*Not printed.*

VOLUME 12—*Continued.*

- 63a.** Return to an order of the House of Commons, dated 11th May, 1892, for copies of all documents, memorials and correspondence between the government and the corporation and board of trade of the town of Sorel and other persons, respecting the granting of a subsidy for the construction of a bridge on the Richelieu River to connect the town of Sorel with the Montreal and Sorel Railway. Presented 25th May, 1892.—*Mr. Bruneau*..... *Not printed.*
- 64.** Return to an order of the House of Commons, dated 23rd March, 1892, for copies of correspondence exchanged between the government and the postmaster of St. Césaire, county of Rouville, or any other person, with reference to deposits of money to be made by the said postmaster. Presented 19th April, 1892.—*Mr. Brodeur*..... *Not printed.*
- 65.** Return to an order of the House of Commons, dated 18th June, 1891, for a return showing the amount of money expended, and the year of expenditure, in each electoral district since confederation, under the following heads: 1. Public buildings. 2. Harbours and rivers. 3. Roads and bridges. Presented 26th April, 1892.—*Mr. Landerkin*..... *Printed for sessional papers only.*
- 66.** Return to an order of the House Commons dated 1st July, 1891, for a return of all correspondence, telegrams, letters, reports, estimates and other documents relating to the surveys for, and construction and cost of a sub-marine tunnel between Prince Edward Island and the mainland. Presented 27th April, 1892.—*Mr. Davies*..... *Not printed*
- 66a.** Return to an order of the House of Commons, dated 23rd March, 1892, for all correspondence, reports, etc., which may have taken place between the government of Canada and Sir Douglas Fox, or any other engineer, since the 1st day of September, 1891, having reference to building a tunnel from Prince Edward Island to the mainland across the Straits of Northumberland. Presented 3rd May, 1892.—*Mr. Perry*..... *Printed for sessional papers only.*
- 67.** Return to an order of the House of Commons, dated 9th March, 1892, that a map of the Dominion be laid upon the table showing the boundaries of townships, counties and electoral divisions in each province, and the number of votes polled in each township for each candidate at the general election in March, 1891. Presented 27th April, 1892.—*Mr. Mills (Bothwell)*..... *Not printed.*
- 68.** Return to an address of the House of Commons to his excellency the Governor General, dated 14th March, 1882, for copies of all correspondence between the government of Canada or any member thereof, and the British government, or between the government of Canada and any person or persons, relating to the admission of live cattle from the United States. Also for copies of all orders in council relating to the same. Presented 29th April, 1892.—*Mr. Somerville*.  
*Printed for sessional papers only.*
- 69.** Return to an order of the House of Commons, dated 14th March, 1892, for a return of copies of all tenders received for engraving and printing since 1882, and of all contracts entered into for the same, including the contract beginning in this present year; also all correspondence relating to the subject since 1882. Presented 3rd May, 1892.—*Mr. Somerville*..... *Not printed.*
- 70.** Return to an address of the House of Commons to his excellency the Governor General, dated 30th March, 1892, for a return of all correspondence, telegrams or other documents between the government of Canada and the imperial government or the government of Newfoundland, or between any member or representative of either of such governments respecting the admission of Newfoundland into the dominion of Canada; including all correspondence or telegrams to and from the high commissioner on the subject; and all reports to and minutes of council thereon. Also copies of any terms or offers which may have been submitted to the government of Newfoundland or any member thereof, with respect to the admission of that island into the dominion. Presented 4th May, 1892.—*Mr. Davies*..... *Printed for sessional papers only.*
- 71.** Return to an address of the House of Commons to his excellency the Governor General, dated 10th March, 1892, for copies of all correspondence, memorials, departmental orders, and orders in council respecting the north-western, northern and eastern boundaries of the province of Quebec, received or passed during the last five years and not already laid before this House, together with all the reports of surveys or explorations ordered thereon by the government of Canada during the same period. Presented 5th May, 1892.—*Sir H. Langevin*.  
*Printed for sessional papers only.*
- 72.** Return to an address of the House of Commons to his excellency the Governor General, dated 9th May, 1892, for a copy of the instructions appended to commission of the lieutenant governors of the provinces of Canada. Presented 9th May, 1892.—*Mr. Laurier*..... *Not printed.*

## VOLUME 12—Continued.

73. Return to an order of the House of Commons, dated 14th March, 1892, for a return of all correspondence, engineers' reports, petitions or other documents relating to the survey or deepening of the channel of the Galops Rapids, and for a statement of the work performed by the chain tug "Iroquois," owned by the government, and of the services performed by one John Stitt, in connection with said tug. Presented 9th May, 1892.—*Mr. Somerville*..... *Not printed.*
- 73a. Return to an order of the House of Commons, dated 11th March, 1892, for a return of all surveys, plans, specifications, contracts, reports and papers connected with the new channel in the Galops Rapids. 2. All reports of engineers as to the striking of steamer "Traveller" in Galops Rapids, in October, 1889. 3. All reports from any steamboat captain who may have reported as to the state of said channel. 4. Statement of cost of investigation by engineers in 1891. 5. Reports from engineers sent to investigate said channel in 1891. 6. Copies of evidence given as to the depth, quantities, etc. Presented 30th May, 1892.—*Mr. Reid*..... *Not printed.*
74. Return to an address of the House of Commons to his excellency the Governor General, dated 4th April, 1892, for copies of the original letters patent of incorporation of the Dominion Cotton Mills Company (Limited), and of the supplementary letters patent increasing the capital stock of the said company from \$100,000 to \$5,000,000, and copies of all correspondence, petitions, statements and evidence submitted to the government in support of the issue of such supplementary letters patent. And also for copies of the original letters patent incorporating the Canadian Coloured Cotton Mills Company (Limited), and of the supplementary letters patent increasing the capital stock of the said company from \$100,000 to \$5,000,000, and copies of all correspondence, petitions, statements and evidence submitted to the government in support of the issue of said supplementary letters patent. Presented 9th May, 1892.—*Mr. Edgar*..... *Not printed.*
75. Return to an order of the House of Commons, dated 2nd May, 1892, for all correspondence concerning the appointment of Mr. W. H. Ingram as Collector of Customs at St. Thomas, Ont. Presented 10th May, 1892.—*Mr. Casey*..... *Not printed.*
76. Return to an address of the House of Commons to his excellency the Governor General, dated 2nd May, 1892, for copies of all correspondence, memorials and documents exchanged between the government, or any member thereof, and any persons, companies or corporations as to the propriety or advisability of relieving or recouping the county of Pontiac railway indebtedness. Presented 11th May, 1892.—*Mr. Murray*..... *Not printed.*
77. Return to an order of the House of Commons, dated 2nd May, 1892, for a detailed copy of the certificate of acting chief engineer that \$32,000 paid to Bancroft & Connolly was done in addition to all previous certificates on Kingston Graving Dock, as mentioned in Auditor General's Report, page C—119. Presented 12th May, 1892.—*Mr. Gibson*..... *Not printed.*
78. Return to an order of the House of Commons, dated 14th March, 1892, for : 1. Copy of the circular issued on the 10th June, 1891, by the department of marine, relative to sick mariners' dues in Canada. 2. A list of persons to whom such circular was addressed. 3. Copy of all answers received. Presented 16th May, 1892.—*Mr. Laurier*..... *Not printed.*
79. Report of the Royal Commission appointed to investigate the working of Civil Service Act, and other matters connected with the Civil Service generally. Presented 20th May, 1892, by Sir John Thompson..... *See No. 16c.*
80. Return to an address of the House of Commons to his excellency the Governor General, dated 2nd May, 1892, for a return stating, for the last year (1891) : 1. The number of applications which were made to the railway committee of the privy council for an adjudication, order or direction respecting any of the matters or things which, under the provisions of the Railway Act, the railway committee had power or authority to deal with. 2. Showing in general terms the nature of the application. 3. The names of the members of the honourable the privy council who (a) Heard each of the applications ; (b) Who were present at any one or more adjourned hearings thereof, and at the final adjudication thereof ; (c) In cases in which adjournments took place, the dates of hearing, and subsequent adjournment or adjournments of final adjudication. 4. Statement showing how each of said applications was disposed of, viz. : Granted or refused, or partially granted. Presented 25th May, 1892.—*Mr. McCarthy*..... *Not printed.*
- 80a. Return to an address of the House of Commons to his excellency the Governor General, dated 2nd May, 1892 : 1. For a statement of all applications or complaints made to the railway committee of the privy council respecting the matters or things referred to in sub-sections (k), (l), (m), (n) and

## VOLUME 12—Continued.

- (p) of clause eleven of the Railway Act. 2. By or against whom such complaints were made. 3. The manner in which the same were dealt with or disposed of. Presented 25th May, 1892.—*Mr. McCarthy*.....*Not printed.*
- 81.**—(1891.) Return to an address of the House of Commons to his excellency the Governor General, dated 3rd June, 1891, for copies of all correspondence between the imperial government and the government of Canada, on the subject of the copyright laws of Canada, and all other papers relating thereto, not already brought down. Presented 24th August, 1891.—*Mr. Edgar*.  
*Printed for sessional papers only.*
- 81.** Return (in part) to an order of the House of Commons, dated 23rd March, 1892, for a return showing which of the dominion buildings in Canada are lighted by electricity; the respective system used in each such building, whether arc or incandescent; the number of sixteen candle-power lamps or their equivalents used in each such building; the cost per lamp of sixteen candle power or equivalent in each building; and the average annual cost for lighting each such building. Also showing in what buildings the plants are owned and maintained by the government, and in cases where not so owned and maintained, from whom the current is obtained or supplied, and whether from central station or private parties; also whether in cases of leased currents the renewal lamps are supplied at government expense, and if so, in what buildings and at what annual cost; also the names of the parties contracting to light any of such buildings, with the names of the buildings, and the dates and duration of each such contract. Also showing which of the public buildings of the dominion are lighted with gas, and the annual cost of lighting each such building. Presented 25th May, 1892.....*Not printed.*
- 82.** Return to an order of the House of Commons, dated 2nd May, 1892, for a return giving all papers, letters, petitions, applications and every other document relating to the dismissal of the postmaster of Eugenia, and the appointment of his successor. Presented 30th May, 1892.—*Mr. Landerkin*—*Not printed.*
- 83.** Return to an order of the House of Commons, dated 16th May, 1892, for a return showing the names of the mail conductors superannuated, their number of years of service, the salary given to each of them during the last year of service, and also the names of those who have had several years added to their period of service. Presented 30th May, 1892.—*Mr. Brodeur*.....*Not printed.*
- 84.** Return to an order of the House of Commons, dated 1st March, 1892, for a return showing the number of royal commissions that have been issued in each and every year since confederation, and to whom issued, together with the subject inquired into, giving the cost of each and the total cost of all. Presented 1st June, 1892.—*Mr. Landerkin*.....*Printed for sessional papers only.*
- 84a.** Supplementary return to an order of the House of Commons, dated 1st March, 1892, for a return showing the number of royal commissions that have been issued in each and every year since confederation, and to whom issued, together with the subject inquired into, giving the cost of each and the total cost of all. Presented 9th June, 1892.—*Mr. Landerkin*.—  
*Printed for sessional papers only.*
- 85.** Statement of number of hours of setting upon the daily Senate *Hansard*, and number of ems set, including corrections, up to 20th May. Presented 2nd June, 1892, by Hon. Sir J. C. Abbott.—*Not printed.*
- 86.** Return to an address of the House of Commons to his excellency the Governor General, dated 25th April, 1892, for a copy of the petition presented and filed in the supreme court of Nova Scotia, under the Dominion Controverted Elections Act, against the election and return of Joseph A. Gillies, for the county of Richmond, Nova Scotia, at the general election holden on the 5th March, 1891; together with the dates of filing and service of such petition; and also all papers and documents in connection with the following proceedings in the supreme court of Nova Scotia: 1. Application to the honourable the chief justice extending the time for setting the petition down for trial. 2. Application to set the petition down for trial returnable before the Honourable Mr. Justice Weatherbe, and the Honourable Mr. Justice Graham, but heard by the Honourable Judge Weatherbe, sitting alone, on the 19th day of November, 1891. 3. The order made by the said Judge Weatherbe, sitting alone, for the trial of the said petition, fixing the 8th of December, 1891, the date for said trial. 4. The notice of appeal, dated 28th November, 1891, from this decision of the Honourable Judge Weatherbe, to the supreme court of Nova Scotia, the grounds of appeal being as follows: (a) Because there was no jurisdiction to make said order, or the portion

## VOLUME 12—Continued.

thereof extending time; (b) Because six months had elapsed since the presentation of the petition; (c) Because the time and place of trial were not fixed within six months from the presentation of the petition; (d) Because the extension of time granted by said order was not made on application for that purpose, supported by affidavits, and it does not appear from such order, and it was not made to appear when the same was made, that the requirements of justice rendered such enlargement necessary; (e) Because the respondent had no notice of any application to extend the time for the commencement of the trial herein; (f) Because one judge has no jurisdiction to fix the time and place of trial; (g) Because the trial of the petition cannot be commenced during the term of the court at which the judges assigned to try the said petition are bound to sit. 5. The notice of motion on said appeal for the 3rd day of December, 1891. 6. The appointment by the Honourable Judge Weatherbe, then senior judge, for a hearing before the supreme court on the said 3rd day of December, 1891. 7. The postponement of this hearing until a later day. 8. The judgment of the supreme court upon this case. 9. The rule of the supreme court, dated the 19th day of December, 1891, setting aside the order of the Honourable Judge Weatherbe fixing the date of the trial of said petition. 10. The date on which the Honourable Judge Weatherbe and the Honourable Judge Graham received a copy of the order of the supreme court setting aside the said order of Judge Weatherbe for trial. 11. The date on which the said judges reported to the Honourable the Speaker of the House of Commons that the said petition had been heard by them, and that they had declared the election of the said Joseph A. Gillies void, and his seat in parliament vacant. 12. The date upon which application was made to the Honourable Judge Weatherbe to defer the decision in the petition pending the decision of the supreme court of Nova Scotia on the question of jurisdiction, and the refusal of this application. Also copies of the several petitions presented and filed in the supreme court of Nova Scotia under the Dominion Controverted Elections Act, against the election and return of Hon. Sir John Thompson, Hon. C. H. Tupper, Mr. C. E. Kaulbach, Mr. J. B. Mills, Mr. N. W. White and Mr. Hugh Cameron, for six of the several counties of the province of Nova Scotia, at the general election held on the 5th March, 1891. Also all papers and documents in connection with the various proceedings in the said cases in the supreme court of Nova Scotia. Presented 3rd June, 1892.—*Mr. Gillies and Mr. Forbes.*

*Not printed.*

87. Return to an address of the House of Commons to his excellency the Governor General, dated 30th March, 1892, for copies of all accounts, claims and certificates presented and transmitted (from 1st July, 1885, to this day) to the dominion government, by each of the judges of the superior court for the province of Quebec, in his capacity as such, for all travelling expenses and hotel expenses, in any place other than that in which such judge had orders to reside, or did in fact reside, either for sitting or for acting therein, or for holding therein (in such capacity) any court in civil, criminal or other matters; together with a detailed statement of the several sums paid in conformity with such accounts, claims and certificates. Presented 3rd June, 1892.—*Mr. Flint.*

*Not printed.*

88. Further supplementary return to an address of the Senate, to his excellency the Governor General, dated 14th September, 1891, for all correspondence between his excellency the Governor General and the Lieutenant Governor of the province of Quebec, in connection with the Baie des Chaleurs Railway, and all other papers and correspondence in the possession of the government on that subject. Presented 31st May, 1892.—*Hon. Mr. Miller*.....*Not printed.*

89. Return to an order of the House of Commons, dated 25th April, 1892, for a return of the amount of crude cotton-seed oil imported into Canada during the year 1891; also the amount of refined cotton-seed oil imported into Canada during the year 1891. Presented 7th June, 1892.—*Mr. McKay.*

*Not printed.*

90. Return to an address of the Senate to his excellency the Governor General, dated 5th May, 1892, for copies of all letters, communications and reports in the possession of the government, having relation to the fixing of a standard of time, and which have been received subsequent to May, 1891. Presented 14th June, 1892.—*Hon. Mr. Sullivan*.....*Not printed.*

91. Return to an order of the House of Commons, dated 10th June, 1892, for a copy of the Reports of the British Farm Delegates, Messrs. McQueen and Davey, on the Maritime Provinces. Presented 15th June, 1892.—*Mr. McMillan (Huron)*.....*Not printed.*

92. Return to an order of the House of Commons, dated 15th June, 1892, for a copy of the minutes of the evidence taken at the trial, under the Dominion Controverted Elections Act, of the case of A. Sturton *et al*, petitioners, vs. P. V. Savard, defendant, in relation to the election for the counties of Chicoutimi and Saguenay, in the year 1891. Presented 15th June, 1892.—*Sir John Thompson.*

*Not printed.*

VOLUME 12—*Continued.*

93. Return to an order of the House of Commons, dated 18th June, 1891, for copies of all papers and correspondence in the department of marine and fisheries, relating to the saving of the lives of part of the crew of H.M.S. "Lily," wrecked on the coast of Labrador, in September, 1889. Presented 17th June, 1892.—*Mr. Edgar*..... *Not printed.*
94. Return to an address of the House of Commons to his excellency the Governor General, dated 10th August, 1891, for copies of all orders in council, memorials, correspondence and documents respecting the rock-slide from the citadel at Quebec, on the 19th September, 1889. Presented 24th June, 1892.—*Mr. Frémont*..... *Not printed.*
95. Return to an order of the House of Commons, dated 4th April, 1892, for : 1. Return of all correspondence, papers, complaints or memoranda of any kind in relation to "The Temperance Colonization Society," received since or not included in a return furnished the House in 1890. 2. List of all stockholders of the company, 1st May, 1885, with amounts paid on calls of the shares, whether in cash, land credits, or otherwise, each year to date, stating what shares were forfeited, when and why. 3. List of stockholders at date of return, showing when they became such, with dates and amount of shares purchased, with price per share. (a) Number of calls on all shares, with details, dates, etc. 4. Amount earned in fees by directors each year to date. 5. Amount of money invested each year, and in what. (a) Total amount received on account of scrip and land sales to date. 6. List of scrip holders, with post office address, who purchased from the company (scrip issued) prior to 1st June, 1882, and since that date, giving date of issue, amount of land purchased by each, price per acre, amount paid thereon to date; showing if cancelled, when and on what conditions. 7. List of all other contracts for purchase of land issued, whether exchanged for scrip, amounts paid to date, whether contract is still in existence, why cancelled, and when. 8. Amount and details of land sales now current and for which land is to be supplied by the company. 9. List of all persons whose scrip was located on even-numbered sections in 1883, showing where located, new location subsequently, if any, with form of contract of even-numbered location. 10. List of homestead settlers in 1885. List at date (actual residents). 11. When contract with the company and government expired, with conditions of extension, if any; conditions of final settlement. 12. List of lands to be conveyed to the company under such settlement. The foregoing information to be furnished, if practicable, under affidavit of the president and accountant. Presented 30th June, 1892.—*Mr. Sproule*..... *Not printed.*
96. Census of Canada.—Bulletin No. 11. Nationalities. Birth places of the people. Presented 30th June, 1892, by Hon. J. Carling... *Not printed.*
97. Return to an address of the House of Commons to his excellency the Governor General, dated 2nd May, 1892, for a copy of location ticket granted to John Alexander McLellan, of Cockburn Island, for lot 15 in the 5th concession, Cockburn Island; copy of all affidavits or declarations, letters and other papers from any person or persons to the department, or any officer of the department, in any way relating to said lot or the cancellation of the said ticket; and copy of any order made for the cancellation of said ticket. Also for a copy of the location ticket granted for lot 16 in the 4th concession, Cockburn Island, and any assignment or transfer thereof to Peter McLellan; copy of affidavits or declarations, letters and other papers from any person or persons to the department in any way relating to said lot or the cancellation of the said ticket, and copy of any order made for the cancellation of said ticket. Presented 5th July, 1892.—*Mr. Lister*..... *Not printed.*
98. Return to an order of the House of Commons, dated 28th March, 1892, for a return showing : 1. The number of Indian reserves in British Columbia. 2. The location of each and name of tribe to whom allotted. 3. The area in acreage of each. 4. The area cultivated on each reserve. 5. The population of each tribe when reserves were first established. 6. The present population of each tribe. 7. The area (estimated) of pastoral land on each reserve. 8. The number of horses, cattle and sheep owned by each tribe. 9. The estimated area of timber land on each reserve. Presented 5th July, 1892.—*Mr. Barnard*..... *Not printed.*
99. Copy of a report of a committee of the honourable the privy council, approved by his excellency the Governor General in council, on the 17th June, 1892, on the subject of a despatch dated 4th November, 1891, from Lord Knutsford, inviting an expression of the views of the Canadian government upon the complaint of alleged discrimination on the part of the government of Canada against citizens of the United States in the matter of canal tolls. Presented 6th July, 1892, by Sir John Thompson..... *Printed for sessional papers only.*

VOLUME 12—*Continued.*

- 100.** Return to an address of the Senate to his excellency the Governor General, dated 10th June, 1892, for a return of subsidy paid the Albert Southern Railway Company, showing the dates when paid, and to whom paid; also copies of all correspondence in reference to the payment of the said subsidy, and of all letters or telegrams asking for payment of same or relating thereto; also copies of all returns or reports of government engineers or inspectors, who inspected or reported on said road. Presented 6th July, 1892.—*Hon. Mr. Power*..... *Not printed.*
- 101.** Return to an order of the House of Commons, dated 9th May, 1892, for a return showing: 1. The total number of acres of public lands granted in Manitoba and the Canadian North-West in aid of railway construction, up to 26th April, 1892. 2. The name of each railway company or line to which a land grant has been made; the length of each line thus aided by land grant, and the number of acres granted to each company or line. 3. The total number of acres of land in Manitoba and the Canadian North-West which have been earned up to 26th April, 1892, under provisions of grants through completion of lines or portions of lines to which land grants have been made. 4. The name of each railway company or line which has earned the whole or a portion of its land grant, with the number of acres earned by each of such lines. Presented 9th July, 1892.—*Mr. Charlton*..... *Not printed.*
- 102.** Return to an order of the House of Commons, dated 21st March, 1892, for a map of Canada showing the areas of spruce and white pine timber, respectively, now standing. Presented 9th July, 1892.—*Mr. Ives*..... *Not printed.*
- 103.** Return to an address of the House of Commons to his excellency the Governor General, dated 25th April, 1892, for copies of all resolutions and memorials passed by the North-West Assembly at its last session and addressed to the government. Presented 9th July, 1892.—*Mr. Davin*..... *Not printed.*
- 104.** Return to an address of the House of Commons to his excellency the Governor General, dated 21st March, 1892, for copies of all letters, correspondence, petitions, etc., relating to the claims or settlement, or proposed settlement of claims of settlers on the Waldron Rancho Company's territory; copies of all complaints made regarding the treatment settlers have been subject to by the company. Presented 9th July, 1892.—*Mr. McMullen*..... *Not printed.*
- 105.** Return to an order of the House of Commons, dated 28th March, 1892, for a return showing the quantity of binding twine imported for consumption in the Dominion, from the 1st of July, 1891, up to the first day of January, 1892; the country from which the same was imported, and the amount of duty paid thereon. Presented 9th July, 1892.—*Mr. Campbell*..... *Not printed.*

# REPORT

OF THE

## COMMISSIONER OF INLAND REVENUE.

To the Honourable  
The Minister of Inland Revenue.

SIR,—Herewith I have the honour to submit statements of the Inland Revenues collected by this Department during the fiscal year ended 30th June, 1891, with the usual information as to the cost of collection and statistics respecting the sources whence those revenues were derived.

The following summary comparison shows the accrued revenue for the years ended 30th June, 1887, 1888, 1889, 1890 and 1891, respectively :—

	1887.	1888.	1889.	1890.	1891.
	\$	\$	\$	\$	\$
Excise .....	6,466,151	6,010,561	6,892,612	7,779,616	*6,825,152
Public Works other than Canals.....	11,950	13,708	10,457	6,782	14,308
Culling Timber.....	19,707	15,096	21,416	17,420	20,178
Weights and Measures, Gas and Law Stamps.....	43,621	46,033	50,034	50,700	45,120
Other Revenues.....	231	56	21	63	247
	6,541,660	6,085,454	6,974,540	7,854,581	6,905,005
Canal Revenue.....	436,625	418,945	.....	.....	.....
Total.....	6,978,285	6,504,399	6,974,540	7,854,581	6,905,005

\*This amount includes \$38,213 accrued from Methylated Spirits.

The following statement exhibits the details of Excise Revenue accrued during the undermentioned years :—

	1.	2.	3.	4.	5.
	1887.	1888.	1889.	1890.	1891.
	\$	\$	\$	\$	\$
Spirits.....	3,737,339	3,099,016	* 3,874,022	4,620,393	3,546,942
Malt Liquor.....	7,045	6,997	12,710	13,631	10,495
Malt.....	433,130	493,030	518,239	556,365	591,399
Cigars.....	524,281	554,067	563,172	603,473	615,179
Tobacco.....	1,668,002	1,740,542	1,840,522	1,896,359	1,926,987
Petroleum.....	31,989	36,569	35,745	39,737	40,407
Manufactures in Bond.....	50,005	53,312	28,082	29,610	34,581
Seizures.....	2,029	13,066	4,880	3,886	2,727
Other Receipts.....	12,331	13,962	15,240	16,162	18,222
Methylated Spirits.....					38,213
Totals.....	6,466,151	6,010,561	6,892,612	7,779,616	6,825,152

\* This amount exceeds that shown by Statistical Statements Nos. 1 and 4, the reason being that an over-collection of \$414.15 was made in Prescott Division, which was afterwards refunded.

The quantity of spirits produced during the year was 4,397,594 proof gallons, as compared with 5,091,475 proof gallons produced in the previous fiscal year. The raw material used in its production being as follows :—

	Lbs.
Malt.....	3,674,177
Indian corn.....	56,821,771
Rye.....	12,070,397
Wheat.....	23,871
Oats.....	854,814
Barley.....	161,884
	<u>73,606,914</u>

The transactions of the several distilleries will be found stated in detail in Appendix A (Statement No. 3).

	Proof Gallons.
There were on the 1st July, 1890, in process of manufacture.....	* 170,703
Manufactured during the fiscal year.....	4,397,594
Returned to distilleries for redistillation.....	159,140
Received into distilleries from other sources, duty paid..	18,117
	<u>4,745,554</u>

This includes 688'26 gallons, excess found in process, in Prescott Division.

These were disposed of as follows :—

Placed in warehouse under Crown lock .....	4,570,564
Fusel oil extracted by redistillation.....	17,427
Deficiency arising from rectification.....	42,086
Remaining in process of manufacture, 30th June, 1891, by actual stock-taking.....	115,477
	4,745,554

The following Statement shows the warehousing transactions in spirits during the year ended 30th June, 1891, and the four preceding years :—

Fiscal Year	1	2	3	4	5	6	7	8	9
	In Warehouse at beginning of Year.	Warehoused during the Year. Ex-Dis-tillery.	Other wise Ware-housed.	Taken for Consump-tion.	Exported.	Used in Bonded Factories.	Other wise Accounted for.	For Re-distillation.	In Warehouse at end of year.
	Pf. Galls.	Pf. Galls.	Pf. Galls.	Pf. Galls.	Pf. Galls.	Pf. Galls.	Pf. Galls.	Pf. Galls.	Pf. Galls.
1886-87.....	2,832,473	4,890,187	15,442	2,864,935	4,597	301,503	3,090		4,563,977
1887-88.....	4,563,977	5,649,632	44,609	2,326,327	7,889	335,785	49,672	115,337	7,423,208
1888-89.....	7,423,208	5,915,673	16,769	2,960,447	8,731	218,142	103,924	116,224	9,948,182
1889-90.....	9,948,182	5,136,688	31,015	3,521,194	12,003	254,666	74,518	154,325	11,099,179
Totals.....	24,767,840	21,592,180	107,835	11,672,903	33,220	1,110,096	231,204	385,886	33,034,546
Annual Average of four years ended June 30,									
1890.....	6,191,960	5,398,045	26,959	2,918,226	8,305	277,524	57,801	96,471	8,258,636
1890-91.....	11,099,179	4,570,724	51,740	2,687,664	20,497	325,235	113,321	159,140	12,415,786

The quantity entered for consumption was 2,687,664 proof gallons as against 3,521,194 gallons during the preceding year. By reference to my report of that year it will be seen that the abnormal increase for the then current year was fully explained by the withdrawal from bond of large quantities prior to the 1st of July, 1890, when the requirement as to maturing came into full force.

The quantity held in stock on 1st July, 1891, was 12,415,786 proof gallons, the largest quantity ever held by the distillers of Canada, the production, however, decreased to the extent of nearly three quarters of a million gallons.

The following statement exhibits the entire quantities upon which duties were collected during the several years recited therein. The total column will be found to accord with the figures shown in Financial Statement No. 13 :—

Fiscal Year.	Canadian Spirits		Imported Spirits used in Bonded Factories. Paid difference between Customs and Excise Duty.	Total Quantity upon which Duty was Collected	Memorandum of Revenue accrued including License Fees.
	Paid duty. Ex-Distillery.	Paid duty. Ex-Warehouse			
	Pf. Gallons.	Pf. Gallons.	Pf. Gallons.	Pf. Gallons.	\$
1886-87 .....	1,904	2,864,935	15,426	2,882,265	3,737,338

1888-89.....	12,485	2,945,124	15,322	2,972,931	3,873,607
1889-90.....	22,590	3,521,339	30,870	3,574,799	4,620,393
Totals .....	83,484	11,657,725	94,502	11,835,711	15,330,354
Annual average of four years ended June 30, 1890.....	20,871	2,914,431	23,625	2,958,928	3,832,588
1890-91.....	21,177	2,636,132	51,532	2,708,841	3,546,941

Appendix A shows the consumption per head of the population, of spirits, tobacco and other goods subject to Excise, and similar goods subject to Customs.

## MALT:

The following statement shows the transactions in Malt during the year 1890-91, and the four years preceding:—

Fiscal Year.	1.	2.	3.	4.	5.	6.	7.
	In Warehouse at beginning of year.	Manufactured during the Year.	Taken for Consumption.	Exported.	Otherwise Accounted for.	In Warehouse at end of year.	Memorandum of Revenue accrued, including License Fees.
	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	\$
1886-87 .....	14,807,457	54,662,804	42,630,440	6,064,360	505,077	20,270,384	440,175
1887-88 .....	20,270,384	54,282,943	48,640,467	5,470,338	671,923	19,770,599	500,027
1888-89 .....	19,770,599	60,500,427	51,111,429	3,339,627	1,055,348	24,764,622	530,949
1889-90 .....	24,764,622	64,314,257	54,974,013	5,471,737	2,034,125	26,599,004	556,365
Totals .....	79,613,062	233,760,431	197,356,349	20,346,062	4,266,473	91,404,609	2,027,516
Annual average of four years ended 30th June, 1890 .....	19,903,265	58,440,108	49,339,087	5,086,515	1,066,618	22,851,152	506,879
1890-91 .....	26,599,004	52,999,874	57,909,201	3,333,633	1,025,725	17,330,319	591,399

The revenue from Malt has increased some \$35,000 as compared with the revenue of the preceding year, and some \$85,000 as compared with the average revenue of the preceding four years. Of the quantity entered for consumption 52,335,914 lbs. were used, together with 47,816 lbs. of sugar, syrup, &c., in the production of 18,069,183 gallons of beer, being an average of 2.89 lbs. of Malt per gallon.

**TOBACCO:**

The following table exhibits the transactions during the Fiscal Year in Tobacco, Snuff and Cigarettes:—

Fiscal Year.	1. In Warehouse 1st July.	2. Manufactured during the Year.	3. Taken for Consumption.	4. Exported.	5. Otherwise Accounted for.	6. In Warehouse 30th June.	7. Raw Leaf taken for Consumption.		8. Total Tobacco taken for Consumption.	9. Duty Collected thereon including License Fees

The revenue derived from goods manufactured in bond during the past five years has been as follows :—

1886-87 .....	\$50,005
1887-88 .....	53,312
1888-89 .....	28,082
1889-90 .....	29,610
1890-91 .....	34,581

#### INSPECTION OF PETROLEUM :

The number of packages of Canadian petroleum inspected during the year is 280,078, and the fees collected thereon \$24,981.22.

The number of imported, inspected by officers of the Department, is 108,631, and the fees collected thereon \$15,425.98.

#### PUBLIC WORKS :

The revenue from this source was as follows :—

	1889-90	1890-91
Hydraulic and other Rents .....	\$3,138	\$ 3,721
Minor Public Works .....	3,644	10,587

#### CULLING TIMBER :

The amount accrued upon culling of timber was, during 1889-90, \$20,177.75, the cost of the service having been \$28,599.75.

#### WEIGHTS AND MEASURES AND GAS :

The usual special reports in relation to these services have been prepared, containing full statistical information.

The revenue accrued from these services and from law stamps of the Supreme and Exchequer Courts was \$45,120.88.

#### PREVENTION OF ADULTERATION OF FOOD AND AGRICULTURAL FERTILIZERS :

The usual supplementary report in relation to this service will be submitted, containing details of the work done and the reports of the analysts.

#### INSPECTION OF STAPLES :

The usual statistics in relation to this service will be found in Appendices **B** and **C**.

#### METHYLATED SPIRITS :

The quantity of methylated spirits manufactured during the year was 124,783 proof gallons ; 123,472 gallons were sold. A statement of details appears on pages 50 and 97.

Appendix **B** contains, as usual, the details concerning illicit stills seized during the year.

An addition has been made to this report by the introduction of Appendix **E**, containing the amount of Excise Revenue collected at each Out Office.

I have the honour to be, Sir,

Your obedient servant,

E. MIALL,

Commissioner.

## APPENDIX A.

REPORT, RETURNS AND STATISTICS

OF THE

INLAND REVENUES

OF THE

DOMINION OF CANADA

FOR THE

FISCAL YEAR ENDED 30th JUNE

1891

---

PART II

INSPECTION OF WEIGHTS AND MEASURES AND GAS

*Presented to both Houses of Parliament by Command of His Excellency.*

JOHN COSTIGAN,  
*Minister of Inland Revenue.*

PRINTED BY ORDER OF PARLIAMENT

OTTAWA:

PRINTED BY S. E. DAWSON, PRINTER TO THE QUEEN'S MOST  
EXCELLENT MAJESTY

1892

[No. 6a—1891.] Price 5 cents.

**REPORT**  
OF THE  
**COMMISSIONER OF INLAND REVENUE**  
ON THE  
**INSPECTION OF WEIGHTS AND MEASURES AND GAS.**

To the Honourable  
The Minister of Inland Revenue.

SIR,—I have the honour to submit herewith my annual report on the inspection of weights and measures and gas, with the usual statements in relation thereto, for the year ended 30th June, 1891.

1. The total revenue collected during the year for the inspection of weights and measures was \$33,662.23, as against \$40,438.88 collected during the year ended 30th June, 1890.

The total expenditure was \$72,305.22, as against \$69,144.76 expended during the year ended 30th June, 1890.

2. Appendix "A" gives a summary statement of the expenditure and receipts of each inspection division.

3. In appendices "B," "C" and "D" will be found a detailed statement of weights, measures and weighing machines presented for verification, verified and rejected during the year. The number of all descriptions may be summarily stated as follows:—

—	Presented.	Verified.	Rejected.	Percentage of Rejections.
Weights, Dominion.....	73,179	72,973	206	0.28
Measures of capacity, Dominion.....	81,624	81,111	513	0.63
Lineal measures.....	4,919	4,852	67	1.36
Balances, equal arms.....	12,030	11,923	107	1.88
do steelyards.....	3,236	3,197	39	1.20
do platform scales.....	21,104	20,716	388	1.83
Irregular weights.....	4,009	3,955	54	1.34
do measures.....	459	459	.....	.....
Troy weights.....	45	45	.....	.....

4. Since the date of my last report, Mr. Johnstone, Chief Inspector of Standards, has visited the Montreal, Toronto, Hamilton, London, Windsor and Orillia Weights and Measures Divisions, and inspected the offices, books, standards, &c., of the several offices, and carefully adjusted, verified and stamped the whole of the 50 lbs. iron standards in use in the Hamilton and Windsor Divisions.

