REMARKS.—The Committee of Judges to whom was reforred the entries of Class VI.—"Durham Cattle,"—beg leave to report, that they have gone through with the divisions of the class, and award the premiums as stated above. In many cases the competition was so close that they might well doubt the propriety of their awards, but they think it is a high compliment to the breeders, that they have arrived at so high a standard of perfection. The ring of cows was such as challenged the admiration of the Committee, and could hardly be parallelled in any country, certainly not excelled.

REMARIS.—The Judges on Hereford Cattle would wish to remark, that there was no competition in this Class; all the animals were the property of Mr. Stone, of Guelph. But; at the same time, we would wish to say that they were up to the standard of Herefords, all the animals, and we consider that Mr. Stone is entitled to great credit for his enterprise in importing them.

CLASS II ATRIBITES 83 ENTRIES.

"PROMISED LAND"-THE FIRST PRIZE THREE YEAR-OLD THOROUGH-BRED STALLION,

Imported and owned by Mr. SIMON BEATTIE, Markham.

The Breeder and Grazier.

Premium Thorough-bred Stallion.

We herewith present our readers with a spirited portraiture of the thorough bred stallion "Promised Land" This finely proportioned animal was bred by Major Green Thompson, Cumberland, England. and imported by Mr. Simon Beattie, Markham, during the present year. "Promised Land" was two years old this spring, and, as stated above, was winner of the first prize in the three year old class of thoroughbreds, at the late Provincial Exhibition. He had also the additional honour of being awarded the diploma as best thorough-bred horse of any age on the ground. "Promised Land" has a good head. with a strong muscular neck and shoulders, well laid back to fine rising withers. Altogether he is a strong wiry-looking animal, and is apparently as full of go as an India-rubber ball. His pedigree is as follows: Sire by "The Judge"; dam, by "Bay Middleton" g. dam, "Nitrocis" by Whisker"; g. g. dam, "Mannilla" by "Dick Andrews," &c. "The Judge" by "Galaon"; dam, "Cerito" by "Saddler; g. dam, "Amaryllis" by "Cervantes," &c.

It may not be amiss to remind such of our readers as are not posted in turf matters, that " Bay Middleton" was a winner of the Derby and two thousand guineas; and was sire to "The Flying Dutchman" and "Andover," both of whom won the blue ribbon of the English turf. It will thus be seen that "Promised Land" is of highly aristocratic descent, and closely related to some of the most illustrious names; . .ng torments for fully an hour and a half, when he in what may be called Tattersall's Court Register.

CURE FOR BLOATED CATTLE. - B. S. Gilbert writes to the New York Faraers' Club that cattle bloated from eating clover or other food to excess, may be relieved in a few minutes by pouring cold water upon their backs.

FEFDING PROPERTIES OF PEA STRAW .-- "Pea straw is richer in oil and albuminous, or flesh-forming matters, than the straw of the cereals. The woody fibre is also more digestible. This fully accounts for the repute in which it is held as fodder for sheep and cattle."

Cow Concert.-The Terre Haute Express says a German in that city, for the sake of being economical, collected a quantity of beef's blood to paint his house with. After finishing his job in the most approved manner, several cows passed near by, and smelling the blood, they set up such a bawling as the poor fellow never heard of. As the bawling increased, the number of cows increased, and at last accounts the poor fellow was still being serenaded in the most terrific manner.

Horse Killed By Wasts .- A correspondent of an American paper, writing from Sulphur Springs, Tenn., says :- "While reclining under a tree I was startled by the footsteps of a horse, and looking up saw the animal coming toward me at full speed. He appeared to be terribly frightened, and commenced running around the spot where I was scated, and I soon discovered that the animal was completely covered with wasps, having no doubt trampled upon a nest of firse lasects. The pour heast ran about in excrucifell dead."

Equive Cumosities.—It may not be generally known, and so we place it on record, that Buffalo can now boast of having within its limits thirteen Shetland ponies, three of them the smallest in the United States. To her stock of half a score of Shetlands, Mrs. Dr. Lord has added three by recent importation, which are marvels of equine symmetry, strength and endurance, their extreme diminutiveness considered. This 'rio of little horses consists of a span of blacks, well mated, and 34 inches high, and a mouse colored pony 33 inches high. From a genuine lover of equine coriosities, we learn that Mrs. Lord sent Mr. Wm. Simpson, a Scotchman, resident of Black Rock, to Scotland, in March last, for the sole purpose of obtaining two spans of Shetlands, of certain dimensions. The fairs at Glasgow, Edinburgh. Aberdeen and other places were visited, but it was only after a long and arduous search that the span of blacks could be found. The little mousecoloured fellow was found in an unfrequented place on the Shetland Islands, where he had been accustomed to feed on fish secured by himself from the water. A fourth was found in another remote corner of the Islands, but unfortunately died on the passage hither. The ponies were brought to this country in charge of Mr. Simpson, in a sail vessel; and after a voyage of between 40 and 50 days, most of which time the animals swung between decks, they reached terra firms in good condition. By the death of one of the quartette, the cost of the three ponies of which we write, does not fall short of \$1200. Mrs. Dr. Lord has displayed decided enterprise, and we are pleased to note her success in the matter of procuring the three smallest Shetland ponies to be found in this country.-Buffalo Courier.

Miscellaneous.

The Severe Period for Machinery.

Among the mistaken ideas that very generally prevail, is one that our farm machinery rapidly wears out. Now, although it is a very important fact, that farm implements and machinery go to destruction at an astonishing rate, we are inclined to attribute it more to negligence than to use, though improper use is very destructive. We believe it to be true that winter is the severest season of the year upon the great bulk of western farm machinery. Have our readers ever thought thus? If so, how easy is the remedy. Simply, proper housing and care. The average "life of a reaper" is but from four to average "the of a reaper" is but from four to five years, during which time 20 or 25 per cent, of the original cost has been spent for repairs, while the farmer who carefully houses his machine will easily make it last double this time, and in the aggregate expend less for repairs.

Verily, if it is worse to "rust out than to wear out," it is also easier with the comments to the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the co

out," it is also easier, with the expensive machinery of the farm. The reaper is but a single illustration, whereas many might be introduced.—Prairie Kurmer.

A down east editor, in a complimentary notice of a certain general, was made, by the omission of a single letter, to call him a "battle-scared veteran." The poor man hastened to make amends in his next issue by stating that it was his intention to have denominated the hero a bot, le-scar ed veteran."

A MAN that has a soul worth sixpence must expect to have enemies. The true motto of life is to do right, and then let the consequences take care of themselves. It is all sheer vanity to strive to accommodate yourself at every point to the whims and notions of some other persons, and strive to square your ways to please this or that sect or party.

A DANGEROUS TASK .- At a recent meeting of a parish, a strait-laced and most exemplary curate submitted a report in writing of the destitute widows and others who stood in need of assistance from the parish. "Are you sure reverend sir," asked another solemn brother, "that you have embraced all the widows." He said he believed he had.

RATS.-Neighbour Jones says, that if we will go to a tin shop and get a lot of scrap tin, and crowd it into their holes, they will evacuate the premises at once. Whether they fear them as traps, or whether they scratch their sides, or whether they have a natural fear for it, he could not tell. He only knows the fact.—Maine Furmer.

FILLING AN ICE HOUSE .- The Utica Herald says that the ice-house of L. R. Lyon, of Lyon's Falls, N.Y., has not been empty for twenty years, nor has a pound of ice ever been put into it. The building is constructed after the ordinary method, and when it is designed to fill it, a rose jet is placed upon the waterpipe, and as the water comes through it is chilled and drops into the ice-house, where it forms one solid mass of ice.

SAD MISTARE.—Some few years ago there was a notary public in Washington, an old and highly respected gentleman, who had held his office through all the political twistings and turnings of our capital all the political twistings and turnings of our capital for nearly 20 years. A young friend was in his office one day, and while sitting by the table picked up a small old leather covered book, which upon being opened proved to be "Thaddeus of Warsaw." He cautiously remarked to Mr. Smith, the notary: "I see you have a copy of 'Thaddeus of Warsaw' here." "Thaddeus of Warsaw!" was the reply, "what do you mean!" "Why, this is copy of it." "Thaddeus of Warsaw," exclaimed to old gentleman. He snatched the book, gave one glance at it, and cried out, "For twenty years I have been swearing people out, "For twenty years I have been swearing people on that book, thinking it was the Bible! All these oaths ain't worth the paper they are written on !"

HOW A CLUB WAS GOT UP FOR AN AGRICULTURAL PAPER.—It is much easier to form a club of subscribers to a periodical than many people imagine. The supposed formidableness of the undertaking de-

of the Genesce Farmer in his pocket, he asked them to look at it, and got five new subscribers in about as many minutes! He was surprised, he said, to find how many farmers there were who took no agricultural paper whatever. He continued his efforts for a little while and soon got up a nice club of eighteen, and will doubtless double it in a few days. How many others are there that will do likewise?"

Labour-Sa ...g Machine

The above is an engraving of a simple and useful ontrivance for holding the mouth of a bag open while it is being filled with grain. No verbal description is needed to set forth the merits of such a convenience. It speaks for itself. Price, \$2. For further particulars, address the inventor, Mr. A. W. Woodbury, London, C. W.

The Canada Karmer.

TORONTO, UPPER CANADA, NOV. 15, 1865.

The Cattle Plague in Britain.

The fatal cattle plague, steppe murrain, or rinderpest still continues to make rapid strides over England and Scotland. For some time to come it promises to be the all-engrossing topic of conversation, and the popular theme for public letter-writing in the 'old country." Unfortunately, up to the date of our latest advices, few subjects have ever led to more diversity of opinion without arriving at some practical conclusion, or even proposing some plausible theory to account for the phenomena exhibited in this extraordinary disease. Owing to this inability on the part of the veterinary profession to deal successfully with the plague, we are not surprised to learn that persons, without the slightest pretension to scientific knowledge, are setting themselves up as authorities and loudly parading their quack nostrums. In the meantime, amid all the fuss of this word-tempest respecting its origin, pathology, and treatment, the fatal rinderpest spreads its dark shadow over the land. From a letter addressed by Professor Simonds to the Clerk of the Council it would appear that a discase, similar in its nature to that raging in the bovine tribe, has appeared among a large flock of sheep in Norfolk. On the other hand, Mr. Taitersall, the great London horse dealer, has alarmed the public by reporting that two horses have died at Windsor, of rinderpest. This statement is contradicted by the Mayor of Windscr in a letter to the Times, in which ters not a few from making the attempt. The subjoined clipping from the last number of the journal
to which it relates, will show how quickly and easily
the thing may be done, if persons will only set about
it: "A young farmer at North Chili, a few days
since, was at the depôt, and happening to have a copy
which the horses had been attacked by the disease. will be placed in a very new right

The owner of them, Captain Perton, is at Windsor and his informant told him that the horses were there also-they being, in fact, in Oxfordshire, and one of them has recovered.

