snows, for a few summers, would bar all communication between Switzerland and Italy: with such difficulty are the lew passes kept open!

After descending repidly for three miles through this scence of desolation, bounded on all sides by precipices, or impending rocks, the river foaming over blocks of granive, the ruins of the surrounding mountains; we crossed the Ponte Tremolo, or trembling bridge; where the view enlarged, and extended over a verdant valley sprinkled

with mimerous houses.

Airolo, the first small burgh, stands at the bottom of the steep descent; to the right is the passage over mount Grias to Munster in the Upper Vallais, practicable only from the middle of July to October, when three hundred horses transport weekly the cheese

from the various parts of Switzeriand.

At Dacio we found comfortable accommodations; that village consists only of a few houses seared at the entrance of a pass, capable of being defended with case against the whole force of traip. A wall and gate is added to its natural strength; but their principal use is to prevent con-taband trade, and to exact a small toll for the merchandise which pas a that way. For half a league is a succession of striking and romantic scenery; the perpendicular rocks scarcery afferding room for the steep road, and transparent waters of the Tesino, which, thundering over the vast fragments, rises in a white form, and subtle mist, visible only from refracting the rays of the sun. We crossed the torreat, it that short space, over three bridges thrown from rock to rock, whose span

and boldness of execution might vie with the boasted, because better known, Devil's Bridge.

Faido is the residence of the brillia, nominated by the canton of Uri. He remains in affice four years, and his power is almost unlimited. Unfortunate insurrections in 1712 and in 1755, have been attended with the loss of the few remaining privileges to a p. ... ple who struggled for liberty against democratic oppression. *

Giornico, called by the Germans Irnis, is Lanous for the victory which 600 Swiss gained, in 1178, over the troops of the duke of Milan, amounting to 15,000 men; a vic tory which insured to the Swiss an honourable and advantageous peace. In this neighbourhood we first perceived the effects of a southern sun, and a lesser elevation above the sea, by the frequent appearance of vineyards, and the walnut and chesnut-trees of a very large size; the girth of several among the latter was not less than thirty lee. At Pole

gio, this bailliage ends.

The Levantine Valley, or Valle Leventina, is supposed to retain, by its name, traces of the Lepontii, the ancient inhabitants of the surrounding regions. Its length from the summit of the passage on the St. Gothard, is about eight leagues; the breadth very inconsiderable. The lower part is extremely populous, rich in pasturage, and produces much hemp and flax. In the neighbourhood of such lofty mountains, its climate must be variable, and liable to frequent rains. To prevent these rains from damaging their crops, the inhabitants suspend and dry the corn and grass on bars supported by two high poles about fifteen feet as under. The houses are entirely of wood, and have externally the appearance of Swiss cottages; but a neglect of cleanliness proves the vicinity and greater similarity to the Italians. The Tesino is here joined by the Bromio, a torrent which takes its rise in mount Uccello, or the Vogelsberg, near Splugen; a bridge over it is the boundary of the two bailliages of the vallies Levantine and Polese, and leads into that of Riviera. The valley now becomes perfectly flat, and of course subject to violent inundations; the few villages are scattered on the sides of the steep mountains; below all is desolate. Ossogna, the residence of the bailiff, consists only of a few houses. The country on improved; the ground rose gently from the bed of the river, when we came in sigh of the be utiful town of Bellinzone, situated in a delightful plain, encireled with ancient walls and battlements in good repair; to the right rise majestically the ruins of an ancient castic; to the left, separately embosomed in trees, are the eastles of the bailills of the three regent cantons, Uri, Schweitz, and Underwalden.