5. I beg leave to call your attention to the fact that many of the weights of our portable kits are very much out of adjustment. Years of constant use and wear and tear have rendered them so seriously incorrect that our officers complain of them, and declare that they are really unfit to be used as standards, and that their continued use as such must result in serious injury to the weights and weighing machines of the whole Dominion. As long as there were unused correct sets of weights in stock in the department they were exchanged with the inspectors for condemned sets, but at present there are none in stock that can be sent out until they have been adjusted. I have before urged to be allowed the services of a mechanic competent to undertake such delicate work as the adjustment of standards. I regret to say that the department is still unsupplied. The necessity for the employment of a competent adjuster is really urgent, and demands careful consideration and prompt action. The desire to economize may go so far as to render the large expenditure already incurred nugatory.

6. The Chief Inspector reports favourably of the manner in which he found the work of inspection progressing. The Act continued to work satisfactorily, except on one or two points,—mainly the want of uniformity in the practice of inspecting officers, especially in first or original inspections of weights, measures and weighing machines in the manufactories where they are made.

7. Manufacturers of weighing machines complain bitterly of this want of uniformity, and suggest a simple remedy, which they claim would effectually do away with the trouble so long complained of, and be at the same time the means of establishing a uniformity in the practice of local inspectors, and thereby help to ensure the manufacture of a better class of weights, measures and weighing machines, especially the latter.

8. The remedy suggested is simply to appoint a competent mechanic to periodically visit the manufactories of weights, measures and weighing machines and there explain to the local inspectors what constitutes, as regards materials, workmanship and finish, a first class article, and the proper method of testing the same. Manufacturers further say that there need be no new appointment made to carry out their suggestion, as they claim that we need have no trouble in selecting from our staff of inspectors and assistants an officer intelligent and competent enough to act as an inspector of local inspectors in manufactories.

9. The inspection in manufactories should invariably be conducted with the greatest possible care, and no article should be allowed to pass until every tittle of the requirements of the regulations had been fully complied with.

10. This much needed carefulness and uniformity of inspection can only be secured by some such means as are above suggested.

11. I consider the foregoing suggestions of the manufacturers well worthy of the careful consideration of the department. It would, in my opinion, be a simple and inexpensive way to ensure the best results.

## INSPECTION OF GAS.

12. The total revenue collected during the year for the inspection of gas and gas meters was \$7,947.90, as compared with \$8,485.80 collected during the year ended 30th June, 1890.

13. The total expenses were \$19,933.71, as against \$19,082.03 expended during the year ended 30th June, 1890.

14. Appendix "F" gives a summary statement of the expenditure and receipts of each gas inspection district.

15. The details of gas meter inspection will be found in Appendix "G." The result as compared with last year may be stated as follows:—

	Presented for verification.	Finally rejected.
1889-90 .....	10,676	208
1890-91 .....	9,679	195

## ILLUMINATING POWER.

16. A statement of the illuminating power and purity of gas inspected during the year will be found in Appendix "H."

The illuminating power, where inspection has been made, has been as follows:—

Places.	Number of Tests made.	Number of times below Standard	Places.	Number of Tests made.	Number of times below Standard

## TESTS FOR PURITY.

17. Gas has been tested for sulphur and ammonia only at Ottawa, Toronto, Montreal, Quebec, St. John and Halifax.

18. In Ottawa the total number of tests made was:—

For sulphur, 24 tests, never in excess.

For ammonia, 24 tests, 12 times in excess.

For sulphuretted hydrogen, 26 tests, never present.

19. In Toronto :—  
 For sulphur, 24 tests, never in excess.  
 For ammonia, 24 tests, never in excess.  
 For sulphuretted hydrogen, 105 tests, never present.
20. In Montreal :—  
 For sulphur, 35 tests, 5 times in excess.  
 For ammonia, 35 tests, never in excess.  
 For sulphuretted hydrogen, 105 tests, once present.
21. In Quebec :—  
 For sulphur, 23 tests, once in excess.  
 For ammonia, 23 tests, never in excess.  
 For sulphuretted hydrogen, 19 tests, never present.
22. In St. John, N.B. :—  
 For sulphur, 44 tests, 6 times in excess.  
 For ammonia, 44 tests, never in excess.  
 For sulphuretted hydrogen, 77 tests, never present.
23. In Halifax :—  
 For sulphur, 20 tests, never in excess.  
 For ammonia, 20 tests, never in excess.  
 For sulphuretted hydrogen, 22 tests, never present.

24. In addition to the foregoing, tests for sulphuretted hydrogen have been made at each of the following places where illuminating power has been tested with the following results :—

Places.	Number of Tests.	Present.	Places.	Number of Tests.	Present.

#### REPORT OF PROGRESS.

25. Since the date of my last report we have had two 10-foot meter-provers and two Aubin photometers made, and three old 10-foot meter-provers re-lined and otherwise thoroughly repaired. The gas inspection office in Cobourg was removed to commodious quarters in the Government building there, one of the new meter-provers

was set in place, and the office fitted up in first class style. The meter-prover formerly used in the Cobourg office was re-lined and otherwise put in thorough repair and set up in the Port Hope office, which was generally overhauled and left in good order.

26. The Belleville gas inspection office was thoroughly overhauled, a new meter-prover was set up, the photometer repaired and everything in connection with the office fitted up in first class style.

27. The apparatus was removed from the old office at Windsor to the basement of the post office there, where after being thoroughly repaired it was set up, making one of the most complete and convenient gas inspection offices we have. A re-lined meter-prover was set in place here, and the old one sent to Hamilton to be re-lined.

28. A full set of standard gas inspection apparatus was recently destroyed by fire at St. John, N.B., to replace which a full set, less the apparatus for making the sulphur and ammonia tests, has been shipped from stock at Hamilton, leaving in stock at present only the old meter-prover removed from the Windsor office, and one Aubin photometer.

29. Gas inspection is asked for at Deseronto, Simcoe and Brampton. In the event of the department's deciding to fit up offices there, two full sets of apparatus would be required in addition to the above named set now in stock. When ordering apparatus to meet the above requirements, it would, in my opinion, be advisable to order a spare set to have on hand to meet any emergency that might arise, such, for example, as that which has so recently arisen in the case of the St. John fire.

30. The whole work of construction of the new, and the re-lining and repairing of the old apparatus, as well as the refitting of the offices aforesaid, was done under the supervision of Mr. Inspector McPhee, of Hamilton, to whom much credit is due for the admirable manner in which the work was performed.

31. In connection with his recent tour of inspection, Mr. Johnstone further reports that he found the managers of gas companies generally complaining of what they claim to be an injustice on the part of the Government in compelling gas producers to submit to the inspection of their meters and of the illuminating power and purity of their gas, while electric light companies are allowed to sell their light without Government inspection of any kind, either as to its measurement or illuminating power. It does seem to be unfair on the part of the Government to insist on such rigid inspection of gas, and at the same time permit the sale of electric light without Government inspection. Consumers will doubtless soon take up the question, and for their own protection demand inspection of electric light. In the face of this fact, would it not be advisable for the department to take such preparatory steps as would enable it to be in a position to take up and deal intelligently with the question when it is presented for consideration?

32. Even this preliminary work, however, requires money, and cannot be undertaken unless provision is made in the Estimates for a sum adequate to employ temporary expert assistance. I would therefore recommend that \$1,000 be placed in the Estimates for this purpose.

Respectfully submitted,

E. MIALL,

*Commissioner.*

## ANALYSIS OF FOOD, DRUGS AND FERTILIZERS.

To the Honourable  
The Minister of Inland Revenue.

SIR,—I have the honour herewith to submit my report respecting the analysis of food, &c., also the reports of the analysts appointed under the Act.

The following is a summary statement of the whole number of samples reported upon by the official analysts:—

SUMMARY of the whole number of Samples analysed by the Public Analysts of the Dominion for the Year ending the 30th June, 1891.

—	Genuine	Adulterated	Doubtful.	Total.
Coffee.....	16	32	.....	48
Drugs.....	6	12	.....	18
Liquors.....	151	13	11	175
Lard.....	9	21	.....	30
Mustard.....	5	25	.....	30
Milk.....	149	49	44	242
Pepper.....	17	28	8	53
Sugar and syrup.....	239	13	.....	252
Tea.....	76	.....	.....	76
Vinegar.....	.....	8	2	10
	668	201	65	934

The following bulletins were published regarding samples collected up to the 30th June, 1891, and from an appendix to this report:—

- No. 17. Milk supply of towns.
18. Ottawa and Magog River waters.
19. Mustard.
20. Pepper.
21. Milk in Western Ontario and Manitoba.
22. Fertilizers.
23. Sweet spirits of nitre ; Diluted prussic acid.
24. Tea.
25. Sugars, syrups and molasses.
26. Baking powder materials.
27. Distilled liquors.

It will be seen that of the 934 samples analysed by the official analysts, 201, or more than 20 per cent, were found to be adulterated.

The publication of the names of parties so offending against the law appears to be insufficient as a deterrent, and in future prosecution will have to be resorted to, in order to cause the law to be respected.

---

The difficulty of obtaining convictions in the event of frauds in respect of articles as to which no standard of quality has yet been determined, as provided for by section 19 of the Adulteration Act, points to the advisability of early steps being taken to fortify the department in this respect. At my request, Mr. Macfarlane, the chief analyst, has suggested certain specific standards for articles, which have recently been the subject of searching and careful analysis, and his recommendations are appended hereto, in the hope that they may be canvassed by the public before any final steps are taken towards giving them legal force.

The bulletins from time to time issued by the department, and reproduced with this report, will be found to be of considerable interest. I am not aware that they call for any further remarks than have already been made by the chief analyst.

Complaints have been made by certain manufacturers of the mention of their names in connection with samples indiscriminately taken from retailers. It will, however, be observed that the names are given as the "alleged" manufacturers only, or parties from whom the goods are stated to have been purchased by the vendor.

In the case of liquors it is quite clear that some, at least, have undergone manipulation after reaching the hands of the retailers, for which the original vendor is in no way responsible.

I have the honour to be, Sir,

Your obedient servant,

E. MIALL,

*Commissioner Inland Revenue.*

## REPORT OF CHIEF ANALYST.

LABORATORY OF THE INLAND REVENUE DEPARTMENT,  
OTTAWA, 27th November, 1891.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—In accordance with your request, I have to state the nature of the recommendations which I have made from time to time, as regards the establishment of standards of quality for, and limits of variability permissible in certain articles of food, with the view of obtaining action by the Governor in Council under section 19 of the Adulteration Act.

*Milk.*

Whole milk shall not contain less than 3·5 per cent butter fat, 8·5 p.c. other solids, and 12 p.c. total solids. Skimmed milk shall not contain less than 9 p.c. total solids.

*Coffee.*

When coffee is sold as a mixture or compound it shall contain only chicory and coffee; the proportion of the former not to exceed 20 p.c.

*Lard.*

When sold as a compound it should not contain more than 10 p.c. of beef tallow.

*Baking Powder.*

Shall not contain more than 20 p.c. starch or flour, and be entirely free from substances containing alumina.

*Butter.*

Shall not contain more than 15 p.c. water, 5 p.c. salt and 2 p.c. curd.

*Mustard.*

The genuine article shall not contain less than 30 p.c. fixed oil, and the compound or mixture not less than 22 p.c.

*Peppers.*

Shall not contain more than 8 p.c. ash.

*Molasses.*

Shall not contain less than 40 p.c. cane sugar.

*Syrups.*

Shall not contain less than 35 p.c. cane sugar.

*Brandy.*

Shall not contain less than 48 p.c. by volume of alcohol, and not more than 0·2 p.c. of total solids.

*Rum.*

Shall not contain less than 48 p.c. by volume of alcohol.

*Whiskey.*

Shall not contain less than 48 p.c. by volume of alcohol, and not more than 0·2 p.c. of total solids.

*Hollands and Old Tom.*

These liquors shall not contain less than 48 p.c. by volume of alcohol.

I have the honour to be, Sir,

Your obedient servant,

THOMAS MACFARLANE,  
Chief Analyst.

# REPORTS OF PUBLIC ANALYSTS

## 1.—DISTRICT OF PRINCE EDWARD ISLAND AND NOVA SCOTIA.

LABORATORY OF THE PUBLIC ANALYST FOR  
NOVA SCOTIA AND PRINCE EDWARD ISLAND,  
66 BEDFORD ROW, HALIFAX, N.S., 28th September, 1891.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to submit my report on the samples submitted to me under the Adulteration Act during the year ending the 30th June, 1891.

Of the 132 samples examined, 88 were found genuine and 44 adulterated, as follows:—

	Genuine.	Adulterated.	Total.
Mustard.....	5	25	30
Sugar.....	24	0	24
Molasses and syrup.....	24	0	24
Coffee.....	5	19	24
Liquors.....	30	0	30
	88	44	132

### *Mustard.*

Only five, or 20 per cent, of these came within the limit allowed. In the remainder mustard was present in various quantities down to 15 per cent; two contained calcium sulphate and one exhausted cake. Flour of different kinds formed the chief addition, assisted by turmeric and cayenne.

### *Sugars.*

The different grade of refined were all of good quality, especially the granulated. The label on sample 10616, reading Porto Rico, is probably an error for Demerara.

### *Molasses and Syrup.*

No adulteration detected though some variation in quality found.

### *Coffee.*

Twenty per cent were free from adulteration. Of the remainder, chicory was estimated to be present in quantities varying from 10 to 35 per cent, the average being 21 per cent. In fifteen samples roasted grain was found. The result may be shown as follows:—

Genuine.....	20·8 per cent.
Adulteration with chicory.....	16·7 do
do chicory and roasted grain.....	62·5 do

### *Liquors.*

No adulteration detected.

I have the honour to be, Sir,

Your obedient servant,

MAYNARD BOWMAN.

## 2.—DISTRICT OF NEW BRUNSWICK.

CHEMICAL LABORATORY, 74 GERMAIN ST.,  
ST. JOHN, N.B., 27th November, 1891.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to submit to you my report on samples of food and liquors received for analysis during the year ending 30th June, 1891.

The following samples were examined, viz. :—

Sugar.....	18
Syrup .....	8
Molasses.....	10
Whiskey .....	14
Rum .....	1
Gin .....	1

None of these samples were classed as adulterated, and with the exception of a rather low alcohol strength in some of the liquors nothing objectionable was found.

I have the honour to be, Sir,

Your obedient servant,

W. F. BEST,

*Public Analyst.*

## 3.—DISTRICT OF QUEBEC.

OFFICE OF THE PUBLIC ANALYST,  
 QUEBEC, 31st July, 1891.

The Commissioner of Inland Revenue,  
 Ottawa.

SIR,—I beg to transmit my report for the fiscal year ended 30th June, 1891.

Samples.	Pure.	Adulterated	Doubtful.	Total.
Pepper.....	17	6		23
Sugar.....	18			18
Syrup.....	6		2	8
Molasses.....	10			10
Coffee.....	10	8		18
Whiskey.....	8		1	9
Rye whiskey.....	7			7
Brandy.....	2			2
Rum.....	3			3
Gin.....	1			1
Scotch whiskey.....	1			1
	83	14	3	100

*Liquors.*

Among the samples analysed there are some classified as pure or good, but which are a little too much diluted.

I have the honour to be, Sir,

Your obedient servant,

M. FISET,

*Public Analyst*

## 4.—DISTRICT OF MONTREAL.

OFFICE OF THE PUBLIC ANALYST,  
MONTREAL, 1st August, 1891.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to submit to you my annual report for the year ending 1st July, 1891.

During this period I have analysed and reported upon 132 samples of food, drink and drugs, and of these I have found 62 genuine, 42 adulterated and 28 doubtful, as detailed in the following table:—

Nature.	Genuine.	Adulterated	Doubtful.	Total.
Peppers .....	6	22	2	30
Sugars .....	17	0	6	23
Molasses and syrup .....	15	2	8	25
Sweet spirit of nitre .....	2	7	.....	9
Prussic acid .....	1	6	2	9
Coffees .....	1	5	.....	6
Spirituous liquors .....	20	.....	10	30
	62	42	28	132

With the exception of the peppers and the coffee, the above show a better average of genuine samples than usual.

The sugars very good, some very pure, but some of the prepared syrups are adulterated with dextrine, which gives a higher polarizing value than pure syrup.

The drugs show an unexpected irregularity in quality, and in some cases great deterioration. The two articles examined are, however, of a perishable nature, and some may have been long imported or kept in stock too long; the result, however, shows the necessity on the part of vendors of constant vigilance in testing the quality of their stock of drugs and especially those of a potent and poisonous character.

The inquiry on this class of goods might be extended to the advantage of the public.

The liquors do not show the amount of adulteration popularly apprehended by the public. The articles suggested in the schedule have not been found, with the exception of fusil oil, which is incident to the production of liquors and high wines from corn and raw grains, and which it is the duty of the distiller to remove as far as possible.

The retailer has no inducement to add this substance as an adulterant; and the Government has given every inducement to the distiller to remove this noxious product by allowing a drawback for all returned to the Revenue Department.

From my general experience, the potable spirits sold in Canada are in this respect better purified than those offered to the public in the large cities of Great Britain or of the United States.

If these were sold by druggists for medicinal purposes, I should claim the strength and purity laid down in the British Pharmacopœa, but in the absence of a legal standard for potable spirits I am not disposed to press the view. I consider some of these liquors are too strong in alcohol for the welfare of the consumer, and whether sold in a weaker state either by the distiller or the retailer I should regard this as a public benefit.

I have the honour to be, Sir,

Your obedient servant,

JOHN BAKER EDWARDS,  
Official Analyst, Montreal.

## 5.—DISTRICT OF KINGSTON.

OTTAWA, 18th August, 1890.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to report on the 54 samples of milk collected since 1st July, 1890, and submitted to me for analysis. Fifteen samples collected at Hull, Que., arrived here curdled, and unfit for proper examination.

The analysis was nevertheless made, and the results tabulated below without further comment.

Of the remaining samples 20 were found genuine, 2 fair, 7 under average, or probably watered, 8 skimmed and 2 watered.

For results of analysis, see table.

RESULTS OF ANALYSIS OF MILK.

9216	1·0285	88·27	11·73	3·64	8·09	Very probably watered.

## SAMPLES FROM CARDINAL.

9217	1·0302	87·72	12·24	3·89	8·35	Fair.
9218	1·0295	88·68	11·32	3·00	8·32	Watered.

## SAMPLES FROM MORRISBURG.

9219	1·0309	88·08	11·92	3·41	8·51	Under average.
9220	1·0311	87·18	12·82	4·02	8·80	Genuine.
9221	1·0326	87·18	12·82	3·60	9·22	do
9222	1·0310	87·90	12·10	3·94	8·76	Under average.
9223	1·0316	87·86	12·14	3·44	8·70	do
9224	1·0333	85·91	14·09	4·39	9·70	Genuine.
9225	1·0325	85·94	14·06	4·53	9·53	do
9226	1·0336	87·80	12·20	2·83	9·37	Partly skimmed.
9227	1·0324	86·59	13·41	4·37	9·04	Genuine.

This table shows that whilst the Cornwall milk supply is very good, that of other localities is to be complained of. In fact skimming and watering are practised on a great scale in Alexandria, Prescott, Cardinal and Morrisburg. In sight of such a state of things, the best remedy that suggests itself would be to post up the names of fraudulent vendors, or at least to publish them in the local papers, as is practised in other countries. This, I believe, would be equivalent to a pretty heavy fine and the result better.

It is true, however, that this means is indirectly employed in the publication of the chief and other analysts bulletins and reports, but these are ignored by the great majority, and the milkmen continue their frauds.

I may be allowed, in order to impress once more upon the public the necessity of good milk supply, to add a few remarks from a medical point of view. If the consumer understood well the ill effects of watered and otherwise bad milk upon more particularly his children, he would perhaps also do his utmost towards uprooting the evil by reporting to authorities such vendors that impose upon him.

The milk being an article of first necessity for all ages, since it is an alimentary drink, a food and also a medicament, moreover this living fluid, the only appropriated to the digestive powers of the new born and infants, being sufficient to their nourishment during the first period of their existence, the Government and boards of health should by a common consent establish severe rules, in such a manner that the milk should be always delivered in a perfect state of purity and subject to certain conditions of temperature, &c., as most important, are the changes induced in it by bacteria.

More important than all else in the prevention of diarrhoeal diseases is it that the rich and poor in city and in country should be supplied with pure and wholesome milk, and that they should be taught how to keep it so in their homes.

Besides the care of cows which should not be fed with garbage, brewery slops, &c., the neatness and good ventilation of the stables should be ensured and the most scrupulous cleanliness of the teats, udders and milker's hands before milking; the

milk should be placed immediately in tightly covered vessels, and be disturbed as little as possible by pouring from one vessel to another.

Until transported it should be in refrigerator cans, and the milk should be inspected on its arrival in the city, and its temperature taken.

No milk should be admitted which registers over 60° F.

The city delivery of milk also should be in carts in which the cans are kept upon ice during the summer months. The sale of milk whether from waggons or from shops should be allowed only by dealers licensed by boards of health, and the dealers should be compelled to keep the milk at the proper temperature, about 50° F.

Systematic milk inspection should be kept up and licenses revoked for violation of rules.

None of the precaution taken to secure against the dilution and adulteration of milk should be neglected.

A good many philanthropists and medical men have already written on the great mortality of children during the summer months, and all those who have dealt with this most serious and important question, have all come to the same conclusion that an impure milk, badly kept, poor, watery and otherwise adulterated is one of the principal causes, not to say the only one. This is the reason why I made it a duty to humbly make the above suggestions, convinced as I am, that if they were followed and put into practice, a great number of the little beings so dear to their parents would be saved, and in the meantime a great service done to society.

I have the honour to be, Sir,

Your obedient servant,

F. X. VALADE, M.D.,

*Public Analyst.*

OFFICE OF THE PUBLIC ANALYST,  
OTTAWA, December 2, 1890.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to report upon eighteen samples of refined and raw sugars, and upon eighteen samples of syrups and molasses, received for analysis from the Ottawa collector since 1st October last. The determinations required by the chief analyst—namely, moisture, glucose and cane sugar—are given in the following tables:—

REFINED SUGAR.

Numbers.	Moisture.	Glucose.	Cane Sugar.

## MOLASSES.

Numbers.	Moisture.	Glucose.	Cane Sugar.	Other Matter.
	p. c.	p. c.	p. c.	p. c.
9783	29.5	15.3	45.1	10.1
9786	29.75	18.1	42.5	9.65
9787	27.3	16.0	47.4	9.3
9788	28.7	15.2	45.5	10.6
9789	30.0	11.55	50.55	7.9
9791	27.45	18.8	43.5	10.25
9794	28.9	14.2	47.9	9.00
9795	28.6	13.1	49.65	8.65
9796	30.2	13.1	49.8	6.9
9797	29.55	15.1	45.8	9.55
9799	27.8	16.7	46.1	9.4
Mean composition....	28.89	15.2	46.7	9.21

A great part of the above are the means of duplicate determination by the following method. The percentage of water was obtained by drying a portion of a convenient solution of the substance in asbestos at 100 per cent, as in the case of milk and the estimations of glucose and saccharose by Fehling's copper solution.

It will be seen that in almost every case refined sugar may be considered as pure saccharose, the slight deficiency being perhaps accounted for in the uncertainty of the end reaction in the copper process the approximation being with the 10cc Fehling, one tenth of 1cc of a half per cent sugar solution or about one per cent in the result.

Generally these sugars contain but faint traces of glucose, are larger grained (No. 9778) however, of a bright gold colour, gave an estimation a percentage of 2.3 of glucose whilst sucrose was found to be only 94.3 per cent.

This peculiar sample revealed also the unusual fact of being superficially coloured, the colour being almost completely washed out by proper treatment with water.

Its crystals adhere to one another as if they were coated with a gummy substance. It also possesses a high sweetening power and has a pronounced taste of molasses.

I am in doubt whether I should return this sample adulterated or not, it is perhaps an imitation of the Demarara sugar of the West Indies.

No experiments were made to ascertain the nature of that colouring matter.

All the samples of brown sugar analysed contained from 6.7 per cent to 9.4 per cent of glucose, a quantity which were it not for the cheapness of the article would lead to suspect the adulteration with cane sugar at any rate, although Allan (commercial organic analysis Vol 1) says that an addition of less than 20 per cent would not pay for the trouble yet one is struck by the idea, that in a beet-root raw sugar which nominally contains only a very small amount of grape sugar admixture of 10 per cent commercial glucose would in my opinion, be quite remunerative, wholesale prices varying by small fractions of a cent per pound.

Of course this is practical only in wholesale warehouses and in those localities where starch sugar is manufactured.

The fact must not be overlooked that in the United States about 10 pounds of corn sugar commercial glucose per head is manufactured and that *none* can be obtained when asked for the total quantity being used by confectioners; sugar refineries and others for the purpose of adulteration (see bulletin No. 25 United States Department of Agriculture.)

This practice may as well spread in this country if not checked in time.

The composition of syrups and molasses was found to be in the average, many samples left a considerable sediment of sugar crystals and dirt, all of which including the raw sugars examined under the microscope were found to contain vegetable debris, sporules of fungi, &c., no insects or sugar mites were however discovered.

I may, in closing this short study refer the reader to an excellent article on this subject in Hassels Food adulteration page 240 S. Seg., and advise the people to make exclusive use of refined sugar which is totally free of organic impurities.

I have the honour to be, Sir,

Your obedient servant,

F. X. VALADE, M.D.,

*Public Analyst.*

OFFICE OF THE PUBLIC ANALYST,  
OTTAWA, 10th March, 1891.

The Commissioner of Inland Revenue.

Ottawa.

SIR,—Since 1st January, 1891, 18 samples of black and green tea were sent to me for analysis, upon which I have the honour to submit for your information the present report.

The usual determination as shown in the annexed table were made for the most part in duplicate, care being taken to carry the test in a uniform manner on all the samples, so that the results obtained may afford the means of comparing them.

These results with perhaps the exception of those of number 10212, in which tannin is rather low, are all within the average of unadulterated tea.

Some samples possess partly, a brilliant lustre as if coated with black lead, but inasmuch as colouring, or facing of genuine tea, is by many, not considered an adulteration or injurious to health, no particular examination was made in that direction.

Botanically examined, no sample revealed the presence of foreign leaves, but not beyond suspicion, as most all were very much broken tea, thus making this part of the work very difficult. In some cases the tea fragments could only be identified with great pains.

No foreign astringents, such as Catechu, &c., were detected, although turbidness of the infusion, after standing some time, occurred in some cases, this fact being according to J. P. Batterstall, indicative of the addition of Catechu.

A few slides of "Skeleton Ash" of leaves were also prepared according to A. W. Blyth for examination under the microscope as a means of detaching foreign leaves, but did not prove in my hands as successful as desired, tea itself being in this way difficult of identification.

Finally I may add that a proper judgment of tea may only be formed from a complete chemical analysis of the leaves supplemented by all available chemical and physical means of detecting adulteration, facing, astringency, foreign and spent leaves, &c., were the analyst remunerated sufficiently for such researches; but a sound opinion may be formed from the determination of the principal constituents that furnish more constant results such as ash, soluble and insoluble, tannin and theine, where only moderate fees are granted for the purpose.

In this series it will be remarked that the percentage of ash in different forms and of theine are very constant and it is principally on these data that I have based my opinion.

#### RESULTS of Analysis of eighteen Samples of Tea.

Serial Number.	Moisture.	Total Ash.	Soluble Ash.	Insoluble Ash.	Total Astringency.	Tannin.	Extract.	Theine.

NOTE.—Total astringency and tannin are calculated and reported as oxalic acid.

I have the honour to be, Sir,

Your obedient servant,

F. X. VALADE, M.D.,

Public Analyst.

---

OFFICE OF THE PUBLIC ANALYST,  
OTTAWA, 15th June, 1891.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I send you herewith my certificates of analysis of 23 samples of various alcoholic liquors, and have the honour to state that, apart from dilution and colouration, nothing injurious was discovered.

The presence of fusil oil was suspected, particularly in No. 10249, and in most of the Scotch and Irish whiskeys, but could not be detected with certainty.

No methyl derivatives were found.

Traces of metallic impurities—tannin and sulphates—were found in mostly all the samples, and No. 10252, termed “ancient whiskey,” in addition to be so contaminated, was ascertained to be flavoured with cinnamon or cassia and sugar.

Caramel was found in rye whiskeys and rums.

Nos. 10251 and 10254 probably contained cayenne.

In forming my opinion I have principally been guided as before by the limits fixed by section 6 of the British Adulteration Act of 1879. No such regulations having yet been decided upon by the department.

I am of the opinion, however, that the English standards are too low for real good brandies, whiskeys and rums, which should not, according to authorities, contain less than 50 per cent absolute alcohol by measure, are thus allowed to be diluted with about one-fifth of their volume of water. The same is true for gin, the strength of which should be 20° U. P., whilst the limit is fixed at 35° U.P.

The annexed table contains my results in detail.

I have the honour to be, Sir,

Your obedient servant,

F. X. VALADE, M.D.,

*Public Analyst.*

Public Analyst.

## 6.—DISTRICT OF TORONTO.

SCHOOL OF PRACTICAL SCIENCE,  
TORONTO, 15th September, 1891.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I beg to submit my report for the year ending 30th June, 1891. During the year I have received 198 samples; two of these (milk) were broken in transit, leaving 196 samples, which I have examined, viz. :—

Articles.	Genuine.	Adulterated.	Doubtful.	Total.
Milk .....	74	24	54	142
Coffee .....	7	17	.....	24
Spirituous liquors.....	30	.....	.....	30

With regard to the milks, my results are contained in a bulletin already published by the department, and need not be repeated in this place.

With regard to the coffees, 7 were reported genuine and 17 adulterated. The adulteration consisted of chicory and farinaceous matter, either together or separately.

The farinaceous matter was either pease or some form of roasted cereal.

I enclose a tabular statement of my results.

In these analysis the caffeine was determined by shaking the aqueom infusion with chloroform, after precipitation with basic lead acetate, and removal of the excess of lead with sulphurous acid.

The specific gravity of the 10 per cent extract was made as follows:—Ten grammes of dry coffee ground to pass through a 400 mesh sieve was weighed into a counter poised flash, and 100 gramme of water added. The flash was connected to an inverted condenser heated on a sheet of asbestos over a bunsen-burner, until it began to boil, after which the boiling was continued an hour. After an hours boiling the apparatus was allowed to cool for 15 minutes, then detached from the condenser, placed on a balance, and water added till the weight was the same as before boiling. The contents were then filtered and the specific gravity taken at 15.5 per cent.

#### *Spirits.*

I enclose a tabular statement of the results of the examination of the samples of spirits. From this table it appears that two samples of rum examined contained 47.60 and 57.81 respectively of absolute alcohol by weight.

Two samples of gin contained 39.00 and 36.46 respectively.

Eighteen samples of whiskey had an average alcoholic strength of 33.24 per cent. Of these five were labelled Scotch or Irish, and averaged 39.15 per cent. The other thirteen averaged 30.20 per cent.

None of the Canadian samples exceeded 36 per cent. None of the Scotch or Irish samples fell below 37 per cent of alcohol.

Two samples of brandies contained 35.56 and 41.11 per cent respectively.

Two samples of highwines contained 75.11 and 75.19.

Two samples of port contained 8.97 and 12.13, and one sample of sherry contained 15.25 per cent alcohol.

One sample of ginger wine (labelled Scotch whiskey) contained 12.15 per cent absolute alcohol.

I have the honour to be, Sir,

Your obedient servant,

W. HODGSON ELLIS,

Labelled by inspector "Scotch whiskey."

## 7.—DISTRICT OF LONDON.

OFFICE OF THE PUBLIC ANALYST,  
LONDON, 30th June, 1891.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I beg to submit my report on samples of liquors analysed by me during the past three months. I have analysed in all twenty three samples, viz. :—

Malt and rye whiskey .....	15	samples.
Gin .....	3	do
Rum .....	1	do
Brandies .....	4	do
Total.....	23	do

In none of these samples did I find any of the adulterants enumerated in "First Schedule" of the Adulteration Act, with the exception of traces of amyl-alcohol, so that any classification will be as to the percentage of alcohol.

*Whiskey.*

The specific gravity varied between .960 and .945, the lowest percentage of absolute alcohol by weight being 28.32 and the highest 37.60. I believe no standard has been established by the department, but they all fall short of the strength required by the United States Pharmacopœia which states that the sp. gr. shall be between .930 and .917 corresponding to a percentage between 44 and 50 of alcohol. The total solid of No. 10481 is .490 per cent, the limit stated in the United States Pharmacopœia being 250 per cent.

*Gin.*

No. 10485, which was labelled "Tom Gin," contained 34.41 per cent of alcohol, and a very high amount of solid residue—2.784 per cent. The other two samples contained 48.78 per cent, and 46.43 per cent of alcohol by weight.

*Rum.*

Only one sample analysed, and contained 61.00 per cent of alcohol.

*Brandies.*

The four samples varied as to percentage of alcohol by weight, between 37.00 and 51.73.

No. 10482 and 10494 contained no tannin, which, according to the United States Pharmacopœia, indicates artificial brandies. No. 10500 contains very high total solid, viz. :—1.517 per cent, and contains a large amount of tannin.

I have the honour to be, Sir,

Your obedient servant,

FRANKLIN T. HARRISON.

*Public Analyst.*

## 8.—DISTRICT OF MANITOBA.

ST. JOHN'S COLLEGE,

WINNIPEG, 30th September, 1890.

The Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to submit my report for the last quarter. During the three months 30 samples of lard were examined. None of the samples were adulterated with water. Twenty contained both cotton seed oil, and tallow—one of these alone being sent to me as “Lard Compound.” Of the remaining ten, nine appeared genuine, the tenth giving doubtful results. Some of the unadulterated samples were in a very rancid condition when received.

I have the honour to be, Sir,

Your obedient servant,

EDGAR B. KENRICK,

*Public Analyst.*

## DRUGS, &amp;c.—Tabulated Statement—Continued.

Vendor.	Residence.	Observations.
Wm. Head.....	Smith Tp., Peterborough	Genuine.
Mrs. Sutherland.....	Simcoe St. do	Below average average as to butter fat.
Mrs. Lynn.....	Peterborough.	Poor in cream.
T. Hooper.....	do	Genuine.
H. Long.....	do	Poor in cream.
J. C. Craig.....	do	Genuine.
Wm. Denoon.....	From Ashburnham.....	Poor in solids, but badly curdled; probably genuine.
Mrs. S. Dormer.....	Lindsay	Genuine.
T. S. Williams.....	do	do
Andrew Brown.....	do	do
J. Guiry.....	do	Poor in butter fat.
Mrs. C. Jewett.....	do	Poor in cream.
D. Gillespie.....	Beaverton	Poor in fat.
A. Hamilton.....	do	Very poor in fat.
Wm. White.....	do	Adulterated by removal of part of the cream.
T. Treveler.....	do	Genuine.
D. C. Campbell.....	do	do
H. Pethrick.....	Orillia	do
P. Cuddahee.....	do	do
Mrs. Wright.....	do	Very rich in fat and low in other solids; probably mixed with cream.
James Howe.....	do	Genuine.
R. M. Pettit.....	do	do
Mrs. Davis.....	do	do
Mrs. Donaldson.....	do	do
Mr. Vanderburg.....	do	do
T. Johnson.....	Barrie	do
John Goodfellow.....	do	do
Wm. Caldwell.....	do	do
S. Dyment.....	do	do
W. Ainley.....	do	do
P. Cavanagh.....	do	Adulterated by admixture with water.
Mrs. W. Chapell.....	do	Genuine.
Mrs. W. Collins.....	Bradford	do
P. Chapelle.....	do	do
Mrs. Archer.....	do	Adulterated by removal of cream.
Mrs. Coutes.....	do	do either by removal of cream or addition of water.
Mr. S. Luke.....	do	Genuine.
Mr. G. Brown.....	do	do
Mr. B. Stewart.....	do	Adulterated by abstraction of cream.
R. Millard.....	Newmarket	Poor in cream, probably skimmed.
Mrs. Wright.....	do	Adulterated by abstraction of cream.
J. Cocksedge.....	do	Genuine.
Mrs. Tienhelder.....	do	Adulterated by abstraction of cream.
C. Lundy.....	do	Genuine.
John Ough.....	do	Adulterated by abstraction of cream.
Mrs. Manning.....	do	Cream.
R. Wells.....	Aurora	Adulterated by abstraction of cream.
Mr. Lyons.....	do	do do
Mr. Robinson.....	do	do do
R. Lawson.....	do	Genuine.
W. Scott & Sons.....	do	Probably genuine; the solids not fat are low, but the milk was badly curdled.
Mr. C. Donan.....	do	Poor in solids not fat.
W. Findlay.....	Toronto	Genuine.
R. J. Coburn.....	do	Adulterated by admixture with water.
C. D. Growhurst.....	do	Poor in fat.