It must be observed that the evidence is by no means conclusive that the horses in questions were affected by rinderpest, while the same observation, in all probability, applies to the ... leged extension of the disease among sheep. Some animals drawn from the affected Norfolk flock have been examined by Dr. Letheby-a highly scientific authority-and in a communication to the Times he reports on the post-mortem appearances as follows :-- " I observed that the intestinal canal was red and inflamed, the perstonesi vessels were gorged with blood, and the mucous membrane of the fourth stomach, as well as the excum and beginning of the large intestine, was patched and spotted with bloody congestion, and all the aggregated glands of Peyer were so gorged with blood as to be distinctly visible through the outer walls of the intestines. In these respects, therefore, the appearances are very similar to those which have been observed in the cattle disease. The lungs, however, were much congested, and the right side of the heart was full of blood, while the left was empty, evidently showing that circulation had failed in the capillaries of the lungs. In this particular there is a difference in the post-mortem appearances of the cattle and sheep diseases, and pending the experimental inquiry which I am informed Professor Simonds is undertaking as to the communicability of the disease by inoculation from one species of animal to the other, it will be well to suspend our opinion as to the identity of the two diseases."

Should it unfortunately turn out to be the fact that sheep and horses are subject to the disease, the gloomy prospects which are opened out are but too evident. If this fatal malady ravages at the same moment oxen, sheep, and horses,-and is communicable from one to the others,-why may it not also extend to swine, and even to man? Little less than an absolute famine of animal food would be the result in Britain, and the consequences, in all probability, would be most disastrous. In discussing this dismal prospect, the Times has the following pertinent remarks: "It will be not the least alarming result of such a discovery (the rinderpest among sheep) that it would seem to render nugatory all our previous measures for preventing the distribution of the disease by means of c stagion. It is evident, in the first place, that while we thought we had guarded against co agion by a rigid quarantine of our cattle, we have b . n liable all the time to have it conveyed by sheep. But, in the next place, with all our sheep as well as our cattle exposed to the plague, how will it be possible to enforce a strict system of separation? Large flocks of sheep are very different from herds of cattle. Where there are hundreds of cattle there are thousands of sheep, and it would seem impossible to ensure that animals in an incipient stage of the disease shall not be conveyed along public roads, or be allowed to pasture among healthy berds. If the system of 'stamping out' the disease by preventing any diseased animal from communicating with any healthy one be still our only resource, nothing would seem likely to be sufficient except the absolute prohibition of all transit of any kind of animals. The outbreak may, in fact, prove to be the reductio ad absurdum of our regulations. It will be seen that the danger has in some measure been already met by the Privy Council. We publish an Order this morning consolidating all the previous Orders on the same subject, in which the word 'animal' receives the widest extension, and is made to include not only horned cattle, but sheep, lambs, goats, and swine. Any good, therefore, that can be done by the Orders in Council, will at ouce affect sheep as well as oxen. Without again indulging in premature speculatious, we may anticipate that many other points in our existing notions on the subject

With regard to Professor Gamgee's suggestion of violesale staughter, or "stamping out," as this medical has been forcibly called, the same journal has the following: "Now that it seems probable that our whole stock of animal food is liable to be affected, shall we persist in the barbarous practice of slaughtering induscraninately every animal in which the disease appears? When a plague among human beings carries off 70 per cent. of its victims does any one propose to slaughter the remaining 30 per cent. in order to prevent contagion? Suppose that seven-eighths of of the cattle attacked sink under the disease, why should we lose the remaining eighth? At all events, it this be the only treatment with which veterinary tical conclusion to the British farmers -that is, not to put themselves to the expense of employing vetermany surgeons. They can slaughter their cattle without the assistance of the veterinary college. We hope, however, a more civilized manner of treatment may be soon adopted, and that those veterinary surgeons who believe in the usefulness of their art, and are willing to extend its resources by the light of experience may take every opportunity of doing

The Field combats the foregoing expression of opinion by the Times, as follows:—"The contrast drawn by the leading journal between the attitude of the public towards the human and veterinary medical professions is by no means justified. Can the dical professions is by no means justified. Can the former claim any greater mastery over cholera than the latter is entitled to over the eattle plague, in spite of its experience during the three visitations with which this country has been afflicted? Preventive measures are absolutely all that can be relied on; and whether we adopt the saline treatment, or caloniel and opium, or homotopathic doses of arsenic. the mortality in severe cases will be the same, as has again and again been proved in actual practice.— The fact is really as stated by Professor-Gamgee than when the mucous membranes lining the stomach and bowels are either disorganized, as in the cattle plague and the malignant scarlet fever of man, or devitalized as in cholera, no absorption of salines or other medicines takes place, and death of the rest of the body follows as certainly as of the looster when he has been so far acted on by boiling water as to turn his shell red, although his muscles continue to act. I, is a strong symptom of ignorance in the physician to refuse to admit his want of remedial power signation to refuse to admit his want of remedial power over certain diseases, and, on the contrary, it will generally be found that the more skill and experience he possesses, the more ready he is to allow that, while he can assist nature to a very considerable extent in the majority of diseases, there are unfortunately but too many over which he has no control whatever. It is hard enough to be obliged to confess ignorance after years of study, but it is doubly hard for the veteriour surgoon to be told in the hard for the veterinary surgeon to be told in the leading columns of the Times that the has fallen into disrepute, because, by his own confession, he is absolutely useless in the presence of disease, and be-cause, avowing houself unable to cure it, he would resort to the most reckless measures in order to avoid its contagion. We cannot always agree with Professor Gamgee in his conclusions, and we have sometimes thought that he rides his hobby somewhat too hard, but, nevertheless, he stands forth as the most scientific man in his profession, and certainly he cannot be accused, in the instance of the cattle-plague, of either idleness or delay. He was the first to warn us of its approach, and to tell us, without circumlocution, of its arrival among us. He has undoubtedly worked hard in the examination of its symptoms, it-treatment, and its pathology, and when he says, in opposition to his own pecuniary interests, that all ke can advise is to put an end to its dissemination by wholesale slaughter, we surely ought to be grateful to him for his candour, instead of twitting him with his uselessness and ignorance."

From a careful consideration of all the circumstanrom a careful consideration of all the circumstances of the case, the Irish Furmer's Gazette is led to the startling conclusion "that our learned, skilful, and practical veterinary professors have made a mistake, and that it is not the rinderpest that has got amongst the cattle, sheep, and horses in England and Scotland, which all considered heretofore to be confined to the learner to be the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of the case of bovine race, but that it is the Siberian plague, which is acknowledged to be communicable from one species or genera of animal to others. If this be so, the case of our neighbours across the channel is a fearful one in-deed, and unless through the mercies of an offended beity he puts a limit to it, it is out of all human cal-

Lation as to when or how it may end."

In this fearful crisis we are not surprised to find that the Archbishop of Canterbury has felt it his duty to direct appropriate prayers to be used in Schools, the schools and Families within his archdiocese "to entreat the Almighty, who alone has the power, to housed, weather 'A word to the wise" is said to be sufficient. The crifful experiences of Britain in the present visital matter.

tion ought to incite our Canadian stockholders to increased care and vigilance in the treatment of their live stock. Prevention is at all times becter than cure. Therefore, see to it that domestic animals are provided with cleam well ventilated dwellings, and a regular and plentiful supply of wholesome and nutil

Unusual Weather.

The weather, like fortune, is proverhially fickle, and occasionally it indulges in strange freaks. That ubiquitous personage, " the oldest inhabitant," has taxed his memory in vain for anything to match the premature, but short-lived winter which set in upon as daring the closing days of last month, and the early days of the present month. On the 26th October, a copious rain fell throughout the greater part of Canada West. In many places it was welcome, for the ground had become so dry and hard that the fall transplanting of trees had been little short of impossible, and other necessary operations were obstructed. The rain continued through the night of the 26th ult., and on the morning of the 27th, tell gently, but was accompanied with such a degree of cold, that the drizzle was converted into hoar frost as it fell. During the afternoon and evening of the 27th, the rain again became heavy, and at times during the night fell in torrents. Freezing as it fell, the outside world presented a singular and unprecedented spectacle on the morning of the 28th. The roads and streets were a perfect glare of ico. Trees, plants, shrubs, and even blades of grass were coated over with ice, the crystalline incrustation being upwards of half an i.ich in thickness. Had the sun burst forth upon the scene. it would have been one of dazzling splendour. But the weather continued dull and cloudy, until gradually the coating of pellucid varnish fell from twig and shrub; and nature again wore its usual ru-set autumn garb. Great destruction, however, was made among fruit and ornamental trees. Orchards were sadly damaged. Many a fine evergreen lost its leader, and large numbers of the softer-wooded lawn and shade trees, were broken to pieces by the weight of ice. We have rarely had such a storm in midwinter, but nobody remembers the like as having occurred during the month of October. | Encouraged by the boidness of its predecessor's exit. November came in like a lion. Turnip-lifting was out of the question during the first few days of the month, so hard was the ground frozen; and many feared they would not get the few roots spared by grub and drought housed at all. These apprehensions, however, proved unfounded, and the precocious young winter, like most precogious growths, had but a short

The lesson taught by this unseasonable sport of hard weather, is that of timely preparation for winter. Our seasons are short, much requires to be crowded into them, and it is not easy to get all things ' taut and snug " as the sailors phrase it, by the last week of October But it is well, as far as possible, to take time by the forelock, so as not to be caught at a distime by the foreign, so is not to be engit at a disadvantage by an unusual turn of the weather. Especially is it important that stock should be comfortably housed at an early day. When chill nights come, animals should have shelter. Like human beings they keenly feel the first nip of cold, and there can be little doubt that in consequence of inattention that the proof of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the con to their comfort, many poor creatures receive a check before winter fairly sets in, from which they do not recover during the entire season. Exposure to such recover during the entire season. Exposure to such a storm as we have now chronicled, could not but be very detrimental to the health and vigour of live stock, and yet large numbers of cattle and horses passed through it with little or no protection. If creatures are left out of doors late in the fall, we believe they shit er off by night all the flesh they gain by grazing through the day. Early housing of animals, is without question, a very great help to their being successfully and comfortably wintered. It has been proved over and over again that it requires far less to keep stock in good condition when snugly housed, than it does when exposed to all sorts of weather, so that considerations of economy as well as those of humanity, urge attention to this important matter.

