FARMER'S CALENDAR, USEFUL RECEIPTS, &c,

To raise Turnips among Corn.—Sow about one pint of Turnip Seed to the Acre, on or about the 21st of July, either before or after the last harrowing; top the Corn as soon as ripe enough, and husk it as soon as the Corn will admit; cut down and bear off the stalks, to let the sun upon the Turnips, and the sweetness of the fodder will compensate for the labour. Take in the Turnips about the middle of December. By pursuing these directions, corn of 40 Bushels to the Acre will produce 80 or 100 Bushels of Turnips at the same time; these for milch Cows and Sheep will be of particular importance.

POTATOES .- Mr. Parmentier's improved method of preserving Potatoes .- To preserve a quantity of these roots sufficient to last till the new crop, it is necessary they should first be partly dressed; and after they have been peeled, sliced and dried in a stove or oven they acquire the transparency, hardness and dryness of horn ; they break clean and the fracture has a glassy appearance. Some in this state have been sent to the East Indies. When these Potatoes, thus prepared, are dried, they may be ground as they are wanted; and the flower, which is a yellowish powder, similar to gum arabac, dissolves in the mouth, and communicates to water the consistence and taste of potatoe that has been cooked. It has been called the poor man's soup. Gruel and rich porridge may be made-with it The indispensible necessity of partly cooking the Potatoe in order to preserve their nutritious quality has produced, in Germany, many useful researches : and among others an instrument has been invented for washing them after they are cooked, It is a cylindrical tube. made of tin, which is pierced with small holes like a skimmer; by this the Potatoes, boiled, and dried in a Stove, produce a kind of Vermecelli. Another method is, to take them in a sound state, neither boiled nor bruised, and to rasp or gratethem. When dr ter separated the potatoes put into to small cakes 1 Soups, &c.

Gruindispensible r to preserve , many useful heen invented lindrical tube. e a skimmer; e, produce a e them in a rasp or gratethem. When dried or sifted, and the juice of the fibrous matter separated they will keep like starch for ages. These rasped potatoes put into a linen bag, and well pressed, then divided into small cakes become friable and very proper to be used in Soups, &c.

For fattening Swine.—Wash Potatoes clean, boil and mash while hot—mix in at the same time oats and pea meal. Put the mixture into a large tub, which must stand till it becomes sour but not putrid. Keep a quantity of this on hand, always fermenting and giving it to your hogs as often as they will eat. It is said that Pork may be fattened in this way and make a saving of one third of the food and time consumed in the usual mode.

CANADA THISTLES.

Worcester, July 23 .- Mr. Editor, -Having seen several are ticles in your paper relating to the Canada Thistle, and having had the satisfaction of destroying several bunches of them in a manner different from what I have seen described, I feel disposed to communicate it to the public. In 1822, I discovered the Canada Thistle in a pasture where I kept 20 sheep; I mowed them twice or three times in wet weather, but they appeared to grow the faster for it, and had by the next spring spread over three times as much ground as they first occupied, and were in a flourishing state. I caused them to be cut once more. I then took about two quarts of salt and spread over the thistles, and the sheep being hungry for it, they soon ate what they could, and continued on the spot until they had stamped much of the grass and thistles into the dirt. I continued to throw on salt once or twice a week for several months, and frequently put in other cattle when they needed salt, so that the ground in a short time was almost bare, and what few thistles were to be seen were covered with rust. The next season I ploughed and planted and sowed it, and I believe there is now not a single thistle on the piece. I discovered another bunch of them in another piece the next year, which I treated in the same manner, and have now on the groud a piece of corn, but have the satisfaction to say there are no thistles in the field .- American paper.

Caterpillars can easily be destroyed. Put a brush on the end of a rod or pole, and wash the nests from the trees, while the worms are in them, with strong soap suds. The suds will instantly kill every caterpillar, large or small, that is wet with it, and at the same time help to freshen and invigorate the tree.

Hot water applied to the roots of trees will resuscitate them if they be worm-eaten. Many trees in a decaying condition have been saved by scalding them in this way. Pour the water round the tree slowly, and be careful that it penetrates to the roots. Hof water will be found extremely beneficial in raddish and other vegetable beds. Scald the earth before sowing the seeds, by which means you will destroy the larvæ of the insects which are apt to be very plenty in a rich soil.

Useful Cement.—A useful cement, for general purposes, is composed of two parts of rosin, melted over a slow fire, into which one part of the quantity of Plaster of Paris is to be introduced, and well mixed by stirring them; and two parts of shell lac, and the whole being in a fluid state, constitutes a firm and durable cement.