**BULLETIN No. 17—MILK SUPPLY OF TOWNS.**  

---

To the Commissioner of Inland Revenue:—

SIR,—In former reports regarding milk supply the particulars given had reference chiefly to the cities and larger towns of the Dominion. In several of these—such as Montreal, Toronto, Hamilton and London—the examination of milk is now carried on either by a special food inspector appointed by the municipality and working under the Adulteration Act, or by medical health officers exercising the powers conferred on them by such statutes as chapter 205 of the Revised Statutes of Ontario. On account of these circumstances, it was thought advisable during the first quarter of the present fiscal year to collect samples of milk sold in some of the smaller towns of Ontario. In order to do this fairly, and obtain a correct estimate of the quality of the milk supplied in the towns visited, the collectors were instructed to obtain samples from as many vendors as possible in each place. The particulars regarding these and the results obtained in their analysis are given in the following tables:—

RESULTS of Analysis of Milk sold as Whole Milk.

**BULLETIN No. 18.—OTTAWA AND MAGOG RIVER WATERS.**

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—The results of an examination into the character of the water of the Ottawa River, carried out by Mr. McGill, Assistant Analyst, in the month of April last, were duly reported to the Minister of Marine and Fisheries, and they were subsequently published in Bulletin No. 15. On the 10th of June the thanks of the Minister for this report were conveyed to you, together with the remark that “he fully concurs in Mr. McGill’s suggestion that samples be taken at some later period, say July or August, when the water is at its lowest point in the Ottawa, with a view to a further analysis being made.” In consequence of this communication a second investigation was authorized by you, the results of which were sent to the Department of Marine and Fisheries on the 3rd October last, and are now placed before you with a view to publication.

It will be seen, from a perusal of the report by Mr. McGill hereto appended, that no facts have yet been discovered which would lead to the conclusion that the sawdust deposits materially affect the quality of the water of the Ottawa River. On the other hand, it seems to be slightly deteriorated in its passage to Montreal by the introduction of refuse matter from the population living on its banks above that city as far as Ottawa.

In consequence of representations by several citizens of Sherbrooke, Que., I received instructions from you to cause analyses to be made of the water supplied to that town. Mr. McGill was entrusted with this investigation also, and his report is herewith submitted, and recommended for publication, along with the one which has reference to the Ottawa River water.

I have the honour to be, Sir,  
Your obedient servant,  
THOMAS MACFARLANE,  
*Chief Analyst.*

10th November, 1890.

**REPORT UPON TWELVE SAMPLES OF WATER FROM THE OTTAWA RIVER AND OTHER SOURCES, COLLECTED BETWEEN THE 18TH AND 27TH OF AUGUST, 1890.**

---

In Table I will be found details as to the time and place of collection of each sample.

In Table II are given the numerical results of analysis.

Table III contains an arrangement of the details of analysis such as to facilitate comparison.

The main object kept in view in the examination of these samples has been the ascertaining whether or not the Ottawa River is materially polluted as a source of domestic supply between Deschenes Lake and the Lake of Two Mountains; and if so, whether this pollution is due to the sawdust deposits occurring between these points.

The samples were all collected between the 18th and 27th of August, during which period the weather remained very uniform in character. The water of Deschenes Lake lowered about 2 or 3 inches (as nearly as I could judge) between the dates. In order to ascertain whether the character of its water had materially changed in the interval I took a sample on the 27th of August from the same point at which I had made the collection on the 18th of the month. The results of analysis of these two samples show a slight change for the better at the last collection, but the difference is so slight that I have thought it quite safe to take the mean of the two analyses as showing the average character of Deschenes Lake water for the period stated.

The Ottawa city supply is taken from the river before any large quantity of sawdust has entered it. The intake is far enough below Deschenes Lake to give the water the benefit of any amelioration effected by the Deschenes Rapids. We might reasonably look for some improvement consequent upon the aëration resulting from the half mile or more of rapids above the city intake, and we find this expectation realized. Two samples, IV and IX, were collected at the laboratory taps after these had run freely for three hours on the 20th and 23rd August. The mean result of these two analyses (which do not materially differ) shows a slight but appreciable improvement in the Ottawa city water as compared with that of Deschenes Lake. This is shown in the lessening of the vegetable organic matter (lower oxygen absorption and loss of weight on ignition of solids) and lessening of the nitrogen content in every form. It is not at all unlikely that the loss of nitrates and of oxidisable matter *pari passu* may be explained by the oxidation of the latter at the expense of the former. A sample (No. 5) was also taken on the 20th August at the site of the proposed intake for city use. This gave a slightly higher mineral content, and slightly higher nitrates and ammonia than the sample taken from the present city supply on the same day; but the differences are very small, and the former averages (line 6, Table III) are scarcely altered by the introduction of these numbers. I shall take the mean (given in line 8 of Table III) as characterizing the Ottawa River water above the Chaudière Falls, *i.e.*, above the sawdust deposits.

In order to ascertain the possible influence of the sawdust deposits, I collected samples at two points further down the river, *viz.*, at Grenville Rapids, above and below, and at St. Anne's.

The samples taken at Grenville and Carillon (see line 17, Table III) show slightly higher mineral matter, with an increase in matter destructible on ignition (chiefly organic). This may possibly come from vegetable debris in the river, but is so very small in amount that it cannot be said to materially alter the character of the water. There is a slight increase of nitrogen both as free and albuminoid ammonia, with a slight decrease of nitrogen in nitrites or nitrates, owing, no doubt, to the destruction of these in contact with oxidisable organic matter.

The vegetable matter oxidisable by permanganic acid is scarcely higher than that found above the Chaudière Falls, and is less than that found in Deschenes Lake.

It seemed right before attributing even these slight changes to saw dust to consider the influence of the city sewage upon the Ottawa water. The sewers enter the river a short distance below New Edinburgh, and I took samples at a distance of about half a mile below the sewer mouths on the 19th of August.

In the sample taken below the sewers on the 29th March (see Bulletin No. 15) I found no certain indications of sewage pollution, and this I attributed to the fact that a thorough admixture of the sewer contents with the water of the river does not take place, especially in winter, until a considerable distance below the sewer outlet. Had I taken these samples very far below the sewer mouths I should have had to select a point below rather extensive sawdust beds, and I chose rather to solve the difficulty by taking four samples at points in a line crossing the River about half a mile below the sewage entrance. The mean result of the work upon these is given in line 13 of Table III. This shows the maximum pollution effected by the Ottawa city sewage; and the differences given in line 14 of Table III show the amount of the change immediately produced.

It must not, however, be inferred that the changes here indicated persist throughout the course of the river. Indeed, it may be easily seen in the study of one of them, the chlorine in chlorides, that while this is distinctly notable at the point in question, it ceases to be a measurable quantity when complete admixture of the sewage with the water of the river has taken place, as at Grenville. This is simply an effect of dilution, since the chlorides are not removed by any influence operating in the course of the river. Other constituents of sewage, as nitrogenous organic matter, *e.g.*, urea, gradually undergo destruction and change in consequence of oxida-

tion or other influences to which they are necessarily subjected in the course of their passage down stream.

While, therefore, it would be unwarrantable to attribute the slight changes in character of the water of the Ottawa River as this is found above the Chaudière Falls, and below Grenville, to the influence of Ottawa city sewage, it is at least justifiable to insist upon the fact that the changes effected by the entrance of the sewage into the streams are in the main identical in kind with the changes seen in the character of the water in the lower reaches of the river. This is true of the increase in total solids, the increase in mineral content, the increased loss on ignition, and the increase of nitrogen as albuminoid ammonia. In spite of the influx of nitrates from the sewers, it is true that we have a marked decrease of these at Grenville, but this is easily explicable as they are prone to reduction in contact with easily oxidised organic matter. It is instructive to note that the readily oxidised organic matter (see oxygen consumed in 15 minutes) is less in quantity as the river progresses, although the total oxidisable organic matter (see oxygen absorption for 4 hours) increases. This seems to point to constant addition of organic matter to the river in a quantity more than enough to make up for that which is constantly disappearing through oxidation. It is also interesting to note that this addition of oxidisable organic matter appears to cease (relatively) with the Lake of Two Mountains. The sample (No. VI) taken at St. Anne's shows markedly less oxygen absorbed than any of the samples collected higher up the river. This sample shows much higher solids than any of the preceding ones, but these solids were largely in suspension, not solution. The sample was taken in rapidly running water just at the head of the St. Anne's Rapids; whereas the other samples were taken in comparatively still water. The only respect in which it compares unfavourably with the preceding samples is its content of albuminoid ammonia, and I am inclined to think that in this factor of the analysis we have the characteristic indication of the Ottawa city sewage, to which has been added that of towns and villages along the river.

To sum up this part of the question, I am of opinion that in the results of analysis here shown we have proof that organic matter (mainly vegetable) in very slight quantity is added to the water of the Ottawa throughout its course between the Chaudière Falls at Ottawa and Carillon; that this organic matter, in so far as it is vegetable, is in too small amount to materially change the character of the river; that the nitrogenous organic matter convertible into ammonia by boiling with alkaline permanganate does not decrease, but even increases as the river proceeds downwards, being higher in amount at the foot of the Lake of Two Mountains than at the Ottawa city intake, and that in the incompletely oxidised sewage indicted by this factor of the analysis lies the most objectionable feature of the water of the lower Ottawa for domestic use. I do not think that this nitrogenous component is due to sawdust, nor to any other cause than ordinary sewage. The limit of safety in the matter of albuminoid ammonia is fixed by Wanklyn and other authorities at 0.150 per million, a number which is exceeded by the water of the Lake of Two Mountains, both in the present examination and in that of April (see Bulletin 15). It is, however, unwise to press any arbitrary standard too closely, and I cannot, from my knowledge of the history of the Ottawa River water, feel justified in condemning it as dangerous; at the same time, I feel sure that it could be greatly improved by proper treatment, not only in the lower reaches of the river, but at the Ottawa city intake.

The examination of the water supply of Montreal did not properly come under consideration, since this is drawn (see Bulletin 15) from the united waters of the Ottawa and St. Lawrence Rivers in Lake St. Louis. Nevertheless, it was thought well to include the result of analysis of samples taken at lower level reservoir (No. VII) and at a tap in the office of the Collector of Inland Revenue (No. VIII).

These samples, although collected on the same day, show great disparity in the analytical result. In the reservoir we have less total solids with much higher mineral matter, less oxidisable vegetable matter and lower nitrates with more

albuminoid ammonia. It is certain that the water in the reservoir is worse than that supplied to the city.

Unless arrangements are made for the periodical and frequent cleaning of reservoirs, it must be evident that they may become dangerous to the health of a city.

A. MCGILL, B.A., B.Sc.,  
*Assistant to the Chief Analyst.*

OTTAWA, 15th Sept., 1890.

TABLE I.

Serial Number	Date.	Remarks.
	1890.	
I.	Aug. 18..	From a floating pier in Deschenes Lake, opposite the Deschenes Mills. The water here is 32 feet deep. The sample was taken at 10 to 12 feet below the surface.
II.	do 18..	In Britannia Bay, at a point about 50 feet from the shore, where water is taken by carts for the supply of the village. The water at this spot is from 3½ to 4 feet deep. The sample was taken at about 1 foot below the surface.
IIIa.	do 19..	This and the following three samples were taken in the Ottawa River between New Edinburgh and Gatineau Village. This is below the city sewers about half a mile. This sample was taken off Nepean Point, in water 49 feet deep, at a depth of 10 to 12 feet.
IIIb.	do 19..	Near middle of river, off Nepean Point, at a depth of 10 to 12 feet. No bottom was found at 50 feet.
IIIc.	do 19..	Taken near the Gatineau shore, in water 14 feet deep, at a depth of 7 to 8 feet.
III d.	do 19..	Taken a little below the preceding and further out from shore, in water 24 feet deep, at a depth of 10 feet.
IV.	do 20..	From the Laboratory tap, which was allowed to flow freely for three hours before taking the sample.
V.	do 20..	Taken from the pier at the intake end of supply pipe. The water is 12 feet deep. The sample was taken at 8 feet. The city does not yet draw its supply from this point of the river, as a distance of nearly 1,100 feet of pipe has still to be laid. The present supply comes from a point below the Canadian Pacific Ry. bridge.
VI.	do 21..	Taken at St. Anne's, about ¼-mile above the locks, and in a strong current setting in towards the rapids. The water at the place when the sample was taken was 14 feet deep, and the sample was taken in 8 to 10 feet.
VII.	do 22..	From the lower level reservoir, at Montreal, a boat was taken out to the middle of the reservoir. The water was found 26 feet deep; sample taken at about 10 to 12 feet.
VIII.	do 22..	From tap in Gas Inspector's office, Montreal. The tap was turned on and water allowed to run freely for three hours before collecting the sample.
IX.	do 23..	At the Laboratory tap, Ottawa. The water ran freely for three hours before collecting.
X.	do 26..	From the Ottawa river, at Calumet. The sample was taken from the middle of the river, here over 40 feet deep, and at a depth of 15 feet.
XI.	do 26..	From the Ottawa River at Carillon. The sample was taken from the deck of the steam ferry-boat, in the middle of the channel, where a very strong current flows. No bottom was found at 35 feet. The sample was taken at about 12 to 15 feet below the surface.
XII.	do 27..	Taken from the same place as Sample I.

REPORT UPON THE WATER SUPPLY OF THE CITY OF  
SHERBROOKE, QUE.

Table I exhibits the numerical results of analysis.

Table II contains a list of the samples taken, together with details regarding the source of each.

The city supply is taken from the River Magog, an intake pipe, partly of iron and partly of wood, being carried out from the pumping station to the river, the intake end of the pipe reaching to the middle of the stream nearly opposite Queen street, a distance of perhaps 1,800 feet from the pump house. The water at this point was 19 feet deep on the 3rd of September, when I took a sample there. The pipe, originally of iron throughout its whole length, has comparatively lately had an addition of about 400 feet of wooden pipe added to it, in order to obtain a supply for the city beyond a point in the river which is often covered by saw-logs. Sample No. 3 was taken near the joint between the old and new portions of the pipe in order to detect any leakage, if such occurred. The results of analysis show the water at this point to be practically identical with that at the intake end of the pipe, except only that the vegetable organic matter here is rather higher than at the intake. For purposes of comparison I obtained a sample of water from Lake Memphremagog, and I find that the water of the river differs but little from that of the lake, the differences being a slight increase of albuminoid nitrogen and a decided increase in oxidisable organic matter, almost entirely vegetable, as the history of the river shows. The water as furnished to the city (see Sample 6) agrees very well in general character with that of the supply, and at the time when these samples were collected was, as shown by the analysis, of fairly satisfactory and unobjectionable quality.

The water of the reservoir is not identical with that supplied to the city, the albuminoid ammonia and the nitrates are much higher in amount, and the organic matter oxidisable by peranganic acid is considerably lower. It is evident that the water ordinarily supplied to the consumers does not come from the reservoir.

*Well Waters.*

A considerable number of wells are in use in outlying parts of the city. Samples were taken at three of these wells, which were stated to furnish water to a large number of families. Sample 7 was taken from a well which gave every evidence of being much resorted to by the people of the neighbourhood. The accesses to it were open and were well tracked. The analytical results are such as to justify me in condemning its use for drinking purposes. The very large amount of nitrogen as albuminoid ammonia, with the high nitrates, chlorides and organic matter, proved that surface drainage finds entrance to it.

Sample 8, from a well at Peter Happy's Hall, is if possible still worse. The amount of free and saline ammonia found exceeds anything which I have before this detected in a water used for drinking purposes; indeed, it is seldom that fresh sewage contains so much. (See Bulletin 13, page 14, Samples 44 and 45.) This, together with the excessive total solids, nitrates and chlorides, compels unhesitating condemnation of the well. In the case of the last well examined, which is scarcely so much a well as a flowing spring whose waters are allowed to collect in a barrel sunk in the ground, the excess of water constantly flowing over the top, the results are less positively condemnatory. The nitrogen in nitrates is, however, much too high; and the chlorine in chlorides can scarcely otherwise be accounted for than as owing its presence to sewage. The geological character of the surrounding country precludes the idea of a purely mineral origin for the chlorides, and the immediate environment of the well, taken in connection with the high nitrates found, suggests unmistakably a sewage origin. There can be no doubt as to the necessity which exists for the discontinuance of the use of all these well waters.

(Signed) A. MCGILL, B.A., B.Sc.,  
Assistant to Chief Analyst.

OTTAWA, 18th September, 1890.

TABLE II.  
SHERBROOKE Water Supply.

No. of Sample.	Date of Collection	Source.	Remarks.
	1890.		
I.	Sept. 2..	Lake Memphremagog....	Taken from the lower end of the lake, about half a mile from shore. The water here is 14 feet deep. The sample was taken about 8 feet below the surface.
II.	do 2..	Magog River. ....	Taken from the middle span of a bridge situate about half a mile below the Hochelaga Cotton Mills. The water is about 5 to 6 feet deep, and the sample was obtained at 2 to 3 feet below the surface. The current is very rapid at this point.
III.	do 3..	do .....	Near the city of Sherbrooke, at near the joint between the old and new portions of the intake pipe supplying the city. The water is about 4 feet deep, and the sample was taken at about 3 feet below the surface.
IV.	do 3..	do .....	At the end of the new intake pipe. The water here is 19 feet deep. The sample taken at about 12 feet deep.
V.	do 3..	Reservoir.....	By reaching out into the reservoir from a rock projecting about 4 feet within the boundary wall. The water here is 3 to 4 feet deep. Sample taken about 6 inches below the surface.
VI.	do 3..	Tap at Central Fire Station.	The tap was allowed to run freely for three hours before collecting.
VII.	do 3..	Well.....	Situate at corner of Liverpool and London streets. The well is covered by a box with a lid. Water is drawn by letting down a pail by means of a forked stick. The well is about 10 feet deep, and contained about 7 feet of water. The sample was taken about 3 to 4 feet below the surface.
VIII.	do 3..	do .....	In front of Peter Happy's Hall. This well was apparently covered in with care, and had a good pump.
IX.	do 3..	do (spring).....	At Mrs. Millar's. A spring flows into a barrel sunk in the ground. The barrel is open, and a considerable overflow of remarkably clear water was observed.

BULLETIN No. 19—MUSTARD.

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—In many of the reports which have been addressed to you by the public analysts of the Dominion during the past ten years, and which are to be found published in the annual reports of the Department, there is abundant evidence to show that mustard, as sold in Canadian markets, is largely subject to adulteration—in fact, it may be said that it is hardly ever sold pure. Some people assert that the public have come to understand that it is just as well that this state of affairs should continue to exist, and that so long as the mustard contains nothing injurious, and is marked or sold as “compound,” the said public has not much to complain of. On the other hand, it may be maintained, as in the case of coffee, spices, &c., that some limit should be set to the amount of diluting substances added; and, in order that arrangements may be made for having this done, with due regard to the position of both vendor and purchaser, I have to call your attention to some analytical work which has been done on samples of mustard collected during the last eighteen months.

The nature and origin of these samples and the results of their analysis are given in the following table (I).

I.—TABLE showing the Origin and Composition

In the foregoing table the results are given of examining 95 samples. In judging of their purity the public analysts have heretofore been guided by the suggestions regarding analysis contained in the circular G. 120, issued by the Department, in which it is stated that "for medicinal purposes mustard should be pure, equal to 35 per cent. of fixed oil. For dietetic purposes, at least 22 per cent. fixed oil required, indicating 30 per cent. admixture of inert farinaceous matter, beyond which sample "should be condemned." This quotation no doubt expresses the views of my predecessor in office, the late Mr. H. Sugden Evans, which have evidently been made use of by Dr. W. H. Ellis, of Toronto, (by whom 42 of the above analyses were made,) and also by Mr. Bowman of Halifax. If the standard here given is adhered to, it is evident that not one genuine sample of mustard is to be found in the above list. It is no doubt the case that this standard of 35 per cent. fixed oil for pure mustard can easily be justified by a reference to authorities on the subject. It appears, however, from work done by Mr. F. W. Babington in this laboratory, and yet to be mentioned, that in some mustard farina prepared from seed he found only 30.5 per cent. of fixed oil. The results of such analyses depend, of course, greatly upon the quality of the seed, on the fineness of the sieve used in separating the flour from the husk, and on the method employed of determining the fixed oil. Until further experience has been gained it would seem wise and reasonable to assume 30 per cent. fixed oil as the *lowest* limit for pure mustard. Yet, even on this assumption only seven of the samples described in the above list can be regarded as pure, viz.: Nos. 6715, 6716, 8753, 9541, 9,877, 9,886 and 9,890.

If, as expressed in the above quotation, an admixture of 30 per cent. inert farinaceous matter be allowed in mustard "compounds," it follows that they should not contain less than 23 per cent. of fixed oil. It is upon this basis that Mr. Babington has calculated the amount of pure mustard in the various samples analysed by him, after making an allowance for the fat contained in the diluent when known. If, however, we adhere to 22 per cent. as the lowest limit for the fixed oil in a "compound" mustard it follows that only 9 of the 95 samples analysed can be regarded as coming within the description of mustard compounded for dietetic purposes. The classification of the mustards above described therefore stands thus:—

	Number of samples.	Percentage of qualities.
"Pure".....	7	7.37
"Compound".....	9	9.47
Adulterated.....	79	83.16
	<u>95</u>	

For purposes of comparison some analyses were made of mustards and mixtures the particulars of which are given in the following table (II). In this work, as well as in that recorded in Table I, Mr. Babington was assisted by Mr. A. L. Tourchot and Mr. A. C. Macfarlane.

Among other interesting results shown by these figures, it would appear that the estimation of the alcoholic extract may become useful for indicating the presence in "compound" mustards of mustard cake, from which, of course, more or less of the fixed oil has been expressed.

With regard to the adulterants which are mentioned in Table I, it may be remarked that it is held by the manufacturers that it saves trouble in grinding mustard seed to add a small percentage of flour, and that this is also requisite to insure the keeping qualities of the product. Even if this be admitted, it appears, from the analyses of the seven pure samples above given (Keen's and Coleman's best), that not more than 6 per cent. is necessary for these purposes. The admixture of larger quantities, even in those qualities which are fairly called "compound," brings with it the necessity of using turmeric to restore the yellow colour. This substance is said to be harmless, but the introduction of any dyestuff into food should be discouraged. In the large class of adulterated mustards above indicated, in which the amount of diluting material ranges from 30 to 80 per cent., it appears that frequently some substance has to be added to restore pungency. This accounts for the presence of cayenne pepper in a considerable number of the samples. The most inexcusable adulterant is, however, terra alba, or sulphate of lime, and no doubt its use is occasioned by the insatiable demand of the retailer for "cheap goods." When it is considered that 83 per cent. of the samples collected contain over 30 per cent. of adulteration it cannot be denied that a remedy is urgently called for, which would probably be as welcome to the manufacturer and dealer as to the general public.

It will, of course, at once be remarked that the proper remedy is the prosecution of the offenders under the Adulteration Act, but that Act practically permits the admixture of substances not injurious to health, provided the mustard sold is labelled as a compound, which, as will be seen from the description given in Table I, is very generally done. The true remedy lies in section 19 of the Act, which empowers the Governor in Council "from time to time to establish a standard of "quality for and fix the limits of variability permissible in any article of food, or "drug, or compound," the standard for which is not otherwise established. In the case of mustard, I would recommend that the limits above indicated be fixed by Order in Council, *i.e.*, that pure mustards should not contain less than 30 per cent. of fixed oil, and "compounds" or "mixtures" not less than 22 per cent. As has been above explained, the latter percentage corresponds to a diluent addition of 30 per cent. This cannot be regarded as too severe a regulation, since the New Jersey State Board of Health only allows 25 per cent., and a similar limit has, by judicial decision, become established in England. If this understanding were effected it would become the interest of the manufacturers to adhere to it, and prosecutions under the Act for the grosser forms of adulteration would become effective. Until such an arrangement is arrived at, I have respectfully to recommend that the publication of such reports as the present one be continued.

I have the honour to be, Sir,  
Your obedient servant,

THOMAS MACFARLANE,  
*Chief Analyst.*

OTTAWA, 11th December, 1890.

**BULLETIN No. 20—PEPPER.**

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—Herewith I enclose and recommend for publication a report by Mr. A. McGill, B.A., &c., Assistant Analyst, on the examination of a large number of ground peppers. From the results given in this report it is plain that at least two-thirds of the peppers sold in Canadian towns are adulterated, some of them very grossly. In the great majority of cases these peppers were sold in bulk, and not labelled as "compound." Legal proceedings could no doubt, therefore, be instituted against the vendors in question, but doing this would unduly tax the means at the disposal of this Branch, owing to the great number of the delinquents. In the meantime, and for the present cases it is considered probable that some good may be accomplished by publishing the names of the vendors and alleged manufacturers of the adulterated goods.

With regard to fixing a limit for the inorganic substances contained in peppers, I expressed the opinion, three years ago, that the latter should not contain more than 8 per cent. of ash, an amount which practically agrees with Mr. McGill's proposed maximum of 7 per cent. With reference to the quantity of harmless diluent which should be allowed in the case of peppers sold and properly labelled as compound, I am not prepared at present to lay before you any recommendation.

I have the honour to be, Sir,  
Your obedient servant,

THOMAS MACFARLANE,  
*Chief Analyst.*

30th December, 1890.

Before any making remarks upon the contents of the foregoing table, it may be well to give the following explanations:—

Pepper is the fruit of *Piper nigrum*, a perennial climbing shrub which is cultivated chiefly in the East Indies. The fruit is a small drupe, *i.e.*, a stone-fruit like the cherry, with a fleshy outer portion (pericarp). This berry-like fruit grows in closely packed clusters, each consisting of from 20 to 30 drupes, upon a common stalk. Portions of this stalk (peduncle) may be found in every sample of black pepper-corns, and on examination will be found to shew concave depressions where the berries were attached. "The plant is capable of growing to a height of 20 or 30 feet, but for the sake of convenience is usually kept low, and is often trained on poles." *Flückiger and Hanbury*.—This peculiarity in the culture of the pepper plant is of very considerable importance, since the trailing habit of the vine brings the pendulous clusters in close proximity to the earth, and explains the fact that a good deal of sand and clay are invariably found attached to the soft pericarp. This mineral matter is dried into the skin of the berry during its later treatment.

**BLACK PEPPER.**—For the production of black pepper the fruit is plucked before it is quite ripe, and "dried in the sun, or in bamboo baskets near a gentle fire." The outer soft portion of the drupe shrivels, turns black in colour, and ultimately becomes quite hard and brittle, and so firmly adherent to the stony inner portion as to be practically incapable of being separated from it.

**WHITE PEPPER.**—When white pepper is wanted, the berries are allowed to ripen before picking. They are then soaked in water for a time to soften the outer portion (pericarp), which is then removed by friction. After this treatment the berries are dried in the sun. It will appear, therefore, that the varying amount of sand and clay which necessarily adheres to black pepper berries should be entirely absent from those of white pepper.

The *Ground Pepper* of the shops should be nothing else than the berries above described passed through a suitable mill.

The analysis of 73 samples of commercial ground pepper, of which details are given in Table I, furnished the following data:—

Genuine pepper,	20 samples.....	27 per cent.
Adulterated pepper	38 do .....	52 do
Doubtful	15 do .....	21 do
	—	
	73 do	100
	==	==

The chief reason why so many samples are classed as doubtful is that no maximum limit is fixed to the amount of mineral matter which may properly be allowed as an unavoidable impurity in pepper. Owing to the trailing habit of the plant, as pointed out already, a certain amount of sand, clay, and other components of the soil, attaches itself to the soft exterior of the berry and dries fast to it, so as to be difficult of removal except by a process which would rub away a large portion of the fruit itself. It is of first importance to determine the limits within which this adhering matter may be considered as a necessary and unavoidable impurity, since there is a strong temptation to add such foreign matter fraudulently. Of course white pepper, which has, as explained, undergone a decorticating and cleansing process before export, should be practically free from adherent earthy matter.

By burning a known weight of pepper, under proper conditions, the whole of the organic matter (ash) represents the amount of mineral matter which properly belongs to the structure of pepper, plus the adventitious mineral matter which has attached itself to the berry during growth, or has been fraudulently added to the ground pepper. The *total ash*, less the amount properly belonging to pepper tissue, is, therefore, a measure of the foreign mineral matter present in a given sample. On treating this ash with hydrochloric acid practically the whole of it is dissolved, excepting that part which consists of sand. It is evident that the undissolved por-

tion will be greater or less as the pepper comes from a sandy soil or otherwise, so that this estimation cannot be expected to be so uniform in its indications for genuine berries; although it should be easy to fix a limit which should never be exceeded by the sand: *i. e.* residue insoluble in hydrochloric acid. The following maxima have been suggested or adopted by the authorities quoted:—

	Total Ash.	Sand.	Authorities.
Black Pepper .....	6·5	2·0	Bavarian Association of Technical Chemists, 1890.
	5·0	1·0	Wm. Johnstone, Ph.D., &c., "The Analyst," March, 1889.
	5·5	.....	A. W. Blyth, Dict. of Hygiene, &c.
	6·0	.....	Röttger, quoted by C. Richardson.
White Pepper .....	5·0	.....	Clifford Richardson; Bull. Dept. of Agriculture, Wash, 1887.
	3·5	1·0	Bavarian Association of Technical Chemists, 1890.
	3·0	.....	Röttger.
	2·0	.....	Clifford Richardson, 1887.

In the following table I have collected, as far as the total ash is concerned, the result of analysis of a large number of samples of genuine pepper.

Unknown	3.00	1.00	.....	Weigmann, Report Anal. Ch. 6, 399.
2.	1.41	1.34	1.37	C. Richardson, Wash., 1887.
5.	3.74	1.64	3.00	Myself.

With the exception of one sample analysed by Heisch, none of the black peppers give more than 7 per cent of ash. I am of the opinion that any sample of genuine black pepper which yields more than 7 per cent of ash should be considered too dirty to be fit for use. I have met only one instance of a whole black pepper which gave as much as 7 per cent of ash, and this sample was certainly unfit for sale. It was obtained in Ottawa in December, 1889. The following are the results of its analysis:—

One hundred parts by weight contained—

A.—Dirt and dust, separated by a sieve of 400 meshes per square inch.....	13.0
B.—Broken berries, stems and dirt, separated by a seive of 256 meshes per square inch from the residue on the former.....	1.5
C.—Small pieces of stems, leaves and earthy matter in lumps picked out by hand..	1.1
D.—Peduncles and stems in large pieces picked out by hand.....	3.8
E.—Fairly clean berries.....	80.6

100.0

Further analysis gave the numbers below:—

Portions Examined.	Moisture, &c., lost at 100° C.	ASH.					Remarks.
		Soluble in Water.	Insoluble in Water.	Total.	Insoluble in Acid.	Sand expressed as a percentage on the total Ash.	
A.....	4.50	0.98	34.56	35.54	.....	.....	It will be seen that the ash obtained from the berries after these had been fairly well cleaned is less than 5 per cent.
B and C.....	8.88	.....	.....	.....	.....	.....	
D.....	10.64	2.45	6.21	8.66	1.33	15.	
E.....	11.45	2.07	2.75	4.82	0.71	15.	
The whole pepper calculated	10.45	.....	.....	9.37	.....	.....	

Had this sample of berries been properly cleaned before placing it upon the market its weight would have been reduced by at least 15 per cent.

The following table (II) gives the results of analysis of six samples of genuine black, and five of genuine white pepper corns, obtained from Ottawa city grocers.

## WHOLE BLACK PEPPER.

Description of Sample.	Moisture, &c., lost at 100° C.	Ash.					Alcoholic Extract.
		Soluble in Hot Water.	Insoluble in Water.	Total.	Insoluble in HCl.	Sand expressed as a percent- age on the total Ash.

do Bate & Co., Ottawa, 17th Oct., 1890.....	11.60	2.52	1.46	3.98	0.06	2	8.54
do C. Stratton, Ottawa, 17th Oct., 1890.....	14.10	2.10	3.06	5.16	1.08	21	9.06
do E. Brown, Ottawa, 17th Oct., 1890.....	12.20	2.64	1.62	4.26	0.10	2	8.68
Average.....	12.03	2.41	2.05	4.47	0.36	8	8.71

## WHOLE WHITE PEPPER.

Berries from Kavanagh Bros., Ottawa, 28th Dec., '89.	11.30	0.72	2.93	3.65	0.37	.....	7.
do do do 17th Oct., '90.	11.80	0.68	2.36	3.04	0.26	9	7.
do Bate & Co., Ottawa, 17th Oct., 1890.....	13.00	0.14	1.50	1.64	0.70	42	8.92
do C. Stratton, Ottawa, 17th Oct., 1890.....	12.90	0.70	3.04	3.74	0.88	24	7.26
do E. Brown, Ottawa, 17th Oct., 1890.....	12.70	0.46	2.48	2.94	0.56	19	7.22
Average.....	12.34	0.54	2.46	3.00	0.55	21	7.73

The following results on cocoa-nut shells may be stated here:—

Total ash, 0.66 per cent.

Soluble, 0.48 “

Insoluble, 0.18 “

Sand, 0.14 “

Moisture (*i. e.*, loss of 100° C.), 7.50 per cent.

Of the eight samples of black pepper which are classed as doubtful, on the result of analysis, the following would be condemned on the ground of too high ash, were the standard of 7 per cent as a maximum adopted:—

No. 8,974 yielding 11.36 per cent ash.

8,987 “ 8.15 “

9,157 “ 10.74 “

9,171 “ 22.42 “

9,173 “ 15.20 “

9,501 “ 7.47 “

9,514 “ 13.02 “

While among these samples which are classed as *genuine*, since they contain no foreign tissue the following would be condemned:—

No. 9,167 yielding 17.12 per cent ash.

9,154 “ 13.38 “

9,170 “ 8.34 “

9,176 “ 8.94 “

9,186 “ 14.38 “

9,189 “ 13.70 “

Among the white pepper samples one is found, No. 8,985, which yields 7·27 per cent ash; at least twice as high a percentage as any fairly clean white pepper corns should give. It appears, therefore, that, on the assumption of such a standard for pepper ash as I have indicated, the result of analysis of the 73 samples examined would lead to the following classification:—

Genuine pepper,	14 samples.....	19 per cent.
Adulterated pepper,	52 " .....	71 "
Doubtful	7 " .....	10 "
	73	100

It is, however, possible to add fraudulently to pepper a substance like pepper dust which contains an excessive amount of mineral matter, and to reduce the total ash in the pepper so adulterated by the further addition of some substance containing very little mineral matter, such, for example, as wheat or rice flour. These substances yield less than one per cent. of ash, and it will be evident that the addition of 50 per cent. of flour to an adulterated pepper yielding 12 per cent. of ash would reduce the percentage of ash in the resulting mixture to 6·5 per cent. The microscopic examination of the sample serves to detect such an addition; and this examination is therefore required as complementary to the estimation of ash.

Before leaving the subject of mineral matter in pepper it may be well to allude to the common adulterant known as pepper dust, and supplied to the trade as P.D.; H.P.D. (hot pepper dust) and W.P.D. (white pepper dust).

The pepper berries, by mutual friction, lose more or less of the dry pericarp and adherent sand in the course of the handling to which they are subject during shipment. The *débris* so resulting is separated by screening in order to render the berries saleable. There can be little doubt that P.D. was originally nothing else than the screenings obtained in this process; but as the supposed exigencies of trade required more of the material than could be supplied for the adulteration of ground pepper, imitations of the genuine pepper-dust were soon manufactured.

Blyth (Foods, p. 497), writes thus:—

"The first, or P.D. used to be principally composed of faded leaves, but linseed-meal is now preferred; H.P.D. is chiefly the husks of mustard, and W.P.D. is ground rice."

Hassall (Foods and Adulteration, p. 538), says:—

"Pepper dust, H.P.D. or P.D. consists either of the sweepings of the warehouses, or else of an article made up in imitation of ground pepper, and expressly used for the adulteration of that article. It is manufactured from rape or linseed cake, mustard husks and cayenne pepper."