Veterinary and Agricultural Instruction.

Ir will be seen by referring to our advertising columns that arrangements are again made, under the auspices of the Board of Agriculture, for a familiar course of instruction in the various branches of science that relate to the principles and practice of Agriculture and the Veterinary art. The object is as follows: To provide suitable instruction for young men preparing for the Veterinary profession. Considering the constantly increasing number and value of our domesticated animals, the great expenses incurred by importation of superior stock from Europe, and the little professional skill at present available in the country to meet effectually serious emergencies, this department cannot be otherwise regarded than of great and pressing importance. The losses constantly occurring in consequence of neglect or unskilful treatment of disease, would, if correctly ascertained, assume serious dimensions; and the only way of preventing, or even mitigating them, is to diffuse among the rising generation of farmers sound and practical information on the various subjects treated of in the above-mentioned course of instruction, and thoroughly to prepare individuals for the practice of the Veterinary art as a profession. Both these points may be readily attained by the scheme herein mentioned, at the least possible expenditure of time and money to the indent.

The course, as regards professional students extends over three terms, and includes dissection and anatomical demonstrations, with a certain amount of practice. We understand that some three or four practice. We understand that some three or four pupils will present themselves for final examination next spring, when, if they succeed in passing, they will acquire the Diploma of the Board, cert fying that they possess a necessary amount of scientific and partial knowledge to enter on their profession in Canada.

The facilities thus offered to young persons intended for, or actually engaged in the business of farming, for acquiring a competent knowledge of such branches of natural science as have important such branches of natural serence as have important relations to their pursuits, ought to interest and attract no inconsiderable number. The course is purposely limited to six weeks, with the view of rendering it generally available. Many young men might conveniently spend that length of time in the depth of winter, and acquire an amount of information which their purposes. the more active periods of the year. Many an agricultural youth never rises to a perception even of the dignity of his vocation, from the fact that his mind

dignity of his vocation, from the fact that his mind has never been earnestly directed to observe and reason on the every-day phenomena of life.

The whole subject of Agricultural Education in this country, both as regards schools and societies, demands a much fuller attention than it has hitherto received. Our agricultural societies, spread over the length and breadth of the land, might do much more for the diffusion of light and knowledge, in more for the diffusion of light and knowledge, in relation to subjects having both a scientific and practical value, if suitable machinery were introduced adapted to the purpose. After all, however, but comparatively little can be done till the farming community, as a whole, is earnestly aroused, and made to feel and appreciate the last importance of the subject. With this view we are glad to learn that Professor Buckland has made such arrangements with the authorities of University College, as will with the authorities of University College, as will enable him to spend the greater portion of the year in visiting and lecturing throughout the Province.

A Graceful Acknowledgment.

WE copy the following paragraph from the columns of a British contemporary with unmixed satisfaction at the evidence it affords of just appreciation of an agricultural editor's merits: - A testimonial, in the shape of a valuable piece of plate and a purse containing one hundred and thirty sovereigns, has been presented to Mr. Robt. Oliphant Pringle, by a number of gentlemen interested in the agriculture of the country, on the occasion of his vacating the editorial chair of the Irish Farmers' Gazette to become editor of the Scotlish Farmer in Edinburgh. The plate bore the following inscription :-

"Presented, with a purse of sovereigns, to Robert Oliphant Pringle, by a number of friends in Ireland, in appreciation of his services in promoting agricultural improvements, especially while in connexion with the Irish Farmers' Gazette.—Dublin, 28th September, 1865. The presentation took place in Reynold's Hotel, Sackville-street, Dublin, in the presence of a large and influential assemblage. Richard Chaloner, Esq., Kingsfort, Moynalty, who occupied the chair, read a very complimentary address, from which the following is an extract:—

We cannot avoid feeling that natural emotion occasioned by the severance of the friendly intercourse which has continued so long between us, but we feel pleasure, at the same time, in knowing that it has arisen from a call to what may, perhaps, be a wider sphere of usefulness in the same field of labour. We are confident that the reputation you have gained as a zealous advocate of agricultural progress, and an able teacher of its principles, will be even further increased in the position you have been called to occupy, and that under your guidance the Scottish Farmer will not suffer either in usefulness or popularity."

larity."

Mr. Pringle made a suitable reply. Mr. Purdon. Proprietor of the Irish Tarmers' Ga.ette, said he could not let the occasion pass without expressing the high estimation in which he had held Mr. Pringle during the twenty years of unbroken friendship which had subsisted between them. Before Mr. Pringle became editor of the Gazette his writings had long been familiar to its readers, subscribed with the initials R. O. P., and it was as R. O. P. that Mr. Pringle afterwards introduced himself to him. From that time a warm friendship arose between them, which had continued uninterrupted ever since, and which, he trusted, would last unbroken to their lives' ends. (Hear, hear.) On the motion of Captain Thornhill, seconded by Professor Cameron, a vote of thanks was passed to the Treasurer, Mr. Rober'son, and the Secretary, Mr. Drummond, and the proceedings ended."

New Use for Indian Corn.

We have repeatedly urged upon our farmers, a more extensive culture of maize. Both grain and stalks are valuable for feeding purposes, and on good land the crop is remunerative. It is very useful in this country in a judicious rotation, both from the nature of the plant, and the mode of culture it requires. It may be safely grown in many localities where the sammer is thought by most people too short for it to ripen. The small yellow variety will mature in most parts of Canada. It need not be planted until about the first of June, which is not the least recommendation of it, as it lengthens out the season of spring work,—a very short one at best in this country.

A new use for this cereal has it appears, been found, and thus another reason for its more extensive cultivation is at hand. We learn from the Trade Revice, that the manufacture of sugar rom Indian corn, is about to be commenced, on an extensive scale, in Montreal. The enterprising and wealthy firm of Molson & Brother, of that city, are just completing a large sugar refinery, and having tried to their satisfaction a number of experiments, are about to commence making sugar from corn, and believe that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless that they will get an everless they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are they are

their satisfaction a number of experiments, are about to commence making sugar from corn, and believe that they will get an excellent article, at low cost.

The Hamillon Times in calling attention to this circumstance, makes the following statements. Its advice to Canadian farmers we readily endorse:—

"The manufacture has already been for some time carried on in Buffalo, and has also been commenced in St. Louis. Indian corn consists for the most part of starch, the greater portion of the starch now in use being made from it. Where then, it may be asked, is the sugar to come from. The answer is, that starch and sugar, though apparently so dissimilar in their nature, are in their chemical composition very nearly alike. The conversion of starch into sugar has long been familiar to scientific men. In this new manufacture, the starch is first made, and then the sugar from it afterwards. We apprehend that the profits on the sugar from the corn will have to be less per pound than what is made on starch; which is at present, if we mistake not, something more than handsome. But then the almost unlimited demand for the article, and its extreme readiness of sale, will more than make up for this. We may reasonably, then, congratulate ourselves on the prospects of making our own sugar, or a great portion of it, ere long. Our farmers would do well to turn their attention more to the raising of Indian corn, a crop which when well attended to, produces a very heavy return per acre. All parts of the Province are not suitable for it, but there is much soil especially along the line from Brantford to Chatham, and towards Lake Erie, on which more to the acre can be raised of it, than of any other grain whatever."

THE PHIZE LIST.—We devote nearly half our present issue to the Prize List of the recent Provincial Exhibition, which, having been revised and corrected by the Secretary of the Board of Agriculture, will be found useful for consultation and reference.

Agricultural Intelligence.

International Veterinary Congress.

DURING the early part of September last, a Congress rare in its kind, but somewhat fruitful in its results, was held in the city of Vienna. The programme was restricted entirely to the discussion of means to be adopted for the prevention of the cattle plague; the length of time to which the quarantine period should extend, the method to be used for the disinfection of railway trucks, ships, &c.; the subject of hydrophobia; and, lastly, questions of importance in relation to the law of warranty. The Scottish Farmer supplies the following synopsis of the proceedings :- " Dr. Vell art nded on behalf of the Government, for the parpose of welcoming the assembly, and gave an assurance that its deliberations would meet with all the attention they deserved. He specially referred to the fact that the laws relating to cattle disease prevention had been entirely revised in 1859, but that the steppe murrain continued to be introduced by smargled stock into the western and southern but that the steppe marrain continued to be introduced by smuggled stock into the western and southern provinces of the State. It was therefore necessary to attempt a more effectual control over the propagation of so disastrous a malady. The members present at the International Congress spoke in favour of estab-tishing a fond are to from the Gavernment grants, for lishing a fund, apart from the Government grants, for the payment of diseased or infected animals which the payment of diseased or infected animals which have to be slaughtered with a view of the prevention of the plague. Special precautions were suggested as to the transmission of articles the product of diseased animals:—Perfectly dried skins, the points of horns cut off, as they often are for commercial purposed the safe and dead intesting of earth matter. poses, the salt and dried intestmes of cattle, metted poses, the satt and dred intestines of cattle, metted tallow, wools, cowhair, &c., could be freel, allowed to pass unobserved. 2. Entire hours, hoofs, &c., which are detached from the soft parts, but which often co-ain admering flesh, &c., should be disintected with coride of lime. 3. As metted tallow is often conveyed in bags which may be charged with the poison, those bags should be washed with chloride of lime salution. It beach haves fresh chine and in lime solution. J. Fresh bones, fresh skins, and intestines, unmelted tallow, raw flesh, and fresh sheepskins should not be sold whenever the Rinderpest exists in a district."

Crops in Nova Scotia.