About the beginning of the filteenth century, the Swiss, at peace with the house of Austria, seem first to have been stimp? and with the ambition of extending their dominion towards the south. In 1410, to whole Helvetic body, excepting the canton of Bern, passed their natural barriers, pland red the town of Domo d'Oscella, and the adjacent country, and resurred laden with spoil to pass the winter in their humble cottages. Elated by success, the ensuing summer's ow them again descend into the plains of Italy, and ravage the dutchy of Milan, then subject to the Viscontis; they again retived, but without attempting to make a settlement. But on these enterprises, we are not surprised, that, in 1422, the three original cantons purchased the town of Bellinzom from its owners the counts of Sax; or that Pallip Mana, duke of Milan, exerted himself to prevent from falling into their hands a town so a uportant, from its situation and natural strength, to check their inroads, and cover has dominions. Having therefore taken possession of it by force of arms, a body of 8000 Swiss passed the Alijs

^{*} The Levantine Valley was included in the canton and department of Bellinzope

The forces of both nations met, the It lians were led on by Carm-anola; a bloody but the ensured, of which both sides clumed the victory, the Swiss retried with a standard

roken from the everny, who remained misters of the town.

Excepting some inroads, nothing of importance was again transacted to the south tile the year 1466, when Galeazzo Maria Sferza, the new duke of Milan, formed an alliance with his transalpine or ighbours; the first article was the cession of the Levantine Valley to the cauton of Uri, for which he was annually to receive three bawks and a cross-bow Yet ten years after, when Chades doke of Burgundy threatened the total destruction of the republic by his powerful invasions, the treachere us duke of Milan sent a body of troops to his assistance, who were intercepted in the Vallais, and worsted. On the defeat and death of Chades at the harle of Namey, they again resolved to make an attempt on Betinzore; but as the season was too far advanced to undertake the siege, a body of 600 Swiss resolved to winter at Grornico. The duke collected an army of 15,000 men, and attacked them in their entrenchments, but was repulsed with the loss of 1400 of his best troops. The mountaineers were enriched with the spoils; but no regular attack was made on the object of their invasion.

From this period the wars in which the Swiss engaged no ways concerned themselves, they sacrificed their blor d in foreign quarrels, and the contending parties made use of their superior valour to attempt or establish conquests in Italy. In 1500 the three cantons obtained what they had so long contended for: the inhabitants of Bellinzone, vexed by the frequent changes in the Milanese, voluntarily surrendered to them. The French, when they had conquered the dutchy, in vain reclaimed it, the Swiss retained possession; and the seven Italian bailliages were formally ceded to them by Maximilian Sforza, in gratitude for their having reinstated him in the ducal seat. Courted or leared by all parties, those valuable territories were confirmed to them by the French, and finally by

the house of Austria.

The bailiff remains in office two years; he is nominated reciprocally by the three cantons, and is generally removed from Riviera the poorest, to Bellinzone* the most lucrative of the three governments. An appeal lies from his decision to the syndicate, and from that court to the three cantons: in ecclesiastical affairs, the inhabitants are cognizable to the bishop of Como, excepting three parishes. Most of the natives understand

Italian, but the language is a corrupt German.

The interior of Belliazone by no means corresponds with its external beauty and situation; the streets are marrow, and the houses iff built. We continued our journey south on the banks of the Tesino, which we crossed in a bad ferry: that river is here increased to a considerable size, by the numerous additions it has received in its course, particularly from the Missa, a torrent which takes its rise in the St. Bernardin, and flowing down the Val Missa, forms a junction above Bellinizone. The valley is level, and laid waste by numerous torrents; the road runs along the sides of the hills through continued vineyards. We proceeded at the foot of the western chain of hills; a similar ridge bounds the view to the east, both clothed to their summits with woods of chesnut and walnut trees, halt concealing frequent spires and numerous hamlets. Before us the view extended to a part of the Valanese, over the lake of Locamo, or Lago Maggiore. Having reached its north western extremity, we coasted its banks for two or three miles; and arrived at the town from which it derives its name.