I have found in genuine pepper dust (*i.e.* the *débris* of pepper berries), as high as 35·54 per cent. of ash. What it may amount to in the P.D. of commerce, as this is found in Canada, I have not had the opportunity of determining.

*Alcohol Extractive.*—Alcohol extracts from ground pepper a varying amount of soluble matter, chiefly piperin and resin, the weight extracted depending upon such considerations as (1) the degree of fineness of the powdered pepper operated on; (2) the temperature at which the extraction is performed; (3) the length of time given to the extraction; (4) the form of apparatus employed.

*König* (Die menschlichen Nahrungs)—und Genussmittel, page 363) points out that while pepper suffers a loss of weight of over 22 per cent. by this process, the weight of the material extracted when determined after drying at 100° C., is only about 12 per cent. of the weight of the pepper used, indicating a loss of about 10 per cent. of volatile matter. He gives the following figures:—

Alcoholic extract of black pepper, dried at 100° C. before extraction.

Calculated from weight lost.....	22.27	per cent.
“ “ dry residue .....	11.67	“
	<hr/>	
Volatile matter in extract.....	10.60	

I have obtained the following duplicate numbers for a sample of genuine black pepper:—

	A.	B.
Extraction from loss of weight .....	24.01	22.48
“ weight of residue obtained at 100° C.....	12.80	12.30
	<hr/>	
Volatile extractive.....	11.21	10.18

Another sample of genuine black pepper gave

By loss .....	20.50	per cent.
By weight .....	8.28	“
	<hr/>	
Difference.....	12.22	

But in this case different forms of apparatus were used in the processes.

The large quantity of volatile matter extracted by alcohol from pepper, and apparently pretty constant in amount under similar conditions, is unfortunately not distinctly characteristic for pepper. König finds 15.76 per cent. for Cayenne; 9.12 per cent. for long pepper; 11.66 per cent. for pimento.

The process is a somewhat tedious one, and since the interpretation of its indication is uncertain in the present state of our knowledge, I have not carried it out with all the samples examined. The number given in the column headed *Alcoholic Extract* is obtained by evaporating to dryness at 100° C, the alcoholic solution obtained by boiling 20 grammes of the air-dry pepper with about 110 cc. alcohol of 0.815 specific gravity for two hours, in a glass cask fitted with a back-flow condenser. For genuine pepper the table on page 117 shews this to amount to an average of 8.71 per cent. for black and 7.73 per cent. for white. The extremes in the case of black pepper are 9.06—8.28; and in the case of white pepper 8.92 to 7.22.

In order to determine the influence of rice starch and cocanot shell upon the alcoholic extract, samples of these were treated with alcohol as in the case of pepper, and the following numbers obtained:—

Alcoholic extract, rice starch .....	0.90	per cent.
“ “ cocanot-shell.....	23.15	“

The effect of either of these substances in admixture is therefore to lower the extractive. Since, however, black pepper shews a higher average extractive than white, it appears that the addition of pepper dust in undue amount will proportionately raise the amount of alcoholic extractive.

An examination of the synoptical tables appended will shew that in general the amount of alcohol extractive found is consistent with the above deduction, when the microscopic and other examinations furnish sufficiently definite data for an opinion. Owing, however, to the very complex character of the pepper adulterants usually present, it is difficult to interpret the meaning of the number found for alcoholic extract with as great definiteness as could be wished.

---

The separation of the piperin in the extractive, from the resin which constitutes its main component, has been attempted in several instances; but since the commercial value of a pepper does not in any way depend upon its piperin content, it has not been deemed advisable to carry out this separation in all the samples analyzed.

I have to acknowledge, in conclusion, that I have received great and valuable assistance in the prosecution of this work from Mr. F. X. Lefebvre, and from Miss E. Davidson.

I have the honour to be, sir,

Your obedient servant,

A. MCGILL.

**BULLETIN No. 21. — MILK IN WESTERN ONTARIO AND  
MANITOBA.**

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—I beg respectfully to recommend for immediate publication the reports which have been addressed to you by Dr. W. H. Ellis, of Toronto, and Professor E. B. Kenrick, of Winnipeg, on milk samples which were collected in Western Ontario and Manitoba during the latter part of last year, and submitted to them for analysis. The tabular statements which accompanied the reports of these public analysts have been reconstructed, in order to insert the names of the vendors, and they constitute the following table, which gives both the origin of the samples, the analytical results and the remarks of the analyst.

I have the honour to be, Sir,

Your obedient servant,

THOMAS MACFARLANE,

*Chief Analyst.*

## SCHOOL OF PRACTICAL SCIENCE.

TORONTO, 29th December, 1890.

The Commissioner of Inland Revenue.

SIR,—I have the honour to submit my report on the work done in my laboratory during the past six months.

During the month of August I analysed sixty-four samples of milk collected from various places in my district as below:

	Samples.
Peterborough.....	6
Ashburnham .....	1
Lindsay.....	5
Beaverton.....	5
Orillia.....	8
Barrie.....	7
Bradford.....	7
Newmarket.....	7
Aurora.....	6
Toronto.....	<u>12</u>

The weather, when these samples were taken was extremely hot and before I was able to analyze them they were nearly all sour and curdled to such a degree as to render the analysis by the ordinary method very difficult and unreliable.

Of the sixty-four samples, thirty-six fell below the standard of 3·5 per cent. fat and twenty-three below that of 12 per cent. total solids.

In November and December eighty samples, of which two were lost in transit from breakage, were collected in my district and sent to me for analysis. The seventy-eight samples which reached me were, most of them, in good condition, only a few of the first sent being sour or curdled. The results of the analysis of these seventy-eight samples is given in the preceding table. The analysis were made by the Asbestos method in duplicate. In the table only one of these duplicate analyses is given.

In Bulletin No. 1, the chief analyst suggested the following limits for milk of good standard quality:

	Per cent.
Total solids.....	12·0
Fat.....	3·5
Solids other than fat.....	<u>8·5</u>

The results of the analyses of these seventy-eight samples of milk may be summarized as follows:—

	Total Solids.	Fat.	Other Solids.
Maximum.....	15·67	7·66	10·79
Mean.....	12·84	4·10	8·74
Minimum.....	<u>10·33</u>	<u>0·78</u>	<u>6·51</u>

The average of the analyses reported in Bulletin No. 1 is:

	In all Canada.	In Toronto Dist.
Total solids.....	12·48	12·27
Fat.....	3·86	3·56
Solids not fat.....	<u>8·62</u>	<u>8·71</u>

It appears, therefore, that the average milk sold in the market in the district of Toronto is at present richer in fat and other solids than was the average milk taken from herds of cows all over Canada in the summer of 1888.

It is quite certain, however, that some of these samples were not genuine milk.

The Society of Public Analysts have established the limit of 3 per cent. for fat and 8·5 for solids not fat, and report all milk adulterated which fall below these limits.

Of these seventy-eight samples, 24, or 30 per cent., fall below these limits as to solids not fat, and seven samples, or 9 per cent., fall short in fat. In one or both respects twenty-nine samples, or 37 per cent., are below the society's limits.

I have elsewhere recorded my opinion that these limits are too high. In 1888 I found 22 per cent. of the samples of milk from herds of cows taken in my presence to fall below them. Deducting twenty-two from thirty-seven we get fifteen, that is, that there are 15 per cent. more of these samples below the limit than I found in genuine milk.

In my report of 1888 I expressed my belief that it is impossible to assert that a milk has been adulterated by admixture with water if the solids not fat are higher than 8 per cent., or that it has been skimmed if the fat is more than 2.5 per cent.

In expressing my opinion as to the quality of these samples, I have been guided by these considerations. All below 8 per cent. solids not fat I have reported watered. All below 2.5 per cent. fat I have reported skimmed.

The number of samples so reported as adulterated is eleven, two skimmed and nine watered; in all 14 per cent.

In the following table the samples taken from each locality are given as of good standard quality, or otherwise, according to the standard suggested in Bulletin No. 1.

Locality	Of Good Standard Quality.	Below Standard.	Total.
St. Mary's.....	2	1	3
Lucan.....	1	1	2
Sarnia.....	5	2	7
Petrolia.....	3	1	4
Dresden.....	2	1	3
Chatham.....	0	7	7
Glencoe.....	0	2	2
St. Thomas.....	3	8	11
Guelph.....	4	3	7
Palmerston.....	3	1	4
Mount Forest.....	2	3	5
Orangeville.....	6	0	6
Shelburne.....	1	3	4
Owen Sound.....	10	1	11
Alliston.....	1	1	2
Total.....	43	35	78

I have the honour to be, Sir,

Your obedient servant,

W. H. ELLIS, *Analyst.*

ST. JOHN'S COLLEGE,

WINNIPEG, 17th November, 1890.

To the Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to submit my report on certain samples of milk collected in some of the larger towns of Manitoba and submitted to me for analysis during the latter part of October and early part of the present month.

The following schedule gives the number of good, inferior and adulterated samples respectively, as obtained from each town:—

	Good.	Below Average.	Partly Skimmed.	Watered.	Total.
Winnipeg.....	27	7	1	1	36
Portage la Prairie.....	4	0	0	0	4
Brandon.....	5	0	0	1	6
Total.....	36	7	1	2	46

The samples classed as "below average" must be regarded as doubtful, being either good milk more or less skimmed or watered, or naturally poor milk deficient in either butter-fat or other solids.

In drawing up this table I have been careful to use the terms employed in the Bulletins on Milk, issued by the Inland Revenue Department, and in forming an opinion on the samples I have been guided by the provisional standards adopted by the Chief Analyst for Canadian milk. It is, however, open to question whether milk samples from different parts of Canada should all be judged by one standard. As pointed out in Bulletin No. 1 the average in Canada for the total solids in milk is at least one-half of one per cent. lower than the standard adopted in the State of Massachusetts for milk "of good standard quality."

The averages obtained for the above forty-six samples are as follows:—

Total solids...	13.52
Butter fat.....	4.57
Other solids .....	8.95

These figures, it will be seen, are very much higher than the averages for both market and normal samples from nearly all those towns of Eastern Canada for which averages are given in Bulletins Nos. 1, 2, 9 and 11.

The above averages contain the results of two watered samples and one partly skimmed, together with at least seven analyses of doubtful samples. On the other hand they include several samples in which the fat was abnormally high, rendering it probable that in some instances the milk was not properly mixed before taking the sample. But even if we exclude the samples consisting in part of cream, it will be found that the general averages for both fat and other solids are markedly higher than the averages obtained for genuine samples of whole milk analyzed in the Department Laboratory at Ottawa. In making these comparisons it should not be forgotten that the present is just the time of year when the highest averages may be expected. The obvious practical result of judging exceptionally rich milks by standards adapted for milk of average quality is that a larger proportion of adulterated samples escape detection.

I may add that the method employed for the analysis of these samples was essentially the one in use in the Inland Revenue Laboratory at Ottawa—a method which in my hands has been found to yield results practically identical with those obtained by the method in use in England by the Society of Public Analysts.

I have the honour to be, Sir,

Your obedient servant,

EDGAR B. KENRICK, *Analyst.*

## BULLETIN No. 22.—FERTILIZERS, 1891.

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—In submitting the following report regarding the agricultural fertilizers, which are offered for sale in the Dominion of Canada this year, it becomes necessary to advert to the amendment which the Fertilizers Act underwent during last session of Parliament, and which were assented to on the 24th April, 1890. The following are the principal changes which these amendments have caused in the administration of the Act and the trade in fertilizers:

1. Every manufacturer or importer is obliged to declare to the department, and describe on the packages, the nature of the materials from which the fertilizer has been manufactured.

2. A fee of \$3 must be paid for the analysis of each sample submitted to the department.

3. In publishing the results of the analysis, a statement must be given at the same time "showing the relative value of each fertilizer calculated from its contents in fertilizing ingredients at their current market value."

The following is a list of the fertilizers sent in for analysis this year, containing the same information as in former reports, with the addition of that received from the manufacturers regarding the materials contained in, or used in the production of, the various qualities.

TABLE I.  
RECORD of Fertilisers Analysed.

No.	Designation.	Name of Manufacturer.	By whom sent.	From what Materials produced.	Cash selling price.
189	"Animal Fertiliser"	F. Rowlin, Fertiliser and Casing Works, Hamilton, Ont.	Manufacturer.		
190	"Bone Meal"	Jackson Johnson, Warkworth, Ont.	do		\$42.50 per ton (less 10 p.c.)
191	"Bone Meal"	Provincial Chemical Fertiliser Co., St. John, N.B.	De B. Carritte, Manager		\$38.50 per ton (less 10 p.c.)
192	"Wood Ashes"	F. R. Lalor, Dunnville, Ont.	Manufacturer.		\$40.50 per ton (less 10 p.c.)
193	"Imperial Superphosphate"	Provincial Chemical Fertiliser Co., St. John, N.B.	De B. Carritte, Manager	Dissolved bone black, meat, bone and blood, tankage, and fish bone, and muriate of potash.	\$20.00 per ton.
194	"Special Potato Phosphate"	do	do	do	\$30.00 "
195	"Soluble Pacific Guano"	W. D. Stewart & Co., 7 Exchange Place, Boston, Mass.	Manager.		\$25.00 "
196	"Oblendorff's Superphosphate of Lime."	The Anglo-Continental Guano Works, London, Eng.	Manufacturers		\$40.00 "
197	"Fertiliser"	James L. Grant & Co., Ingersoll, Ont.	C. C. L. Wilson, Manager	Tankage, bones and blood	\$15.00 "
198	"Complete Fertiliser"	F. Rowlin, Fertiliser and Casing Works, Hamilton, Ont.	Manufacturer		\$37.50 "
199	"Pure Animal Fertiliser"	do	do		\$30.00 "
200	"Pure Fine Bone Meal"	do	do		\$39.00 "
201	"Superphosphate of Lime"	The Standard Fertiliser and Chemical Co., Smith's Falls, Ont.	R. J. Brodie, Manager	Apatite, bone charcoal and sulphuric acid.	\$32.75 "
202	"Special Fertiliser"	do	do	Apatite, bone charcoal, sulphuric acid, potash, ammonia, magnesium salts and nitrate of soda.	\$30.00 "
203	"No. 1 Fertiliser"	do	do	do	\$39.00 "
204	"Fruit Tree Fertiliser"	do	do	do	\$32.75 "
205	"Standard Fertiliser"	do	do	do	
206	"Nitrate of Soda"	do	do	do	

207	"Nitrate of Soda"					\$35.00	"
208	"Guano"		The Steele Bros. Co., Toronto, Ont.	do		\$3.50 per 100 lbs.	"
209	"Lawn Fertiliser"		The Standard Co., Boston, Mass.	do		1 1/2 cents per lb.	"
210	"Food for Plants"		do	do			"
211	"Compound Fertiliser"		Wm. Davies & Co., Pork Packers, &c., Toronto.	Manufacturers			Dried blood, bone and; ankeage..
212	"Bone Meal"		W. P. Churchill, Yarmouth, N.S.	Manufacturer		\$35.00 per ton.	"
213	"Farmers' Pride"		W. A. Freeman, Dominion Fertiliser and Casing Works, Hamilton, Ont.	do		\$30.00	"
214	"Grape Food"		do	do		\$40.00	"
215	"Bone Meal" (general fertiliser)		do	do		\$40.00	"
216	"Dissolved Bone"		do	do		\$38.00 per ton.	"
217	"Sure Growth"		do	do		\$40.00	"
218	"Animal Fertiliser"		do	do		\$35.00	"
219	"Flower Lawn and Park Fertiliser"		do	do		\$12.50 per case (50 pkgs.)	"
220	"Bone Dust"		Saunuel Archibald, Truro, N.S.	do		\$38.00 per ton.	"
221	"Fertiliser"		do	do		\$32.00	"
222	"Bradley's XL Superphosphate"		Bradley Fertiliser Co., Boston, Mass.	G. C. Miller, Middleton, N.S.		\$32.50	"
223	"The Reliance"		G. H. Nichols & Co., Capleton, P.Q.	Manufacturers		\$27.00	"
224	"The Victor"		do	do		\$30.00	"
225	"The Royal Canadian"		do	do		\$38.00	"
226	"The Capleton Superphosphate"		do	do			"
227	"No. 1 Superphosphate"		do	do			"
229	"Ground Bone"		Pidgeon & Mosher, Windsor, N.S.	do		\$35.00	"
230	"Eureka Phosphate"		do	do		\$36.00	"

TABLE I—RECORD of Fertilisers Analysed—Concluded.

No.	Designation.	Name of Manufacturer.	By whom sent.	From what Materials produced.	Cash selling price.
231	"Eureka Potato Manure"	Pidgeon & Mosher, Windsor, N.S.	Manufacturers	Bone, animal matter, nitrate of soda and potash salts.	\$38.50 per ton.
232	"Westport Fertiliser"	J. O. Morrison, Westport, N.S.	Manufacturer	Fish offal, salt, soot, copperas and sulphuric acid.	
233	"Ceres' Superphosphate"	Messrs. Jack & Bell, Chemical Fertiliser Works, Halifax, N.S.	Manufacturers		
234	"Medium Bone"	do	do		
235	"Bone Meal"	do	do		
236	"Reid's Superphosphate of Lime"	Thos. Reid, St. John, N.B.	Manufacturer		
237	"High Grade Ammoniated Bone Superphosphate."	E. Frank Coe, 16 Burling Slip, New York	do		\$40.00 "
238	"Potato Fertiliser"	do	do	Dried blood, meat, fish guano, bone, phosphatic guano, sulphate of potash and oil of vitriol	
239	"Bowker's Ammoniated Food for Flowers."	Bowker Manufacturing Co., Boston, Mass.	J. A. Simmers, 147 King St. East, Toronto.	do	
240	"Genuine Peru Guano"	Mapes Formula Guano Co., New York.	do		
241	"Bone Meal"		Wm. Rennie (vendor), Seedman, Toronto.		
242	"Blood Manure"		do		
243	"Croft's Indian Bone Meal, No. 4"	Imported	Louner, Rohr & Co., Montreal		
244	"Croft's Indian Bone Meal, No. 5"	do	do		

The results of the analyses of these samples are given in Table II, which also states, in the most of cases, the percentages of fertilizing constituents which the manufacturers guarantee them to contain. Certificates of analysis have not in all cases been supplied by the vendors, and frequently the quantities guaranteed are mere approximations. This must be remembered in comparing these with the percentages as ascertained in this laboratory.

Table II also contains a column in which is stated the "relative value" of the fertilizers. It must not be supposed that these values indicate the prices at which the goods ought to be sold to the consumer, because, in calculating them, no regard whatever has been paid to the cost of manufacture or mixing. The Act only requires that the *relative* value should be given, evidently in order that a comparison should be instituted among the fertilizers themselves. The manner prescribed by the Act has been followed in estimating the values, and the following rates, which correspond roughly to the values of the fertilizing ingredients in wholesale Canadian markets, have been used in the calculations:—

	Cents. per lb.
Nitrogen in ammonia salts or nitrates.....	14
Organic nitrogen in ground bone, fish, blood or tankage .....	14
Phosphoric acid soluble in water .....	7
do soluble in ammonium citrate .....	6½
do as contained in the Thomas phosphate powder.....	2½
do in ground bone and tankage.....	6
do in finely-ground rock phosphate .....	2
Potash as contained in potashes or pearl ashes.....	7
do as contained in wood ashes .....	6
do as contained in high grade potash salts .....	5½
do as contained in kainite if imported in bulk .....	3½

Some of the fertilizers manufactured in Canada still leave much to be desired as regards their fineness and evenness, and it has not been found advisable to state the relative value of the following samples on account of their coarseness: Nos. 190, 212, 220, 229 and 234.

TABLE II.  
ANALYSES of Fertilisers.

No. of sample.	NAME OR BRAND OF FERTILISER.	NITROGEN.		PHOSPHORIC ACID.					Potash.	Moisture.	Relative value per ton of 2,000 lbs.
		Total; including that of Nitric Acid or Ammonia if present.	Total; calculated as Ammonia.	Soluble in Water.	Reverted or Citrate Soluble.	Insoluble.	Total.	Total Available.

An attempt was recently made from this office to ascertain the extent of the fertilizer trade in Canada, but the returns obtained were incomplete and can only serve as the foundation for an approximative estimate. The latter cannot be placed higher than 3,400 tons, which was the probable quantity of fertilizers sold in the Dominion last year. From this it appears that the trade is as yet in its infancy, and that "high farming" is still unknown in Canada. The prices here are, on the whole, lower than in the United States, where at least a million tons are made use of annually.

Canadian farmers seem to entertain a prejudice against the use of fertilizers, owing to the apparent high prices charged for them. In a former report addressed to you, dated 20th December, 1886, and published in Supplement III to the departmental report of that year, I called attention, among other matters, to the fact that the cost of fertilizers is greatly increased by the admixture of substances containing nitrogen, which ingredient might be saved by the exercise of a little care on the part of the farmer. Since you may possibly authorize the publication of this report, I take this opportunity of mentioning a few particulars connected with this subject which may be of interest to agriculturists generally.

If we take the case of an ordinary compound fertilizer, containing, say, 3.6 per cent of nitrogen, the cost to the manufacturer of introducing that quantity into it amounts to \$10 per ton, which the farmer must pay if he purchases, and which he is perfectly capable of saving in his own stables or producing upon his own farm. It has long been known that stable-yard manure experiences considerable loss of its fertilizing constituents, but more especially of nitrogen, when left to itself in the dung heap. According to the experiments of Wolff, this loss amounts to 55 per cent of the nitrogen contained in fresh manure from horned cattle. The later experiments of Heiden and Holdefleiss place it at 23.4 per cent. These results were obtained when ordinary reasonable care is taken of the manure, but give no data for estimating the loss which occurs when, as is most frequently the case in Canada, the manure is treated with the grossest neglect. It is safe to assume that generally 50 per cent of the nitrogen contained in the barnyard manure of this country returns unutilized to the atmosphere. Assuming that an average quantity of 36,000 lbs. is produced annually by each animal, and that it contains 0.4 per cent of nitrogen, it follows that a loss of 72 lbs. nitrogen, worth \$10.08, takes place for each head of cattle. This loss can be prevented by strewing amongst the manure in the stables about 700 lbs. ground plaster for each head, at a cost of about \$2.50 per annum. By doing this the farmer would be relieved from the necessity of purchasing the nitrogen of agricultural fertilizers.

Not only can the farmer thus save the nitrogen of his barnyard manure, but he can actually increase the stock of it stored away in his fields, products and dung heaps. Recent investigation has shown that certain crops have the power of appropriating the nitrogen of the atmosphere, and that, by a judicious course of crop rotation, the farmer may take advantage of this fact to enrich his farm. For more than a century, agricultural chemists have discussed the question as to whether free atmospheric nitrogen can be assimilated by plants, and probably the controversy would have continued without result to the present hour had not a practical agriculturist, named Schultz, in North Germany, thrown light upon the subject by means of his trials on the large scale, and the manner in which he described and explained these to his countrymen. König, of Munster, gives the following summary of Schultz experience:—

"Schultz acquired the farm Lupitz in the year 1855; its soil consisted of a poor, cold diluvial sand; the profit in working it was very small. Lupines yielded indeed as fodder tolerable results, but when used as green manuring for rye or oats, no return was obtained from them. The application of artificial manures produced good crops, but they did not pay; burnt lime showed itself to be too heating. The use of manure was more favourable, especially when fertilizers containing phosphoric acid were used at the same time. But at the best the total result was not satisfactory.

“Shortly after Schultz acquired Lupitz the great discovery of potash salts was made, and about 1860 they began to be produced from the mines of Stassfurth. Schultz made up his mind to try them as manure and he obtained the most surprising results. After lupines had shown themselves to be useless as forerunners of grain, they were excluded from the rotation, and grown on a separate field without any manuring and alternating with sheep pasture. But the harvest on these became worse and worse, until the field in question became quite lupine sick. Schultz made his first trial on this field, manuring it with 300 lbs. kainite per morgen (1 Prussian morgen = 0.631 acre); the sickness was at once cured, and for twenty-five years afterwards Schultz has grown lupines on this ground without interruption, always with the application of 300 lbs. kainite. Schultz obtained similar good results on the ground which had received the marl, by the application of potash salts. This ground had indeed yielded well with lupines for two years after the application of the marl, but in the third year they sickened here too. When, however, the 300 lbs. kainite were applied here and ploughed in in the fall, the ground was cured, although an application of phosphates had not produced the desired results.

“The favourable influence which the manuring with kainite or potash salts had exerted on lupines induced Schultz to try them on grain, in conjunction with phosphates. But in this case he obtained contradictory results, according to the nature of the crop which preceded the grain. For instance, while grain sowed after lupines and manured with potash and phosphates yielded very good and remunerative harvests, these were not to be obtained if grain was grown after grain or after potatoes. This behaviour of these crops was explained by Schultz in this way, that lupines as deep rooted plants leave in the soil after harvest a residue of root, in which a considerable amount of nitrogen has accumulated—an amount sufficient to supply the wants of the following grain crop; that, on the other hand, the application of potash and phosphates to grain, after a preceding grain crop, is without effect, for the reason that the latter had consumed the stock of nitrogen. Grain crops always reduce this stock—never increase it. Schultz has given the name nitrogen collectors to the lupines and similar plants, while grains are called nitrogen consumers. His system of rotation is therefore the following: Sow first nitrogen collectors (lupines, pease, beans, vetches, clover, lucerne, serradella, &c.), or, as they have been called, renovating crops, and give them 300 lbs. kainite per morgen, with perhaps an addition of 20 lbs. phosphoric acid. After harvesting the nitrogen collectors sow a nitrogen consumer, raising a grain or exhausting crop, giving it also 300 lbs. kainite and 20 lbs. phosphoric acid. The grain crop is perfectly successful, because the first crop left behind it nitrogen enough to supply the wants of the grain. In this way the keeping of stock, which is expensive on a poor sandy soil, can be reduced, and the purchase of nitrogenous fertilizers dispensed with, because the nitrogen collectors are able to stock the soil with that valuable element.”

The foregoing description is taken from Professor Königs' "Stickstoff Vorrath," published in 1887 (Paul Parey, Berlin). It was in 1884, nearly thirty years after the purchase of his sandy farm, that Schultz, of Lupitz, published the results of his experience, although they did not contain anything very new, and although they only confirmed experiences still older than his own. But his case was surprising, and his explanation of the cause of his successful farming challenged the attention of scientific agriculturists. The consequence has been the issue of many pamphlets on the subject, and an activity in the region of agricultural experimenting which has continued for five or six years, and is not yet ended. Atwater, Wagner, Heiden, Hellriegel, and many others have participated in these investigations, and Professor Woods, of the Storrs Agricultural School in Connecticut, gives the following general conclusions as the result of the work up to the present:—

“1. Pease, alfalfa, serradella, lupine, clover in all probability, and apparently leguminous plants in general, are able to acquire large quantities of nitrogen from the air during their period of growth.

“2. There is scarcely room to doubt that the free nitrogen of the air is thus acquired by plants.

"3. That there is a connection between root tubercles and this acquisition of nitrogen is clearly demonstrated. What this connection is, what are the relations of micro-organisms to the root tubercles and the acquisition of nitrogen, and in general how the nitrogen is obtained, are questions still to be solved.

"4. The cereals with which experiments have been completed have not manifested this power of acquiring nitrogen, nor do they have such tubercles as are found on the roots of legumes.

"5. In the experiments here reported, the addition of soil infusions did not seem necessary for the production of root tubercles. A plausible supposition is that the micro-organisms or their spores were floating in the air and were deposited in the pots in which the plants grew.

"6. As a rule, the greater the abundance of root tubercles in these experiments, the larger and more vigorous were the plants and the greater was the gain of nitrogen from the air.

"7. In a number of these experiments, as in similar ones previously reported, there was a loss of nitrogen instead of gain. The loss occurred where there were no root tubercles; it was especially large with oat plants, and largest where they had the most nitrogen at their disposal in the form of nitrates. As the gain of nitrogen by the legumes helps explain why they act as renovating crops, the loss in the case of the oats suggests a possible reason why they should appear to be an exhaustive crop.

"Practical inferences.—The ability of legumes to gather nitrogen from the air helps to explain the usefulness of clover, alfalfa, pease, beans, vetches and cow-pease as renovating crops and enforces the importance of these crops to restore fertility to exhausted soils. The judicious use of mineral fertilizers (containing phosphoric acid, potash and lime) will enable the farmer to grow crops of legumes which, after being fed to his stock, will, with proper care to collect and preserve all manure, both liquid and solid, enable him to return a complete fertilizer in the shape of a barnyard manure to his land. A further advantage of growing these crops is that the nitrogenous material, protein, which they contain in such great abundance, is especially valuable for fodder."

From the foregoing it seems that, in the present condition of our knowledge, the conclusion may fairly be drawn that the atmosphere stands ready to furnish the farmer gratis with all the organic constituents which his crops require, provided always that he, on his part, will exercise a sufficient amount of skill and intelligence in appropriating and retaining on his farm the fertilizing materials, and especially the nitrogen. If he does this, all that it is necessary for him to provide, in order to replace the losses which his farm sustains from the sale of stock or produce, are the inorganic or mineral constituents of these, and especially the phosphoric acid and potash. There is much in all this to remind one of Sprengel and Liebig's teaching of fifty years ago, according to which a plant cannot thrive if its soil does not contain all the substances which are to be found in its ash. As regards the cheapest forms in which these inorganic constituents can be applied to crops, there is no doubt that these are high grade superphosphate or Thomas phosphate powder for the available phosphoric acid, and kainite for the potash. There does not appear to be any reason why these substances should not be introduced into the stable manure in the same manner as in the case of the ground plaster above mentioned. Some of the salts contained in the superphosphate and kainite would be useful with the sulphate of lime in fixing the ammonia, as soon as formed from the organic nitrogen. Should this suggestion be found to have practical value, there is no doubt that our fertilizer manufacturers would be found able to supply our farmers, at a very moderate cost, with a mixture of ground plaster, superphosphate and kainite, in such proportions as experience might show to be most advantageous.

I have the honour to be, Sir,

Your obedient servant,

THOMAS MACFARLANE,

*Chief Analyst.*

10th March, 1891.

**BULLETIN No. 23—SWEET SPIRITS OF NITRE AND DILUTED PRUSSIC ACID.**

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—In the following tables you will find a statement of the results which have been obtained by Mr. Franklin T. Harrison, official analyst for the District of Windsor, in the examination of certain samples of Spirit of Nitrous Ether and Diluted Hydrocyanic Acid which were submitted to him for examination. These results are on the whole confirmed by the reports of Dr. J. Baker Edwards, official analyst at Montreal, who examined the same samples. The tables also gives the names of the parties from whom the samples were purchased, and those of the wholesale houses supplying the goods according to the statement of the vendor. From the particulars given it would appear that these drugs are sometimes sold in a deteriorated condition, and that some of the samples may be described as adulterated within the meaning of the Act respecting the Adulteration of Food, Drugs and Agricultural Fertilisers. The whole of the samples referred to were collected in Montreal, but it is quite likely that about the same state of affairs exists in other cities of the Dominion. I enclose herewith Mr. Harrison's report on this investigation, and have to recommend that it, as well as the table, be published.

I have the honour to be, Sir,

Your obedient servant,

THOMAS MACFARLANE,  
*Chief Analyst.*

OFFICE OF THE PUBLIC ANALYST,  
LONDON, ONT., 11th May, 1891.

THOMAS MACFARLANE, Esq., F.R.S.,  
Chief Analyst.

SIR,—I have the honour to transmit herewith the report of my work upon samples of Sweet Spirits of Nitre and of Acid Hydrocyanic Dilute, which were analysed by me during the first three months of the present year.

I have examined in all eighteen samples—nine of the spirit and nine of acid. The following table gives the results obtained :—

Samples.	Genuine.	Below B.P. Strength.	Adulterated	Total.
Spirits of Nitrous Ether.....	3	4	2	9
Acid Hydrocyanic dilute.....	3	4	2	9

As both of these substances are liable to deteriorate on keeping, even if they are originally pure and of full strength, I have placed a separate column for those which came below the B. P. strength, but which may not have been adulterated.

*Spirit of Nitrous Ether.*

This is a preparation, official in the British Pharmacopœia, and is very extensively used in pharmacy. It consists essentially of a solution in Rectified Spirit of Ethyl Nitrite ( $C_2H_5NO_2$ ) more or less pure.

Though no doubt it always contains substances of a more or less complex nature, its value, medicinally, depends on the amount of Ethyl Nitrite present.

The tests of the Pharmacopœia consist in detecting the presence, and estimating the amount of Ethyl Nitrite and in detecting the presence or excessive amount of impurities. It states that it should yield, when treated by "Allens test," seven times its volume of Nitric oxide gas, or on being kept some time, not much less than five times its volume, measured at  $60^\circ F.$  and  $760^m$  pressure.

By this test, 5.3066 times the volume of gas corresponds to 2 per cent. of Ethyl Nitrite, the specific gravity of the sample being .845; so that a good sample ought to contain not much less than 2 per cent. or more than  $2\frac{1}{2}$  per cent.

Three samples which I examined corresponded to the B. P. test as to the percentage of Ethyl Nitrite, while the others were deficient in strength, one sample being entirely devoid of Ethyl Nitrite.

All the samples effervesced with Bicarbonate of Sodium.

All contained traces of aldehyde, which is nearly always present, but three contained what I considered excessive amounts.

Two samples were adulterated with water. This is a very objectionable addition; not only does it dilute the spirit, but it renders it very liable to deteriorate, and in a short time will become quite worthless. A sample of full strength which I diluted with water until it had a specific gravity of about .900 was entirely devoid of Ethyl Nitrite in six months, while samples which I prepared according to the B. P. process and kept in glass-stoppered bottles entirely filled were of full strength after keeping one year; but after the bottle was opened, and on using out of it daily, it gradually deteriorated, so that I think it ought to be kept in bottles completely full, and with glass stoppers, and of such size that it will be disposed of in about a fortnight after being opened.

*Acid Hydrocyanic Dilute.*

Of the nine samples analysed two were labelled "Scheeles Strength."

Two of the samples contained Hydrochloric Acid, and which I returned as adulterated, as the B. P. mentions it as an adulteration, though I do not consider it in any way injurious or detrimental, and as many eminent pharmacists claim, that the addition of a mineral acid will preserve Hydrocyanic Acid the addition was doubtless made for the purpose.

I have the honour to be, Sir,

Your obedient servant,

FRANKLIN T. HARRISON.

## BULLETIN No. 24—TEA.

E. MIALL, Esq.

Commissioner of Inland Revenue.

SIR,—I return herewith the report addressed to you by Professor Edgar B. Kenrick, official analyst for Manitoba, with reference to a number of samples of tea submitted to him for analysis, and have to recommend its publication in the Bulletin series, together with the tables showing its results. These tables have been slightly enlarged by the addition of particulars regarding the source of the samples examined, but Professor Kenrick's order of arrangement has been retained.

Besides the many valuable results of Professor Kenrick's work, it seems to show that the statement made by Claus, to the effect that inferior varieties of tea contain more theine than the higher grades, is not well founded.

It will be observed that Professor Kenrick, in comparing the yield of the various samples in certain soluble substances, has adopted a method of infusion closely resembling that in ordinary household use. Some interesting conclusions may be drawn from a comparison of these results with those heretofore obtained by other analysts who generally adopt the plan of completely removing all the soluble substances. Geisler is mentioned as having practised the household process in 1884, but there is an instance as early as 1876 recorded by König, who determined the quantity of the substances soluble in water in a sample of black tea according to the "customary domestic method". He only found 18·22 per cent, a result much below all of Professor Kenrick's averages. König describes this tea as the best sold in Münster, and remarks that the quantity of soluble substances is surprisingly small compared with the results obtained by the methods of the analysts. This last remark is equally applicable to Professor Kenrick's figures. The following table shows the average percentage of soluble substances with tannin removed by complete extraction, according to the analysts named:—

AUTHORITY.	BLACK TEA.			GREEN TEA.		
	No. of Samples	Total Extract.	Tannin.	No. of Samples	Total Extract.	Tannin.
Hassal.....	27	33·85	.....	13	41·20	.....
do .....	1	33·25	15·24	1	39·06	18·69
Slater .....	13	30·36	11·15	1	41·48	21·35
Battershall.....	3*	30·13	13·61	4†	37·95	18·37
Average.....		31·89	13·33	.....	39·92	19·47

\* Congou. † Young Hyson.