Is some parts the point is more injured, and the crops will be lighter than in 1864, but, taking the crops as a whole, it will probably average anything that has been harvested for several years past. The samples in the market are so far good, and exhibit more of that floury whiteness characteristic of the healthy esculent than formerly. The farmers seem to be cultivating the earlier and finer kinds; and though the yield perhaps may not be as abundant, yet the profit is doubtless larger. The wheat crop this year, as in past years, where any considerable quantities are sown, in some parts, has escaped the ravages of the fly—the late in others. The risk of losing the crop entirely deters many of our best farmers from attempting to raise wheat at all. Oats are quite an average, probably above it, throughout the Province. Buckwheat, where sown, has, we understand, done well. Larly and late frosts are the enemies of that wholesome and profitable cereal, otherwise the crop is almost certain, and is peculiarly adapted to lighten heavy soil, and is fit for a rotation of crops.

of that wholesome and profitable cereal, otherwise the crop is almost extain, and is pecutiarly adapted to lighten heavysoil, and is fit for a rotation of crops.

The hay crop of Nova Scotia this year is above an aver, ge, although certain localities are short. But this i not general. And the hay is ancommonly well put up. The dry season experienced has been peculiarly advantageous in that respect with regard to kinds of farming produce. Perhaps there has not been a season in the remembrance of any living inhabitant, where the drought has been so general, so long, and so severe, as during the present summer and autumn, and yet continues. Streams and brooks, and water courses, never before known to fail, are dead dry,—and water mills, as a rule, are all at a stand still.

The apple crop is all but a failure. A few barrels have found their way to the market, but the prices rule unusually high, and the quality is below the average.

Prices of furm produce are good, and pay. Butter is high, and likely to continue so during the season. Contract beef, as it is called, is low, yet butcher's meat keeps up and mutton and lamb commands higher prices and sales. Taking it all in all, the season of 1863 is one of prosperity for the agriculturist. Everything b has to sell brings good prices, and there is nothing that his labour produces but is in good demand.—Unionist.

Canadian Meat for the British Market.

MEAT being now scarce in Great Britain, and the supplies usually obtained from the Continent having failed, the Morning Post recommends that recourse be had to Canada. The case is thus put:—

"The average price per pound of butchers' meat in the markets of Quebec, Montreal, Ottawa, Kingston, Toronto, and Hamilton, in 1894, was: Beef, from 6 cents to 8 cents per pound; mutton, 5 cts, to 8 cts, per pound, and veal and pork, from 6 cts, to 10 cts, per pound. As to the practicability of bringing across the Atlantic dead meat in a marketable condition, there is little reason to apprehend difficulty, when we know that the tables on board the ocean steamers are all the year round supplied daily with fresh meat of the best quality. The average duration of the voyages of the Canadian mail steamships is between muc and ten days; and it has been ascertained that meat, when properly packed and forwarded in vessels fitted for the purpose, will keep a fortnight or three weeks. Should the first experiment of bringing to our markets live stock or dead meat from Canada prove successful, it is impossible to estimate too highly the importance of the trade both to Canada and ourselves."

Sale of Ayrshires and Jerseys.

We learn from the Massachusetts Ploughman, that the sale of the Ayrshire herd of H. N. Tharber, Pomfret, and the Jersey herd of John Gales, of South Woodstock, came off, as advertised, Oct. 18, on the farm of Mr. Giles. We extract, from the above-named paper, the following statement of the prices obtained:

AYRSHIRES.

	Name. Age. Purchasee.	1ºcice

JERSEYS.

The sale of Jerseys was remarkable, from the fact that all the pure bred cows went to one man, William B. Dinsmore. Esq., of Staatsburg, near Hyde Park, N. Y.. President of the Adams Express Co. The highest went at \$350, for a cow 3 years old, and others at \$310, \$300, \$255, \$225, and so on. A yearling heifer brought \$160, and a few grades from \$75 to \$150. A pure-bred spring's calf sold to H. C. Gregory at \$105. Two others went for \$95 apiece, another for \$80, and a bull calf at \$50. The Jerseys sold high as compared with the Ayrshires. They were not so uniform in colour and quality as the Ayrshires, and there were fewer that were desirable for founding a herd of that breed.

ANThe cultivation of the tobacco plant is rapidly extending in Algeria. In the year 1863 and 1864 eleven hundred and fifty native farmers planted this popular "weed."

Bone Mill.—The Rural Advertiser for October, has a cut and description of Bogartus' bone mill, of which several are in successful operation in that city and vicinity. It is said to be "the only mill in the market capable of grinding the raw bone. There are two sizes of these mills. No. 2 weighs about 600 lbs., is calculated for a two-horse tread power, and is capable of making out of unboiled and unburned bone a harrel of bone dust in twelve minutes. Price in Philadelphia, \$215. The large mill, No. 5, is adapted for a four-horse power, and will make a barrel of bone dust in six minutes. It weighs \$1,600 lbs., and costs in Philadelphia \$310. Extra plates can be furnished for grinding corn and cob."

720 THE Western Rural says that several persons near Auburn, N. Y., have recently been stung, or bitten, by a large worm that infests tomato vines, so that death ensued in a few hours. The worm is d scribed as about three inches long, of a green colour, and armed with claws and impress, with a black horn extending in front, three-fourths of an inch long.

SHEEP GONE CRAZY. - A gentleman who came down on the Hempfield train yesterday informs us that two untes this side of Claysville there was a flock of sheep inclosed in a pasture field. At one point the fence can along the edge of a high precipice. On Wednes-day a stampede occurred among the flock, when the trightened or crazy sheep commenced jumping the the same time. Two hundred and eighty of the animals were killed.—Wheeling Int.

It PAYS. - What pays? To raise sheep, when they can be sold as Mr. Tindale, of this Township, sells them. He informs us that he has lately sold five them. He informs us that he has lately sold live rams, of different ages, for \$135. The purchasers were—Alex. Murton. Bentinck, County of Grey, one tam lamb, \$20; Joseph Powley. Peel, County of Wellington, one ram lamb, \$20; John Page, Mary-horo', one ram lamb, \$20; John Hackney, Carrick, County of Huron, one three-shear ram, \$40; Elam Vrooman, Garafraya, one shearling ram, \$35. Good prices containly all respective for the statements. prices, certainly.—Fergus Constitution.

CONNECTICUT TORACCO CROP.- The tobacco crop will probably be the heaviest ever known. At present prices its value will not fall short of \$6,000,000. At old prices about \$1,750,000 would be a reasonable estimate. The tobacco interest is, in fact, becoming one of the leading interests of Connecticut. Large quantities are exported to Cuba and elsewhere y arry. the Connecticut wrapper being the best for all put poses in the market. A great quantity of stock from that State is also yearly exported to Germany, and comes back as imported tobacco, having been improved wonderfully by a trip to Europe.

Sheep Killed by Dogs.-Our Garafrana correspondent informs us that Mr. Robert Black, of that township, had thirteen sheep killed by dogs a few nights ago. We have repeatedly cautioned our farmers against the carelessness manifested in the night keeping of their stock. They are frequently left to roam at will over the farm, when a more tempting bait to a ravenous dog, than a flock of sheep, could not possibly be devised. We hope this warning will not be lost upon the agriculturists of the county. Guc'ph Advertiser.

Gurafrana Plotoning Match. - The Garafrana Agricultural Society held their annual Ploughing Match on the 28th ult., on the farm of John Dobbin. Esa. The competition was not as keen as might have been expected, but the quality of the work was tully up to that of former years. The company enjoyed been expected, but the quality of the work was fully up to that of former years. The company enjoyed Mr. Dobbin's hospitalities during the day, and when the work was fuished they adjourned to his house and spent a very pleasant evening. The following is the list of prizes: In the first class—men 1st. John Richardson; 2nd, John Duncan; 3rd, William Graham. Second class—men—1st, George Wilkie, 2nd, George Dickson. Boys' class—1st, Robt. Richardson; 2nd, John Strange.

FINE PEARS AT BOSTON. - The Massachusetts Horticultural Society have just closed their 37th Annual Exhibition, which was held in the new, splendid and commodious Halls in their new building in Tremont Street, an account of which will be found in another page. Notwithstanding the remarkably dry season, the pears were finer than ever before seen, and surpassed in quantity, as they did in quality, any of the exhibitions of late years. No less than 60 entries were made for the prizes for single dishes, and we venture to say that all these lots, not to mention others quite as fine, and in many instances tiner, made up a display of pears never equalled anywhere. Duchess pears weighed twenty-four ounces each, and Diches pears weighed twenty-lour ounces each, and 12 Bartletts weighed just 10 lbs. Sheldon, Howell, Doyenne du Conice, Hovey, Buerre Bosc, Beurre d'Anjou, Dix, Beurre Diel, and many others were equally large and superb. The following are the names of the 20 varieties which obtained the first premium of :25:—Moore's, Sheldon, Doyenne du Comice, Merriam, Abbott, Swan's Orange, Marie Louise, Beurre Bosc, Bartlett, Belle Lucrative, B. d'Anjou, Golden Reurre of Bilboa, B. Hardy, Hovey, (1989) Golden Beurre of Bilboa, B. Hardy, Hovey, (Dana's) Howell, Gausell's Bergamot, B. Superfin, Glout Morceau. Urbaniste, and Andrews, from Hovey & Co. The collections of pears comprised 160 varieties from Hovey & Co., 115 from M. P. Wilder, and 60 varieties from H. Vandine.—Hovey's Magazine.

Britisk Gleanings.

Pears have been so abundant in England tha year, that they have been sold at the rate of " I lbs for 2d." They have been cheaper than potatoes.

73 Vercues-a capital forage-plant grow best upon a loamy soil. It is not usually designated a rotation crop, being like peas, more a "catch" or stolen crop. The best crop for it to succeed is a cereal. Sown in autumn, it is ready to be cut for green food for cattle early in the spring, after which the land may be prepared for a root-crop. The seed should be sown at intervals, in order to seeme a succession of cuttings.

A tourist writes from a scaport town of the Highlands of Scotland, as follows : -" In a back street, inhabited principally by pilots and fishermen, a sanguinary announcement may be seen in a parlour window. It runs as follows: 'Sailors' vitals cooked

STRAW AND BEER.-The Scottish Farmer shrewdly says: " Mr. Mechi may persuade himself that he is in the secret of converting considerable quantities of straw into beef, but we rather suspect it is the straw which renders him capable of extracting nourishment out of the large allowances of concentrated food which he makes use of."

THE QUEEN'S ARMS. - A country fellow, anxious to see the Queen, left his native village and came to London to gratify his curiosity. Upon his return, his wite asked him " what the Queen was like?" " Loike! cried Hodge, " why, I ne'er was so cheated in my loite. What doo't think, Margaret? her arms are loike tholne and moine; although I have heard our excisemen say a score of times her arms were a hon and a unicorn.