These three baillinges are in the new division consolidated into the canton or department of Bellington;

Locatao contains about 1500 inhabitants. Part of the town is built on process of orm of a crescent with two wings; in front is a row of trees, and the public walk the old part of the town is dirty, and the streets narrow. It contains three convents, and a small Frunciscan monastery, perched on a rock overhanging the valley, and commanding a superb view of the lake and its magnificent boundaries. The canopy, in the chareful of the Capuchins, deserves to be mentioned for its beautiful execution; it is of straw

work, and almost rivals velvet and gold fringe.

Of the four transdpine bailliages which belong to the twelve cantons, Lugano holdthe principal rank, Locarnos the second. The governor, or commissacy as he is called is sent in succession by all the cantons except Appenzel; he remains in office two years. in criminal affairs his decision is absolute; in civil, an appeal lies to the annual syndicate from the regent cantons, and from thence to the Helvetic body assembled at the diet. The emoluments of this post are not great; but the profits unfortunitely depend too much on the virtue of the man, as they arise principally from fines exacted for cri minal offences. The people cujoy some privileges, and hold an annual assembly in the month of Limiary, in which they cicet twenty counsellors; twelve out of the town, three from Ascona, the remainder from the country at large. These counsellors have the charge of watching over the interests of the republic, as far as does not interfere with the superior powers, of settling the public expences, and of raising the supplies paid to the governor. These bailliages do not produce corn sufficient for their domestic consumption; that grain is furnished by treaty from the dutchy of Milan, and is weekly imported from Livino, a village on the opposite shore. The chief food of the peasants is a cake made with maize and millet; the inhabitants on the banks of the lake are well supplied

The fisheries give employment to a great number of hands, although they are in some degree subject to monopolies. In the months of May and June, from 200 to 250 lb. weight are taken in a day: tront of 40 lb. and perch of 9 lb. are found in the lake.

In 1555, the doctrines of the reformation had made considerable progress in these parts: but the Catholic cantons, at the general diet, obtained an edict, that those who refused to return to the ancient faith should quit the town and province. Numbers, thus driven from their native country, were received with open arms by the canton of Zuric, which was benefited by their industry, and owes to them the introduction of the

Locarno was once situated on the lake, and had a port capable of receiving large silk manufactures. barks: at present it stands at the distance of a quarter of a mile; a circumstance owing

to the accumulation of sand brought down by the torrent Maggia.

The little voyage from hence to Magadino is delightful: we crossed the upper part of the lake in an hour; the banks of this noble piece of water rise boldly, and are well wooded: Locarno forms a fine object, to the south is the opening into the Val Maggio. terminated by mountains covered with eternal snow. The spot where we landed consists only of a few scattered houses, for the purpose of receiving the merchandise, which is put on shore and sent on horses to Bellinzone. Old Magadino is more inland, and swed its origin to the vicinity of the lake, the retiring of which has caused its min. From thence the road winds up the steep sides of the mountain Cenero, through woods of walant and chesnut trees, interspersed with oak and holly; on the summit of the passage is a small oval plain, the boundary of the bailliages of Locarno and Lugano. Our

^{*} These two baillinges of Lugano and Loc duo, together with those of Val Maccelo, Mendelsio, are Balerna, are formed into the canton or department of Lugano

descent by between the hills, through luxuriant and verdant vallies, peopled with numerons villages, and rich in every production. The vines, laden with fruit, are conduct d in degant festoons from tree to tree; a constant variety of scenery, softened by the glow of a setting sun, and next silvered by the moon glimmering on the distant

lake, heightened the charms of our journey through this Elysian country.

The situation of Lugano is delightful; it is built round the curve of a bay, and backed by a fine succession of hills, rising in gentle swells to a considerable height: in front, a bold mountain clothed will forest projects into the lake, of which a noble branch extends to its right and left. To that spot boats of every size are continually passing and repassing, its base being perforated with cantine, or caverns, to which the inhabitants send their meat, and all sorts of provision, where it is kept untainted for seven or eight days, and the wine preserved with a delicious coolness. Enjoying the advantages of a southern climate, it has few of its inconveniences: the heats are moderated by the surrounding hills and the cool breezes from the lake. It is no less sheltered from the Alpine blasts, which, chilled by the neighbouring snows, would otherwise descend with violence, and destroy the temperature of this equal climate. Offive, almonds, and all the southern fruits, ripen here to perfection.