By the domestic method, as applied by Professor Kenrick, the following quantities are removed:—

Teas.	No. of Samples.	Total Extract.	Tannin.
Congou.....	10	23·37	5·18
Unclassed black.....	13	23·76	5·40
Average.....	23	23·56	5·29
Gunpowders.....	2	28·55	8·00
Young Hysons.....	5	34·22	10·98
Average.....	7	31·38	9·49

From these figures it appears that in the ordinary method of using black tea about 73·7 per cent. of its soluble constituents, including only 39·7 per cent of the tannin, is removed, and that in the case of green tea these figures amount to 78·8 and 48·7 per cent respectively.

On the other hand, Professor Kenrick's work shows that by the domestic practice the theine is completely utilised. The quantities he obtained are fully up to those yielded by analysis when methods of complete extraction are used. The following are some of the averages which have been obtained in the latter case:—

AUTHORITY.	PERCENTAGE THEINE.	
	Black Tea.	Green Tea.
Mulder.....	0·46	0·43
Hassal.....	2·53	2·79
do.....	2·08	2·17
Dragendorff.....	1·86	1·69
Bell.....	3·24	2·33
Battershall.....	2·62	1·70
Average, excluding Mulder's.....	2·47	2·14

Professor Kenrick's results show that for black tea 2·73, and for green 2·47 per cent of theine are removed in the method of preparing the infusion which is adopted.

There is possibly nothing new in the statement that, by the domestic method of using tea, much of the astringent substance is left undissolved in the residue; but I believe that the figures, proving this as well as the complete utilization of the theine, are given for the first time in Professor Kenrick's report.

The amount of adulteration in the samples examined does not exceed at most 6 per cent of their number.

I have the honour to be, Sir,

Your obedient servant,

THOMAS MACFARLANE,

Chief Analyst.

ST. JOHN'S COLLEGE, WINNIPEG, 22nd May, 1891.

To the Commissioner of Inland Revenue,  
Ottawa.

SIR,—I have the honour to present my report on fifty-eight samples of tea upon which I have been working during the past five months.

Though tea is one of those few articles which is seldom adulterated, it is a matter of common knowledge that tea, according to its quality, varies in price between very wide limits. It was desired that if possible a relation might be traced between the chemical composition and the price of a tea.

The following alleged sophistications to which tea is liable are chiefly as follows:—

1. Admixtures with leaves from plants other than the tea plant.
2. The substitution, wholly or in part, of "exhausted" leaves, or leaves which have been already used in making tea, and subsequently dried and rolled up again in imitation of genuine tea.
3. The addition of various mineral substances, such as sand, powdered quartz, magnetic iron, &c., in order to add weight to the tea.

The colouring or "facing" of green tea is by some considered an adulteration, but taken *per se*, it can scarcely be regarded as such, for the colouring matter, being used in small quantities only, can add no appreciable weight to the tea, and, in fact, is said rather to increase the cost of production. No doubt, however, facing is frequently resorted to, in order to disguise the appearance of inferior teas, or in making up various spurious imitations. "An undue proportion of stalks" also is described by one writer as an adulteration, and "lie-tea," to which I shall have occasion to refer later on, can scarcely be regarded in any other light.

Although there appears to be no doubt at all that tea is, or certainly was at one time, very extensively adulterated by the Chinese, on the other hand there seems to be a difference of opinion as to the extent to which adulteration has been practiced after importation. Thus, while many writers state that at one time there existed manufactories in London for the working-up of exhausted leaves, Dr. Wynter Blyth, in his well-known work on "Foods," says that there is "no evidence that a single hundred weight of tea has been tampered with in England." I shall briefly refer to these various adulterations with reference to the tea samples now under consideration.

*Foreign Leaves.*—The botanical characters of the tea leaf are so well marked that there is no difficulty in distinguishing it from the leaves of other plants. A careful examination of the leaves of these samples after treatment with hot water failed to disclose the presence of a single suspicious looking leaf.

*Exhausted Leaves.*—These are not easy to detect. The analyst is usually guided by the amount of total solids extracted by hot water and by the quantity of ash—these being less in the exhausted leaf. The variation in chemical composition between the different varieties of genuine tea are unfortunately so great that consideration of this kind are of little value, except when the proportion of exhausted leaves is comparatively large. In the Departmental circular, G. 126, "Suggestions to Public Analysts" (1884), the minimum limits suggested are 5.75 per cent for total ash, and 3 per cent for soluble ash. An inspection of the accompanying tables will show that 12 samples fall below these limits as regards total ash, while only 1 falls below the limit of 3 per cent for soluble ash. In view of figures obtained from genuine teas by reliable chemists, I cannot help thinking that the limit for total ash in G. 126 is too high. Both Ceylon teas (Table III) give very low results in total ash, but it will be seen that this is owing to the small amount of insoluble ash, the soluble ash in both cases being well above the limit. It will be seen, too, that the Assam teas (Table II), which, in many respects, is similar to the Ceylon teas, give results in total ash low as compared with the amount of soluble ash. Sample No. 17 in Table IV looks very much as if it were adulterated with exhausted leaves.

*Mineral Substances.*—The addition of such mineral substances as sand, magnetic oxide of iron, &c., would obviously increase the amount of total ash—the addition, for example, of 5 per cent of sand to the tea, meaning an increase of about 5 per cent in the total ash. A comparison of the ash of the individual samples with either the averages for the whole series, or with averages obtained by other chemists, will show at once that no adulteration of this kind has been practiced. The maximum limit for the total ash of genuine teas is usually placed at 8 per cent. All these samples give results below this limit, the nearest approach to it being in No. 46, Table IV, and the two Gunpowders in Table VII.

I have made no systematic examination for facing. None of the samples were heavily faced, though some of the Japan teas appeared to be slightly coated with colouring matter. The substances used for facing teas are, I believe, of an entirely harmless nature, and, unless employed to conceal the true character of spurious teas, very little can be said against the practice.

In speaking of the colouring of Japan teas I may here refer to the rather extraordinary, though not uncommon, popular belief that green and Japan tea owe their colour to the presence of copper acquired from copper vessels during the progress of preparation. I have been unable to trace the origin of this belief, and can find no record of analysis in which copper has been detected in tea. The green colour of ordinary green or Japan tea is due simply to chlorophyll—the green colouring matter found in nearly all plants. This green colouring matter is not soluble in water, and so is not dissolved out in the ordinary process of making tea, but if any kind of tea (green or black) be pulverized and shaken up with alcohol a more or less grass-green solution is obtained, in which chlorophyll may very readily be identified by its characteristic absorption spectrum. There is not as much difference as might be expected between the amount of chlorophyll given by a green and black tea, but I have found that the cheap black teas yield less chlorophyll than the better kinds, and I am inclined to think that results of practical value might be obtained by making a simple colorimetric determination of chlorophyll.

Samples Nos. 52 and 53 in Table VII must undoubtedly be looked upon as adulterated. No. 52 was sent to me labelled “Japan tea,” but I have no doubt from its appearance, and especially from its resemblance to No. 53, that it is a Gunpowder, and I have accordingly classed it with the latter sample. The analysis of these two samples, it will be seen, resemble each other very closely. The total solids extracted by hot water are (for green teas) rather low, and soluble ash is much below the average. Insoluble ash in these samples is very much above the general average, being only exceeded in one out of the whole 58 samples. This would indicate an undue amount of mineral impurities, but the quantity is not sufficient to render it probable that mineral substances have been added by themselves as an adulteration. The little spherules of agglutinated dust and dirt, made up in clever imitation of the general leaf balls, appear to be the material known to the Chinese as “lie-tea”—a substance described as the sweepings of the warehouses worked up with colouring matter and rice water. In order to ascertain, if possible, if these two samples were representative of the Gunpowder sold in Winnipeg, I examined 10 additional specimens obtained myself from retail dealers in Winnipeg. One only out of the 10 resembled all the samples whose analysis are given in Table VII. Nearly all of these Gunpowders—including the adulterated sample—were sold at 60 cents per pound. One was sold at 50 cents, and another was very much cheaper. The last mentioned was found to be pure. Even if these spurious teas do not contain injurious substances it is evident that such adulterated samples as the two whose analysis are given are very poor value for the money, if sold at 50 or 60 cents per pound. I have been informed that it is a particular class of Gunpowder (known as Pingscey) that are adulterated in this way. It is satisfactory to find that the majority of Gunpowders sold in Winnipeg do not belong to this class.

It would thus appear that, out of the 58 samples analysed, two, or at most three, are adulterated. I shall now endeavour to show how far a chemical analysis may be depended on in judging of the value of tea.

The primary causes influencing the value of a tea appear to be chiefly the age of the plant, the age of the leaf, and the time of year at which the leaves are picked. The younger the leaf the more tender and juicy will it be, and the more ready to give up its soluble constituents to hot water. Thus, the more valuable grades of any kind of tea will consist of the younger and smaller leaves. Much will naturally depend upon the care bestowed upon it in its preparation, and no doubt the quality of a tea is much influenced by the nature of the soil, the climate, &c. Furthermore, as is well known, tea loses its "goodness" on keeping, the characteristic aroma and odour gradually passing off. Thus, even if it were possible by the physical characters alone to judge of the value of a tea at a known interval from the date of its preparation, owing to the deterioration which takes place on keeping, it would be impossible by an examination of the leaves alone to form an estimate of their value if the year of their growth were unknown.

In the technical valuation of tea the "tea-taster" pours a measured quantity of boiling water on a weighed amount of the tea sample, and after the lapse of exactly three minutes pour off the infusion from the leaves. The unrolled leaves left in the vessel are carefully examined, and note taken of their size and the extent to which they are broken up or damaged. In forming a judgment on the infusion, both the strength and flavour are taken into account, and the peculiar odour of the unfolded leaves is noticed. It may thus happen that two tea samples, having equally good "drawing" or infusing qualities, may have a very different commercial value, owing to the difference in the physical characters of the leaves. In the process of manufacture the different sized leaves are separated by sifting, and no doubt in this process a quantity of fine fragments and dust is obtained, and this, though possibly having good drawing qualities, would be sold at a cheap rate. Among the samples I have examined there were teas consisting very largely of these small fragments, and as these samples had very little of the characteristic odour of tea it may be that teas consisting of these broken up leaves would deteriorate more rapidly than those made up of tightly tolled, perfect leaves.

In a tea-taster's examination a portion only of the soluble constituents are removed from the leaf. In a chemical analysis the tea is usually boiled for some hours with water, the water is poured off, the leaves boiled up again with fresh water, and this operation is repeated until nothing more will dissolve. The joint extracts are then analysed, the constituents usually determined being theine and tanning, together with the total amount of solid substances extracted by the water.

It will be seen at once that the tea-taster's method of preparing the infusion resembles much more closely the practice of the ordinary tea drinker than does the method of the analyst. The value of the tea to the consumer depends entirely on what is extracted by hot water in the ordinary method of making tea, and not on what is thrown away with the leaves. The tea-taster takes advantage of this in valuating the tea. In view of these facts, and considering that the ordinary chemical method of estimating the whole amount of tannin, theine and soluble solids in the leaf gives very little indication of the value of the tea, I have ventured to depart from the ordinary practice, making my determinations of these ingredients in a solution prepared after the manner of the ordinary household method of making tea. In this process (which was employed by Geisler in 1884 in an extensive series of analyses of teas imported into the United States) 100 parts of boiling water are poured on 1 part of tea, and the infusion poured off at the end of ten minutes. It is probable that ten minutes is much nearer the average time allowed in the household process than is the three minutes in the tea-taster. The proportion of water is perhaps rather larger than that commonly employed in making tea. Slight variations in the proportion of water used do not, however, make any material difference in the results obtained—these, of course, being calculated on the weight of tea taken.

The amount of total solids in the infusion thus obtained is probably comparable to the "strength" of the infusion as noted by the tea-taster; no data are, however, obtained corresponding to the flavour taken into account in a technical valuation. The alkaloid theine, though physiologically speaking the more important ingredient,

has a slight bitter taste only, and neither this nor the tannin determines the flavour of the infusion. The flavour is probably due to the volatile oil present in small quantity, and to other substances existing in the tea in still lesser proportion.

In collecting the series of 34 tea samples which I examined during the early part of the year—16 of which were obtained in this city and 18 in the neighbourhood of Ottawa—no distinction was made between the various kinds of black and green teas, all the samples, with the exception of two Indian teas, being sent to me simply as "Black" and "Japan," as the case might be. In forwarding my returns for these samples I said that while there appeared to be a general relation between price and chemical composition, the results would be more intelligible if the teas from one country were compared among themselves, and not with those from other districts. I suggested that if it were desired to have the normal relations between the price and chemical composition, in buying the samples the names of the teas should be obtained from the vendors, and, if possible, the wholesale prices. A fresh series of samples was accordingly procured from the wholesale firm of Messrs. G. F. & J. Galt of this city, the results of which are given in Tables I, III, V and VIII. Before referring in detail to these, I would call attention to the following table of averages, which shows to a certain extent how far a chemical analysis can be relied on in judging the value of a tea of unknown origin.

TABLE IX.

## AVERAGE OF TEAS CLASSED ACCORDING TO PRICE.

## BLACK TEAS.

Price.	—	Solids.	Tannin.	Theine.	Soluble Ash.	Insoluble Ash.
Cts.						
25	2 samples	19.3	3.83	2.34	3.01	2.74
40	2 do	20.9	5.50	2.36	3.36	2.60
50	6 do	26.6	6.01	3.00	3.63	2.25
55	1 do	(24.7)	(5.54)	(3.31)	3.64	2.26
60	1 do	27.9	6.49	3.23	3.68	2.10
80	1 do	(16.5)	(3.47)	(2.68)	4.06	(2.24)

## JAPAN TEAS.

20	1 samples	26.5	(9.29)	1.89	(3.67)	3.04
25	1 do	28.3	7.93	2.21	3.48	(2.59)
30	6 do	29.8	8.96	(2.58)	3.57	3.01
35	3 do	30.9	10.17	2.35	3.53	2.27
40	5 do	(29.7)	(8.98)	(2.51)	3.62	(2.86)
50	2 do	33.2	11.24	2.42	3.93	2.13

It will be seen from this table (Table IX) that, although there may be great irregularities when individual samples are compared, the average for teas of the same price vary regularly in accordance with the commercial value. Thus in both black and Japan teas total solids, tannin, theine and soluble ash increase with the price, while insoluble ash decreases as the price raises. The numbers placed in brackets are exceptions to this rule. The single samples of black tea at respectively 55 and 80 cents, and the 40 cent Japan tea seem totally out of their places. The 80 tea gave the lowest results of the whole series of 58 samples, and I can see no reason at all for its high price. On the whole there appears to be greater regularity in the black teas than in the Japan, the exception in the case of the former being confined to individual samples.

A careful study of Tables IV and VI, and especially a comparison of the chemical data with the notes on the physical characters, will bring out many interesting points. The cheap teas, while giving as a rule low figures in the analysis, are often seen to be made up of small fragments of leaves and possesses very little odour. On the other hand, as in No. 12, Table II, a much broken-up leaf may give a very strong infusion. Undoubtedly in the case of this sample the cheapness (20 cents per pound) is due to the fragmatory nature of the leaves. I have been unable to find out to what extent keeping a tea effects its chemical composition. On the other hand the cheap teas, which from their lack of odour would appear to be old, give weak infusions, while on the other hand the average obtained from the teas of Messrs. Galt, in Table V, are very little higher than those in Table VI, and there can be no question that the former are much newer teas than the latter.

Though I have been unable to predict the drawing qualities of a black tea from its outward appearance, the colour in the case of Japan teas gives some indication of the quality in this respect. These latter teas contain leaves of different shades, varying from dark-olive to a pale green. The dark green leaves appear to give most extract. Though it is not possible to make an exact division, I have divided the teas in Table VI roughly into two classes according to their colour. The darker ones I have distinguished in the table by the word "dark green." It will be seen that those teas thus designated give extract from 30.4 upwards, while those not so distinguished fall below 29 per cent.

Tables I, V and VIII show three series of teas, each table containing teas of one kind only and presenting a gradation in price. These teas were obtained from the wholesale firm of Messrs. G. F. & J. Galt, of Winnipeg. Messrs. Galt were careful to select teas of the same years' growth in order that the results of the analysis might be strictly comparable.

In Table I it will be noticed that up to a certain point there are relations similar to those pointed out with reference to the averages of Tables IV and VI. Thus in the first five numbers of the series there is a tolerably regular increase in the total solids, tannin and soluble ash, and a corresponding decrease in insoluble ash. After this the remaining five samples give irregular results, differing little from the 2nd and 3rd members of the series. The theine is irregular all through the table. In Table V the first four members exhibited a striking regular increase in total solids, tannin, theine and soluble ash, with a falling off of these ingredients in the 5th member. As in Table VI, the darkest coloured tea gave the most extract. The Young Hysons, in Table VIII, give less regular results. As far as they go, the results for Assam and Ceylon teas in Tables II and III show relations of the same nature as those already pointed out.

The practical conclusions I have arrived at are briefly these:—

1. The value of a tea will depend on:—
  - A. Its infusing qualities.
    - (i.) As regards strength.
    - (ii.) As regards flavour.
  - B. The extent to which the leaves are damaged.
2. The strength and flavour of the infusion will be determined by (i) the age, and consequently the size, of the leaf; and (ii) the time the tea has been kept since its manufacture.
3. The infusing qualities may, therefore, to a limited extent be predicted from the size (as indicating the age) of the leaf.
4. A chemical analysis will indicate the strength but not the flavour of the infusion.
5. In cheap and medium priced teas the strength is of more importance than the flavour, and hence a chemical analysis will indicate the value of the tea.
6. In high-priced teas the flavour becomes a more important factor, and, therefore, the valuation of these teas is beyond the reach of a chemical analysis.

TABLE X.—AVERAGES.

	No. of Samples.	Cents per lb. *Wholesale.	Substances extracted by ten minutes infusion.			Moisture, p.c.	Soluble Ash, p.c.	Insoluble Ash, p.c.	Total Ash, p.c.	Ratio of Total Solids to Tannin.

Gunpowders . . . . .	2	.....	28·55	8·00	2·39	4·72	3·36	3·70	7·06	3·57
Young Hysons . . . . .	5	*23·8	34·22	10·98	2·52	5·40	3·83	2·10	5·93	3·12

Table X shows the average obtained for the different kinds of tea examined. The most interesting figures in this table are those contained in the fourth, fifth and sixth columns—representing as they do the ingredients dissolved from the leaves in the ordinary process of making tea. Congou, it will be seen, give a less amount of total solids than greens and Japans, while the Indian and Ceylon teas yield intermediate results. The chief constituent of these total solids is tannin, and the tannin is not directly proportional to the total solids—rising and falling more rapidly than the latter. The last column gives the ratio of the total solids to the tannin. Not only do the Japan and green teas yield more tannin than black teas, but the proportion of tannin to the whole extract is greater than the Japan and green teas. In view of the well known action of tannin on the digestive organs, these facts are of special interest in a country where Japan tea is so largely consumed and where dyspepsia is so prevalent a disease. Another point of interest is the relative amounts of theine obtained from infusions of black and green teas. Theine is an official compound in the British and United States Pharmacopœas, being prescribed as a remedy for sick headache. It would appear from the table that black tea would have an advantage over green when theine is used in the form of strong tea as a domestic remedy for headache.

I have the honour to be, Sir,

Your obedient servant,

EDGAR B. KENNICK.

## BULLETIN No. 25.—SUGARS, SYRUPS AND MOLASSES.

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—From the month of October, 1890, to that of February, 1891, a large number of samples of sugar, syrups and molasses were collected in the Lower Provinces, Quebec and Ontario, and submitted to the district official analyst for examination. Their results will be duly published in the food report for the fiscal year ending 30th June, 1891. From among those samples 100 were selected and subjected to a more minute examination by my assistant, Mr. F. W. Babington, F.I.C. His results, as well as the particulars regarding the source of the samples, are given in the tables appended to this letter, and Mr. Babington's remarks on these as well as his descriptions of the methods employed by him are also sent herewith and recommended for publication.

The descriptions of the samples and the results of their analysis are given in the tables in the following order:—I. White sugars, 21 samples. II. Yellow sugars, 22 samples. III. Syrups, 26 samples. IV. Molasses, 31 samples.

The percentages of cane sugar contained in the white or granulated class vary from 98.84 to 99.8; the average is 99.26. There is no adulteration, and indeed, as has been remarked before now, these sugars are probably among the purest food substances in commerce.

The yellow or brown sugars vary from 86 to 94.9 per cent. of cane sugar; average 90.23. No case of adulteration was detected. It is necessary to remark that the samples may have lost some moisture betwixt the time of their collection and analysis, and that the percentages given may not be exactly true of the samples at the time of their purchase.

The separation of the two groups, syrups and molasses, is not to be regarded as expressive of any essential difference in the two classes of the table. The sub-division has only been made to indicate the names under which they were sold. It would, however, be of advantage, both in trade and technology, if these terms were always used more in accordance with their original signification. If this were done, then it might be possible to restrict the term molasses to the drainings from raw sugar as produced from sugar cane in tropical countries. The word "treacle" was originally used to signify the thicker product which drains from refined sugar in the moulds used in the same localities. It seems now to be almost obsolete in this country, and possibly, even in the tropics, it is being replaced by the word "syrup." It is not unlikely, for instance, that the grade known as "Barbadoes syrup" may be equivalent to what was formerly known as "treacle." "Syrup" in pharmacy means an aqueous solution containing about 66.7 per cent of pure cane sugar, and the word might in commerce be restricted to the high-grade products of the refineries of the consuming country. As now used, however, the term includes products of very variable composition.

If we attempt a reclassification of the syrups and molasses described in the table on the principle that the latter class should never contain less than 40 per cent cane sugar, as indicated by saccharimeter reading, and should always possess the peculiar characteristic odour of molasses or treacle, these samples will be eliminated which have been noted as "genuine" among the molasses and also those among the syrups against which the remark "probably molasses," stands in the tables. Many of these on standing deposit a sediment containing cane sugar, and it is to be remarked that it was found impossible thoroughly to distribute this sediment among the bulk of the sample previous to testing it. The percentages given are therefore to be taken as applying only to the liquid part of the sample of molasses or syrup.

The 35 samples thus separated as genuine are all dark brown in colour, and show the following variations as regards the percentage of constituents found in them:—

Cane sugar, average percentage.....	42·30 to 54·42
Reducing sugar do .....	11·86 to 23·72
Total sugars do .....	62·41 to 69·74
Water do .....	27·17 to 32·87

It will be observed that the amount of reducing sugar in these samples never exceeds 23·72 per cent, and that the quantity of total sugars in them averages 66·07 per cent.

The following is a list of the samples in the table which cannot be classed under the terms "molasses" or "treacle," as above defined, excluding the three fruit syrups, Nos. 10647, 10635 and 10636:—

No.	Description.	Average Cane Sugar.	Reducing Sugar.	Total Sugars.	Water.	Colour.
10617	Golden Syrup .....	32·82	37·92	70·74	25·50	Dark yellow.
10626	do .....	30·78	42·00	72·78	24·32	do
9943	Syrup .....	39·25	29·94	69·19	29·30	do
9968	do .....	38·07	30·72	68·79	28·00	do
9246	Golden Syrup .....	12·47*	30·33	42·80	28·93	Greenish yellow.
9252	do .....	35·85	31·10	66·95	26·32	Dark yellow.
9255	do .....	27·56	27·20	54·76	36·08	do
9269	Syrup .....	4·47*	53·96	58·43	22·61	Grey paste.
9272	do .....	12·12*	32·46	44·58	32·59	Dark yellow.
9273	do .....	46·97	20·70	67·67	27·53	do
9278	do .....	38·25	23·50	61·75	22·63	Dark brown.
9283	do .....	43·68	26·44	70·12	26·91	do
9289	do .....	40·16	22·94	63·10	23·82	do
9291	do .....	39·74	22·54	62·28	30·95	Dark yellow.
9294	do .....	38·30	28·18	66·48	27·30	do
10625	Molasses .....	39·66	29·16	68·82	28·62	Dark brown.
10633	Demerara Molasses .....	43·90	24·20	68·10	30·00	Dark yellow.
9310	Porto Rico Molasses .....	39·13	26·64	65·77	30·90	Dark brown.
9271	Molasses .....	30·30	22·08	62·38	32·01	do

In this list, where the average percentage of cane sugar is marked with an asterisk \* the saccharimetric reading has been neglected. In three samples it runs beyond 100 per cent., and these have been condemned as adulterated with starch syrup. In the remaining samples the following variations are shown:—

Cane sugar, average percentage.....	27·56 to 43·90
Reducing sugar do .....	20·70 to 42·00
Total sugar do .....	54·76 to 72·78
Water do .....	22·63 to 36·08

There is thus a very wide range of variation in the composition of these "syrups," and indeed their average contents of cane sugar is about 11 per cent less than that of the "molasses" above referred to, the former averaging 48·82 and the latter 37·77 per cent. There would seem to be a necessity for establishing a lowest limit for the contents in cane sugar of these syrups, and if it were placed at 30 per cent it would probably not be unjust either to vendor or purchaser. As it is, the cases of adulteration in syrups amount to 3 in 19 or 18·8.

I have the honour to be, Sir,  
Your obedient servant,

THOMAS MACFARLANE,

Chief Analyst.

31st July, 1891.

OTTAWA, 22nd June, 1891.

THOMAS MACFARLANE, Esq., Chief Analyst.

SIR,—I have the honour to submit to you a report of the results of work done on 100 samples of sugars, syrups and molasses during the last few months. These results are contained in tables I to IV, submitted herewith, in which will also be found my remarks regarding each sample. Besides the examination for evidence of adulteration in these samples, a very considerable amount of work was done in order to decide upon rapid and fairly accurate methods of analysis.

With regard to the white granulated sugars, the samples were found to be practically pure, the average being 99·26 per cent of cane and 0·35 per cent. of reducing sugar. The yellow sugars range from 84 to 94 per cent. of cane sugar and average 90·23 per cent, beside 4·73 per cent. reducing sugar. These were also found to be genuine.

The only adulteration detected was in the syrups, three of them, as remarked in the table, being found to be mixed with starch glucose. One sample, No. 9269, contained so much of the latter substance that it became semi-solid on keeping. The other two samples are good imitations of the genuine article, so far as taste and appearance are concerned. It is possible to say that the remaining syrups containing no admixture of starch glucose, the methods of analysis adopted being quite equal to its detection when present in comparatively small quantity. In order to show this, commercial starch syrup was subjected to the same sort of examination as the samples, as was also a mixture of starch syrup, cane sugar and water. The results thus obtained, as well as in the case of genuine golden syrup and the adulterated samples, are given in the following table:—

	CANE SUGAR.				Reducing Sugar by Fehling Solution.	Water.
	By Scheibler's Saccharimeter.	By Clerget's Method.	By Inversion and Fehling Solution.	Average.		
	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.
Genuine Golden Syrup. . . . .	38·80	40·00	38·95	39·20	29·94	29·30
Golden Syrup No. 9246 . . . . .	112·80	10·80	14·14	.....	30·33	28·93
do 9272. . . . .	113·20	15·00	9·24	.....	32·47	32·59
do 9269. . . . .	131·80	7·20	1·75	.....	53·96	22·61
Commercial Starch Syrup. . . . .	153·80	.....	.....	.....	45·01	23·12
A mixture of $\frac{1}{3}$ starch syrup, $\frac{1}{3}$ cane sugar and $\frac{1}{3}$ water. . . . .	43·10	34·30	34·60	34·60	16·13	39·75

The mixture last mentioned was made in the proportions least calculated to arouse suspicion of adulteration, and on the direct saccharimeter reading would probably pass unchallenged. But the facts that the latter changed in amount and continued to diminish until constant, and that the inverted reading was plus and not minus (which latter would have been the case with cane sugar products), are sufficient to show that the sample contains starch syrup. Such fraudulent mixtures would probably contain a much larger proportion of starch syrup than the one experimented on, and weaker mixtures very soon undergo decomposition. It must always be remembered that the analysis of syrups and molasses is never so accurate as that of sugars, because the former contains other substances which affect the results yielded both by the optical and chemical tests.

In order that the value of the results recorded in the tables may be rightly appreciated, I think it is wise to describe, as briefly as possible, the processes used in obtaining them.

The reagents, &c., employed were the following:—1. Animal charcoal in fine powder after 12 hours' digestion in dilute hydrochloric acid, washing and re-ignition; 2. Alumina cream, prepared by precipitating a solution of alum with ammonia, washing thoroughly, and allowing the precipitate to consolidate to a magma; 3. Fehling solution, which consisted of a mixture of solutions A and B in equal volumes; A contained 34·639 grammes of pure copper sulphate dissolved in water, filtered and made up to 500 cubic centimetres; B contains 173 grammes Rochelle salt dissolved in 300 c. c. water, with 40 grammes sodium hydrate added, dissolved and made up to 500 c.c., and then filtered through glass wool or abestos fibre; 4. A nearly saturated solution of carbonate of soda; 5. The asbestos filters used for obtaining and weighing the cuprous oxide were constructed in the following manner: A "Macfarlane milk tube" is used for containing the filtering materials. Such tubes are made specially for this laboratory, but may be made from a 50 c.c. pipette with long bulb, by cutting the latter across in the middle, and leaving enough of the small tubes at the other ends to pass through a perforated cork. A piece of platinum gauze or perforated platinum foil is placed at the bottom of the wide part of the tube, sufficiently large to prevent the asbestos from being drawn through, and the tube is inserted in the perforation of a rubber stopper, closing a Bunsen filtering flask, which is connected with an exhausting apparatus. The latter is put in operation, and a loose layer of common abestos fibre (crysotile), about an inch deep, placed upon the platinum gauze. A thin pulp made of Italian or hornblendic asbestos is then poured into the tube in sufficient quantity to form a filtering bed. This pulp is made by scraping down a piece of hornblendic asbestos in the direction of the fibre, digesting it for one hour with 4 per cent soda solution, and washing thoroughly. Sufficient pulp must be poured into the tube to form a layer  $\frac{1}{2}$  to  $\frac{3}{4}$  of an inch in thickness. The filter is then washed once with alcohol and once with ether, dried thoroughly in the water bath, cooled in the dessicator and weighed.

With regard to the details of the processes used, the following may be mentioned:—

*Saccharimeter Readings.*—The saccharimeter employed is manufactured by Schmidt and Haensch, Berlin, and is known as the Soleil-Ventzke-Scheibler apparatus, the reading giving the percentage of cane sugar direct. 13·024 grammes of the sugar are taken and dissolved and washed, by means of 50 or 60 c.c. warm water, into a flask of 100 c.c. capacity; 1 gramme animal charcoal is added, and agitated occasionally for half an hour; then 20 to 30 c.c. alumina cream is introduced into the flask, mixed with its contents, cooled and made up to the 100 c.c. mark. The solution is then filtered through a dry ribbed filter into a dry flask, introduced into the 200 millimetre tube, and read in the saccharimeter. The reading  $\times 2$  gives the percentage. Syrups and molasses are treated in the same way as the sugars, but sometimes require more animal charcoal or have to be read in the 110 m. m. tube.

*Clerget Inversion.*—50 c.c. of the same solution prepared for the saccharimeter reading are placed in a 50 c.c. flask provided with a mark at 55 c.c.; 2·5 c.c. of strong hydrochloric acid are added and mixed with the solution. The flask is then immersed in water, the temperature of the latter raised to 70° C. and kept between 60° and 70° for 20 minutes. The flask is then cooled to room temperature, made up to 55 c.c., and the solution placed in a 200 m.m. tube fitted with a thermometer and observed in the saccharimeter. The temperature of the solution can also be determined in the ordinary tube immediately after its removal from the saccharimeter. The reading should be (unless in the case of samples containing dextrose or starch syrup) to the left (or—), and its amount, which in the case of sugars varies from —13 to —14 at 20° C., should be increased one-tenth, on account of the dilution. The Clerget formula is then applied, viz.:—

$$\frac{(\text{Direct reading} + \text{invert reading}) \times 200}{142 \cdot 7 - \frac{1}{2} \text{ temp. of invert.}} = \text{percentage of cane sugar.}$$

*Reducing Sugars.*—In the case of samples of white or yellow sugar,  $2\frac{1}{2}$  grammes are taken, dissolved and washed into a 50 c.c. flask by the use of about 25 c.c. warm water. 50 c.c. of undiluted Fehling solution are placed in a small beaker, and the latter, as well as the 50 c.c. flask, are immersed in boiling water, and allowed to remain until their contents have about the same temperature as the surrounding water. The sugar solution is then poured into the beaker, and the flask washed out with hot water, not more than about 25 c.c. being used, so that the resulting mixture may not exceed 100 c.c. in bulk. The beaker is allowed to remain in the boiling water for 10 minutes longer, and then the solution containing the precipitated cuprous oxide is poured into the weighed asbestos filter, standing in connection with the exhausting apparatus. If the filter has been properly made the filtration proceeds as rapidly as the liquid can be poured in, and the precipitate can be very rapidly washed into it with hot water. The filter is then filled up three or four times with hot water, and, when the filtrate gives no alkaline reaction with litmus paper, the tube is filled up once with alcohol and a second time with ether. While this is going on, it is convenient to proceed with the precipitation of another assay, which has been previously heated up in the boiling water. After the washing with ether, the tube is heated in a steam bath, to complete dryness, is cooled in the desiccator, and weighed. The increase in weight of the tube multiplied by 0.4861 and 40 gives the percentage of reducing sugars.

*Cane Sugar by Inversion and Fehling's Solution.*—In testing white and yellow sugars, 0.25 gramme is washed into a 50 c.c. flask by using 25 to 30 c.c. of warm water; 0.5 c.c. of strong hydrochloric acid is added and the mixture inverted by heating, as in the Clerget inversion process. It is then neutralised by solution of soda carbonate, the quantity necessary having been previously ascertained in a blank experiment. Excess of the soda carbonate must be avoided, as it interferes with the correctness of the result. The precipitation, filtration and washing are conducted as described above, under reducing sugars, but 66 c.c. of Fehling solution are used instead of 50, and the bulk of the mixture made up to 110 instead of 100 c.c.m. The increase of weight which the tube experiences,  $\times 0.4861$ ,  $\times 400$  gives the percentage of invert sugar resulting from the cane sugar. This, minus the percentage of reducing sugar  $\times 0.95$ , gives the percentage of cane sugar.

With syrups and molasses 5 grammes of the sample are washed into a 250 c.c. flask and made up to mark; 25 c.c. are used for the reducing sugars, and the same quantity is inverted for the cane sugar. Precipitation, filtration and washing are conducted in the same way as in the case of the yellow and white sugars, excepting that 60 c.c. Fehling's solution are used in determining the reducing sugars and 70 to 80 c.c. of the Fehling when the cane sugar is to be estimated, and that, further, 2 c.c. of the strong hydrochloric acid are used for the inversion, and a corresponding quantity of soda carbonate for neutralising it.

*Moisture and Water.*—The moisture in the white and yellow sugars was determined by drying 2 grammes to constant weight. In the case of the syrups and molasses, the quantity of water was ascertained by dissolving 20 grammes in warm water, and diluting to 100 c.c. of this solution=4 grammes of the sample into ordinary asbestos fibre (crysolite) contained in a milk tube, the tube and contents having been previously dried and weighed. The milk tubes used in this case had an inside diameter of 40 m.m., a depth of 35 m.m., with an opening at the bottom 5 m.m. in diameter, into a small tube 8 m.m. in length. The tube, with contents, is placed in a water-bath and dried at from  $90^{\circ}$  to  $100^{\circ}$  C. The drying is complete in 48 hours, and the increased weight of the tube and contents gives the amount of dry substance contained in 4 grammes of the sample.

In addition to the foregoing particulars regarding methods of examination and manipulation, I may state that the constant for the Clerget inversion, 142.7, is taken from the redeterminations by Wohl, given in "Spencer's Handbook for Sugar Manufacturers" (p. 116). The half normal weight for the quantity of sugar was taken because, with the saccharimeter used, accurate readings to the left were not obtainable with the normal weight. It must also be mentioned that the factor, 0.4861,

used for calculating the amount of reducing sugars from the cuprous oxide, was ascertained from a number of determinations of the quantity of the oxide yielded by pure cane sugar after inversion. These determinations agreed closely, but it is quite possible that changes in the manipulations by other operators would alter the factor. Basic lead acetate was not used for clarifying in any of the above analyses, in order to avoid the lead error, or the trouble of removing the lead oxide previous to inversion.