POTATO DISEASE IN GREAT BRITAIN AND BRILAND -The Mark Lane Express of October 2 says . "The more we hear of the potato crop, the less assurance have we of its keeping qualities. In some localities the whole growth has been lost. It would seem rom the general reports in the English papers that the crop is the largest that has been raised for many years but that the disease is unusually virulent and

Europation room Inplane. The official report of the Registrer-General for Ireland has recently been published. For the seven first months of this year, "62.262 persons left the country, stating it to be their intention not to return." In 1864 the number for the same period was 84.556, showing in this year a decrease of 22,321. The total number of emigrants from the commencement of the enumeration at the Irish ports, in May 1851, to the 31st of July, 1865, is 1,591,487."

ANIMAL INSTINCT.-We clip the following from a British eychange :- " A few days ago a young horse, which was landed recently from the steamer at the foot of Lochgoil was sent with a load to a farm at the head of the Loch, a distance of six miles, from which it was to return with the tenant on horseback next morning. In the morning, however, the horse, which had been turned out to grass, was not to be found, and it turned out that at the time the search was being made for him, he was quietly feeding in a field upon the farm on which he had been landed. The road between the field and the farmaouse to which the animal was sent was crossed by high gates, which are closed at night, and over which, or the adjoining dykes, it must have leaped on its way home-wards. The curious part of the proceeding is that the animal had never before been out of the farm upon which it was landed."

DISEASE AMONG PIGS IN IRELAND.-We learn from an exchange that this fearful calamity still continues throughout Westmeath with unabated violence, and should it not speedily abate, pigs will be about as scarce as swans. In a radius of about one half mile there have not been less than from 100 to 150 of these animals fallen victims to this terrible disease, within the last few weeks. One poor struggling small farmer, holding ten acres of land, lost five out of six, with

it, as in former years, when pigs were numerous and healthy, and consumed to advantage the greater portion of the diseased potatoes. Landlords will, it is to be feared, find many shortcomings amongst their poorer class of tenants." The Scottish Farmer is informed that several deaths have recently occurred among the Irish peasantry, which are clearly traceable to the use of diseased pork. The fiesh of the hogs, which have fallen a prey to the epidemic, has been freely used by the lower orders, and, as a consequence, a species of English cholera has carried off several of the partakers of this unwholesome food.

THE HONEY HARVEST IN SCOTLAND .- "A Lammermoor Beekeeper" in the Scottish Farmer, gives the results of his honey harvest for the past season, as follows:-" I began the season with nine hives, and from them have now twenty-three, and have taken from them 290 lbs. flower honey. I had three tops as fine honey as ever was seen, weighing respectively 40. 36, and 32 lbs. net. The 40 lbs. was gathered by a top swarm within five weeks, the others about the same time. They are the heaviest which have ever been seen in this locality. I attribute my success to the liberal feeding which I gave them early in the spring when the queen was breeding. By or any success to the hoerit feeding which I gave them early in the spring when the queen was breeding. By o doing, I had strong hives, which were ready to take advantage of the white clover; and as my bees are now all Ligurians, or hybrids between them and the black ones, I cannot help giving them the preference, as I never could obtain such results before with the common bee.'

HIGHLAND HITS AND COWGATE DENS .- Alexander Smith, in his book on Skye, says :- " I protest I cannot become pathetic over the Highland hut. I have sat in the turfen dwellings, amid the surgings of the blue smoke, and received hospitable welcome, and found amongst the inmates, good sense, industry, family affection, contentment, piety, happiness. And when I have heard philanthropists, with more zeai than discretion, maintain that these dwellings are a disgree to the country in which they are found, I have thought of districts of great cities which I have seen—within the sound of the rich man's chariot wheels, within the hearing of multitudinous Sabbath bells—of evil scents and sights and sounds; of windows stiffed with rags, of thundle feets that look out dows stuffed with rags; of female faces that look out on you as out of a sadder Inferno than that of Dante; of faces of men containing the debris of the entire Decalogue, faces which hurt you more than a blow would; of infants polsoned with gin, children bred for the prison and the bulks. Depend upon it there are worse odours than peat smoke, worse next-door neighbours than a cow or a brood of poultry; and although a couple of girls dragging a harrow be hardly in accordance with our modern notions, yet we need not forget that there are worse employments for girls than even that. I do not stand up for the Highland but; but in one of these smoky cabins I would a thousand-fold rather spend my days than in the Cowgate of Edinburgh, or in one of the streets that radiates from Sayan Disk." that radiates from Seven Dials

A CATTLE PLAGUE PSAIM.-The following is part of a psalm sung in Osmotherley Church, Yorkshire, above a century ago. It was composed by the parish clerk on the occasion of the murrain, a severe distemper that raged among the horned cattle in the year 1717. It was sung and chorused by the whole congregation in the church. The four first stanzas contained an account of the cattle that died and the names of the farmers to whom they belonged; the remaining verses were as follows:

> No Christian's bull nor cow, they say, Hut takes it out of hand; And we shall have no cows at all, I doubt, within this la.

The doctors, though they all have spoke, Like learned centlemen And told us how the entrails look, Of cattle dead and green;

Yet they do nothing do at all, With all their learning's store; So Heaven drive out this plague away, And yex us not no more.

This piece was so well received that after the ser-Incling ten acres of land, lost five out of six, with which he flattered himself he could pay his November except five farmers, who wept, declaring that the rent. Another lost three out of five, each worth from £3 lost to £4, and, in like manner, from the full grown said to the clerk, "Why John, what psalm was that store to the suckling of a month old. The distress from this cause is very great, and considerably aggrevated by the rapid spread of the potato blight, the poor people having to look on at their potato crop isiling, without the satisfaction of the mitigation of Allertonshire and Birdforth.

Annual Fruit Growers' Meeting.

The Fruit Growers Association of Upper Canada, held its annual meeting at Paris, on the 4th October. The President, his honour, Judge Logie, in the chair. The following varieties of pears were shown by Mr. Holton-Seckel, Forelle or Trout, White Dovenne. Grey Doyenne, Napoleon, Buffam, Vicar of Winkfield, Swan's Orange, Jalousie de Fontenay, Beurre D'Anjou, Lawrence, Louise Bonne de Jersey, Beurre Bosc, Beurre Clairgeau, Flemish Beauty, Duchess d'Angouleme, Columbia, and Beurro Diel.

Mr. Mills, of Hamilton, exhibited the Columbia Mr. Mills, of Hamilton, exhibited the Columbia twenty years, and has not yet shown any symptoms plum, Delaware and Rebecca grapes, and the Ribston of cracking.) Pippin.

Mr. Smith, of Grimsby, brought samples of Smock's Freestone peach, and Hyder Eliza, and the Perkins' grapes.

Mr. Arnold, of Paris, exhibited at the meeting, and in his grounds, a large number of varieties of grapes and apples; among the grapes were Rogers' Hybrids Nos. 3. 4, 15, and 19, the Maxatawny, Diana, Delaware, Alvey, Ontario, Black Prince, and four varieties of seedling grapes, hybrids raised by himself, and two varieties of raspberry, one of which he had obtained by crossing the common Yellow Cap with the White Marvel of four seasons, and the other by crossing the Yellow Cap with Belle de Toutenay. Among the apples exhibited by Mr. Arnold, were the Wagner, Orange Russet, Benoni, Gravenstein, Northern Spy, and Bourrassa.

After partaking of a lunch, kindly provided by Mr. Chas. Arnold, the Association spent some time in examining the fruits in Mr. Arnold's grounds, and particularly the different varieties of grapes re-assembling for business, the meeting took up the discussion of pears.

Beurre Diel .- Mr. Arnold said the tree was a miser able crooked grower, but the fruit good. Mr. Holton, of Hamilton, said it was a good bearer, a strong growing tree, succeeds well on the quince stock, fruit sugary but gritty, would not call it first class; tree hardy, but a crooked, straggling grower. Mr. Hamilton, of Paris, thought the tree a good bearer, and hardy, the fruit gritty at the core.

The President considers this one of the best late pears. Recommended for further trial.

Summer Doyenne or Doyenne d'Ele.-Mr. Holton considers it one of the best early pears; free hearer, fruit small but handsome, with bright red check; if picked before ripe, is a very fine, rich, juicy pear, better than the Madeline, but if allowed to ripen on the tree, it becomes mealy and inferior. It ripens about the same time as the Madeline, a free upright grower, and bears young on the pear stock.

Mr. Mills thought it an exceedingly fine flavoured pear. Recommended for trial.

Beurre Clairgeau .- Mr. Holton said it was a fine pear if picked at the right season, rich and juicy, finely coloured, does not succeed well on the quince stock, is apt to break off at the union, it bears young on the pear stock; that he had it bear in three years from the bud, indeed it is inclined to overbear. Retained on list for further trial.

Kirtland.-Mr. Hamilton, of l'aris, considers it one of the finest varieties in his garden, it grows well on the quince, fruit small to medium, an orange russet, very fac flavour, almost equal to Seckel, a larger pear than the Seckel, appears to be a good hearer, comes in immediately after the Bartlett, a thrifty, good grower.

Mr. Arnold only knows it from having seen it in Mr. Hamilton's garden, thinks it a first class pear. (Note by the Secretary-the Kirtland is very apt to rot at the core-early picking in some measure remedies this defect.) Recommended for trial.

White Doyenne.-Mr. Holion stated that this pear was very liable to crack in some parts of the U.S., so much so that in some places its cultivation had been given up. He considered it one of the best pears in cultivation, and had seen no symptom of eracking about Hamilton.

Mr. Arnold could endorse all that Mr. Holton had said, adding that he has found it liable to overbear. and to become stunted in consequence.

Mr Smith, of Grimsby, thought it one of the best pears in cultivation, not liable to crack in his locality. Mr. Woolverton, of Grimsby, thinks it a good pear, but not so highly flavoured as some others.

Mr. Little, of Dumfries, said it was a splendid pear, but the tree does not succeed well with him, it looks

Mr. Mills, of Hamilton, -is a very fine pear, upright grower, great bearer. Retained for general cultiva-tion. (Note by Secretary—the White Doyenne has been cultivated at St. Catharines for nearly or quite

Buffam.—Mr. Smith thinks this requires only a little more size to make it equal to White Doyenne; it is a thrifty grower, and good bearer on quince, and

believes it equally good as a standard; fine flavour if properly ripened.