Lugano is the emporium of the greater part of the merchandise which passes from Italy over the St. Gothard, or the Bernardin. At the end of autumn, the Swiss mountaineers bring down numerous herds of cattle for sale, and return with less bulky commodities. The town contains about 8000 inhabitants; most of the houses are built of tuf-stone; the residence of the capitano, or governor, is a low building; on the walls are the arms of the twelve regent cantons. On an eminence above the town stands the principal church, remarkable only for the beautiful carving in stone round the doors, and rose window, and for the delicious prospect from its terrace. In the cloisters of the Recollets is a capital picture, attributed to Luvino: their church is handsome, and the skreen is ornamented with the painting of the Passion, by the same master. The

palace of the marquis de Riva contains a few good pictures.

We then embarked upon the lake of Lugano,* which is about twenty-five miles in length, and from two to four in breadth: its form is irregular, and bending into continued sinuosities. The town is a fine object, backed by the amphitheatre of hills; the banks on each side are bordered with a succession of gardens and villas. After visiting the noble branch pointing northward, we crossed to the Cantine, and continued our voyage under the precipitous rocks, whose bases are lost in the depths of the lake. We landed at Porto, a small village in the dutchy of Milan, situated at its southern ex-

From this point an arm of the lake bends northward, and discharges itself into the Lago Maggiore, by means of the river Trisa. It is searcely possible to imagine a more perfect or greater variety of beauties than this noble piece of water affords; the vast overhanging woods, the bold precipices, the transparency of the water, unite to form a

scenery in the highest degree luxuriant.

From Porto the traveller may observe, with satisfaction mingled with compassion, the strong contrast of a free and arbitrary government; the borders of the lake subject to Switzerland studded with a succession of villages, houses, and gardens; this part of the Milanese is desolate, and almost unpeopled.

^{*} The lake of Lugano is about 190 feet perpendicular higher than the lake of Como, and Lago Maggiore. The two last-mentioned lakes are of the same level, and about 240 feet higher than the city of Milan. Veri Storia di Milan, p. 5. Abb. Frisi Dei Canali Navig. di Lombardia, 4to. p. 465

On leaving that village, the hills begin to diminish, and in the course of three miles are totally lost in the rich plain of Lombardy. Varese is entirely composed of the seats of the Milanese nobility. The principal palazzo is the residence of the dutchess downger of Modena; the gardens are laid out in the old taste; the artificial mount commands a fine view over a rich plain, a small lake, and bounded by the long chain of Alps. In the magnificent saloon are some tolerable portraits of the families of Modena and Austria. The emperor, as duke of Milan, has exerted himself in the suppression of convents; a Franciscan monastery has fallen a sacrifice to his plans of reformation.

The road from hence to Laveno, a small burgh on the Lago Meggiore, is varied, and the country very rich; to the right, on an eminence, is San Sacramento; to the left we passed near some lesser lakes. From Laveno we were rowed across the delightful passage to Isola Bella, one of the famous enchanted islands so particularly described, and with such pleasure, by bishop Burnet and Keysler, who compares it to "a pyramid of sweetmeats, ornamented with green festoons and flowers." But as the taste of mankind alters with the succession of years, I considered it only as a monument of expendent and folly; terrace rises above terrace in regular gradations, bordered with flower-pots, or gigantic statues of horses, gods and goddesses; the whole is raised upon arches, and the soil has been brought from the shore to cover them. The palace is magnificent, and contains a profusion of marbles and paintings; the lower part of the house over hangs the lake on one side, where several apartments are furnished in the style or grottos; the floors, pillars, and walls, are inlaid with various-coloured stones, marbles, and shells; the view and the coolness united make this part a delicious summer retreat.

