Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

- Coloured covers / Couverture de couleur
- Covers damaged / Couverture endommagée
- Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
- Cover title missing / Le titre de couverture manque
- Coloured maps / Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
- Bound with other material / Relié avec d'autres documents
- Only edition available / Seule édition disponible
- Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
- Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- Additional comments / Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages / Pages de couleur
- Pages damaged / Pages endommagées
- Pages restored and/or laminated / Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed / Pages décolorées, tachetées ou piquées
- Pages detached / Pages détachées
- Showthrough / Transparence
- Quality of print varies / Qualité inégale de l'impression
- Includes supplementary material / Comprend du matériel supplémentaire
- Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
- Opposing pages with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below / Ce document est filmé au taux de réduction indiqué ci-dessous.

10x	14x	18x	22x	26x	30x
12x	16x	20x	24x	28x	32x

The copy filmed here has been reproduced thanks
to the generosity of:

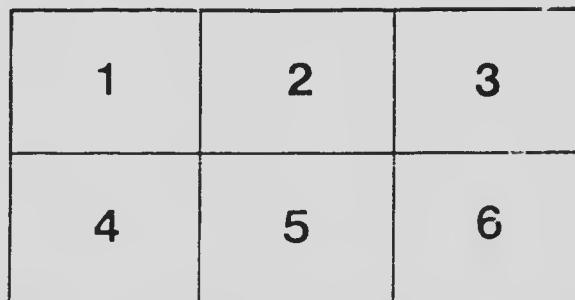

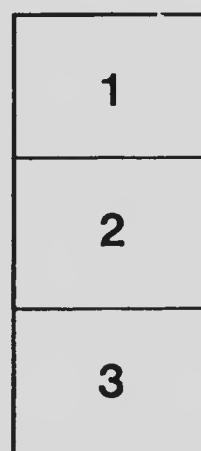

Library
Agriculture Canada

The images appearing here are the best quality
possible considering the condition and legibility
of the original copy and in keeping with the
filming contract specifications.

Original copies in printed paper covers are filmed
beginning with the front cover and ending on
the last page with a printed or illustrated impres-
sion, or the back cover when appropriate. All
other original copies are filmed beginning on the
first page with a printed or illustrated impres-
sion, and ending on the last page with a printed
or illustrated impression.

The last recorded frame on each microfiche
shall contain the symbol → (meaning "CON-
TINUED"), or the symbol ▽ (meaning "END"),
whichever applies.

Maps, plates, charts, etc., may be filmed at
different reduction ratios. Those too large to be
entirely included in one exposure are filmed
beginning in the upper left hand corner, left to
right and top to bottom, as many frames as
required. The following diagrams illustrate the
method:

L'exemplaire filmé fut reproduit grâce à la
générosité de:

Bibliothèque
Agriculture Canada

Les images suivantes ont été reproduites avec le
plus grand soin, compte tenu de la condition et
de la netteté de l'exemplaire filmé, et en
conformité avec les conditions du contrat de
filmage.

Les exemplaires originaux dont la couverture en
papier est imprimée sont filmés en commençant
par le premier plat et en terminant soit par la
dernière page qui comporte une empreinte
d'impression ou d'illustration, soit par le second
plat, selon le cas. Tous les autres exemplaires
originaux sont filmés en commençant par la
première page qui comporte une empreinte
d'impression ou d'illustration et en terminant par
la dernière page qui comporte une telle
empreinte.

Un des symboles suivants apparaîtra sur la
dernière image de chaque microfiche, selon le
cas: le symbole → signifie "A SUIVRE", le
symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être
filmés à des taux de réduction différents.
Lorsque le document est trop grand pour être
reproduit en un seul cliché, il est filmé à partir
de l'angle supérieur gauche, de gauche à droite,
et de haut en bas, en prenant le nombre
d'images nécessaire. Les diagrammes suivants
illustrent la méthode.

Field Husbandry Circular No. 31

KUBANKA WHEAT

By

MANLEY CHAMPLIN,

Professor of Field Husbandry.

College of Agriculture, Saskatoon.

HISTORY.

Kubanka wheat belongs to the amber durum class of spring wheat which was introduced into the United States by the federal Department of Agriculture for the purpose of establishing a class of wheat which would be adapted to the sub-humid or semi-arid portions of the Great Plains region. A number of varieties were introduced from Russia near the close of the last century. These were tried out on the experiment stations in South Dakota, North Dakota, Montana and other

states. As a result of these trials Kubanka was found to be an outstanding good variety both in yield and quality, in western Dakota, eastern Montana and Wyoming. Its culture has since been taken up in a limited way in Saskatchewan.