Mr. Hamilton.—It grows rapidly, and is apt to be killed back in winter, is not equal to White Doyenne. Mr. Holton.—Is a handsome tree, upright, inclined to overbear, varies much in different years, in some seasons nearly equal to White Doyenne, in others nearly tasteless, very unequal in size, small and spotted if the tree overbears; when grown in the shade, is apt to be without flavour, but in the sun, well coloured and better flavoured; is a very sweet

Mr. Arnold .- it is one of the finest growers, is liable to grow too fast when young, and in consequence to be injured in winter; it requires poor cultivation at first, and rich afterwards; flavour nearly equal to the Seckel, small size, apt to be spot-

Mr. Woolverton thinks it as hardy as other pears. Recommended for further trial.

Winter Nelis .- Mr. Hamilton thinks this is the times for inter pears, the tree is hardy, bears early, but grows very twisted, his are standards; the fruit is of first quality, and will keep into March, or may be ripened in December in a warm room.

Mr. Holton had found the tree subject to blight,

Mr. Holton had found the tree subject to hight, and a very crooked grower indeed.

Mr. Arnold said it was a very fine pear, but the tree grew so crooked and unsightly that nurserymen were not disposed to grow it, and when they do they keep it out of sight. Placed on the list for trial.

Laurence.—Mr. Holton had only fruited it twice, last year and this. It is an upright, medium grower, and hardy, fruit very fine, juicy, and of a very agreeable flavour.

able flavour

Mr. Hamilton has fruited it two years, thinks it a very line winter pear, and not difficult to ripen.

Mr. Smith thinks it long of coming into bearing

Put on the list for trial.

Smock's Peach.-Mr. Smith thought this a good late smock & Fack.—Art. Shift thought this a good late variety, hardy, and a good bearer. It is a yellow fleshed freestone variety. Mr. Holton requested Mr. Smith to name the four varieties of peaches which he considered the best for general cultivation, in localities where peaches succeed. Mr. Smith named Serrate Early York or the Early Purple; Crawford's Early, Early Barnard or Yellow Albert, and Jacque's Rare-

Early Barnard or Yellow Albert, and Jacque's Rareripe; and for a late peach, Smock.

The Association next proceeded to consider the
new varieties of grapes exhibited by Mr. Arnold.

ROGERS' ITURINS: No. 3.—Mr. Arnold said that
this ripened nearly as early as Hartford Prolific. He
covers all his vines in winter, and does not know
whether it will endure exposure, it appears to be as
hardy as the Delaware, ripens its wood well, and from
that fact he infers that it is as hardy as any other
grape. It is a fair grouper, though not so strong as grape. It is a fair grower, though not so strong as some others; he has seen no symptom of blight or mildew, the foliage keeps freeh and good, does not burn or wither; he has fruited it only one year, the bunch is as large as Isabella, berry larger, is a high flavoured grape.

No. 4.—Mr. Arnold said this was as hardy as No. 3. When young the vine bears larger and finer bunches than any of the others, it ripens from ten days to two weeks later than No. 3, it was ripe and in good con-dition at the time of the last Provincial Exhibition,

the vine is trained against a stone wall, No. 3 is trained on a trellis upon a terrace. No. 4 ripens carlier than the Diana, which is also grown against a wall with similar exposure. It is a good vigorous grower, and the only one of Rogers' Hybrids showing any symptoms of the leaf burning or withering.

No. 19.—Was ripened by Mr. Arnold on an open trellis, about the same time as No. 4, is not as early as No. 3, is a good grower, not subject to mildew. berry about the size of No. 4, and larger than No. 3.

No. 15.-Ripens a shade later than either of the Ao. 15.—tipens a snaue later than either of the preceding, on a stone wall beside No. 4; is quite hardy, the strongest grower of them all; the bunch improves every year; Mr. Arnold considers it the finest flavoured native grape, and equal if not superior to the Black Hamburgh. He would place these hybrids in the following order, in point of flavour, No. 15 first, then No. 19, then No. 4, and then No. 3.

The members present all considered Rogers' grapes very fine, highly flavoured grapes, and large in bunch and berry. Some thought No. 4 superior to No. 19. they were tasted and compared with each other and and with Delaware, Diana, and other grapes. The Delawares grown in Mr. Arnold's garden were inferior in sweetness and flavour to those brought by Mr. Mills. It was remarked by members that this year the Delaware has not coloured well, or come up year the Delaware has not coloured well, or come up to its flavour anywhere. (Note by the Secretary,—that it was his privelege this year to see two hundred vines of the Delaware finely loaded with perfectly coloured and most deliciously flavoured grapes. They were grown by Mr. J. D. Shuler, of Lockport, and sold in Buffalo at twenty-five cents per pound.)

On motion of Mr. Holton, seconded by Mr. Mills, it was resolved that on account of the flavour, time of ripening and size both of herry and hunch of

of ripening, and size both of herry and bunch of these hybrids Nos. 3, 4, 15, and 19, they be put upon the Society's list of grapes which promise well.

Maxatawny .- Mr. Arnold said this was the finest native grape in cultivation, a good but not rampant grower, quite hardy, ripens about the same time as Rebecca, a better grower than Rebecca, and the foliage not so liable to burn. Recommended for trial.

CHAS. ARNOLD'S HYBRIDS.-These were raised by Mr. Arnold, at Paris, with the view of obtaining a valuable wine grape.

No. 1.—This was the largest in bunch and berry, and best in flavour of these hybrids. Mr. Arnold said it is a cross between the grape known as the Kitchen wine grape and the Black Hamburg, that this is the third year of fruiting. The first year it bore a few grapes, the second year a few small clusters, and this year the clusters were large and fine. He kept a few bunches last year until February, then it was first-rate, better than now. It ripens carlier than the Republic and so for the vine does not carlier than the Isabella, and so far the vine does not appear to be subject to disease, and is a good strong grower.

No. 16.—This Mr. Arnold said was a cross between the Black St. Peters and the Clinton. This was the first year of bearing, it was a good grower, and so far not liable to disease,—the vine has much of the appearance of a Clinton.

No. 17.—This Mr. Arnold said ripens about the

same time as the Isabella, rather before. Is apparently hardy and free from disease. Mr. Arnold stated that he did not expect any of his hybrids to come up to any of Rogers' as a table grape, but they might prove to be of some value for wine.

On motion of Mr. Holton, Arnold's Hybrid No. 1,

was put upon the list of grapes which promise well.
After passing a resolution of thanks to the municipality of Paris, for the use of the room, and to Mr. Arnoid for his generous hospitality, the Association adjourned, to meet in the City of Hamilton, on Wednesday, the day January, 1866.

Injury to Plants Permanent.

Ir is with the vegetable, as with the animal kingdom-an injury will affect the future health. We therefore see many infirm men and animals, who date their infirmity to some mishap in previous life. It is difficult to root out a disease when once it becomes hereditary, or thoroughly established in the consti-

tution.
So it is with plants: a thing, however, we pay too little attention to. Sow your grain early in spring—and if the weather is severe, there will be a pale, straggling appearance of the grain, showing the hurt it received. And, though the weather may be favourable after that, and the ground rich, there will not be the crop that a healthy start would produce: the constitution of the plant is affected. How often have we seen after-planted corn better than that planted early, in consequence of the unimpeded, healthy growth, which fully developed the plant, and brought it thus to maturity. The later corn is always best where the fall favours ripening.

A garden mane early, produces early, but not so abandantly as one made a few weeks later-when everything rashes right forward. It will even over-take the early, unless the difference of time is great. But speed (of growth) is not so much what we are after, it is the abundance—the thorough health and vigour are the cause of this abundance. An insect wigour are the cause of this animaline. An insect may cripple a tree, pretty much for life. Why do people look for new seed to sow, fresh, of the last year's raising? Because it is healther; time has not been hurting it, drying up its vitality. It is known that vigorous, new seed produces, not only the surest, but the best crops.

It matters not how your seed is injured, whether by time, insect, or otherwise; whether it is hardly ripe, or has suffered from a too long exposure to wet; the r has since a from a too long exposure to wel; the has there. This germ, which embodies the future point, mas, be what we wish the plant to be. Why we select the earliest cars, the largest, the objective? Because we wish to get corn like in module we do, if we do not injure the corn afterwards, in managing it.

We most select the best seed, if we wish to get the bes, crops. And we must see that it is not injured in the injurgement afterward. Do we do these We do not. And we are constantly getting the results of our not doing it. Health is what is wanted in everything. Then there will be vigour. growth, profit.—Er.

Old Orchards.

It there is anything upon a farm that calls forth an anathema on its owner, it is an old orchard going to decay, and no young trees to supply the places of those about to be consigned to obtivion. Here in Out da county we see scores of such orchards, that were planted 50 years ago, and now show unmistakable signs of soon passing to that pomological bourne, wheace no fruit tree ever return-

The owners of such orchards generally profess to be men of ordinary common sense; and some of them are considered rather "sharp" in their dealings, saving every penny that can be secured on honest principles; yet they are so blind to their own interes.s. to the interests of their children-to nosterity as to go down into their graves, with scarcely a sound appet tree upon their farms! Such men are not throw away the opportunity to produce a young or-chard or good grafted fruit, to come into bearing when the old one should fail, through age, to produce it. golden harvest.

Farmers of this class, for what do you live " Farmers of this class, for what do you live I is it for wealth? Then why were the young orchards neglected to be planted, in these days of choice, high priced frum? Do you live for the enjoyment of the good things of this world! Then how could you suffer your families to be depicted of an ample store of Baldwins, Greenings, Spitzenburgs, &c? We tell you plainly you are a lazy, improvident class, and only allowed to exist, as tares among wheat. But

"While the lamp holds out to burn, The poorest farmer may return "-

Return to his duty to himself, his family, and to posterny that shall come after he shall "be known no more forever.

A good way to set a young orchard is to plough up the old one, and plant it to potatoes, and the next spring set young trees between the old ones, and keep the land cultivated for several years, till the trees get a good growth, and when the old trees cease to bear feuit profitably, cut them down as cumberers of the ground.—Ex-

Storing Celery.

We have said a great deal latterly about the cultivation of celery; and now as the crop must be pretty well grown, we shall proceed as usual at this season. to give some reliable directions for preserving it

through the winter.

Many people complain of their celery—one of the most difficult garden crops to raise in perfection—that it does not keep well through the winter—sometimes withers, but oftener rots. It is recommended by some that it should be preserved in the rows where it proves and that removed have on the single garden. it grows, and that removal more or less injures it. Where the plant is grown in soil of a dry nature and celery never should be grown therewell kept in the row; but we dony most emphatically that removal injures it in the slightest particular.