If any thing justly gives this island the appellation of enchanted, it is the prospect from the terrace: the gradual diminution of the mountains from the regions of eternal snow to the rich plain, the sinuosity of the lake, its varied banks, the bay of Margozzo bounded by vast hills, the neighbouring burgh of Palanza, and more distant view of Laveno, the numerous villages, the Isola Madre, on which is a palace of the Borromean family, and another island sprinkled with fishermen's huts, form a delightful assemblage. These islands, and the whole western coast of the lake to the bailliage of Locarno, was ceded to the king of Sardinia, by the late empress queen, at the treaty of Worms, in consideration of the assistance which she received from that monarch.

We re-entered our boat, troubled by the importunities of the beggars, whose miser able buts adjoining to the palace disgrace the island. Belgeritta is a neat village, containing some excellent houses, and a handsome church. From thence we continued our voyage down the lake. The tract of country to our right, from near Palenza to ten miles south of Arona, pays a small contribution to the Borromean family for seigno rial rights. That family receives a toll from the merchandise which passes, grams the privilege of fishing, and appoints cleven judges in the respective villages; but an ap peal lies from their decision to a superior, nominated by the king of Sardinia, and resident at Palanza, and again to Turin. The riches of this opulent house are now increasing from the product of the gold mines, which he amongst the most maccessible parts of the mountains, thirty miles from Margozzo. Above Arona is a seminary for forty boys, founded by San Carlo Borromco; near it his colossal statue, sixty feet in height, is placed on a pedestal of just proportions; he is represented in his cardinal's habit, the right hand extended, a Look under the left arm. The statue is of Lronze, was east at Milan, and brought in separate pieces. San Carlo, nephear to pope Prus the Fourth, was born near this spot; he passed with early credit through his studies, and the dignities of the church; was made a cardinal, and archbishop or Milan. His

Magne city In my mater receiver tions, during the plague which ravaged his diocese, the subject of tomany fine platters at Milan, insure han more general tenown than his canonization in to te.

Arona in semall town, with a neat port; above it rises a ruined castle, which, in the carlier part of the Milanese history, was a place of the atmost importance: at the perical when the great contests arose between the families of Viscondi and Torrani, this eastle was the projectual object of capture and reprisal. Otho Visconti, the archbishop, who at length gained the ascendancy, was twice repulsed and driven from hence. Two promontaries project into the lake at this spot; the eastern is crowned with the eastle of Aughiera, and gives name to this valuable province, which in 1397, to gratify Gale 1220, the second duke of Milan, was erected into a country by the emperor Wenceslaus. and has since been transferred to the king of Sardinia. On doubling the promontory of Arona, the lake again enlarges, and forms a bay; the banks are very low. Soon after entering the Tesino we landed at the dirty village of Sesto; hired another boat, and were harried with great rapidity down that river, between high banks of gravel, to the commencement of the Naviglio Grande, the great canal which forms the junction beween the Po and the Adda, calculated not less for conveying merchandise and wood to Wilan, than for benefitting the neighbouring country with partial inundations, and for the purpose of laying the rice fields under water. Its breadth at first is great, but narrows as we advance, and the stream becomes almost a dead water.*

If had weather and other circumstances had not prevented me from extending my tour, I purposed visiting the bay of Margozzo, Domo D'Oscella, Varallo, and the gold mines in its neighbourhood; an excursion, which, from the reports I have heard, could not fail of affording the highest satisfaction to the naturalist, and the lover of nature in her great features.

*According to the abbe Frisi, the length of the Naviglio is 86,000 braccia, or 14 Italian miles (60 to a degree;) its breadth at the entrance 70, which gradually diminishes to 20; and the perpendicular height of the fall of water is 58; at first 5 braccia per mile; gradually decreasing for the first twelve makes, until it is no more than one braccio in a mile; then increasing for the five next miles to a little more than five braccia in a mile. See Canal Navig di Lomb. C. 1. A Milanese braccio is to an English toot nearly as 22 to 11.