Some of the syrup and molasses samples show greater differences than usual between the results obtained by direct and inverted saccharimeter reading. The differences reappeared even when basic lead acetate was employed to clarify, and were probably due to the presence of unusually large amounts of syrup-forming substances different from sugar. All these analyses were done in duplicate, but I do not consider this to be necessary, as the optical and chemical results check each other and are equivalent to a duplicate analysis.

In giving these details regarding the processes used, it is not intended to suggest that these should be substituted for others now in use. But since, in the examination of saccharine substances, many different methods of analysis are in use, the results of which may vary slightly according to the nature of the process and the mode of manipulation, I have thought it necessary to give these particulars, in order that they may be taken into consideration when comparisons are being made with the results above stated and the work of other analysts.

I have the honour to be, sir,

Your obedient servant,

F. W. BABINGTON,

*Assistant to the Chief Analyst.*

## BULLETIN No. 26.—BAKING POWDER MATERIALS.

REPORT ON THE EXAMINATION OF MATERIALS USED IN THE MANUFACTURE OF BAKING POWDER, AND ON THE METHODS USED IN THEIR ANALYSIS; BY A. MCGILL, B.A., B.Sc.

### *On the analysis of Cream of Tartar, and Substitutes for Cream of Tartar.*

1. In the course of work continued at intervals during four years upon samples of cream of tartar and substitutes for that article, as found in the Canadian market, I have met with the following substances as components or adulterants;—

Potassium bi-tartrate, calcium tartrate, free tartaric acid, calcium sulphate, alum (ammonia alum in most cases), calcium super-phosphate, tri-calcium phosphate, potassium bi-sulphate, starch (including wheat flour.)

Small quantities of sand, and in one case bi-carbonate of soda, have also been found, but as these are evidently unintentional impurities they will not be further referred to.

2. The whole number of samples which I have fully analysed is one hundred and twenty-three (123); but I have made partial analyses of nearly half as many more. Out of this number I have found only one sample, No. 6705 of the Adulteration of Food Branch, I.R.D., to consist of pure bi-tartrate of potassium. Since the samples were taken at the shops of the leading grocers of most of the cities of Canada, it is to be inferred that cream of tartar and bi-tartrate of potassium are not synonymous terms. This is, of course, to be expected, and I shall, in the sequel (see section 13) show to what extent calcium tartrate is found in genuine cream of tartar. I propose, however, to preface these results by notes of work done with the object of ascertaining the trustworthiness of certain processes, and the verification of certain constants employed in interpreting the results of analysis.

3. *Effect of drying bi-tartrate of potassium at 100° C.*

a—Pure crystal were pulverised, pressed between folds of filter paper and weighed. Loss of weight at 100° C—

In 4 hours.....	0·19 per cent.
In 8 hours.....	0·30 “

b—*Cream of tartar* (No. 3230), treated as above, lost at 100° C—

In 3 hours.....	1·7 per cent.
-----------------	---------------

This sample contained 11·44 per cent of calcium tartrate.

c—*Cream of tartar* (X)—lost at 100° C—

In 17 hours.....	1·69 per cent.
------------------	----------------

This contained 8·84 per cent of calcium tartrate.

d—*Cream of tartar* (No. 3232), lost at 100° C.

In 3·5 hours.....	3·1 per cent.
-------------------	---------------

This sample was adulterated with burnt alum ( $\text{SO}_3=16\cdot8$  p.c.)

4. *Effect of drying Tartaric Acid at 100° C.* Pure crystals, pulverised and dried between folds of filter paper on heating to 100° C, the weight lost

In 4 hours was .....	0·13 per cent.
In 7 “ .....	0·13 “

5. *Calcium tartrate.*—Loss at 100° C. A sample was prepared by precipitating Calcium Chloride with Rochelle Salt, thoroughly washing the precipitate and drying at 65° to 70° Fah.\* This lost weight at 100° C.

In 3 hours.....	2·27 per cent. (mean)
In 20 “ .....	8·24 “ (mean)
In 17 “ .....	15·86 “
Dupl.....	10·92 “

The combined water in  $\text{Ca}_2\text{C}_4\text{H}_4\text{O}_6, 4\text{H}_2\text{O}$  forms 27·7 per cent by weight of the salt.

6. *Calcium Sulphate (terra alba)*—A sample was prepared by stirring plaster of paris, added gradually in excess of water; washing and drying in the air at 65° F. to 70° F. for some days.

This gave, on analysis, 45·81 per cent  $\text{SO}_3$ . Theory requires (for  $\text{CaSO}_4, 2\text{H}_2\text{O}$ )—46·50 per cent  $\text{SO}_3$ .

The sample contains, therefore, 98·52 per cent  $\text{CaSO}_4, 2\text{H}_2\text{O}$ , and 1·48 per cent water. This lost at 100° C.

In 3 hours.....	7·1 per cent.
In 12 hours.....	15·45 “
Dupl.....	15·50 “
In 30 hours.....	15·65 “

The chemically combined water in  $\text{CaSO}_4, 2\text{H}_2\text{O}$ , constitutes 20·92 per cent by weight of the salt.

7. A sample of maize starch which had been kept in a stoppered bottle in the laboratory for over six months, lost, when dried at 100° C, to constant weight, 6·1 per cent.

A sample obtained at a grocery in Ottawa, and packed in pasteboard, lost 7·9 per cent in weight.

\*NOTE—This sample of calcium tartrate gave the following results on analysis:—

(a)  $\text{CaO}$  by ignition sol. in  $\text{HCl}$ . and estimation as oxalate,  
 $\left. \begin{array}{l} =21\cdot812 \text{ p. c. } \\ \text{Dupl.} =21\cdot800 \text{ p. c. } \end{array} \right\} =101\cdot26 \text{ per cent } \text{Ca}_2\text{C}_4\text{H}_4\text{O}_6, 4\text{H}_2\text{O}.$

(b) By washing with 10 per cent sol. of  $\text{Na}_2\text{CO}_3$  etc. (par. 14) gave 21·95 p. c.  $\text{CaO} = 101\cdot9$  per cent.  $\text{Ca}_2\text{C}_4\text{H}_4\text{O}_6, 4\text{H}_2\text{O}.$

(c) By ignition, decomposition of resulting  $\text{CaCO}_3$  by normal acid in excess and titrating back with  $\text{NaOH}$ ,  $\text{N } 762\cdot7 \times 13 = 99\cdot15$  per cent  $\text{Ca}_2\text{C}_4\text{H}_4\text{O}_6, 4\text{H}_2\text{O}.$

A sample separated by dilute hydrochloric acid from acid phosphate of lime, and ascertained to be pure, was dried at 65° to 70° Fah. for three days. On further drying at 100° C; this lost 8·1 per cent. On standing over night in laboratory, the sample took up 7·9 per cent of moisture from the air.

A sample of Edwardsburg corn starch in lumps gave 10·42 per cent. moisture. Two samples separated from cream of tartar (Nos. 8921 and 8922) gave 13·12 and 12·96 per cent. of lost respectively after drying in air at 65° to 70° Fah. for twenty-four hours. On further exposure to air for twelve hours these samples took up about 7·5 and 8 per cent moisture.

A sample of Berger's starch (rice) which had been bottled in the laboratory for over six months, gave 10·67 per cent lost at 100° C.

A sample of potato starch obtained from F. W. Fearman & Co., Hamilton, and labelled "German potato flour," gave a loss of 13·25 per cent.

This dried sample took up 9·3 per cent of moisture from the air over night.

8. Maize starch is less hygroscopic than potato starch. Starch in lumps retains more moisture than the same starch in powder. Air dry maize starch retains about 8 per cent of moisture. Maize starch separated by aqueous solvents (dilute hydrochloric acid), and dried on a filter, cakes into lumps, and in this condition retains about 13 per cent of moisture which may be reduced to about 8 per cent by pulverizing the lumps and further exposing to dry air at 65° to 70° Fah.

#### BI-CARBONATE OF SODA.

NOTE.—Crystals were pulverized to a moderate degree of fineness in a mortar. Exposed to a temperature of 100° C. the weight lost was as follows:—

In 2 hours .....	0·94 per cent.
In 6 hours .....	2·74 per cent.

With a much more finely powdered sample the loss of weight was very much more marked, and in 17 hours amounted to 35·34 per cent of the weight of the sample.

A complete conversion of the bi-carbonate to mono-carbonate, as in the following equation:—

NOTE 2.—Bi-carbonate of soda and bi-tartrate of potassium, both chemically pure and dry, were mixed in the proportion  $\text{H Na CO}_3 : \text{K H C}_4 \text{H}_4 \text{O}_6 :: 84 : 188$ .

For 1 hour .....	loss 0·19 per cent.
For 5 hours .....	" 0·28 per cent.

A similar mixture of very finely pulverized bi-carbonate of soda, with commercial genuine cream of tartar, containing 8·84 per cent of calcium tartrate, was made, and exposed to 100° C. for 17 hours.

Loss was 11·80 per cent of weight.

Since this mixture contained 30·88 per cent of bi-carbonate of soda, which (see par. 2) would lose  $\frac{35\cdot3}{100} \times 30\cdot88 = 10\cdot90$ , while the cream of tartar would *per se* lose  $\frac{1\cdot69}{100} \times 69\cdot12 = 1\cdot16$  under the condi-

tions of the experiment (par 3, C.—Cream of tartar) this loss of 11·80 per cent of weight in the mixture does not necessarily involve any mutual decomposition of the decomponents.

NOTE 3.—A mixture of pure bi-carbonate of soda with pure tartaric acid in the proportion:—

was heated to 100° C:—

For 1 hour .....	loss 1·15 per cent.
For 5 hours .....	" 2·16 per cent.

This loss of weight is probably due to the bi-carbonate of soda (par. 37, note 2) chiefly.

9. From this it appears that bi-tartrate of potassium and free tartaric acid are easily dried at 100° C. to constant weight, without decomposition.

The other components of commercial tartar substitutes are all more or less irregularly affected by exposure to 100° C., so that no advantage is gained by drying the sample at 100° C. before analysis. And this is true of genuine commercial tartars as well as of substitutes, since the calcium tartrate, which is always present in small amount, parts with an indefinite amount of water at this temperature.

10. When an alkali tartrate is burnt with access of air, an alkali carbonate is formed equivalent in amount to the tartrate burnt, *i. e.*, each equivalent of tartaric acid produces an equivalent of carbonic acid. By dissolving the carbonate in normal acid in excess, boiling off carbon dioxide, and titrating back with normal alkali the tartaric acid originally present may be ascertained.

Pure crystals of tartaric acid were pulverized and dried between folds of filter paper. Two grams, dissolved in water, required 26·6 cc. normal soda to neutralize (phenol-phthalein as indicator). The solution of sodium tartrate was evaporated to dryness in platinum, and ignited at dull redness over naked flame. The ash was

treated in the dish with 32 cc. normal sulphuric acid, and about 100 cc. boiling water. The filtrate after boiling required 5.4 cc. normal soda to neutralize (phenolphthalein used as indicator).— $26.6 \times 50 \times 0.75 = 99.75$  per cent  $H_2 C_4 H_4 O_6$ .

11. In combination with lime, tartaric acid may also be estimated by converting to carbonate by ignition, since, although the lime carbonate formed may be partially converted into caustic lime by heat in presence of the excess of carbon, yet the lime formed has the same neutralizing power as against the normal acid added.

*Calcium tartrate* (preparation see par. 5).—From 3.079 grms. ignited, and extracted with water and  $H_2SO_4 \bar{N}$ —Obtained 760.3 cc.  $H_2 SO_4 \bar{N}$  per 100 grammes. From 3.254 grms. treated as described obtained 765.2 cc.  $\bar{N}$  per 100 grammes. Mean = 762.7 cc.  $\bar{N}$  per 100 grammes.  $762.7 \times .13 = 99.15$  per cent.

12. The following work upon mixtures of bi-tartrate of potassium and calcium tartrate show how closely the proportions of each salt present can be estimated by ascertaining the following:—

- (1) The available acidity of the mixture—which is entirely due to the bi-tartrate present.
- (2) The total tartaric acid present, by ignition, &c. (as described in sections 10 and 11).

Experiments upon mixtures of tartrates:—

(a)—A mixture was made as follows:—

Pure bi-tartrate of potassium.....	80 parts.
Pure calcium tartrate (par. 5).....	20 do

100

2.5 grammes required 10.35 KOH,  $\bar{N}$  to neutralize (phenol-phthalein as indicator)—

= 414 cc.  $\bar{N}$  per 100 grammes—  
 =  $414 \times .188 = 77.83$   $KHC_4 H_4 O_6$ .

The whole was evaporated to dryness and ignited—(details of treatment, see par. 10) required 24.35 cc.  $H_2 SO_4 \bar{N}$ .

= 974 cc.  $\bar{N}$  per 100 grammes  
 Total tartaric acid — 974 cc.  $\bar{N}$

$\bar{T}$  as  $KHC_4 H_4 O_6 = 2 \times 414 = 828$  do

As calcium tartrate = 146

=  $146 \times .13 = 18.98$  per cent  $Ca C_4 H_4 O_6, 4 H_2 O.$

The errors which result from this method are therefore, from the above experiment—

For 80 parts $KHC_4 H_4 O_6$ we obtain.....	77.83
For 20 parts calcium tartrate (?) we obtain.....	18.98

For 100 parts mixture..... 96.81

(b)—Bi-tartrate of potassium.....	66.6 parts
Tartrate of calcium.....	33.4 do

100.0

On similar treatment this gave Free acid = 340 cc.  $\bar{N}$  per grammes =  $340 \times .188 = 63.92$  per cent  $K H C_4 H_4 O_6$ .

Total organic acids = 943.3 cc.  $\bar{N}$  per 100 grammes.

Deduct  $2 \times 340 = 680.0$  “

263.3 cc.  $\bar{N}$  as Calcium Salt = 363.3

$\times .13 = 34.23$  per cent  $Ca C_4 H_4 O_6, 4 H_2 O.$

For 66.6 potass. bi-tartrate we find 63.92

For 33.4 calcium tartrate we find 34.23

100.0

98.15

(c)—Bi-tartrate of potassium 75 parts.  
Calcium tartrate 25 "

100

Thus gave (using 4 grammes)

Acidity = 390 c.c.  $\bar{N}$  = 73.32 per cent  $K H C_4 H_4 O_6$ .  
Organic acids = 957.5 c.c.  $\bar{N}$  per 100 grammes  $2 \times 390$   
= 780 "

$CaC_4 H_4 O_6 \cdot 4 H_2 O$ ;  $73.32 \times 23.08 = 96.40$ .  
177.5 c.c.  $\bar{N}$  as Calcium Salt =  $177.5 \times .13 = 23.08$

(d)—Bi-tartrate potassium 60 parts.  
Calcium tartrate 40 "

100

This gave (using 2.5 grammes)

Acidity 318 cc.  $\bar{N}$  per 100 grammes =  $318 \times .188 = 59.78 K H C_4 H_4 O_6$ .

Organic acid = 926 cc.  $\bar{N}$   
Less  $2 \times 318 = 636$

$290$  cc.  $\bar{N}$  =  $37.7 Ca C_4 H_4 O_6, 4 H_{10}$   $59.78 + 37.7$   
= 97.48.

#### SYNOPSIS—Bi-Tartrate Potassium, Calcium Tartrate.

	Present.	Found.	Present.	Found.
(a).....	80	77.8	20	19
(b).....	66.6	63.9	33.4	34.2
(c).....	75	73.3	25	23.1
(d).....	60	59.8	40	37.7
Total.....	281.8	274.6	118.4	114.0

When we take into account the facts that (1) the components are air dry at about 60° to 70° Fah., (2) the uncertainty as to the exact composition of the calcium tartrate (see section 5), I think that as a ready method of obtaining fairly accurate knowledge of the composition of commercial cream of tartar, this process may safely be recommended to analysts.

In the following section, I give the results of work (using this method) upon 70 samples of genuine tartar, as a contribution to data now accumulating for deciding how high an admixture of tartrate of lime may be permitted in cream of tartar without constituting an adulteration of the same.

13. The percentage of tartrate of lime present in genuine cream of tartar as found in Canada may be seen in the following results of analysis of 70 samples collected during the past four years in Montreal, Toronto, Ottawa, Halifax and other Canadian cities and towns. Where the departmental number of the sample is given details as to time and place of collection may be obtained by reference to the Bi-

letins issued by the Department of Inland Revenue; or from the Reports of Adulteration of Food:—

14. Nearly all samples of cream of tartar give traces of sulphates. I have estimated the sulphuric acid in six samples which were undoubtedly genuine, containing no starch, free tartaric acid, phosphates nor alumina. In the following table I have expressed the sulphuric acid found as hydrated sulphate of lime ( $\text{CASO}_4, 2\text{H}_2\text{O}$ )—

Designation of Sample.	Acidity in cc's $\text{NaO, H}\bar{N}$ ,	Bi-tartrate of Potassium.	Organic Acids in cc's $\text{H}_2 \text{SO}_4 \bar{N}$	Organic Acids as Neutral Salts.	Expressed as $\text{Ca } \bar{T} + 4 \text{H}_2\text{O}$ ,	$\text{CaSO}_4 + 2\text{H}_2\text{O}$ . — From $\text{SO}_3$ found.	TOTAL.

These are the only samples of undoubtedly genuine cream of tartar in which I have found notable amounts of sulphates. In all other cases where sulphates have been present they have either formed a very high percentage of the substance (over 50 per cent) and have consequently been added with fraudulent intent; or they have been associated with starch, free tartaric acid or other adulterant.

15. From the available acid found by igniting, &c., after neutralization with soda the proportion of bi-tartrate of potassium and tartaric acid present together in admixture may be determined—

A mixture was made of the following composition:—

Pure bi-tartrate of potassium.....	60 parts.
“ tartaric acid.....	40 “

Acidity=844 cc  $\bar{N}$  per 100 grammes. Total organic acids on evaporation, ignition, &c.=1158 cc.  $\bar{N}$  per 100 grammes.

Deduct.....844 “

314 cc.  $\bar{N}$  represents the combined tartaric acid in  $\text{KHC}_4\text{H}_4\text{O}_6=314 \times 188=59.03$  parts  $\text{KHC}_4\text{H}_4\text{O}_6$ . Also,  $1158-2 \times 314=530$  cc.  $\bar{N}$  measures the free tartaric acid= $530 \times 0.75=39.75$  parts per 100.  $59.03 \times 39.75=98.78$ .

16. In such a mixture the free tartaric may be washed out by alcohol, and titrated with soda.

In the same mixture (see sec. 15) the tartaric acid was washed out (from 5 grammes) by repeated treatment with absolute alcohol. The washings amounted to about 200 cc. These were diluted with water to about 500 cc., and titrated hot with normal soda.

Required 26.6 cc.  $\bar{N}=532$  cc.  $\bar{N}$  per 100 grammes of the mixture.= $532 \times 0.75=39.9$  per cent tartaric acid in the free state.

The bi-tartrate of potassium remaining on the filter was dissolved in boiling water and titrated with soda.

Required 15.3 cc.  $\bar{N}$  *i.e.*, 306 cc.  $\bar{N}$  per 100 grammes mixture.= $306 \times 188=57.53$  per cent  $\text{KHC}_4\text{H}_4\text{O}_6$   $57.53 \times 39.9=97.43$ .

17. In the same mixture the combined tartaric acid was estimated by direct ignition of the dry substance (using 5 grammes)—the ash being treated with  $\text{H}_2\text{SO}_4$  and hot water—organic acids=306 cc.  $\bar{N}$  per 100 grammes= $306 \times 188=57.53$  per cent  $\text{KHC}_4\text{H}_4\text{O}_6$ .

18. In genuine cream of tartar a very neat way of estimating lime is to wash with carbonate of soda solution, which leaves the lime as carbonate.

A sample of commercial cream of tartar containing 91.18 per cent of  $\text{KHC}_4\text{H}_4\text{O}_6$ , and ascertained free from every other impurity than calcium tartrate, was washed (10 grammes being used) with about 200 cc. of a 10 per cent solution of carbonate of soda.

The washing liquid was used hot, and the resulting carbonate of lime was dried on the filter, ignited and weighed as calcium oxide.

Obtained 2,215 per cent of  $\text{CaO}$ , equivalent to 10.28 per cent  $\text{CaC}_4\text{H}_4\text{O}_6, 4\text{H}_2\text{O}$ .

Estimated as in par. 12, this sample gives tartaric acid as calcium tartrate, equivalent to 8.84 per cent  $\text{CaC}_4\text{H}_4\text{O}_6, 4\text{H}_2\text{O}$ .

As compared with the method described in section 12, this process has the disadvantage of being inapplicable in presence of sulphate or phosphate of lime, starch or alum.

19. In the following experiments a sample of ammonia alum was used, which gave 11.38 per cent  $\text{Al}_2\text{O}_3$ . Theory requires 11.36 per cent in accordance with the formula  $(\text{NH}_4)_2\text{Al}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$ . The burning of alum has for its object the dehydration of the alum. It is impossible, in practice, to effect complete dehydration of ammonia alum without the loss of more or less sulphate of ammonia. Assuming all the sulphuric acid in combination as alumina salt to be available for the neutralization of soda, the formula  $(\text{NH}_4)_2\text{SO}_4, \text{Al}_2(\text{SO}_4)_3, 24\text{H}_2\text{O}=907$  corresponds to an available acidity measured by  $\frac{6000}{907} \times 100 = 661$  cc.  $\bar{N}$  per 100 grammes. On complete dehydration the acidity should become  $\frac{6000}{475} \times 100 = 1263.1$  cc.  $\bar{N}$ . On complete loss of sulphate of ammonia the acidity becomes  $\frac{6000}{343} \times 100 = 1749.3$  cc.

$\bar{N}$  per 100 grammes.

There is great difficulty in ascertaining the end point of the reaction in neutralising alum with soda, and this is particularly the case with ammonia alum, where not only does the precipitated alumina interfere with recognition of the point of neutralization, but the ammonia becomes a troublesome factor when phenolphthalein is used as indicator. Phenolphthalein is the best indicator, and even with

ammonia gives very fair results, provided it is used in sufficiently large amount. (J. H. Long, Am. Chem. Journal, quoted in Analyst, Vol. XV, pp. 38 et seq.) Methyl-orange is not a good indicator for this purpose, the change of colour not being decided enough, and cochineal is precipitated as a lake by the alumina. I have used coralline with some satisfaction, but prefer phenol-phthalein.

The acidity of crystallized ammonia alum (phenol-phthalein as indicator) was 648 cc.  $\bar{N}$  per 100 grammes. This is the mean of a large number of estimations, varying among themselves through a range of 16 cc.  $\bar{N}$  for 100 grammes alum. On heating ammonia alum in an air bath for some hours to 130° C., the loss of weight amounted to 38.1 per cent. Assuming this loss to be entirely due to dehydration, it corresponds to 80 per cent of the water of crystallization.

The acidity of the sample should then be increased to

$$\frac{100}{62} \times 661 = 1064 \text{ cc. } \bar{N}.$$

Experiment gave 990 cc.  $\bar{N}$  per 100 grms.

On heating to a dull red heat for half an hour, ammonia alum lost 52.5 per cent, by weight.

This corresponds to total loss of water and additional loss of  $(52.5 - 47.6) = 4.9$  per cent of sulphate of ammonia.

On further heating (after pulverising and returning to platinum dish) for half an hour longer, the loss of weight amounted to 61.75 per cent.

This corresponds to total loss of water and all but  $(62.2 - 61.8) = 0.4$  per cent of the sulphate of ammonia present.

On further heating at a somewhat higher temperature for fifteen minutes the loss of weight amounted to 67 per cent.

This corresponds to total loss of water and sulphate of ammonia as well as of nearly *five*  $(67 - 62.2)$  per cent of sulphuric acid in the sulphate of alumina.

The acidity at this stage was 1440 cc.  $\bar{N}$  per 100 grammes.

The acidity corresponding to a loss of 67 per cent of weight, the loss being due to total loss of water and ammonium sulphate, and partial loss of  $\text{SO}_3$  from sulphate of alumina is

$$\begin{array}{r} \frac{33}{100} \times 907 = 299.3 \text{ made up of } \text{Al}_2\text{O}_3, 103.0 \\ \text{SO}_3, 196.3 \\ \hline 299.3 \end{array}$$

$$100 \text{ grammes} = \frac{196.3}{40} \times 1000 \times \frac{100}{299.3} = 1639.6 \text{ cc. } \bar{N}.$$

On further prolonged ignition for some hours the acidity became 1160 cc.  $\bar{N}$  per 100 grammes. This corresponds to loss of sulphuric acid in nearly 34 per cent of the sulphate of alumina. Another portion of the alum was very carefully ignited, and repeatedly weighed at intervals until the loss of weight reached 62.5 per cent. This should correspond to total loss of water and sulphate of ammonia, and an insignificant loss of sulphuric acid in sulphate of alumina. The acidity was 1556 cc.  $\bar{N}$  per 100 grammes, instead of about 1740 cc.  $\bar{N}$ , required by theory.

## Synopsis of Results.

Availability, acidity per 100 grammes.	Calculated.	Found.	Difference.
Crystallized ammon. alum .....	661	648	13
Loss of 38·1 per cent weight .....	1064	990	74
“ 62·5 “ “ .....	1740	1556	184
“ 67·0 “ “ .....	1640	1440	200
On prolonged ignition .....	—	1160	—

This shows a continually increasing divergence between theory and fact in the assumption that ammonium sulphate volatilizes completely before sulphate of alumina parts with its acid on heating.

In order to ascertain whether sulphate of alumina begins to decompose with loss of  $\text{SO}_3$  before the whole of the sulphate of ammonia is volatilized I made the following experiments:—

A sample of ammonia alum was heated in platinum, until it sustained a loss of weight amounting to 48·8 per cent. This corresponds to an excess of  $48·8 - 47·6 = 1·2$  per cent loss over and above loss due to complete dehydration. Had this additional loss been entirely due to sulphate ammonia, there should remain in the residue from each 100 parts of alum burnt 37·7 parts sulphate of alumina and 13·5 parts sulphate of ammonia = 51·2 parts by weight.

The acidity of such a residue should be  $661 \times \frac{100}{51·2} = 1291$  cc.  $\bar{N}$  per 100 grammes.

The ascertained acidity was 1192 cc.  $\bar{N}$ .

The sulphuric acid, ammonia and alumina in the residue were separately estimated with the following result:—

Sulphuric acid .....	$(\text{SO}_3) = 67·5$
Ammonia .....	$(\text{NH}_4)_2\text{O} = 9·8$
Alumina .....	$(\text{Al}_2\text{O}_3) = 22·4$
	99·7

The ammonia calculated to sulphate corresponds to 24·86 per cent.  $(\text{NH}_4)_2\text{SO}_4$ . This contains 15·3 sulphuric acid, leaving 52·43  $\text{SO}_3$  in combination as sulphate of alumina. This corresponds to 22·5  $\text{Al}_2\text{O}_3$  (Cas  $\text{Al}_2(\text{SO}_4)_3$ ) as against 22·4 found.

Hence it appears that in the sample worked over, no loss of sulphuric acid from sulphate of alumina had taken place.

Against this is to be placed the fact that I have frequently found in cream of tartar substitutes, a higher percentage of alumina than corresponded to the available sulphuric acid present; and I am of opinion, that in a sample of alum burnt to nearly or complete loss of ammonia salt, it would be found that the alumina sulphate had undergone more or less decomposition.

20. When sulphate of ammonia is largely present in alum the titration with soda must be performed with great care to avoid aberrant results due to decomposition of sulphate of ammonia and liberation of ammonia. A sample of commercial ammonia alum (crystallized) gave the following results on titration with soda:—

Titrated cold—phenol-phthalein (a) .....	621 cc. $\bar{N}$
“ “ “ (b) .....	630 cc. $\bar{N}$
Mean .....	= 625·5 cc. $\bar{N}$

Titrated cold—coralline (a).....	590 cc. $\bar{N}$
“ “ “ (b).....	590 cc. $\bar{N}$
“ boiled phenol-phthalein (a).....	702 cc. $\bar{N}$
“ “ “ (b).....	718 “
“ “ “ (c).....	719 “
“ “ “ (d).....	696 “
“ “ coralline (a).....	600 cc. $\bar{N}$
“ “ “ (b).....	626 cc. $\bar{N}$
Mean.....	=613 cc. $\bar{N}$

The acidity (theory) for pure ammonia alum is 661 cc.  $\bar{N}$ ; that obtained with pure alum was 648 cc.  $\bar{N}$  (see section 19).

It would seem that in boiling solution coralline works better than phenol-phthalein. Prolonged boiling with excess of soda causes great loss of ammonia which escapes detection when phenol-phthalein is used. On heating to loss of 60.5 per cent of weight, *i. e.* about 2 per cent short of total loss of sulphate of ammonia, the available acidity was 1565 cc.  $\bar{N}$  per 100 grammes.

21. Commercial burnt alum as furnished to the manufacturers of baking powders is not usually burnt to anything like complete loss of ammonia salt. A sample obtained through the Department of Customs gave an acidity of 1176 cc.  $\bar{N}$  per 100 grammes, which may be taken as fairly representing the average article in the trade.

22. I do not know that potash alum is used in cream of tartar substitutes. In the event of an excess of carbonate of soda with ammonia alum a secondary reaction of ammonia with carbonate of soda, forming volatile carbonate of ammonia—an effective leavening agent—may take place under favourable conditions, but is is questionable whether this consideration enters into the calculations of the manufacturers of baking powder.

In an experiment with pure potash alum I found as follows:—Loss at 130° C.=38.2 per cent of weight. This corresponds to a loss of 84 per cent of its water of crystallisation. Acidity as crystallised allum—647.5 cc.  $\bar{N}$  by soda and phenol-phthalein. On using normal carbonate of soda solution, I obtained 624 cc.  $\bar{N}$ . Theory requires 622 cc.  $\bar{N}$  for 100 grammes  $K_2SO_4, Al_2(SO_4)_3, 24 H_2O=949$ . The acidity of the sample dry at 100° C. was 960 cc.  $\bar{N}$ . Theory requires  $\frac{100}{62} \times 632=1002$  cc.  $\bar{N}$ .

23. The presence of hydrate of alumina does not seriously interfere with the determination of available acid in bi-tartrate of potash by soda titration with phenol-phthalein as indicator.

An actual experiment, using nearly 2 grammes hydrate of alumina with 2.5 grammes bi-tartrate gave acidity =512 cc.  $\bar{N}$  instead of 516 cc.  $\bar{N}$  per 100 grammes.

24. On neutralizing burnt alum with soda, using phenol-phthalein as indicator, —evaporating to dryness and igniting—taking up the dry residue with normal sulphuric acid, and titrating back with soda (as in determination of total tartaric acid or tartrates, see section 10), the difference between the amount of normal acid used in effecting solution, and that of normal soda, used in effecting neutralisation is not greater than might be expected from the difficulty of ascertaining the exact point of neutralization in burnt alum. In two experiments I obtained, using 20 cc. acid for solution,—

1. Soda exactly equivalent to acid used.

2. Soda in excess equal to 5 cc. per 100 grammes of burnt alum.

25. When, however, burnt alum and bi-tartrate of potash are present together the process described in section 10 for estimation of tartrates does not give satisfactory results.

Mixture 1.—Burnt alum.....	75
Bi-tartrate potash.....	25
	100

The available acidity of this mixture should be  $\frac{75}{100} \times 1170 \times \frac{25}{100} \times 523 = 1015$  cc.

$\bar{N}$  per 100 grammes. Titration with soda gave (a) 958 (b) 950, mean = 954 cc.  $\bar{N}$ . On treating the neutralized solution of 5 grammes as described in section 10, I obtained (a) 68 (b) 82 cc.  $\bar{N}$  per 100 grammes as representing organic acids. These numbers correspond respectively to 6.39 and 7.71 per cent  $\text{KHC}_4\text{H}_4\text{O}_6$ , instead of 25 per cent present.

Mixture 2.—Burnt alum ..	3.75 grms.
Cream tartar .....	1.75 "
	5.50

The ..... should be 1230 cc.  $\bar{N}$  as calculated; as found by soda it was 1208 cc.  $\bar{N}$  per 100 grammes. Organic acids on evaporating, igniting, &c., were 93 cc.  $\bar{N}$  instead of 338 cc.  $\bar{N}$  per 100 grammes, (i. e., 8.74 per cent instead of 31.77 per cent  $\text{KHC}_4\text{H}_4\text{O}_6$ ).

26. The only explanation of this peculiarity which I can suggest, is the formation of double tartrates of alumina and soda, which are either neutral to phenolphthalein, or so slowly decomposed by soda in excess as to lead to the errors in determining the available acidity which are illustrated in the preceding section.

Of course on submitting such tartrates to ignition, the organic acid equivalent to the alumina in combination would be completely destroyed.

27. Acid phosphate of lime seems to be present in the Canadian market as a cream of tartar substitute, in two conditions:—

1. So-called "straight phosphate," that is acid phosphate containing the whole of the sulphate of lime formed as a bye-product during manufacture from apatite or bone-ash (chiefly, if not altogether, the former).
2. Purified acid phosphate, made by dissolving the soluble phosphate out of the mixed salts obtained by action of sulphuric acid on tri-calcium phosphate, and evaporating the filtered solution. The product in this case is so deliquescent as to necessitate its being mixed with starch, flour or other material to render it capable of being powdered.

In the "straight" phosphate, the sulphate of lime, which, provided the manufacture is perfect, forms 53.8 per cent by weight of the total product;

answers the purpose of a dryer, and this is probably considered a justification for its presence by some manufacturers.

Still a third mode of preventing the too great deliquescence of the product is to leave a large percentage of unchanged tri-calcic phosphate in the manufactured article. I have not met this in any cream of tartar substitute, but in a baking powder in which only 2.48 per cent of  $\text{SO}_3$  was present, I found 40.32 per cent of  $\text{P}_2\text{O}_5$ ; and the efficiency of the sample showed most of this to exist as neutral salt.

28. A sample of straight phosphate obtained from the manufacturer, gave the following results on analysis:—

Moisture, loss at 100° C.....	5.28	per cent.
Lime (CaO) .....	31.70	"
Sulphuric acid ( $\text{SO}_3$ ).....	29.695	"
Phosphoric acid ( $\text{P}_2\text{O}_5$ ). Total = .....	23.25	"
"    "    soluble in water.....	19.95	"
$\text{P}_2\text{O}_5$ insoluble .....	3.30	"

Available acidity (soda and phenol-phthalein) = 690 cc. N per 100 grammes.

The sulphuric acid found corresponds to 51.22 per cent of calcium sulphate, or on the dry substance to nearly 54 per cent, so that the amount of calcium sulphate present would indicate complete conversion of tri-calcic phosphate. Such conversion, however, would give 28.6 per cent  $P_2O_5$  in the product instead of 24.05 per cent (calculated on the dry substance) found. This points to the existence of hydrated sulphate in the product, which also contains phosphoric acid to the extent of 3.3 per cent either as unchanged phosphate or in the form of di-calcic salt— $(H_2Ca_2P_2O_8)$ .

29. A sample of so-called pure superphosphate of lime, obtained from Brodie's Works, Smith's Falls, gave the following results:—

Loss of weight at 100° C ..... 7.80 per cent.

Sulphuric acid ( $SO_3$ ) .. ..... 0.07 “

Acidity to soda = 495 cc. N per 100 grammes.

Maize starch (air dried) = 52 per cent.

“ “ dry at 100° C = 47.8 per cent.

$100 - (7.8 + 47.8) = 44$  per cent (approximate) of acid phosphate of lime.

Assuming this to have the composition indicated by the formula  $H_4CaP_2O_8$  and to react with soda, according to the following equation:—

44 parts acid phosphate should require 501 cc. normal soda.

30. There is some difficulty in ascertaining the exact point of neutrality with phosphoric acid and soda using phenol-phthalein as indicator. In order to determine the possible error in use the following experiment was made:—

5 grammes pure sodium phosphate ( $HNa_2PO_4, 12H_2O$ ) dissolved in water gave an alkaline reaction with phenol-phthalein. On adding 0.7—0.8 cc. normal sulphuric acid the neutral point was reached; but it was found impossible to read nearer than to between one and two-tenths of a cubic centimetre of normal acid.