We pursue two modes, and find both to answer completely. The first is to remove the celery to high and dry ground, dig a trench spade deep, stand up a row of plants, then three inches of soil, then another row, and so or until about a half dozen rows are finished, and then commence another bed, and so

up so that the tops of the celery are just covered, up so that the tops of the early are main. Over then spank off roof fashion to turn the main. Over this two wide boards, nailed together, should be placed as a security against moisture. For remember it is water, not frost, as some say, that rots celery Frost adds to its tenderness.

Another plan is to sink burrels into the earth, so that the tops are two or three inches below the surface, stand them compactly full of celery, put close or tight covers upon them, and than a couple of inchor three years until all was consumed, which was late in spring — Geometric (T.) jraph.

.... The Adirondac Grape.

To the Editor of The Canada Painter .

Another season has given us further opportunity to test the merits of this new variety, and the reports that come in from every quarter are very encouraging. Correspondents of our Horticultural publications unanimously agree in saying that it ripens as early as the Hartford Prolific, and some say that it ripens before it. In New Jersey it was perfectly rine on the 22nd of August. But what will no doubt prove to be of more interest to the Canadian grape grower, is the fact that it was ripened here the past season by Thos. Gravdon, E-q in his garden, and that it was fully ripe the first we k in September. In quality the grape is far superior to the Hartford Prolific or to Blood's Black, or any of those foxy grapes; the nuln is sweet and tender to the very core, and is as free from all foviness as a Black Hamburg. liage bears considerable resemblance to that of the Isabella, and the growt cof the vine is nearly as vigorous There was no appearance of milden, rust, or sun burning upon the leaves of any of the vines that came under my observation, though Mr. Graydon's was the only one in bearing. As to its value as a wine grape we have yet to be informed, but those who have made some experiments with it for this purpose are very sanguine that it will be one of the very best, if not the best yet introduced. At my suggestion, Mr. Baily, who brought this variety into notice, has sent a few pounds of the Adirondae grapes to Mr. Harmes, a celebrated maker of Delaware and Untawba wines, residing at Put-in-Bay Island, Ohio, with the view of testing their value for this purpose. There is no better climate than that of some parts of Canada for wine making, and it may be that the Adirondae will yet be extensively planted in Canada for that purpose.

Mr. DeCourtenay at Cooksville, has already established an extensive vineyard and wine cellar, where he is manufacturing this year several thousand gallons of wine from a grape that very much resembles the Clinton, and for which he finds a market in advance at the rate of two dollars per gallon. This is certainly a very pleasing indication to the Canadian vinyardist, for as two thousand gallons of wine can be made from an acre of vines in full bearing, there cunnot fail to be a very handsome remuneration. We are but just beginning to develope the resources of this our Canadian climate, and the time is at hand when our fruits and wines will take a high rank, and command a corresponding price.

Yours. &c., D. W. Beadle. Oct. 30, 1865.

DISTINCE APART FOR STRAWBEARTES .- I invariably plant in rows and accer in bols. I hold that the obections to planting in beds are so great and so palit will admit of no discussion whatever ly standard rule is to plant in rows three feet apart. and plants two feet in the row. - Cor. Hort.

BLANCHNG CELERY.-Seeing lately in your journal some remarks on different modes of blanching celery, I am reminded of a plan I saw in Oxfordshire, in lugust last. It was simply placing a common drainpepe upright, and allowing the plant to grow up through it. My friend, in whose garden I saw it. assured me that he not only had his celery blanched much better, but also that it was ready for the table much earlier. That the latter is the case I can affirm from my own observation; for the plants I saw her row, and so or until about a half dozen rows growing in the pipes had already grown above the hished, and then commence another bed, and so tops of the pipes, while those treated in the ordinary. The soil should be packed firmly, and banked way were not half so high.—Cottage Gardener.

LARGEST VINEYARD IN THE WORLD.—It is said that the Buena Vista Vineyard, in Sonomad County, Calithe Buena Vista Vineyard, in Senomad County, California, is the largest in the world. It consists of 6,000 acres, with 272,000 vines planted previous to 1865, and 700,000 planted or to be planted this year. Last year the yield was 42,500 gallons of still wine, 60,000 bottles of sparkling wine, and 12,500 gallons of brandy. One hundred men are constantly employed, and double that purpose during the victors. of brandy. One hundred men are constantly em-ployed, and double that number during the vintage. There are \$,000 fruit trees, and large varieties of grapes.

FREEZING ONIONS.—If it is designed to keep the onious till spring the cheapest and the best way is to freezo them. To do this, select the north-west to freezo them. portion of some out-building under which the air does not circule te, spread the onlone about one and a half feet in depth, leaving a vacant space of about two feet from the side of the building, let them get thoroughly frozen, then cover them closely with an old sail, or any cloth, to keep the hay from mixing with them, and spread the hay two feet or more in depth above the covering; also pack fine hay closely between the heap and the sides of the building. Here let them remain untouched until the frost is entirely out, when they should be spread at once, well aired, and turned often until thoroughy dried.—Cor. Ohio

"FARMER'S FLOWERS.—We had our first frost on Tuesday night (October 21). The ice was a quarter of an inch thick, but it does not seem to have injured anything except heliotrope. My beds of Phlox Drummondli are still blooming freely, and the Petunias are as shown as ever—The Asters (which last year kept on blooming later than any other flower except Chrysanthemum) have been out of bloom for weeks. dry weather of August ripened up the seed prematurely. Mignonette also ripened its seed early in Aug., and I thought the beds were used up for this season; but we cut off the stems that were gone to seed, down to the ground, and the plants started again, and a finer bed of this sweetest of all flowers could not be desired. I call Phlox, Asters, Petunias, and Mignonette the "Farmer's flowers," because they can be grown with little trouble. Nearly all the flowers we have this year were from self-sown seeds. It is but little labour to set out the plats and hoc them—and nothing more is required. Our flower garden has been much admired, and this is about all that can be done to it.—
Harris's Walks and Talks.

Louitry Nard.

NEST EGGS.—To have a supply of these, indestructible to heat or cold, just empty some eggs, as you need them, through as small an aperture as possible; mix up with water to the consistency of cream, some pulverized plaster; fill up the shells briming full; when they have hardened, if you choose to peel them, you will find them perfect; and if you think your Brahmas will be fastidious about colour, a little annatto mixed in will render the illusion perfect.

OMONS AND POULTRY .- Scarcely too much can be said in praise of onions for fowls. They seem to bo a preventive and remedy for various diseases to which domestic fowls are liable. Having frequently tested their excellencies, we can speak understandingly. For gapes and inflammation of the throat, eyes and head, onions are almost a specific. We would, therefore, recommend giving fowls, and especially young chicks, as many as they will cat, as often as twice or three times a week. They should be finely chopped. A small addition of cornneal is an improvement.—Genesce Farmer.

PRESURVATION OF EGGS.—The best method I know of to preserve eggs, is to fill the pores of the shell with fresh clean land, so as to exclude all the air. It with result fact. So as to execute an the art. It is my opinion that this simple and easy method is preferable to any now in use. Some put them in lime water; some lay them down in salt; some put them in saw dust. But the lime cooks them, so that they have a dried appearance; salt has a similar effect, while eggs saturated with lard, as far as my experience goes, open fresh and nice.—Cor. of the Cilli-

AN AFFECTIONATE GRANNY HEN .- A lady in Vermont relates the following curious incident concerning the affection of a len. Last year, the hen selec-ted one from a broad of chickens, attached herself ted one from a brond of chickens, attached herself closely to it, and appeared to be happy only with the object of her love; unhappy when it was out of her sight, roosted with it and has continued this manifestation of affection until the present hour. This year the chicken, that was, produced in her turn a brood, and the grandmother hen, still faithful to her first love, employs herself with greatest solicitude in helping the daughter to provide for the wants of the little family of grand-chickens.

The Apiary.

The Sexes of the Bee.

To some it may seem out of place at the present day to occupy space in attempting to point out the different sexes of the bee; but I find in my conversations with many old bee-keepers, that it is still a subject of doubt with them whether it is the drone, queen, or working bee, which lays the eggs.

I intend then, in this paper, to point out the economy of the hive. Schirachs, the German naturalist, was the first to ascertain that there was no difference between common worker eggs and those laid for the especial production of queen bees; and that any egg laid in a worker's cell was capable of being converted into a queen, if the bees had access to it not more than three or four days after its having been laid; and that, in fact, every working bee is an undeveloped queen. This is now well known among all beekeepers who have paid any attention to the subject, and has been proved in various ways, that of artificial swarming being one of them. This is now adopted by many beekeepers, and the method of performing which I will detail in another article.

I will state a case that occurred in my own apiary last year. I had a queen in 1863 which could lay only done eggs from being bred late in the year, and being unsuccessful in her wedding flights. I kept her still among her subjects all the winter to see if she would continue done laying in the spring, and found that she did. I removed her on the 2nd of May, and gave the subjects a bar frame of eggs taken from a Ligurian queen hive. However, from some cause, they were not successful in bringing any queen cells, and then reduced the number to three; but they were all abortive, a circumstance which seldom happens.

I then took out on the point of my knife a new laid egg from a cell in the same Ligurian hive, taking care to remove the piece of the cell which had the egg attached to it, and placed it in one of the queen's cells which had proved a failure. I watched it with great attention to see the result, and was rewarded by seeing the young princess eat herself out of the cell on the 25th of June, last year. She came off with a fine top swarm on the 11th of June this year. In this case there could be no doubt but that the queen was raised from the egg that I put in, as I took care that there was no other than worker eggs, all sealed up, in the hive before I introduced the egg into the queen's cell. It takes about 16 days to rear a queen, and 21 days for workers; and a young queen coming off with a second or third swarm will be laying eggs in six days after if the weather is fine.

I had a third swarm from a Ligurian on the 12th of June this year, and examining her on the 19th, I found that she had laid many hundreds of eggs: so she had been successful in finding a mate her first

flight after swarming.