To remove the musty flavor from wheat which has been damaged.—An English receipt book directs as follows:—For every bushel of wheat take two pounds of potash, dissolve it in water bushel of wheat take two pounds of wheat. Let the wheat be with about double the quantity of wheat. Let the wheat be thoroughly washed in the solution, rinsed with pure water, and dried quickly.

In a letter to the Right Honourable Sir Joseph Banks, it is observed, "if wheat be musty, it must be put into any convenient vessel, capable of containing at least three times the quantity, and the vessel must be subsequently filled with boiling watity, and the vessel must be subsequently filled with boiling watity, and the vessel must be subsequently filled with boiling watity, and the vessel must be subsequently filled with boiling watity, and the vessel must be subsequently filled with boiling watity, and the vessel must be subsequently filled with boiling watity, and the vessel must be subsequently filled with boiling watity, and the vessel must be cocasionally stirred, and the hollow and decayed grains, (which will float) may be removed. low and decayed grains, it is to be drawn off. It will be proper thalf an hour is elapsed, it is to be drawn off. It will be proper then to rinse the corn with cold water, in order to remove any portion of the water which had taken up the must; after which the corn being completely drained, it is without loss of time, to be thinly spread on the floor of a kiln, and thoroughly dried, care being taken to stir and turn it frequently, during this part of the process."

Cockroaches.—A respectable professional gentleman informed us yesterday, that he has recently discovered that the spirits of turpentine is an effectual remedy against the depredations of cockroaches. He recommended to put a little of it upon the shelves or sides of your book-cases, bureaus, armoirs, or other furniture, in which they take shelter, which may readily be done with a feather, and these troublesome insects will soon quit, not only the furniture, but the room. The remedy is simple, and easily obtained by every person that wishes it. It is not unpleasant to the smell, soon evaporates, and does no injury to furniture or clothing. This is a valuable discovery, if it proves in all cases as effectual as our informant assured us it did in his own house.

Poisoned Sheep .- A correspondent of the N. E. Farmer, says the best remedy for a poisoned sheep is to give it a small lump of butter or a qu either is to produpoison and effects while the animal 1

Farmer, says a small lump of butter or a quantity of skunk's grease. The operation of either is to produce nausea or sickness, which dislodges the poison and effects a cure. The butter or grease must be given while the animal has life enough to swallow.

Pneumatic Punch and Ginger Beer.—Fill two half pint tumblers a third part full of toast and water; in one dissolve thirty grains of carbonate of soda, and in the other twenty-five grains of citric acid, both pounded fine; when the powders are perfectly dissolved, pour the contents of one tumbler into the other, and sparkling soda water is instantly produced.

Ginger Beer will be produced by the addition of eight grains of ginger and three drachms of lump sugar, rubbed well in a mortar with the carbonate of soda.—Household Economist.

Remedy for the Rot in Sheep.—One table spoonful of spirits turpentine, and two of water, to be given once in eight days, for three times—one table spoonful of water to be given first, then the spirits of turpentine; and lastly, the remaining spoonfull of water. This remedy has been used for many years by a farmer at Grimsby, in Lincolnshire, in his own flock, most successfully.

Hints to Young Farmers.—Consider your calling the most elevated, and the most important; but never be above it, nor be afraid of the *frock* and the *apron*.

Put off no business, which ought and can be done to-day, un-

til to-morrow. As soon as the spring opens and the frost is out of the ground,

put your fences in order. Plant no more ground than you can well manure and cultivate

to advantage. Never hire a man to do a piece of work which you can do

yourself. Every day has its appropriate duties, attend to them in succession.

Keep no more stock than you can keep in good order, and that of the best kind.

Never "run into debt" without a reasonable probability of solving it at the time agreed.

By driving your business before you, and not permitting your business to drive you, you will have opportunities to indulge in innocent diversions.

Keep a place for your tools-and your tools in their places.

Instead of spending a rainy day at the dram-shop, as many do to their ruin, repair whatever wants mending—post your books.

In December reckon and settle with all those with whom you have accounts—pay your shop-bill and your mechanics, if not promptly done at the time, which is best of all. On the first of every January reckon with yourself, and reckon honestly—bring into view all debts and credits—notes and accounts—ascertain to what amount your expenses were the last year, and the loss or gain—make out a fair statement and enter the whole in a book for the purpose. Having arrived at this important knowledge, you will imitate the prudent traveller, who always keeps in view where he is next to move. You will now look forwards and calculate how and in what way you shallbest meet and prosecute the business of the ensuing seasons.

And lastly, when the frost of winter shall lay an embargo on your operations, and the chilling blasts of Boreas shall storm your castle, let your fireside be a Paradise, and let the long evenings be consumed in social glee, or in the pursuit of useful knowledge,—AN OLD FARMER.