On adding 10 cc. normal sulphuric acid to the neutral solution, boiling and titrating back with normal soda, the normal point was reached when 8.7—8.9 cc. had been added.

In order, therefore, to ensure the existence of the phosphoric acid as di-sodic phosphate it is necessary to add soda solution to a strong alkaline reaction; and this requires about 1 cc. for 5 grammes of sodic phosphate after the first appearance of a reddish tint in the liquid.

31. In mixtures of acid phosphates of lime (containing starch) and bi-tartrate of potash it is impossible to get accurate results for tartaric acid by the method described in section 10.

A mixture—

Superphosphate lime purified phosphate (see section 29)..... 75

Bi-tartrate potassium..... 25

100

Available acidity should be  $\frac{75}{100} \times 495 + \frac{25}{100} \times 532 = 504$  cc. N.

The acidity obtained by titration with soda was 468 cc. N per 100 grammes of the mixture.

The organic acids estimated as carbonates (see section 10) amounted to 230 cc. N = 21.6 per cent bi-tartrate of potash, a loss of 3.4 per cent.

A mixture was made as follows:—

“Straight phosphate” (par. 28)..... 30 parts.

Bi-tartrate potassium..... 25 “

Calcium tartrate (par. 5) ..... 25 “

Tartaric acid . ..... 20 “

100

Available acidity should be—

30 per cent of	690=207	due to "straight" phosphate.
25 " "	532=133	" bi tartrate of potash.
20 " "	1333=266	" free tartaric acid.

606 cc.  $\bar{N}$  per 100 grammes.

Total organic acid  $\frac{25}{.094} = 255.3$  due to bi-tartrate potash.

$\frac{25}{.130} = 192.3$  " calcium tartrate.

$\frac{20}{.075} = 266.6$  " free tartaric acid.

714.2 cc.  $\bar{N}$  per 100 grammes.

Combined organic acid  $= \frac{255.3}{2} + 192.3 = 319.9$  cc.  $\bar{N}$  per 100 grammes.

This was used in the following experiments:—

(1.) Available acidity—soda and phenol-phthalein, *boiling*,

(a.) 30.65 } = 30.85 = 617 cc.  $\bar{N}$  per 100 grammes.  
(b.) 31.05 }

(2.) Available acidity—soda and phenol-phthalein, *cold*,

(a.) } = 26.475 = 529.5 cc.  $\bar{N}$  }  
(b.) } = 532.5 cc.  $\bar{N}$  }  
(c.) } = 26.775 = 535.5 cc.  $\bar{N}$  }  
(d.) }

(3.) On extracting 3 grammes with 250 cc. alcohol the following acidity was found:—

(a.) 9.3 cc.  $\bar{N}$  } = 8.9 cc. = 296.7 cc.  $\bar{N}$  per 100 grammes.  
(b.) 8.5 cc.  $\bar{N}$  }

(4.) On evaporating neutralized mixture to dryness, igniting, dissolving in excess  $H_2SO_4$   $\bar{N}$  and titrating back after boiling off  $CO_2$ , obtained organic acids = 762 cc.  $\bar{N}$  per 200 grammes mixture.

(5.) On igniting 5 grammes of mixture *per se* taking up with  $H_2SO_4$   $\bar{N}$ , etc., obtained, combined organic acids = (a) 6.4 (b) 6.5—mean = 6.45 cc. = 129 cc.  $\bar{N}$  per 100 grammes.

SYNOPSIS.	Present.	Found.
1. Available acidity.....	606	617
2. " " estimated cold.....		533
3. Tartaric acid, by alcohol extraction.....	266	297
4. Total organic acids.....	714	762
5. Combined organic acids.....	320	129

The errors in 1 and 4 are due to the difficulty in hitting off the end point in neutralizing with soda. In 3, we have free phosphoric acid extracted by alcohol, while 5 shows the impossibility of estimating organic acids with accuracy by ignition in presence of acid phosphate, which liberates the organic acid.

33. The efficiency of a mixture of burnt alum with acid phosphate of lime is not the sum of the acidities of the components. To establish this fact I may quote the following results:—

A. *Burnt Alum*.—The sample used was a commercial cream of tartar substitute. Acidity, as measured by normal soda, was 1176 cc.  $\bar{N}$  per 100 grammes.

B. *Acid Phosphate of Lime*.—A commercial sample, the acidity of which to normal soda, was 500 cc.  $\bar{N}$  per 100 grammes.

1. A mixture of A and B in equal proportions by weight gave acidity to soda equal to 710 cc.  $\bar{N}$  per 100 grammes instead of  $\frac{1176 \times 500}{2} = 838$  cc.  $\bar{N}$ , showing a decrease of efficiency amounting to 128 cc.  $\bar{N}$  or  $\frac{128 \times 100}{838} = 15 +$  per cent.

The following mixture was then made:—

C.—Burnt alum (A) and bi-carbonate of soda in the ratio 100 : 98·8.

D.—Acid phosphate of lime (B) and bi-carbonate of soda in the ratio of 100 : 42.

E.—A mixture of equal weights of C and D.

On boiling with water (2 grammes in each case) and absorbing  $\text{CO}_2$  by potash

(C.) gave 24·85 per cent  $\text{CO}_2$

(D.) “ 12·95 “ “

(E.) “ 15·05 “ “

Hence, for 100 parts burnt alum used with bi-carbonate soda, we get (C)  $\cdot 2485 \times 199 = 49\cdot 45 \text{ CO}_2$ .

For 100 parts acid phosphate lime so used we get (D)  $18\cdot 39 \text{ CO}_2$ .

100 grammes of the mixture (E) contains  $\frac{100}{199} \times 50 = 25\cdot 1$  grammes alum, and

$\frac{100}{142} \times 50 = 35\cdot 2$  grammes acid phosphate lime.

Used each separately in a baking powder, these amounts of alum and acid phosphate give:—

25·1 alum.....	(C) = 12·41 grammes $\text{CO}_2$
35·2 acid phosphate.....	(D) = 6·48 “ “

18·89

Instead of which we obtain only 15·05 grammes  $\text{CO}_2$ , showing a deficiency of 3·84 grammes, (=20·3 per cent) and of this a portion is derived from the excess of bi-carbonate of soda due to the change:— $2 \text{ H Na CO}_3 = \text{Na}_2 \text{ CO}_3 + \text{H}_2 \text{ O} + \text{CO}_2$ . This loss of efficiency is doubtless due to the interaction of the phosphoric acid with the alumina, by which phosphate of alumina is formed, and phosphoric acid rendered unavailable for the decomposition of bi-carbonate of soda.

34. In baking powders and cream of tartar substitutes when acid phosphate of lime and alum are present together, the accurate estimation of phosphoric acid and alumina becomes a matter of considerable difficulty. I select the following experimental work as bearing on this subject:—

Organic acid and starch are got rid of by igniting in platinum. The residue is dissolved in hydrochloric acid (unless the molybdate precipitation is used in  $\text{P}_2 \text{ O}_5$  estimation, in which case nitric acid is the solvent), filtered into a graduated flask, and made up to a known volume.

The precipitation of phosphoric acid as magnesium ammonium phosphate in presence of citric acid, was carried out as described by Sutton. (Vol. analysis, fifth edition, p. 247), except that the magnesium phosphate precipitate was weighed as pyrophosphate instead of estimated volumetrically by uranium.

The following samples give results obtained by me, as checked by the phosphomolybdate method.

Phosphoric acid found as $P_2O_5$ .	Molybdate method.	Citro-magnesia method.
(a)	5·664	4·608
(b)	2·800	2·430
(c)	40·320	36·672

To determine the solubility of phosphate of alumina in acetic acid I made a solution of 5 grammes pure potash alum in 250 cc. In each of the following estimations 20 cc. (=0·4 gram alum) was precipitated by excess of ammonium phosphate, ammonia added to faintly alkaline reaction, then acetic acid. In the first experiment the acetic acid was added without measurement; in the last three cases 100 cc. of a solution of 50 cc. glacial acid diluted to 1 litre was used. The precipitation was effected in cold solution, the precipitate washed on the filter with dilute acetic acid (10 cc. glacial acid to 1 litre), about 100 to 150 cc. wash liquid being used, the dry filter and contents strongly ignited—

20 cc. (.4 gram alum = 0·103 Al PO <sub>4</sub> )	
Al PO <sub>4</sub> obtained from 20cc.....	a. 0·086
	b. 0·098
	c. 0·095
	d. 0·097

When phosphoric acid is precipitated by alumina in excess, although free acetic acid is present (in proportions just mentioned) basic phosphates of alumina of varying composition are thrown down. It is therefore necessary to ensure the presence of excess of phosphoric acid in these mixtures. The precipitate (Al PO<sub>4</sub>) gives the alumina present, and the excess of phosphoric acid is obtained by a titration with uranium acetate (or nitrate). I have worked as follows:—

5 grammes of the sample is neutralized by soda solution, a slight excess of soda being used to convert any sulphate of ammonia into soda salt and thus prevent loss of sulphuric acid on ignition, if the sulphuric acid is to be estimated in same solution. The whole is evaporated to dryness in platinum and ignited to destroy organic matter. The residue is repeatedly heated with small quantities, say 5 cc. of hydrochloric acid, till complete solution is effected, the filtrate being made up to a known volume, say 125 cc. Sulphuric acid comes out too low in this solution, owing to loss as sulphuretted hydrogen on decomposing the sulphides formed by reduction of sulphates in contact with carbon during fusion. The loss is not a constant one; but experiments show it to be small enough to be neglected in commercial work.

To 50 cc. of this solution (=2 grams) is added 5 cc. of a standard solution of sodium phosphate (.05 - .06 P<sub>2</sub> O<sub>5</sub>) then 20 cc. of a 10 per cent solution of acetate of potassium. (Should too much free hydrochloric acid be present in the solution, this must be partly neutralized by soda, until such an amount only is present as may be neutralized by the first ten cubic centimetres of acetate of potash added, which may be known by the appearance of the precipitate of aluminum phosphate. This ensures the presence of a nearly constant and not too great excess of free acetic acid).

The precipitate is allowed to settle, then washed on a filter with about 150 cc. of a solution of 10 cc. glacial acetic acid in 1 litre water.

The precipitate is dried, ignited and weighed as Al PO<sub>4</sub>, from which the Al<sub>2</sub> O<sub>3</sub> is calculated (factor = 0·4204),

In the filtrate the excess of  $P_2O_5$  is determined by uranium solution (standardized under similar conditions). From the total  $P_2O_5$  found both as  $AlPO_4$  and by uranium is deducted the amount added as sodium phosphate, the remainder being the  $P_2O_5$  sought.

The following solutions were made to imitate conditions frequently occurring in cream of tartar analysis:—

*Solution A.*—Microcosmic salt was dissolved in water and the contained phosphoric acid estimated by magnesia. This was added to a solution of pure potash alum so as to give a solution of the following value:—

1 c.c. =  $P_2O_5$  0.00992;  $SO_3$  0.03107  $Al_2O_3$  0.01.

*Solution B.*—Made from A, by adding 17.875 grammes calc spar (=10 grammes CaO) dissolved in hydrochloric acid, the whole made up to 1 litre.

1 cc. =  $P_2O_5$  0.00248;  $SO_3$  =0.00777  $Al_2O_3$  =0.0025; CaO =0.005.

The sodium phosphate solution referred to below contained 0.011  $P_2O_5$  per 1 cc.

The following experiments were made by Mr. Lefebvre, of the Inland Revenue Department (Nov., 1889).

a.—To 10 cc. solution A were added 50 cc. water, 5 drops concentrated hydrochloric acid, 5 cc. sod. phos. solution (=0.055  $P_2O_5$ ), ammonia to alkaline reaction; acetic acid (1—10) in slight excess. The whole heated on water-bath, filtered, the precipitate washed with dilute acetic acid (1 to 100), dried, ignited and weighed as  $AlPO_4$ ; the filtrate titrated with Uranium for  $P_2O_5$ .

d. To 50 cc. solution B were added 100 cc. water, 10 cc. soda phosphate solution and 50 cc. ammonia (1 - 6), and 15 cc. acetic acid (1 - 10), heated, filtered, etc., as in preceding work.

$$d\ 1. \text{AlPO}_4 = \cdot 2850 \begin{cases} \text{Al}_2\text{O}_3 = \cdot 1197 \\ \text{P}_2\text{O}_5 = \cdot 1653 \end{cases}$$

$$\text{P}_2\text{O}_5 \text{ in filtrate} = \cdot 0735$$

$$\text{Total P}_2\text{O}_5 = \cdot 2388$$

$$d\ 2. \text{AlPO}_4 = \cdot 2978 \begin{cases} \text{Al}_2\text{O}_3 = \cdot 1251 \\ \text{P}_2\text{O}_5 = \cdot 1727 \end{cases}$$

$$\text{P}_2\text{O}_5 \text{ in filtrate} = \cdot 0685$$

$$\text{Total P}_2\text{O}_5 = \cdot 2412$$

$$\text{Al}_2\text{O}_3 \text{ present} = 0\cdot 1250$$

$$\text{Mean Al}_2\text{O}_3 \text{ found} = 0\cdot 1224$$

$$\text{Mean error} = 0\cdot 0026 = 2 \text{ per cent of Al}_2\text{O}_3 \text{ present}$$

$$\text{P}_2\text{O}_5 \text{ present} = 0\cdot 234$$

$$\text{Mean P}_2\text{O}_5 \text{ found} = 0\cdot 240$$

$$\text{Mean error} = 0\cdot 006 = 2\cdot 7 \text{ per cent of P}_2\text{O}_5 \text{ present (excess).}$$

These results may be taken to show that while the process is not faultless, its simplicity may justify its use when strict accuracy is not required.

Mr. Lefebvre precipitated the alumina in 10 cc. of solution A, after precipitating the phosphoric acid by molybdate of ammonia. The precipitate was re-dissolved in nitric acid, and again precipitated by ammonia. Duplicate estimations gave

$$A. \text{Al}_2\text{O}_3 \dots\dots\dots = 0\cdot 1001$$

$$B. \text{Al}_2\text{O}_3 \dots\dots\dots = 0\cdot 1001$$

$$\text{Mean error} = 0\cdot 0001 = 0\cdot 1 \text{ per cent of Al}_2\text{O}_3 \text{ present.}$$

36. Starches of different kinds are largely employed (1) as a filling in baking powders, (2) as an adulterant in genuine cream of tartar, (3) as a component for the various substitutes for cream of tartar.

In most cases the separated starch is used, but the flour (wheat and maize), in which gluten, cellulose, etc., are present, is occasionally employed.

The estimation of the starch by inversion and subsequent titration of the glucose with Fehling's solution is at best a tedious process, and has not, in my hands, given very satisfactory results. The following illustrative examples may possess interest:—

Inversion was effected by boiling a suitable weight of the substance (from 1 to 5 grammes according to the amount of starch present) with 150 to 200 cc. of dilute hydrochloric acid, containing 4 per cent of real acid, for five hours under a back flow condenser, cooling, neutralizing with soda, and making up to 250 cc.

$$A.—\text{Acid phosphate of lime} \dots\dots\dots 48\cdot 5$$

$$\text{Maize starch} \dots\dots\dots 51\cdot 5$$

$$100\cdot 0$$

The starch contained 8·1 per cent of moisture, so that 51·5 represents 47·3 anhydrous starch. Estimation with Fehling's solution gave 46·3 per cent dry starch.

$$B.—\text{Cream of tartar} \dots\dots\dots 36\cdot 00 \text{ (approximate).}$$

$$\text{Tartaric acid} \dots\dots\dots 7\cdot 95$$

$$\text{Sulphate of lime} \dots\dots\dots 36\cdot 68$$

$$\text{Maize starch} \dots\dots\dots 16\cdot 00$$

$$96\cdot 63$$

This gave 5·5 per cent dry starch.

C.—Maize starch..... 44·1 (=40·5 dry starch).

Acid phosphate of lime

Equivalent to P <sub>2</sub> O <sub>5</sub> .....	21·5
Alum (= Al <sub>2</sub> O <sub>3</sub> ).....	2·06
“ &c., (SO <sub>3</sub> ).....	4·80

This gave 39·47 per cent of dry starch.

D.—Corn (maize) flour gave 69·44 per cent of starch (dry).

E.—Corn starch, a pure sample (ascertained by microscopic examination), containing 6·1 per cent moisture gave 80·14 per cent starch (dry).

These, with other estimations which I have made, show that, while with great care to secure the right proportion of acid, time of boiling, degree of dilution, etc., starch may be accurately estimated by inversion, the method is too tedious, elaborate and uncertain when applied as a practical operation to cream of tartar and baking powder mixtures when the time which the analyst can give to the determination is limited.

The following experiments were made to determine the feasibility of separating, by appropriate solvents, the other constituents of the mixture, and weighing the residual starch.

Ten grams of the sample was used in each case. Where a starch comparatively free from gluten was contained in the sample the most efficient solvent was found to be dilute hydrochloric acid, about 5 parts of the strong acid to 100 parts of water by volume. Although a much stronger acid may be employed with most starches if the temperature is kept low. When *wheat flour* is used as a filling it will be found very difficult to filter the solution owing to the imperfectly dissolved gluten which clogs the filter paper. In this case I have found two per cent (volume) acetic acid the most efficient solvent for the gluten, and after its use if calcium sulphate, acid tartrate of potassium or phosphate of alumina should remain undissolved the sample may be treated with dilute hydrochloric acid. The separated starch has been, in every instance, submitted to microscopic examination at the same time for its specific identification and to ascertain its freedom from crystalline or other foreign matter. In the application of this method of working to nearly two hundred commercial samples of baking powders and cream of tartar substitutes, I have very seldom found the separated starch other than pure. Where foreign matter has been found I have either renewed the treatment by solvents or incinerated an aliquot portion, the ash being taken to represent the foreign matter present.

MIXTURE 1.—Bi-carbonate soda .....	25
Bi-tartrate potassium.....	25
Maize starch .....	50
	100

*Solvent*.—Water only used, 500 cc.; starch obtained (air-dry), 49·6 per cent, contained a few crystals of bi-tartrate traces only.

MIXTURE 2.—Bi-carbonate soda .....	24·7
Bi-tartrate potassium.....	55·3
Maize starch .....	20·0
	100·0

*Solvent*.—Hydrochloric acid, 1 to 20 used 500 cc., followed by 250 cc. wash water; starch obtained, 19·5 per cent, quite free from crystalline matter.

MIXTURE 3.—Bi-carbonate soda .....	20·5
Bi-tartrate potassium .....	46·1
Wheat flour (strong) .....	33·4
	100·0

I failed to get a solution that I could filter when I used hydrochloric acid as solvent. On using acetic acid (1 to 50), employing 1 litre, I got a solution that filtered easily, obtaining 27 per cent starch, quite free from crystalline matter; using the factor 1.25 to convert wheat starch to flour—

$$27 \times 125 = 33.75 \text{ per cent flour.}$$

MIXTURE 4.—Bi-carbonate soda .....	21
Bi-tartrate potassium.....	47
Wheat flour (biscuit).....	34
	102

This mixture, treated like No. 3, gave 28.2 per cent wheat starch, very pure. The factor 1.25 (which is probably too large in such a case) gives 35.25 per cent flour.

The constancy of result for the same mixture is shown in the cases of nearly one hundred samples of commercial baking powders worked over in duplicate, the duplicate estimations seldom differing by more than one or two per cent.

The sample (10 grammes) was weighed into a large beaker and drenched with about 500 cubic centimeters of the solvent. This was done in the morning so that the sample might be stirred at frequent intervals during the day. It was then set aside to settle over night, the filtration and washing of the starch being proceeded with next morning, and the starch allowed to dry on the weighed filter at about 65° to 70° Fah., for 48 hours before weighing. I may add that I have found automatic stirring a very great improvement in this process, although most of my work had been done without this aid. I find that if the mixture be stirred for two hours in the forenoon, and allowed to settle for three hours or so, the starch may be filtered out and set aside to dry on the afternoon of the same day. I have tabulated below the results of work upon known mixtures intended to test the solvent power of hydrochloric acid diluted with water in the proportions 1 to 50 and 1 to 20:—

H	51·8	47·4	47·6 "

All the starches separated by (1 to 20) acid were pure except D, and had the sulphate of lime been added as *terra albi*, i. e., the hydrated sulphate, there is no doubt that it would have been perfectly dissolved. It was added as plaster of Paris, a form in which it is never found in Baking Powder, not only because of the greater weight of the hydrated sulphate, but because the dry sulphate cakes on the addition of water, and is thus unsuitable for use in baking.

The available acidity of Cream of Tartar has generally been determined by titration with normal alkali. The conditions are not those which obtain in baking, when the cream of tartar is mixed in the dry state with a slight excess of bi-carbonate of soda before being mixed with the flour. The following experiments were made with the object of ascertaining how far the estimation of acidity by normal soda agreed with the results of treatment of the sample as mixed with bi-carbonate of soda in a baking powder. The samples examined were thoroughly mixed with bi-carbonate of soda in the proportions given in the table below, and in this mixture the carbon-dioxide liberated by boiling with water was estimated by absorption with caustic potash.

The mixtures used were as follows (the number in brackets is the Departmental number of the sample) :—

The following results show that too high a value is given to cream of tartar when its acidity is taken in solution with normal soda. In line H of the table it will be seen that this excess is particularly large in No. 3—when part of the acidity is due to free tartaric acid, while it is notably small in Nos. 4 and 5, where the acidity is also largely due to free tartaric acid. This is one of the anomalies of my work which I cannot explain. It may be due to error in estimation of the  $\text{CO}_2$ . In acid phosphate powders the difference is usually considerable (Sec 7, 11, 12 and 13).

G. Weight of CO <sub>2</sub> corresponding to acidity B, calculated for 100 grammes sample.....	0.52	0.60	2.34	0.04	0.05	.....	1.17	0.14	0.45	0.59	1.09	1.49	1.20	1.15	0.24
H. Difference between F. and G.....	15.72	12.79	10.39	6.98	4.91	6.52	6.60	7.65	7.91	5.66	6.91	6.57	9.56	9.69	5.96
I. Weight of CO <sub>2</sub> per 100 grammes of mixture D considered as a baking powder.....															

The subjoined table shows the relative order of excellence among the samples as indicated by each method:—

Serial Differences. cc's. $\bar{N}$ .	Order of Excellence by Normal Soda.	Number of Sample.	Order of Excellence as Baking Powder.	Serial Differences. CO <sub>2</sub> per cent.
.....	1	1	1	.....
130	2	2	2	5.80
100	3	3	3	3.50
10	9	4	8	.05
35	14	5	14	1.00
15	10	6	11	.25
10	7	7	9	.25
5	6	8	6	.35
85	5	9	5	2.58
5	11	10	13	.35
..	11	11	7	.95
5	8	12	10	.10
....	3	13	4	1.47
5	13	14	12	.70

From this it appears that the indicated order of excellence is the same except where the differences in quality are very slight. Undoubtedly the method of valuation by weighing the liberated carbon dioxide is the more accurate in indicating the value of the cream of tartar as a component of baking powder, but it is doubtful whether this consideration will cause its adoption by analysts in view of the much greater labour which it involves.

NOTE 1.—A sample of commercial burnt alum gave acidity to soda=1176 cc.  $\bar{N}$ . On the basis of this acidity 100 grams. alum mixed with bi-carbonate soda in proper amount should yield  $1176 \times .044 = 51.74$  CC<sub>2</sub>.

Obtained..... 49.45 “  
Difference..... 2.29 “

A sample commercial acid phosphate gave acidity=500 cc.  $\bar{N} = 500 \times .044 = 22.0$  CO<sub>2</sub>.  
From mixture with bi-carbonate of soda..... 18.39 “

Difference..... 3.61 “

NOTE 2.—In alkaline baking powders a certain amount of CO<sub>2</sub> is obtained from the excess of bi-carbonate of soda on boiling with water.

(a) 2.5 grammes bi-carbonate of soda boiled with 100 cc. water for 30 seconds gave 2.8 per cent CO<sub>2</sub>.

(b) 5 grammes bi-carbonate soda boiled with 100 cc. water for 5 minutes gave 5.04 per cent CO<sub>2</sub>.

38. In admixture with bi-tartrate of potassium free tartaric acid is easily detected by treatment with absolute alcohol—which dissolves tartaric acid readily, but does not dissolve the bi-tartrate.

If, however, acid phosphate of lime be present this is sufficiently soluble in alcohol to give a precipitate with alcoholic solution of potassium acetate, and thus render the test for free tartaric acid unreliable.

If, however, the alcoholic extract be evaporated to dryness on a watch glass over the steam bath, the crystalline residue of tartaric acid is quite characteristic and easily distinguished from the more or less amorphous residue which is left when acid phosphate is present. In mixtures of the two, however, the detection of tartaric acid is less easy. I have found the following method to work very well:—

Shake up 2—3 grammes of the substance to be examined with about 20 cc. of ether (ethyl oxide) in a test tube, without warming. The shaking is repeated four times during ten minutes and the ethereal solution filtered off. Bi-tartrate of potassium is quite insoluble in ether, and acid phosphate of lime is only dissolved in traces. On evaporation of the solvent on a watch glass characteristic crystals of tartaric acid are left if this be present in the substance examined. The residue from acid

---

phosphate is in very minute quantity and scarcely crystalline, so that it cannot be mistaken for tartaric acid.

NOTE.—As illustrating the acidity dissolved out by alcohol from acid phosphate of lime I may quote the following experimental numbers:—“*Straight phosphate*” (see section 28), acidity of alcoholic extract of 5 grammes with 300 cc. alcohol (cold)=95 cc.  $\bar{N}$  per 100 grammes. Total acidity of this sample=690 cc.  $\bar{N}$ .

A mixture of acid phosphate of lime and starch, having available acidity to soda=602 cc.  $\bar{N}$  per 100 grammes, on treatment with cold alcohol gave acidity to alcoholic solution=208 cc.  $\bar{N}$  per 100 grammes.

**BULLETIN No. 27.—DISTILLED LIQUORS.**

E. MIALL, Esq.,  
Commissioner of Inland Revenue.

SIR,—It is a popular impression that many of the spirituous liquors offered for sale in Canada are more or less adulterated. When engaged in collecting food samples for analysis the inspectors connected with this branch are not unfrequently asked why they do not take samples at liquor stores, where, it is assumed, the mixing or “drugging” of liquors is carried on, and is much more injurious to the public health than are the falsifications of ordinary groceries or food stuffs. The same idea is sometimes mentioned in the newspapers, as the following extract from a recent issue of *La Presse* will show. Referring to spirituous liquors generally it says:—“Toutes ces liqueurs, plus ou moins mauvaises pour la santé de ceux qui en consomment quelques coups par jour, sont pernicieuses au plus haut degré pour ceux qui en abusent, et cela quand ces liqueurs sont de bonne fabrication et de source naturelle. Que sera cet empoisonnement, si ces mêmes liqueurs, pour la concurrence commerciale et pour atteindre le bon marché relatif, sont fabriquées de toutes pièces par un simple mélange d’alcool et d’eau, et de teintures avec essences et huiles diverses. C’est là, souvent, le genre simple des liquides absorbés à bon marché.”

Not only is it believed that liquors are thus falsified, but it is maintained that the adulterants present in alcoholic beverages often produce worse effects than the alcohol itself. The Rev. Father McCallen, of St. Patrick’s Church, Montreal, spoke as follows at a temperance convention held there on the 1st October, 1890:—“If a butcher sold tainted meat, a druggist compounded an injurious prescription, a baker adulterated his food products, they were pounced upon by the law; but those who send men to their homes intellectual, physical and moral wrecks, through the sale of adulterated beverages, which so quickly affect the brain, shatter the health, bring disease to the body and create an irresistible craving in the drunkard for still greater potations, did so with an impunity which is simply appalling to contemplate.” In addition to this, it has been plainly stated that no returns have been made by the officers of the Government with regard to any analysis of intoxicating liquors. Mr. J. J. Curran, member for Montreal Centre, said in Parliament: “I believe that the officers of the Government are being instructed to analyse liquors issued from compounderies and distilleries, but I am not aware any such steps have been taken with regard to places where liquors are sold by retail.” The Hon. the Minister of Inland Revenue was able at once to correct this mistake, and said: “When my hon. friend says that while analyses have been made of different items of food and drugs, none have been made of liquors, he is not, perhaps, aware that officers in the Chief Analyst’s Branch of the Department have collected very large numbers of samples in different cities throughout the Dominion, with the view of ascertaining the condition of the liquors sold by retailers.” I have thought it necessary to call your attention to these facts as a justification for addressing to you the following report on distilled liquors, and requesting that you will cause the same to be published in the Bulletin series, in order that the public may understand the exact position of this branch of the Department with reference to the alleged adulteration of the liquors in question.

If reference is made to the reports on the adulteration of food which have been published by the Department, it will be seen that the number of samples of distilled and malt liquors, wines, liqueurs and cordials collected and analysed since 1883 has been as follows :—

Year ending	Total No. of Samples Collected and Examined.	No. Found to be Adulterated	No. Found Doubtful.	No. Found to be Un-adulterated.
June 30th, 1883 .....	46	8	1	37
do 1884 .....	113	9	3	101
do 1885 .....	85	19	7	59
do 1886 .....	210	31	3	176
do 1887 .....	50	6	2	42
do 1888 .....	164	23	10	131
do 1889 .....	12	6	0	6
Total .....	680	102	26	552

All these samples were collected from retail dealers. In general it may be remarked that the adulterations detected consisted for the most part of dilution by water, and the addition of colouring substances not injurious to health. None of the substances enumerated in the first schedule of the Adulteration Act were found in any of the samples, with the exception of occasional traces of amyl-alcohol (fusel oil). Diligent search for methyl-alcohol (from the possible addition of methylated spirit) failed to discover any.

The liquors sold under the names brandy, rum, gin, whiskey, &c., have been found, when samples of each class were compared with each other, to vary considerably as regards alcoholic strength. Nevertheless, it was not found practicable to institute prosecutions for the sale of liquors deficient in alcohol, because in all such instances they had not been offered for sale under any professed standard, and because there is no legal standard of strength yet established for these liquors in Canada. No doubt section 19 of the Adulteration Act gives the Governor in Council power to establish such standards, but this has not yet been acted upon.

In the course of the discharge of their duties, the officers of this branch have become aware that, among the various brands of distilled liquors offered for sale in Canada, there are many of a spurious character, not derived from the source indicated by their names, and, in fact, as stated in the newspaper extract above quoted, made up of alcohol, water and other materials. It was, however, found to be a difficult matter to distinguish the factitious from the genuine article, and no attempt in this direction appears to have been made by any of the public analysts. In fact, the existence of this sort of manufacture has long been known to and recognized by the Inland Revenue Department, but it is only recently that the various ethers, essences and oils used in the production of spurious brandy, rum, gin, whiskey, &c., have been publicly offered for sale. This branch is, however, not yet in possession of any information to show that advantage has been taken of these facilities by retailers, to any very large extent, to manufacture brandies, &c., on their own premises.

In order to prosecute further the examination of these liquors, instructions were issued by yourself in the month of April last to the food inspectors for the collection of 180 samples of distilled liquors, which were obtained at the places indicated in the following list :—

Place.	High Wines.	Brandy.	Rum.	Gin.	Whiskey.				Total.

These 180 samples were submitted to the various district analysts, and the duplicates, as required by law, forwarded to the Department. The reports of the analysts were all of the same character as in the former examinations of such liquors referred to above. On the other hand, the duplicate samples, along with some others specially selected, were subjected to a much more minute examination than usual, in this laboratory, one of the objects being if possible to detect any of the samples which might be of artificial origin. The tables hereto attached, Nos. I to VIII, give a description of the various samples, and form part and portion of the report, also hereto attached, of Mr. A. McGill, B.A., &c., Assistant Analyst to the Chief Analyst, who carried out the examinations.

I have to recommend this report to your attentive perusal, but I must also point out several of the results of it as worthy of special notice, and make some general remarks regarding each class of liquor described, with the view of arriving at proper definitions and legal standards for each, without which the administration of the Adulteration Act, so far as regards distilled liquors, will be impossible. For the various statements made and figures given I might give the authority, but I do not consider it necessary to burden this report with too many quotations.

*Brandy.*—The 24 samples varied in alcohol contents from 59·16 to 33·40 per cent by volume, or from 3·63 per cent over proof to 41·47 per cent under proof. Brandy imported in wood is usually understood by the trade to be 4 o. p. ; in bottle it is commonly 15 u. p. This is equal to 85 per cent of proof spirit, or 48·54 per cent by volume of alcohol. Exactly one-half of the samples are below this limit, and their vendors would have been liable to prosecution had it been legally established as the lowest saleable percentage. On the other hand, if the English lowest limit of 25 u. p., or 75 per cent proof spirit, or 42·84 per cent by volume of alcohol, had been legalized in this country, then there would have been only three cases for prosecution, or 12·5 per cent of the samples collected. With reference to the amount of extract, “total solids,” “dry substance” or, as it is called in the tables, “fixed matter dried at 100° C.,” it is usually supposed that a brandy, being a distillate, should not contain more dry substance than it is capable of dissolving from the cask in which it is stored. According to Clifford Richardson, strong whiskey (with 43 per cent alcohol) after six months’ storage in casks shows 0·0337 per cent of dry substance. This is the average of 8 samples, and the amount, after storage for four or five years, does not exceed 0·2 per cent. According to X. Rocques, (Bull. chim. 50, 157 ; 1888) the extract in 3 samples of genuine cognac (Chateau des Andreaux, Charente,) were as follows :—

Cognac, 1875 .....	1·30	grammes per litre.
do 1848 .....	3·30	do
do 1836 .....	4·90	do

Assuming 2 grammes per litre as the maximum extract in a genuine, 8 year old, cognac, it follows that only 3 out of the 24 samples examined came up to this standard, and it becomes plain that what are usually considered the best qualities of brandy receive artificial additions for colouring or other purposes after distillation. Among these probably the least harmful are small quantities of syrup, the use of which is admitted by the manufacturers. Nevertheless, the German government has decided that cognacs containing it are not pure, and can only be imported on payment of a higher rate of duty. Additions are no doubt also frequent of alcohol which has not been produced from wine or grapes. It is notorious that large quantities of high-strength German spirit are imported into France for mixing with brandy, and even for making artificial imitations of it. Statistics show that the average total production of cognac by the Charente Departments does not amount to one-tenth of the quantity exported by France to foreign countries. It would, therefore, be unjust to regard all imported brandies as genuine, or as, in every case, very much better than the domestic product, some of which, as their vendors naively state, are “blended by themselves with rye whiskey.” These vendors might very fairly maintain that their rye whiskey made from grain is superior to the German spirit made from potatoes. It does not seem that any of the samples examined are produced exclusively from high-grade alcohol. This conclusion is based on the results of the tests for opalescence in the distillate and for furfural. It would not be wise, however, to place too much reliance upon the presence of the latter substance and of volatile oil or ether, because it would be an easy thing for manufacturers to add these if it became a matter of importance to them to render the detection of the adulteration impossible. In passing judgment upon the 24 samples examined it is very evident that none of them come up to the old or popular definition of brandy, namely, “ardent spirits distilled from wine without any subsequent addition.” If this definition cannot be upheld, then a new one becomes necessary before the public analysts can give any reliable opinion as regards adulteration. The Select Committee of the

English House of Commons on British and foreign spirits, in their report, printed this year, call attention to this difficulty of definition, and say: "Foreign brandy consists of dilute alcohol flavoured with the bye-products of the grape, but British brandy is an imitation without these bye-products, and is made from a silent spirit." Under such circumstances, it would seem impossible for chemical analysis to render much service in the matter. It seems to be more a matter of smell and flavour, and that connoisseurs or experts experienced in these are the proper judges, and the persons to suggest a standard for brandy. Meanwhile, it would not be unreasonable to establish a lowest limit of variability for these liquors. It might also be possible to restrict their names, so that they should signify as follows:—

Cognac; made in the Charentes district and guaranteed free from admixture of foreign spirit.

Brandy; also imported from France, but without guarantee.

British Brandy; the imitations imported from England.

Canadian Brandy; imitations made in Canada.