The drones are the males, and are laid by the queen in cells larger than the worker bees. They are reared in about 16 days. It has been a matter of much speculation why it is that there are so many drones in hives, while they do nothing but eat. Some writers, the "Times Beemaster," Dr. Cumming, among the number, hold the opinion that the drones are for keeping up the heat in the interior of the hive, when there are plenty of worker bees in the cells. If they were necessary for that purpose, we would naturally be led to expect them to be seen at an early period of the year, when heat is really necessary, as in the cold months of January. February, March and April; but it is not till the latter end of April or the beginning of May that any drone eggs are laid; and, besides, worker brood and the workers themselves are as capable of rendering heat as the drones, and are more required at that time, when all the energy of the hive is in operation; so that the "Times' Beemaster' has no ground for his opinion, when we know that the young princess, in order to secure a husband, generally comes out of the hive from one to two o'clock, and celebrates the happy event in the air, remaining only a few minutes out. Thus we can see the wise provision made by having a great 1 umber of drones (although only one is required) that there may be as little chance as possible either of the queen remaining long out, or laving to go far for a mate.

And that it is a great event in the economy of the

And that it is a great event in the economy of the reliable hire is evident to any one who watches the commolypecular tion that takes place among the bees, and with what hurts of joy they receive the queen when she returns from Lewis.

the wedding ceremony, knowing well that, had any accident occurred, they were powerless to rectify it, if it were a second or a third swarm. The queen seldom if ever goes out of the hive after the event, unless to swarm. The young queen continues to lay workers' eggs till September, and commences again in February, or earlier, according to the strength of the hive, and the season.

All the drone and workers' cells are wrought horizontally in the hive, as any one may have observed in a piece of comb. The queen cell hangs perpendicular from the comb, her head being undermost. I am unable to give any opinion for the reason of this strange position. The queen is fed with what Huber termed royal jelly—not an improper term, as it has just the consistency of apple jelly, but it is white, and has a sweet taste; while the workers are fed while in the cell—with a yellow or brownish matter, much thinner than that of the queen's, and has a bitter taste. They all cat themselves out of the cells without any assistance from the bees,—Scottish Farmer.

The Zousehold.

Our Eyes.

Indigestion is the principal source of weak eyes. Reading in the cars of en seriously disturbs the vision. A delicate and wonderful apparatus within the eye is constantly busy in adapting it to the varying focal distances. The jerking motion of the cars compels an exhaustive effort to maintain the required adaptation. Thousands of eyes are spoiled by reading in the cars and other vehicles. Recently I was consulted by a railroad expressman, who had become totally blind by reading the newspapers in the cars. Thousands who have never consciously suffered any inconvenience from the habit, are obliged to wear glasses prematurely to correct an unsteadiness of vision produced in this way. Reading with the gas light before you is another cause of weak eyes. The light should always hang quite high and behind you, and allowed to hang over the shoulder. If convenient it should be over the left shoulder. If using kerosene, it is best to employ the lamps which hang on the wall. Neither should you read with your face toward the window. Reading by twilight is dangerous. Gradually accommodating itself to the receding twilight, the eye is unconsciously strained. I have seen more than one case of grave disease of the eye, produced by an undue effort to use the vision too long at twilight. White paint outside, white paint inside, white paint everywhere. During the season of brightest sunshine, the glare hurts the eye. I wonder if it is not in bad taste likewise? I notice that artists have none of it about them. In our constant reading, the eyesight is much tried by the white paper. I hope that the tinted paper, with a still deeper solor, may become fashionable. Avoid reading by artificial light when you can. We read too much. We read as we eat—pell-mell, hotichity-potch; no mastication, no digestion. If, as a people, we read less we might know more.

Few indications are more unpromising in a child than a remarkable passion for books. I doubt if a good lady, who called on me the other day with her son will ever forgiv? me for what I said to her. Her boy was of the regular Boston type—great head and eyes, with small and narrow chest. She said in a mournful voice, but with evident pride, "Ah, doctor, he has such a passion for books. As soon as he is out of bed, he is down at some great book, and scarcely leaves it but for his meals. He never plays like other children." I told her, among other things, that unless she could break up that habit, her son would very likely turn out a dolt. She left very soon with the belief that I did not understand her son's case. I should have about as much hope of a man who gave himself up to childish sports, as I should of a child who gave himself up to the habits and life of a man. The newspapers have much to answer for in the way of small type and imperfect printing. I would cheerfully give two hundred dollars a year to support a newspaper which would give us, morning and evening, a half column of the really reliable news, instead of fifteen columns of diluted speculations and tricky canards, the reading of which hurts our eyes and wastes our precious time.—Dio

A writer in the American Medical Gazette gives the following lucid explanation of the phenomenon of a lady's blush: "The mind communicates with the central ganglion; the latter, by inflex action through the brain and facial nerve, to the organic nerves in the face, with which its branches inosculate." The blush loses nothing by the explanation.

paties quiet has been patented: As soon as the squaller awakes set it up, propped by a pillow, if a cannot sit alone. Smear its angers with thick melasses; then put half a dozen feathers into its lands, and it will sit and pick the feathers from one hand to the other until it drops asleep; as soon as it awakes again apply more feathers, and in the place of innumerable sleepless nights there will be silence and enjoyment unspeakable.

Girls, Brwarr!—Girls, beware of transient young men. Never suffer the addresses of a stranger. Recollect that one good farmer's boy, or industrious mechanic, is worth all the floating fops in the world. The allurements of a dandy Jack, with a gold chain round his neck, a walking stick in his paw, a three-penny cigar in his mouth, or some honest tailor's coat on his back, and a brainless, though fancy skult, never can make up the loss of a good father's home, and a good mother's counsel, and the society of brothers and sisters; their affections last, while that of such a young man is lost in 'the wane of the honey moon.' Tis true.

SMART GIRLS.—During the past season the Prairie Furmer has given us, as the heading of an advertisement, a young lady seated on a "Sulky Hay Rake," from whose mouth proceeds a scroll with the inscription, "My brother has gone to the war." Riding there with both hands grasping the reins, we thought she was doing well for an Illinois girl. But just see what they do in Vermont. The last number of Walton's Journal gives the following as a specimen:—

ton's Journal gives the following as a specimen:— Edith Wheatley, daughter of Nathaniel Wheatley, of Brookfield, Vt., is what we call a "smart" girl, though but fifteen years of age. She has this season raked 100 tons of hay, and while guiding the rake she quietly pursued her knitting.—Jowa Homestead.

MEDICAL USE OF SALT.—The Medical World says in many cases of disordered stomach a tablespoonful of salt is a certain cure. In a violent internal pain termed cholic a teaspoonful of salt dissolved in a pint of water, taken as soon as possible, with a short nap immediately after, is one of the most effectual and speedy remedies known. The same will relieve a person who seems almost dead from a very heavy fall. In an apoplectic fit, no time should be lost remain to allow of swallowing; if not, the head must be sponged with cold water until the senses return, when salt will completely restore the patient from the lethargy. In a fit the feet should be placed in warm water, with mustard added, and the legs briskly rubbed; all the bandages removed from the neck, and cool aperient procured, if possible. In case of severe bleeding at the lungs, when other remedies failed, Dr. Rush found that two teaspoonfuls of salt stayed the blood.

A CURE FOR CHOLERA.—Dr. Chapman publishes a pamphlet to show that in the application of ice to the spine he has found a powerful remedy for cholera, and the slighter complaint of diarrhoad. He has only had the chance of trying his theoretic remedy on one case of cholera, and that, though it had all the worst symptoms, was probably a severe case of English rather than genuine Asiatic cholera. However, in that case it proved to be exceedingly effective in subduing all the more dangerous symptoms. On the lesser complaint both he himself, and Mr. D. M. Williams, honorary surgeon in the Liverpool Infi mary for Children, have more than once tried it with great effect. One of Mr. William's experiments with a child in the infirmary is very remarkable. The remedy is to apply an India-rubber bag full of ice "next to the skin, along the central line of the back, letting it extend from the nape of the neck to the lower part of the hollow of the back." This is kept close to the back, and is renewed as long as sickness, cramps, coldness of the skin, and other symptoms of cholera, or any sign of collapse continues. If, as is not unfrequent, feverish symptoms set in after the reaction is produced, he applies warm-water bags, with the water at 110 deg. to 120 deg., to the back to remove it. This is the chief element of his treatment, and, as we said, Dr. Chapman, arriving at this treatment on theory, has found it very successful in the instances in which he has been able to apply it.—

Markets.

Toronto Marketa.

"CANADA FARMER" Office, Not 15, 1365

"Camba Farmar" Office, Not. 15, 1865
We have to record a fortinght of moderate business in ail departments of trade. The deliveries of gran were comparatively light, although ful wheat and barley were easy riverignment for at eligibity alvaced prices. During the fortinght we have been visited by every kind of weather, sunshine, ran and river. A gate which prevailed list week the considerable damage to the shipping interest. The disasters which are reported to have occurred, are some of them of a very second adure, and it is leaved many valuable lives have been lost.

Directly for each for a week the received have been not you me to real to

them of a very second nature, and it is teared many valuation lives have been fest.

During the past two weeks the market has been only moderately active. The steady tendency of prices in cereals, together with the total structure in the total structure. The steady tendency of prices in cereals, together with the total structure in the country roots, has checked supplies from timers, and deliveries at this as well as at nearly all interior statung, have considerably fallen of. In flour there is no demand, and on the interior almost nominal. Fork packing has commenced, and although little or nothing has yet been done, proparation is are both in market in the seen squales of fat legs we many trade during the winter. The log cropus extensive. Nearly every day on our streets are to be seen squales of fat legs we many the formation to have the received in the tops were great with a small supply. Proceedings there rule high, those averaging 270 to 320 lbs. bring \$12 or to \$1275 per cental, gross.

With cold weather upon us, the price of fuel has reached a point improcedented in our city, and great handship is likely to be the rath amongs the poorer classes. Wood has advanced \$1 to \$1.30 per cent within the just two months. Hard coat is exceedingly scarce, and the small quantity in the market community a veryingh price. The scarcity in Auditractic coal is caused by prolonged strikes in the mines in the United States, and prices are further accelerated by the high rate of railway freight. Beech and Maple wood selfs at \$5.50 to \$6.

Flour—market nominal, no demand, and few transactions. No

wood selfs at \$5 50 to \$6.

Flour—market nominal, no demand, and few transactions. No 1 superflue at \$6 00 to \$6 25, extra do at \$7 20 to \$7 20, sepernor extra at \$7.5 to \$8 00, and higher
Fall What in fair demand and steady, at \$1.42 to \$1.50 on the street; Smutty, \$1.3 to \$1.55.