USES.

Amber durum wheat is used for making the well known food products, macaroni and spaghetti. It is also in demand for the manufacture of puffed wheat breakfast food preparations and a large percentage is used for blending with common wheat in the manufacture of flour for bread and pastry making. Kubanka wheat is one of the best varieties of durum for milling purposes.

ADAPTATION.

Kubanka wheat has been grown in the semi-arid sections of the former Russian Empire for centuries. It is protected from the sun's heat and hot winds by means of long awns or beards. It has a vigorous root system and does not stool out very freely. These characteristics enable it to resist drought to a considerable degree. It also possesses a high degree of rust resistance, rarely rusting enough to injure the crop materially. ON THE OTHER HAND, IT IS VERY SUSCEPTIBLE TO THE DISEASE KNOWN AS WHEAT SCAB. The scab develops most freely in seasons that are rainy or wet during the period between heading and maturity. Because of the scab disease it is next to impossible to grow durum wheat in humid regions. This gives a monopoly in the production of durum wheat to the regions of light rainfall. *The range of Kubanka wheat includes the western two thirds of North and South Dakota, and the eastern half of Montana. From a comparatively limited trial it appears to be adapted to southwestern Saskatchewan. In the northern sections, there is reason to believe that it will not do any better than the standard bread wheat varieties.*

YIELDS OF GRAIN.

Kubanka has been compared with Marquis and Red Fife, two of the leading varieties of hard spring wheat, for a period of nine years at Saskatoon with resulting average yields as follows: Kubanka 26.2, Marquis 27.4 and Red Fife 27.8 bushels per acre. It has produced 16.8 bushels per acre as compared with 12.7 for Fife at Brookings, South Dakota as an average for 12 years. At Fargo, North Dakota, in a seven year average, Kubanka yielded 34.3 bushels per acre as compared with 24.7 for the Fife variety. At Highmore, South Dakota, Kubanka produced 16.6 bushels per acre in a ten year average as compared with 11.1 for Ghirka which is a variety quite similar to Fife. The Fife was not on trial during the same ten year period but produced an average of 11.5 bushels for the twelve years that it was on trial. The above results from Dakota are taken from U. S. Dept. of Agr. Bul. No. 618, which gives detailed accounts of experiments with durum wheat in many different localities. These results indicate that in regions where Kubanka wheat is adapted, it is likely to produce more bushels per

acre than the standard hard spring varieties, but that it is of no particular advantage in regions well adapted to the production of bread wheat.

THE SEED.

A limited quantity of seed has been introduced into Saskatchewan so that there is now a considerable amount for sale within the province. This seed is not always pure. A marked improvement can be made by any one who will take the trouble to select enough true to type heads for a seed plot. OWING TO THE PREVALENCE OF WHEAT SCAB IN THE DAKOTAS, IT IS NOT DESIRABLE TO INTRODUCE SEED FROM THERE UNLESS PRECAUTIONS ARE TAKEN TO MAKE SURE THE SEED IS SCAB FREE.

As with other wheat, thorough cleaning of the seed constitutes the cheapest and easiest way to improve the crop. In addition to thorough cleaning the seed should be treated in the usual manner with formalin for the purpose of killing the spores of covered smut and any other diseases that may be harboring on the surface of the seeds.

THE SEED BED.

The seed bed for durum wheat like any other wheat should be firm and even with a granular or "pebbly" surface. Any treatment that will give this result is likely to prove satisfactory. If summerfallow is used it is preferably plowed in late May or early June and cultivated sufficiently to keep it reasonably free from weeds until fall. The last cultivation in the fall ought to be deep enough to leave the land ridged to help check soil drifting during winter. In the spring a limited amount of cultivation is desirable to warm the seed bed and destroy weeds that have made an early start.

If land which has produced an intertilled or hood crop such as corn, potatoes, oats in three row groups, mangels etc., is used, it should be double disked and harrowed once or twice before seeding unless liable to drift. It is not good practice as a rule to try to grow two grain crops in succession in the semi-arid sections but under some circumstances, it may be necessary to do so.

SEEDING.