*Rum.*—The strength of the 13 samples collected varies from 78.80 per cent alcohol by volume to 35.62 per cent, or from 32.82 per cent over proof to 37.51 per cent under proof. It is said to be usually imported into Canada in wood at from 32 to 42 over proof, and to be generally sold wholesale in this condition, but its value is based upon a price per gallon at 16 o. p. The latter strength corresponds to 66.21 per cent of alcohol by volume, which is somewhat higher than the French authority quoted by Mr. McGill, and, if adopted as the lowest limit, would cause 10 out of the 13 samples examined to be condemned. If the English lowest limit of 25 u. p. were adopted, which is equal to 42.84 per cent alcohol, then only 2 of the 13 would be condemned. If rum is to be regarded as a variety of ardent spirits, distilled in the West Indies from fermented sugar refuse, molasses, &c., then the amount of extract should not exceed 2 grammes per litre. But it is said that even at the place of production burnt sugar is mixed with the distillate in order to give it the desired colour. Genuine rums, according to recent analysis, vary in the amount of extract from 6.68 to 30.47 grammes per litre, which latter figure much exceeds any of the results given in Table II. It has not yet been found possible to make an accurate determination of the amount present of the peculiar ether to which rum owes its characteristic aroma, or to distinguish reliably betwixt the genuine and the adulterated article or artificial imitations. The only way in which to protect the public from the latter, at present, would seem to be so to arrange matters that no liquor could be sold as rum which was not imported direct from the country of production. It seems impossible to rely on the character of the rum imported from England, in view of the fact that the Excise authorities there allow an artificial mixture called Hamburg rum to be stored, and also to be blended in bond with the pure colonial product.

*Whiskey.*—In the wholesale trade of Montreal, Scotch whiskey in wood is usually imported at 11 over proof; in bottles at 15 under proof. As put on the market by Canadian distillers, it runs from 10 to 25 under proof. Taking the latter strength, 42.84 per cent alcohol by volume, which is also the legal lowest limit in England, as the lowest at which whiskey should be sold, and comparing with it all the whiskeys described in Tables III, IV, V and VI, it will be found that the following are too low in alcohol:—

	Per cent.
Among 61 Rye whiskies 47 are too low.....	= 77
“ 23 Scotch “ 5 “ .....	= 21.7
“ 11 Irish “ 2 “ .....	= 18.2
“ 33 White “ 21 “ .....	= 63.6
128	= 58.6
75 are too low.....	=

These figures plainly show that there is a necessity for fixing "the limits of variability" as regards whiskey by Order in Council, as provided for in the Adulteration

Act. That law also provides that "Food shall be deemed to be adulterated, within the meaning of the "Act, if it is an imitation of, or is sold under the name of another "article." But in order to prove an imitation it is necessary, in many cases, to define the original article for which it is substituted. Therefore, a legal definition of the term "whiskey," as well as of the names for other distilled liquors, is necessary before any proceedings against parties selling the spurious articles can be undertaken, unless indeed such liquors are found to contain substances injurious to health.

*Hollands and Old Tom.*—The strength of gin ordinarily imported into Canada in wood is about proof, and, when bottled, 20 per cent under proof. Seven of the 21 samples examined and described in Table VII and VIII are below this strength. The lowest legal limit in England is, however, only 35 u. p., or 65 per cent. proof spirit which strength is exceeded by all the samples collected. The old definition of gin is "a kind of ardent spirits manufactured in Holland from rye and malt, in rectifying which juniper berries are added to the contents of the potstill to give the peculiar flavour." According to the analysts, about one-third of the number of samples collected do not answer to this definition. As there are British brandies and British rums so it appears there are also British gins. But the analysis of the latter under the name of Old Tom would lead one to class it among the liqueurs rather than under distilled liquors.

This investigation leads generally to the following conclusions:—

1. That the opinion held by many regarding the injurious character of the substances added to spirits or distilled liquors, for various purposes, is destitute of sufficient foundation. Some of the essences, ethers, &c., used by blenders or compounders, taken by themselves, may be said to be injurious, but the quantities used are so minute in the resulting product that they cannot be considered to have any worse effect on the human system than the dilute alcohol with which they are mixed.

2. That, in very many cases, liquors are sold under the designation of brandy, rum, Scotch and Irish whiskey, and gin, which have no right to such names, on account of their being merely imitations.

3. That this Branch finds it impossible under the Adulteration Act to prevent such sale until the limits of variability have been fixed and standards established by the Governor in Council or by Parliament.

I have the honour to be, Sir,

Your obedient servant,

THOMAS MACFARLANE

*Chief Analyst.*

30th October, 1891.

	"K"	2 do ..	.....	.....	Gooderham & Worts..	.....

None of the samples of rye whiskey gave any opalescence on dilution of the alcoholic distillate 1 : 2.

In this table are included four samples of so-called "Bourbon" whiskey, viz: Nos. 9975, 9981, 10680 and 10685. Of these No. 10680 shewed a very faint opalescence on diluting the distillate 1 : 2. The others behaved like the rye whiskeys in this respect.

## LABORATORY OF THE INLAND REVENUE DEPARTMENT,

OTTAWA, 30th September, 1891.

T. MACFARLANE, Esq., F.R.S.C., &c.,  
Chief Analyst.

SIR,—I beg herewith to hand you my report upon samples of liquors collected in April and May of this year. These are classified as below :—

	Samples.
Brandy .....	24
Rum .....	13
Rye whiskey .....	61
Scotch do .....	22
Irish do .....	10
White do .....	33
Hollands gin .....	16
Old Tom do .....	3
Total .....	<u>182</u>

In addition to these, 6 samples of artificial liquors have been prepared (according to formulas published by vendors of flavouring essences) and submitted to analysis, and much experimental work has been done for the purpose of enabling an interpretation to be put upon the figures obtained in analysis. Owing to the prolonged absence (through illness) of Mr. Lefebvre nearly the whole of the work has been done by myself. Any exceptions are credited duly in their proper places.

1. *Original Gravity*.—This has been taken by means of the specific gravity-bottle (Geissler's pattern), and great care has been given to ensure, not only accuracy in weighing, but that the bottle should be filled exactly at 15·5° C. In carefully distilled liquors which have been kept in glass or metal vessels the original gravity should (using Hehners or other alcohol tables) give a very close approximation to the actual content of alcohol. When solid matter in solution is present the gravity will be correspondingly raised, and the spirit indication will be less than the truth, since these tables are constructed for mixtures of alcohol and water only. An examination of the numbers found will show that in some cases the difference between proof spirit indicated by the gravity and that actually present amounts to 5 or 6 per cent.

TABLE showing the effect of Solid Matter in solution in lowering the apparent Spirit strength by the Hydrometer.

Sample.		Per cent. Proof Spirit, Correspond- ing to Gravity.	True Strength (proof spirit) p. c.	Difference.	Residue (Grammes per Litre).
Brandy .....	No. 8..	87·02	92·54	5·52	16·784
Rum .....	" 2..	118·77	122·58	3·81	11·904
Rye whiskey .....	" 22..	69·29	73·92	4·63	12·244
Scotch whiskey .....	" 4..	88·97	91·14	2·17	1·428
Irish whiskey .....	" 2..	52·64	58·22	5·58	10·308
Whiskey .....	" 19..	67·06	69·97	2·92	3·592
Holland gin .....	" 2..	95·96	97·19	1·23	0·948
Old Tom gin .....	" 1..	58·24	71·90	13·66	28·620

Solids may be present from their (1) having mechanically passed over the goose-neck in distillation, (2) from having gone into solution as a result of the action of the liquor upon the material of the cask or other vessel in which it was stored, (3) from

legitimate addition, as in rye whiskey, or in the manufacture of a liqueur, or (4) from fraudulent addition, for the purpose of giving colour, flavour or body to an artificial brandy or rum, etc.

2. *Spirit Gravity*.—By this term I would indicate the gravity which the liquor would have if it contained no other substances than alcohol and water. In order to obtain the spirit gravity I have proceeded as follows:—A measured volume of the liquor (usually 250 cc.) is taken, and to it, in the distilling flask, is added nearly an equal volume of distilled water. The mixture is now slowly distilled until not more than from 50 cc. to 75 cc. remains in the flask. The distilling flask is provided with a fractioning tube, and the receiver is closed by a funnel tube, containing glass beads kept wet with distilled water. The distillate so obtained is made up to twice the volume of liquor taken at first, *i.e.*, to 500 cc. in most cases, and this is done at the same temperature at which the original measurement was made. From the specific gravity of the distillate the spirit gravity is obtained thus: From the alcohol tables is taken the volume per cent. of alcohol corresponding to the specific gravity of the distillate found. This volume per cent is multiplied by two (2) and opposite to a number in the volume per cent column, identical with the number so obtained, will be found the spirit gravity.

I find that with such apparatus as I have described above it is not practicable to distil over the whole of the alcohol from a liquor of nearly proof strength without dilution. Even on diluting to nearly two volumes the whole of the alcohol is not contained in the first portion of the distillate corresponding to the volume of liquor taken; *e.g.*, on distilling 500cc. reduced grain spirit, after adding 350cc. distilled water, the first 500cc. of distillate contained only 47.36 per cent of alcohol, as against 48.05 per cent contained in the liquid distilled. On distilling such a mixture until 750cc. came over, diluting to 1 litre and calculating from the gravity of this distillate the whole of the alcohol was accounted for.

The specific gravity is given to four decimal places. Numerous duplications have proved that strict accuracy to three places can always be obtained on careful working. The same figure in the fourth place is not always obtained, but the average error does not exceed 0.0003, corresponding approximately to two tenths of 1 per cent. of alcohol by weight.

3. The alcohol by weight contained in the sample operated on is obtained from the gravity of the distillate (to double volume) by use of the following formula:—

$$\frac{\text{Sp. grav. dist.} \times \text{corresponding alc. p.c. from tables}}{\text{original gravity}} \times 2 = \text{alc. p.c. by weight in sample}$$

or, if S=Specific grav. of distillate.

w=Corresponding alcohol p.c. by weight, from table.

G=Original gravity.

W=Alcohol percentage by weight required.

Then  $\text{Log. W} = \text{Log. S} + \text{Log. (2} \times \text{w)} - \text{Log. G.}$

The content in alcohol percentage by volume and in proof spirit are of course obtained by doubling the numbers found in the alcohol tables opposite the specific gravity of the distillate to double volume.

4. *Residue, dry at 100° C.*—The residual liquid contained in the distilling flask (and representing usually 250cc. of the liquor worked on) is transferred to a porcelain dish, and, with the washings of the flask, concentrated on the steam bath to a volume of about 10cc. This is poured into an asbestos-filled tube (like those described by Mr. Macfarlane, *Trans. Roy. Soc. Can.*, 1887, Sec. III, p. 33) previously dried to constant weight at 100° C. The tube with its contents is returned to the drying oven, and allowed to remain at 100° C, until no further weight is lost. This usually requires, in the case of rye whiskies and brandies, from 36 to 48 hours.

The residue (which in the foregoing tables is stated in grammes per litre) bears, in a very general way, an intelligible ratio to the difference between the original gravity and the spirit gravity. In order that this correspondence should be strictly constant it would be necessary (1) that the solid matter present in the liquors should be of the

same kind, (2) that the alcoholic strength of the liquors should be uniform. The second condition is very far from being fulfilled in the case of any kind of liquor examined. The extremes will be seen in the following table :

Kind of liquor.	No. of Samples.	Alcohol p. c. by weight.		
		Highest.	Lowest.	Difference.
Brandy .....	24	51·10	27·51	23·59
Rum .....	13	68·50	29·48	39·12
Rye whiskey .....	61	42·76	22·77	19·99
Scotch do .....	22	54·41	32·74	21·67
Irish do .....	10	42·58	27·31	15·27
Whiskey .....	33	42·39	21·68	20·71
Holland's gin .....	16	49·44	35·25	14·19
Old Tom gin .....	3	38·66	33·87	4·79

The first condition is equally unfulfilled, since even samples of liquor of the same name give residues of very various kinds. In the case of Canadian rye whiskey the solid matter added to the same brand by the same manufacturer might be expected to be constant in kind and in amount, and would thus become a means of indentifying the genuine liquor from an imitation.

5. Any volatile oils present in a liquor are carried over with the vapour of alcohol, and are therefore found in the alcoholic distillate. Such oils are, as a rule, insoluble in water, and nearly insoluble in very dilute alcohol. In consequence of this, when water is added to the distillate, so that its volume is double that of the liquor distilled, the oils are largely thrown out of solution, and the emulsion so produced becomes decidedly opalescent, even if they are present in but very minute quantity. In genuine brandy, distilled from wine or marc, such oils are necessarily present, as also in rum, in Scotch and Irish whiskeys and in Hollands gin. Grain spirit, well rectified as by the patent stills, is practically free from these oils, and gives no opalescence on dilution with water. As rye whiskey is generally made from such spirit, as also much of the liquor sold as white whiskey, we find no opalescence on diluting the distillate from these liquors. The following synopsis shows the behaviour of the samples analyzed in this respect :—

Kind of Liquor.	OPALESCENCE.			Total Samples.
	Distinct.	Slight.	None.	
Brandy .....	4	11	9	24
Rum .....	7	5	1	13
Rye whiskey .....	1	1	60	61
Scotch do .....	7	12	3	22
Irish do .....	2	4	4	10
White do .....	1	.....	32	33
Hollands gin .....	13	3	.....	16
Old Tom gin .....	.....	1	2	3

The sample of white whiskey which gave opalescence on diluting is believed to be a Scotch whiskey, although not sold as such. The rye whiskeys include four samples of so-called Kentucky Bourbon, and it was one of these which gave the faint opalescence referred to in the table above. Six samples of artificial liquors were prepared in the laboratory from patent still spirit and essences sold for flavouring purposes. These samples included one each of brandy, rum, Scotch and Irish whiskey, Hollands gin and Old Tom gin. None of the distillates from them gave any opalescence on diluting with water.

It is not unlikely that in cases where the opalescence produced is very slight the liquor is essentially an imitation article, to which a proportion of genuine liquor has been added—since in every case in which a high degree of certainty exists as to the origin of a pot-still liquor a very decided opalescence has been found on treatment as above.

6. The presence of furfural in alcohol is believed to be due to the charring of portions of the malt (or other material used) during the process of distillation. (M. L. Lindet—Bull. de la Société Chimique de Paris, tome V, p. 20).

In patent stills, where steam heat only is used, this charring of the contents of the still does not take place, and in the spirit produced furfural is not found. The ageing of the spirit, which causes changes in the nature of most of the secondary constituents of spirits, does not apparently affect the furfural, which is present as largely in old as in new pot-still whiskies. (Evidence of A. H. Allen before the Select Committee on Spirits appointed by the British House of Commons, 1891).

The test liquid for furfural I have prepared as follows :—

Aniline (re-distilled) .....	1 vol.
Acetic acid (glacial) .....	1 “
Distilled water .....	2 “

When 1cc. of this liquid is added to 50 cc. of the liquor to be tested, contained in a Nessler glass, an intense reddish colour is imparted, when as much as 0.01 of 1 per cent of furfural is present ; and a distinct colouration is produced in presence of one-tenth of that amount. On account of the tint possessed by most liquors it is necessary to make the comparison with an equal depth of the sample contained in a second test glass.

I believe that it would be possible to make the operation quantitative, provided that the liquors operated on were first decolourized by animal charcoal or other means, but I have not attempted to use the test quantitatively further than by noting the intensity of the colouration as *distinct*, *faint* or *none*.

Kind of Liquor.	Furfural Reaction.			Total.
	Distinct.	Faint.	None.	
Brandy .....	13	11	.....	24
Rum .....	3	9	.....	13
Rye whiskey .....	1	.....	60	61
Scotch do .....	9	10	.....	19
Irish do .....	5	3	.....	8
White do .....	1	.....	32	33
Hollands gin .....	9	2	.....	16
Old Tom do .....	.....	.....	3	3

7. The residue in the flask from which the alcohol distillation was made (*see* sec. 2) has in every case been examined for odour of amyl alcohol or other characteristic indication of fusel oil ; but in no case has such indication been found.

8. The alcoholic distillate, after having been used to obtain the specific gravity, has been submitted to a rapid distillation, and in the first 150cc. taken off (from the total 500cc.) search has been made for acetone, as a means of detecting the presence of wood naphtha—should the liquor have been made in whole or in part from methylated spirit. In no case has any trace of acetone been found. The sensitiveness of the test used (known as Reynold's test—*see* Allan's Com. Org. Analysis, vol. 1, p. 50) has been amply confirmed by experimental researches conducted by me in September, 1887.

In November, 1887, I examined the following samples of liquor for methylated spirit, using the acetone test. It was at that time required by regulation of the Inland Revenue Department that wood naphtha intended for methylating purposes should contain 25 per cent of acetone. No acetone was found in any of the samples examined :

Rye whiskey, Nos. 1031, 2431, 2741, 3244, 3245, 3246, 5755, 5757, 5760, 7228, 7238—11 samples.

White whiskey, Nos. 1032, 2428, 2528, 2529, 2933, 2936, 5761, 6580, 6532, 6534, 6536, 6843, 6844, 7220, 7222, 7224, 7225, 7234, 7236—19 samples.

Old tom gin, Nos. 1028, 1030, 2633, 3771, 5753, 5754, 5756, 5758—8 samples.

Hollands gin, Nos. 1025, 2429, 2430, 2432, 2525, 2636, 2743, 2744, 2934, 2935, 2937, 3242, 3243, 3247, 3773, 5752, 5759, 5749, 6538, 6540, 6542, 6544, 6546, 6548, 6550, 6552, 6845, 6846, 6847, 7025, 7028, 7029, 7030, 7223, 7226, 7227, 7230, 7231, 7232, 7240, 7241, 7242, 7243, 7244, 7245, 7216—46 samples.

## RESUMÉ.

Rye whiskey .....	11	samples
White whiskey .....	19	do
Tom gin .....	8	do
Hollands gin .....	46	do
Total .....	<u>84</u>	<u>do</u>

9. Of the other substances mentioned in the schedule appended to the Adulteration Act of 1886, none have been detected in any of the samples analyzed, although search has been made for all of them (not excluded by the nature of the liquor examined).

So far as special cases seemed to demand investigation, Cannabis Indica (Indian Hemp), Cocculus Indicus (picrotoxin), Capsicum (cayenne pepper), and Lolium temen-  
tulum (darnel), which are added to liquors to increase their intoxicating power, need only be looked for in such samples as are deficient in alcohol. In such samples they have been sought, but in no instance has any evidence of their presence been obtained.

*Brandy.*—Twenty-four samples sold under this name have been analyzed. Eleven of this number are draught liquors, the remainder being so-called case liquors, and claim to be sold as imported. The variation in alcoholic content will be seen in the following table:—

	Alcohol per cent.					
	MAXIMUM.		MINIMUM.		MEAN.	
	Weight.	Volume.	Weight.	Volume.	Weight.	Volume.
13 case liquors .....	51·10	59·16	30·51	36·84	41·26	48·77
11 draught liquors .....	48·22	56·36	27·51	33·40	39·61	46·95

If brandy be identical with *eau de vie* distilled from wine, the ethers necessarily present in it will cause a distillate from it to become at least slightly turbid and opalescent on dilution with water to double the volume of the liquor operated on. In this respect the following results have been obtained:—

	Opalescence on Diluting the Distillate one Volume to two Volumes.		
	Distinct.	Slight.	None.
13 case liquors .....	3	5	5
11 draught liquors .....	1	6	4

This shows at least a slight opalescence in 62 per cent of the case liquors and in 64 per cent of the draught liquors. A distinct opalescence, however, was obtained in 23 per cent of the former and in only 9 per cent of the latter. I have always obtained opalescence in any sample of brandy which I had specially good reason to believe a genuine *eau de vie* from wine. An artificial brandy made from patent still spirit with flavouring essences as furnished to the trade for compounder's use gave no opalescence. This "brandy" was made from the following formula:—

Alcohol (about 10 below proof).....	1,600 cc.
Brandy, essence .....	1 cc.
Glycerine .....	5 cc.
Brandy colouring .....	6 cc.

It is evident that the intensity of the opalescence may be reduced either by addition of patent-still spirit to a genuine brandy, or by using a very inferior grape or wine in the production of the genuine article.

Eight of the 13 case liquors give distinct furfural reaction, and 5 of the 11 draught liquors show furfural distinctly present. In every one of the brandies at least traces of furfural are found, proving that they consist at least in part of pot-still spirit.

The fixed matter show the following variations:—

	Fixed Matter (Grammes per Litre.)		
	Maximum.	Minimum.	Mean.
13 case liquors .....	16·784	0·952	8·850
11 draught liquors .....	17·924	2·504	8·679

Owing to the absence of any standard it is quite impossible to classify these so-called brandies as adulterated or as genuine. That such extremes should be found in genuine brandy as are exemplified among these samples, whether we consider spirit strength, solid residue, volatile ethers or furfural, seems very unlikely, and should, if recognized in the trade, cause the prices to vary as greatly as the quality. With reference to the nature of the solid residue, Mr. Babington made an examination of it in the case of 4 samples of brandy, with the following results:—

	Grammes per Litre.			
	Champagne Cognac—B.	Draught Liquor, 9360.	Jules Robins, Brandy, 10247.	E. Dumas Cognac, 10256.
Total residue.....	7·373	2·097	4·196	0·405
Insoluble in water.....	·070	·000	·005	·000
Soluble in water.....	7·303	2·097	4·191	0·405
Cane sugar.....	?	0·650	1·683	?
Invert sugar.....	4·576	1·674	3·638	0·212
Precipitate with acid, soluble in alkali.....	Heavy.	Slight.	Slight.	Slight.

NOTE.—Where the cane sugar is questioned the cuprous oxide obtained after inversion was less or equal to that obtained directly.—F. W. B.

*Rum*.—Thirteen samples collected as rum have been examined, in addition to which a sample of artificial rum has been prepared and analyzed. The high total solids from this sample consist chiefly of caramel, added to give the necessary depth of colour, and glycerine. The following formula was used in preparing it:—

Alcohol (about 30 below proof).....	1,600 cc.
Rum essence .....	2 cc.
Rum colouring .....	2.5 cc.
Glycerine.....	10.0 cc.

The variations of alcohol strength are given in Table II.

Highest alcohol strength .....	P. c. 68.60 (wgt.) = 75.80 (vol.)
Lowest do do .....	29.48 do = 35.62 do
Mean do do .....	46.22 do = 53.67 do

The total solids, dry at 100° C., are stated in grammes per litre:—

Highest.....	11.904
Lowest .....	2.160
Mean.....	4.997

All but one of the samples gave at least a slight opalescence on diluting the alcoholic distillate to double volume. In this respect the sample in question (No. 10250) resembled the artificial rum prepared in the laboratory. This sample is the only one which does not give at least a faint indication of the presence of furfural,

It is remarkable that some of these samples (*e.g.*, 10675 and 10690) which are suspicious on account of their low content in alcohol, nevertheless give a distinct opalescence on diluting the distillate. This may be due to the fact that they are genuine rums, merely reduced by the addition of water; or that genuine rum, or some of its characteristic volatile oil, has been purposely added. This is the more likely since, with a single exception, all the samples show at least traces of furfural.

Beaudrimont (Dictionnaire des Alterations et Falsifications des Substances Alimentaires, p 1055) says true rum is solely the product distilled from fermented molasses of the sugar cane. The name *tafia* is given to the liquid distilled from fermented sugar cane juice, although this last is generally sold in France under the name of rum.

Genuine rum should contain 50 to 65 per cent (volume) of alcohol, the mean accepted strength being 52 per cent.. If this mean strength were adopted, 6 out of the 13 samples, or over 46 per cent. would be condemned as too low in alcohol.

*Rye Whiskey*.—There have been 61 samples of rye whiskey analyzed, but in this number are included 4 samples of so-called Bourbon whiskey. One of these (No. 10680) gave a slight opalescence on diluting the alcoholic distillate due to separation of ethers, but all the other samples, with a single exception, appear to be made from patent still spirit only. The exception is No. 10266, which gave a distinct reaction for furfural, implying a blend with pot-still spirit. The highest alcohol content (No. 9975) is 50.34 (volume per cent), and the lowest (No. 10220) is 27.80.

The highest residue is found in No. 10230, being 12.244 grammes per litre, and the lowest in No. 10234, being 0.308 grammes per litre. There is no apparent consistency in this respect even among whiskeys which are stated to be made by the same manufacturer. The following, for example, are stated to be made by Messrs. Gooderham & Worts, Toronto:—

Serial No.	Alcohol % (Vol.)	Residue.
18	41.98	1.492
20	38.78	2.004
23	41.22	0.308
27	39.74	1.600
32	43.78	2.352
61	46.76	1.842
Mean .....	<u>42.04</u>	<u>1.599</u>

Qualitative examination of a number of residues obtained from rye whiskey showed them to consist chiefly of glucose, cane-sugar, tannin, glycerine and resinous matters. The total amount of residue available was not large enough to permit accurate quantitative separations.

The following examination of the solid residue in a few of the samples was made by Mr. Babington:—

No .....	Grammes per Litre.							
	9359	10220	10226	10229	10230	10234	10236	10242
Total residue.....	·237	·341	·501	·225	3·061	·077	·235	·254
Insoluble residue.....	·028	·010	·002	·013	·018	·005	·018	·001
Soluble residue.....	·209	·231	·499	·212	3·043	·072	·217	·253
Cane sugar.....	·006	·015	·049	·017	1·53	.....	·006	·006
As invert sugar.....	·022	·041	·216	·056	2·48	.....	·044	·070
Precipitated by hydrochloric acid soluble in alkali.....	.....	.....	Ppt.	Ppt.	Ppt.	Ppt.	Ppt.	Ppt.
Difference between gravities.....	·0015	·0010	·0006	·0008	·0045	·0015	·0010	·0011
Residue, grammes per litre.....	0·948	0·964	2·004	0·900	12·244	0·308	0·940	1·016

It appears that where the residue is high, as in 10230, the invert sugar found bears a high ratio to the total weight of the soluble residue. In other cases the invert sugar found is low. Sweetness may be given to the liquor, in such instances, by glycerine, or other substitute for sugar; and there can be little doubt that many of the liquors sold as rye whiskey contain added glycerine. In order to determine the probable loss on drying a glycerine residue in asbestos at 100° C., the following experiments were made:—

Experiments made by Mr. Tourchot.	LOSS OF WEIGHT AT 100° C. (PER CENTAGES).		
	15 hours.	21 hours.	40 hours.
	Experiment 1.....	2·49	2·49
do 2.....	3·41	3·54	5·46
do 3.....	6 hours.	17 hours.	
do 4.....	5·48	6·76	
do 5.....	6·60	7·94	
	4·92	5·96	

The same sample of glycerine was used in all these experiments.

Experiment 1—2·291 grammes glycerine added to dry asbestos tube, and exposed in water oven to temperature of 100° C.

do 2—2·345 grammes glycerine as above.

do 3—2·026 do do

do 4—2·180 do do

do 5—Five grammes glycerine dissolved in 250cc. alcohol of sp. gravity 0·9512, concentrated on the water bath, and finally dried in asbestos tube.

From these experiments it appears that glycerine loses in weight at 100° C. when exposed to dry air in asbestos tubes; that the weight lost depends upon the time of exposure, but is variable between 3 and 5 per cent., for reasons not made apparent by

these experiments. The loss of weight is not increased either in rapidity or in amount by dissolving in alcohol and evaporating with the alcohol.

The addition of any solid matter to alcohol causes an increase in the density, and a consequent apparent reduction in alcoholic strength as indicated by the hydrometer. It is not unlikely that glycerine may be added instead of sugar, in order that the acquired degree of sweetness may be obtained without so great apparent reduction of alcohol strength. In order to obtain some trustworthy data on the subject of the difference in gravity produced by addition of glycerine and sugar respectively to dilute alcohol, I caused the following experiments to be made :—

	Specific Gravity at 15·5° C.	Corresponding Alcohol (from Hehner's Tables.)		Weight of Residue. — Grammes per Litre.	Alcoholic strength by Dis- tillation. — p.c. by Wgt.
		Weight.	Volume.		
Expt. 1 .....	·9489	35·05	41·90	0·096	34·94
do 2 .....	·9510	34·05	40·79	5·008	35·03
do 3 .....	·9504	34·33	41·11	4·800	35·05
do 4 .....	·9334	43·05	50·62	.....	.....
do 5 .....	·9388	40·40	47·78	18·720	.....
do 6 .....	·9420	38·78	46·02	28·268	.....
do 7 .....	·9414	39·10	46·37	19·996	.....
do 8 .....	·9458	36·67	43·69	29·640	.....

- Expt. 1—Mr. Babington.—Commercial grain spirit, No. 1 quality, diluted with distilled water.
- do 2 do Dilute alcohol as above, prepared with 5 grammes cane sugar per litre. The residue due to sugar is (5·008—0·096) = 4·912, instead of 5 grammes added, showing 1·76 per cent moisture in the sugar.
- do 3 do Alcohol as above, with addition of 5 grammes glycerine per litre. The residue due to glycerine was (4·800—0·096) = 4·704, instead of 5 grammes. Loss of 5·92 per cent glycerine in drying.
- do 4—Mr. Touchot.—Grain spirit diluted with distilled water.
- do 5 do Above diluted alcohol with 20 grammes glycerine per litre. A loss of 1·280 in the glycerine is 6·40 per cent.
- do 6 do As in No. 5, but 30 grammes glycerine per litre added. A loss of 1·732 in glycerine is 5·77 per cent.
- do 7 do As in No. 5, but 20 grammes cane sugar per litre added.
- do 8 do As in No. 5, but 30 grammes sugar added. This lost in drying 1·2 per cent of weight.

These results confirm those given in the preceding table, showing that glycerine cannot be dried in asbestos without loss of about 5 per cent of its weight. They further show that while the addition of 0·5 per cent of sugar reduces the apparent alcoholic strength by about 1·11 per cent. (volume), the addition of the same weight of glycerine reduces the apparent strength only 0·79 per cent; also, while 2 and 3 per cent sugar added reduced the apparent alcohol strength by 4·25 and 6·93 per cent (volume) respectively, the addition of the same weights of glycerine reduced the apparent strength by 2·84 and 4·60 per cent. In the absence of any recognized standard as to alcohol strength for rye whiskey it is, of course, impossible to pronounce as to the genuineness of any of these samples. None of them have been found to contain anything that could be considered injurious to health. It cannot be denied that certain of them could be selected as much better value than others for the price put upon them by the vendors, if the alcohol content were taken as the basis of valuation.

*Scotch Whiskies.*—These whiskies claim, I believe, to be produced by distillation of malted grain, or a mixture of malted and unmalted grain, in pot-stills. They are characterized when new by the very large amount of so-called “empyreumatic oils” which they contain. The new or raw spirit, being quite unfit for use, is aged in wooden vessels, and in the course of time, through the changes which take place, the oils are oxidized or otherwise converted into products which give the characteristic bouquet or flavour to these whiskies.

Of the 22 samples analyzed, 7 are case liquors and 13 draught liquors. In two instances I am uncertain whether the samples are from draught or not. Nine samples claim to be imported. The highest content in alcohol (62·30 per cent volume) is found in samples that do not claim to be imported. The lowest alcohol content is found in one (No. 10691), which claims to be imported as a case liquor, made by Thom & Cameron, of Glasgow. The only other sample claiming to be made by Thom & Cameron (No. 10701) gives very different results on analysis. In only 5 samples does the alcohol (volume) fall below 45 per cent, and 3 of these claim to be imported liquors. All of the samples give the furfural reaction, but in ten only is it distinct. Of these, three claim to be imported. It would appear, therefore, that much of what is sold as imported Scotch whiskey is greatly diluted with patent-still spirit.

The solid residue found in these whiskies varies from 1·7 (No. 10269) to 0·280 (No. 9389) grammes per litre. It is remarkable that the solids found in this class of liquors bear a less constant ratio to the difference between original and spirit gravity than in brandy or rye whiskey. This may be to some extent due to the nature of the residue, which, at least in the genuine samples, is not a foreign addition to the liquor. The artificial sample was made as follows :—

Alcohol (about 10 below proof) . . . . .	1,600cc.
Scotch whiskey essence . . . . .	1cc.
Glycerine . . . . .	5cc.

It is not a good imitation of the genuine article.

*Irish Whiskey.*—This is supposed to be, to a large extent, a pot-still product from malt and grain. Of the ten samples analyzed, only 2 fell below 45 per cent (volume) of alcohol. The highest percentage is 50·14 and the lowest is 33·22. Four of the samples fail to give any opalescence on diluting the distillate, and 3 of these claim to be imported, including No. 10249, which contains the highest spirit percentage found. All give the furfural reaction, and 7 give it distinctly. There is something very abnormal about No. 9980. The total solids found is entirely exceptional, and the spirit strength is at the same time very low. The artificial sample referred to was made as follows :—

Alcohol (about 10 below proof) . . . . .	1,600cc.
Irish whiskey essence . . . . .	1cc.
Glycerine . . . . .	5cc.

It is not a good imitation of the genuine Irish whiskies.

*White Whiskey.*—Under this heading I have tabulated samples sold under the name white whiskey, together with such samples of whiskey as were not specified as “rye,” “Scotch,” “Irish” or “Bourbon.” Many were sold simply as “whiskey,” others as “malt whiskey.” The total number is 33. Two samples are included which would more correctly, judging from the results of analysis, have come under other headings. These are serial numbers 21 and 22, the first of which is undoubtedly intended for a “rye” whiskey and the second for a “Scotch whiskey.” These whiskies exhibit a very great disparity in alcohol strength, varying from 49·96 per cent. (volume) in No. 7, to 26·48 per cent. in No. 33. There can be little doubt that many of them, in the very low solids they contain and the total absence of any characteristic flavour, show that they are merely made by reducing grain (or silent) spirit by addition of water. Where the solids amount to a few tenths of a gramme per litre they may be introduced in solution in the water used for dilution. None of the samples (except 10254) give any opalescence on dilution, or any reaction for furfural.

*Hollands Gin.*—Fifteen samples have been fully examined and a sixteenth sample has been partly analyzed by Mr. Tournot. Of the 6 “case” samples of gin, all gave a distinct reaction for furfural. Three of the “draught” samples gave this reaction distinctly, but 5 contained no furfural, and 1 (No. 9974) gave the reaction but faintly. An artificial gin, made with essence and silent spirit reduced, gave no reaction for furfural. It would therefore appear that genuine Hollands contains furfural, and, by inference, such samples of gin as do not give the reaction are probably factitious, and made from silent spirit, by addition of essence of juniper. Seven of the samples approximate very closely to proof strength. The highest content in alcohol is 57·36 per cent (volume)—i.e., one-half per cent over proof. The lowest in alcohol is No. 10676, containing 42·18 per cent alcohol by volume, or about 26 under proof strength. All of them give opalescence on dilution, but in 3 of them the opalescence is but slight. A genuine Hollands gin should give no residue on drying at 100° C, other than that due to matter dissolved from the cask or vessel in which it has been stored. In the case of the artificial gin the residue found is chiefly glycerine, the sample being made from the following formula:—

Alcohol (about 10 below proof) .....	1,600c.
Hollands' gin essence .....	1c.
Glycerine .....	4c.

The highest residue found in any of the regularly collected samples is less than 1 gramme per litre; and with the exceptions of No. 9358, in which it reaches 0·948 grammes, and No. 10696 in which it is 0·342, gramme per litre, the amount is practically insignificant, as far as suggesting the intentional addition of solid matter. Even in the cases excepted, it is not impossible that the solids found may be derived from the cask. It will be noticed that the highest residues are always found in the draught samples.

*Old Tom Gin.*—This seems to be essentially a sweetened gin, containing oil of juniper and sugar. None of the samples gave any reaction for furfural, and I interpret this to mean that they are manufactured from patent still spirits. These gins seem to bear the same relation to Hollands that rye whiskey bears to Scotch or Irish pot-still whiskey. The residue in Booth's gin amounts to about 29 grammes per litre, or nearly 3 per cent. It consists almost wholly of sugar. A draught gin, No. 10485, imitates Booth's gin pretty closely, except in spirit strength. The sample made in the laboratory from the following formula:—

Alcohol (about 10 below proof) .....	1,600c.
Old Tom Gin Essence .....	1c.
Glycerine .....	5c.

gives a very low residue as compared with the other samples. The presence of so much sugar in solution greatly lowers the apparent alcohol strength. In No. 10485, for example, the strength indicated by the original gravity is only 33·23 per cent (volume), while the true strength is 41·04 per cent.

I have the honour to be, Sir,

Your obedient servant,

A. MCGILL,

*Assistant Analyst.*