Every Man has own Physician .- I take the liberty to hand you, Mr. Editor, the following recipe for publication-it has been found very useful in families during the warm season, and if persisted in, will invariably prove an admirable preventive, and obviate the necessity of using harsher medicine; the writer can safely recommend it to all disp. sed to make trial of it; and can add moreover, that it has been used in the family of an eminent physician for several years past; and in his neighbourhood, it is customary in almost every famile to have a demi-john filled with this water, and placed in some convenient part of the house, so that all may have access to it; and it a ual for every member of the family to take a glass of it, as y . larly as they eat their breakfast; the effect is a fine appetite, and an improved The qualities of the water are very similar to state of health the celebrated Cheltenham water -

8 oz Glauber Salts.—4 oz. Epsom do —2 table spoonfulls common salt to a gallon spring water.

The dose is one wine glass full put in a tumbler, and filled with spring water, to be drank half an hoar before breakfast, and the same repeated at night if reqired.

Preservation of Farming implements.—Sir John Sinclair-observes that no circumstance marks more the character of an attentive husbaudman than great attention to his farming implements Upon every farm, also, there ought to be one or more places, properly constructed, for holding the larger implements; and some secure place allotted, for containing the smaller tools. Where machines are necessarily exposed in the field a great part of the season, they require to be new painted at least every second year. This defends them, not only from drought, but also from rain and rust.

Disease of Horses.—An old and respectable friend informs us, that he is grieved to learn that so many horses on Long Island, have fallen saerific cure for this disease to it. It is nothing the grizzle of the m is a certain cure. (the horses in the cit noble animals in an

informs us, long Island, have fallen sacrifices to the blind staggers, but assures us the cure for this disease is so simple that every body car have access to it. It is nothing more than to pass a shoe maker's awl through the grizzle of the nose that separates the nostrils. This he says, is a certain cure. Our informant adds that there is no danger of the horses in the city taking this disease, as it is confined to those noble animals in and about the salt marshes and meadows.

Cure for the Ague and Fever.—A writer in the Charleston Mercury recommends the following prescription for the cure of Ague: Take a gill of very strong coffee mixed with an equal quantity of lime juice, the dose to be taken just before the ague is expected. A single dose had cured an acquaintance of the writer, who had nearly forgotten it when he came across a review of Dr. Pouqueville's Travels in the Morea," which contained the following paragraph:

"I have often seen intermitting fevers subdued entirely by a mixture of Coffee and lemon juice, which is the general remedy for them, all over the country. The proportions are three quarters of an ounce of coffee ground very fine, two ounces of lemon juice, and three of water. The mixture to be drunk warm, and fasting."

SPRING.

"Sweet daughter of a rough and stormy Sire, Hoar Winter's blooming child, delightful Spring, Whose unshorn locks with leaves

> And swelling buds are crown'd " (Mrs. Barbauld.)

Away ! away ! unto me bring Fresh water from Castalia's spring, And wake my lyre chords into day To tune them for a rural lay.

I sing the joys of rustic life, And business of the Farmer's wife; Of Shepherds bright Pandean reeds Of rivers, coppices, and meads.

Now comes the sweet enchanting Spring; Bidding the feather'd race to sing, And hail the season of delight When Flora captivates the sight— And lo! before the sun is seen, Nancy treads the dewy green, O'er which the humble daisies spread, And many a cowslip hangs its head; With merry steps and aspect hale Onward she bears the loaded pail, And hums a cheerful tune the while The passing moments to beguile.

Some pleasure it may bring perchance, In yon fair Dairy just to glance, Where coolness all the place pervades, From the tall laurels spreading shades— Behold ! the leaden cisterns teem,* With milken fluid top'd with cream ; And mark that high suspended board With perfum'd Cheeses neatly stor'd : The maidens, in the sweet vats, lay The snowy Curds t'express the Whey, While others ply the heavy Churn., And the rich Cream to Butter turn.

But see! young Giles now takes his way, (While round him the young lambkins play,) His team to harness for the Plough, Behind yon sunny barley mow;† And then the sower strews his grain O'er the even furrow'd plain, And onward as he gaily goes Behind him skulk the ebon Crows.

Then grant, O, Heaven! this my prayer, To take beneath Thy special care, The fruitfulness of every soil, And so reward the Farmer's toil. — H. S. G.

* In most parts of England, Dairies are furnished with long Leaden Cisterns, or Coolers, in which the Milk is preserved fresh for a length of time.

t Mow, In the Devonshire dialect, is a Stack of Corn, &c. t A custom prevalent at Farm Houses in England is, at Sheep Shearing, a large basin, or ewer, is placed full of water with the sweetest flowers floating in it, in which the Shearers, at dinner, supper, &c. wash.—H. S. G.