In general, the earlier the crop is sown, the better will be the yield and quality. Occasional seasons prove exceptions to this rule, owing to distribution of the rainfall, but the rule holds nevertheless. Kubauka wheat resists considerable frost in the spring so that there is little to fear from that source. An early sown crop often dodges rust or drought better than one that is sown late. Five or six pecks per acre is the most common rate of seeding. As the seed is larger and the plants produce less stools than Marquis or Red Fife, a correspondingly heavier rate of seeding is necessary. A good way to determine the proper rate of seeding is to use one or two more pecks of seed per acre than one is accustomed to use of the common wheat.

The ideal depth of seeding is two to three inches, but to insure even and prompt germination it is necessary to place the seed in moist earth.

CULTIVATION.

Generally, no cultivation is needed but in sections where the Russian thistle is prevalent, the harrow can be used to destroy the small seedlings after the grain is well up. The thistles start later than the grain if the seed bed has been well prepared. Harrowing after the grain is well established will destroy myriads of the seedling of thistles without material injury to the grain.

A Field of Kubanka S.D. 75 Wheat at Eureka Experimental Farm.
By courtesy S. D. Agricultural College.

Kubanka wheat is harvested exactly the same as other wheat except that the straw is inclined to be longer so that harvester or header must be adjusted accordingly. An occasional crop leans so that it has to be cut one way. Shocking is somewhat more difficult than with common wheat because the bundles are long and the large heads and beards tend to make the bundles top heavy. A shock of from 8 to 12 bundles makes a convenient and satisfactory size. If threshing cannot be done promptly it is worth while to stack the bundles in the usual round form.

MARKETING.

When any new crop is grown in a community, there is always difficulty in marketing it. The dealers may be slow in awakening to the fact that there is such a crop grown in their locality and neglect to adjust their business accordingly. In such communities, at first, it will be necessary to ship individual car loads. Owing to the many uses of the crop there is not likely to be much difficulty with the terminal markets absorbing all that is produced. Minneapolis is the leading

market for durum wheat in the United States. The Minneapolis price of durum wheat has usually been a little lower than for the same grade of hard spring but there have been years when durum wheat brought a better price than hard spring wheat. This was true during the Balkan wars when Russian wheat for the Italian macaroni and spaghetti manufacturers failed to find an easy outlet, so that American durum had to be substituted. The increasing importance of puffed wheat, macaroni, spaghetti and other durum wheat products, as well as the fact that a certain percentage of durum wheat flour can be used in making flour for ordinary uses should tend to hold the market price fairly close to that of hard red spring. The fact that the area in which durum wheat can be produced in North America is comparatively limited ought also to have a beneficial effect upon the market price in the future. For the first few years a good percentage of the Saskatchewan crop may be in demand for seed. It is of vital importance that mixing be avoided.

KUBANKA COMPARED WITH MARQUIS.

Kubanka wheat yields slightly less than Marquis at Saskatoon but has exceeded Marquis in yield at several other stations farther south. Kubanka resists drought better than Marquis and is perhaps 85 per cent. resistant to rust while Marquis is very susceptible. Kubanka is more subject to lodging owing to its tall straw, is a few days later in maturing and is more subject to wheat seab than Marquis. Both varieties hold their seed well but the Kubanka is superior in this respect being very free from shattering. Marquis is the leading bread wheat variety while Kubanka is a leader among durum varieties.

SUMMARY.

1. Kubanka is the leading variety of amber durum wheat introduced from Russia.
2. It is used for making macaroni, spaghetti and puffed and to mix with other flour for bread.
3. It shows promise of being adapted to southern Saskatchewan more particularly the southwestern portion. It requires dry weather during the maturing period.
4. Kubanka is quite resistant to rust but is susceptible to seab attacks.
5. Saskatchewan seed is to be preferred because there is danger of introducing seab if Dakota seed is shipped in.
6. Seed should be thoroughly cleaned and treated for smut.
7. Summerfallow or intertilled crop land is preferred as a seed bed.
8. Five or six pecks sown into moist ground as early in spring as land can be prepared usually gives good results. Cultivation is unnecessary, save harrowing to destroy small Russian thistles.

9. Harvesting is similar to the harvest of other wheat except for minor adjustments.

10. Marketing by individual car lots may be necessary in some localities at first but there is little doubt about its final market owing to its many uses and to the limited area in which it can be successfully grown, if natural economic laws are permitted to operate.
